as a private residence, has long been found inadequate to the proper accommodation of the vast and continually increasing collections that belong to the museum; and in consequence a new quadrangular building has been designed by Sir R. Smirke, a part of which is already completed, and open to the public. In 1756 the Harleian MSS. were purchased, and the Cottonian library was removed from Dean's Yard, Westminster; in 1757 the royal library, founded by Henry VIII. out of the libraries of the suppressed monasteries, and enlarged by his different successors, was presented by George II. George III., in 1763, gave a valuable collection of pamphlets on the civil wars, and between 1806 and 1818 the Lansdowne, Hargrave, and Burney MSS. were purchased at an expense of 26,400*l.* Various presents have been made from time to time, but the most valuable addition of late years has been the library of George III., collected at an expense of 200,000*l.*, and presented to the Museum by his successor.\* Modern English publications are added, free of expense, in consequence of a privilege which this establishment enjoys in common with the two universities, and some other bodies, of receiving *gratis* a copy of every book entered at Stationer's Hall; and about 3,000*l.* a year are expended in the purchase of old and foreign works, in the latter of which, however, the library is still extremely deficient. There are about 330,000 printed books, and 27,000 MSS., exclusive of charters. The want of a *clois-e-ratoire* is much felt by the great majority of persons who resort to the library for study or research. The reading-rooms are open from 9 till 4 in winter, and till 7 in the evening during 4 summer months. The average number of readers is about 220 a day. Admission is procured by a recommendatory letter either to one of the trustees, or to the chief librarian; and every facility is given by the numerous attendants for the most extensive research. No books are allowed to be taken out, it being supposed that such permission would lead to frequent and heavy losses; but, provided the value of the books were previously deposited, we incline to think that certain descriptions of works might be lent out with great advantage. In the department of antiquities may be mentioned the collection of Egyptian monuments, including the famous Rosetta stone (see Vol. I. p. 751.), acquired at the capitulation of Alexandria, in 1801; the Twosley marbles, purchased for 28,000*l.*; the Phigalian and the Elgin marbles, the cost of which was 35,000*l.*; the latter include the statues of Theseus and Hissus, and the sculptures in *alto-relievo*, from the friezes of the Parthenon. The collection of minerals was, for many years, deficient in various important particulars; but the recent additions purchased from Messrs. Hawkins and Mantell are extremely valuable; and now, both for size and classification, this department will bear to be compared with any mineralogical collection in Europe. The department of zoology is rich in birds and insects, but poor in other respects, especially in mammalia. The collection of medals, which has been accumulating since the foundation of the museum, consists of about 20,000 coins, above 6,000 being purchased with the Hamilton collection of Herculanean antiquities, in 1772. The coins can only be seen by an order from a trustee, or a private introduction to the officer to whose charge they are entrusted. The public days at the museum are Mondays, Wednesdays, and Fridays, when all persons have free admission from 10 to 4, and in the summer months from 10 to 7. The building is closed during the first weeks of January, May, and September. The establishment is governed by 48 trustees, 22 of whom are official; and to these the officers are responsible. The chief acting trustees, with whom the appointment of the officers rests, are the archbishop of Canterbury, the lord chancellor, and the speaker of the H. of C. (*Part. Rep. on British Museum*, 1835.)

**Literary and Scientific Societies.**—Before the present century the learned societies of London were few in number, and very comprehensive in their objects. The great advancement of the physical sciences, in recent times, and the increased ardour with which every branch of knowledge has been cultivated, have produced a corresponding increase in the number of learned associations, and in all recent instances each body has confined its operations within a limited sphere. The following list comprises the principal societies, with the dates of their formation, the objects contemplated by them, when not sufficiently indicated by their names, and the publications made at their expense:—

The Royal Society; physical and mathematical sciences. Instituted early in the 17th century; incorporated 1663. "Philosophical Transactions," from the year 1665.

The Society of Antiquaries. Instituted 1717; incorporated 1751. "Archæologia," from this year 1770.

Medical Society. Established 1773. "Vestata Monumenta," from 1747.

\* It is much to be regretted that this library had not been placed in an accessible situation to the W. end of the town.

Society of Arts. Established 1754, for the encouragement of the arts, commerce, and manufactures of Great Britain, by granting rewards. "Transactions," from the year 1783.

Linnean Society; natural history. Established 1788; incorporated 1802. "Transactions," from the year 1791.

Royal Institution. Estab. 1799, for the application of science to the ordinary purposes of life. "Journal," from 1810.

Horticultural Society. Established 1804; incorporated 1809. "Transactions," from 1812.

Royal Medico-Chirurgical Society. Established 1805. Chartered 1831. "Transactions," from the year 1808.

Geological Society. Established 1807; incorporated 1826. "Transactions," from 1811.

Society of Civil Engineers. Established 1817; incorporated 1828. "Transactions," from 1834.

Royal Astronomical Society. Established 1820; incorporated 1831. "Memoirs," from 1822.

Medico-Botanical Society. Established 1821. "Transactions," from 1834.

Royal Asiatic Society. Established 1823; incorporated 1824. "Transactions," from 1827 to 1835; "Journal," from 1831.

Royal Society of Literature. Founded 1821; incorporated 1825. "Transactions," from 1827.

Zoological Society. Instituted 1829; incorporated 1829. "Transactions," from 1833.

Royal Geographical Society. Chartered 1830. "Journal," from 1831.

Entomological Society. Established 1833 or 1831.

Statistical Society. Established 1834. "Journal," from 1837.

Architectural Society. Established 1831.

Royal Institute of British Architects. Established 1835; incorporated 1838. "Transactions," from 1836.

Royal Botanic Society. Chartered 1839.

Nearly all these societies hold meetings twice a month, on Saturdays and Sundays, at which papers are read illustrative of matters connected with the objects of each association.

The following Table, taken from Gilbert's "Clerical Almanack" for 1840, supplies several details with respect to some of the more important of these Societies, on which, it is believed, considerable reliance may be placed:—

STATEMENTS AS TO the principal Scientific and Literary Societies in London.

Name of Society.	Date of Institution or Incorporation.	Income.	No. of Officers and Members.	Henry, Foreign, and Corresponding Members.	Total No. of Members.

**Picture Galleries.**—The present national collection of pictures is of recent foundation, and should only be looked upon as the nucleus of one that may hereafter be worthy of the country. It occupies the W. wing of the National Gallery, erected 1834-37, at the public expense, on the N.W. side of Trafalgar Square, facing Whitehall and Parliament Street, unquestionably the finest situation in the metropolis. The building has a front of 500 ft., with a portico and dome in its centre, supported by Corinthian columns. But whether it were owing to the limited means placed at the disposal of the architect, or to some incapacity on his part, the fabric is neither worthy of its site, its object, nor of the country. Unfortunately, too, the defects of its exterior are not counterbalanced by any superiority of internal economy, the apartments for the exhibition of the pictures being miserably deficient in point of size, and ill-arranged. The pictures, which consist of the Anglo-Saxon collection, purchased in 1824, of Sir G. Beaumont's collection, given by him in 1826, and of others,

partly presented and partly purchased, amounting in all to about 170, are arranged in five rooms, of such diminutive size, that they will contain only a few more pictures, and none of large size. About half the pictures belong to the Italian school; and of these the *Ecce Homo*, and the Mercury, Venus, and Cupid, of Correggio; the Raising of Lazarus, by Sebastian del Piombo; the Bacchus and Ariadne, of Titian; and the Holy Family, by Murillo, are reckoned the most valuable. The works of the two Caracci, N. and G. Poussin, and Claude, may be here seen in their highest perfection; and there are some fine specimens of the English school, by Reynolds, Hogarth, Gainsborough, Wilson, and Lawrence. The gallery is open to the public on the first four days of the week: on Friday and Saturday students are permitted to copy the pictures. The Royal Academy, which at present (by permission of government) occupies the remainder of this edifice, was established in 1768, for the instruction of young artists: lectures are delivered in anatomy, painting, sculpture, and architecture, and daily instructions are given to the students by the master, and other academicians. The annual exhibition of this corporate society usually comprises about 1,200 specimens of art, and is one of the favourite lounges during the summer months. The profits of the exhibition, besides paying all the expenses of the schools, contribute to form incomes for the most deserving artists, while studying at Rome. (See *Comm. Report on the Arts, &c.* of 1838.) The Society of British Artists exhibits annually a good collection of pictures; but, as a whole, they are very inferior to those exhibited by the academy. The British Institution, and Society of Painters in Water Colours, have, also exhibitions, and their rooms are crowded during the fashionable season.

**Theatres and Music.**—The great theatres of modern London present a curious contrast to the rude and confined buildings called the Globe, Blackfriars, and Old Drury, in the time of Shakspeare, in which neither scenery, decorations, nor the comfort of the audience were at all considered. The two patent theatres, Drury Lane and Covent Garden, contiguous to each other, have handsome exteriors, and very extensive and highly decorated interiors. They enjoy, or rather are supposed to enjoy, the exclusive privilege of representing tragedy and comedy, the legitimate drama; but the declining taste of those who visit the theatres, and the caprice of managers, have led to the frequent introduction of spectacles, and other pieces, to which music and scenery contribute more than the actors on the stage. Late dinner hours and other circumstances have of late years occasioned a great falling off in the taste for theatrical exhibitions, which are now visited more by strangers than by residents in London. At present, few theatres are profitable. The Haymarket theatre, which has recently enjoyed more than ordinary prosperity, is of smaller size, and therefore better adapted for hearing, than the immense houses above mentioned: it is open during about eight months of the year, including the recesses of the two patent theatres. Besides these, there are several minor theatres, the names, localities and objects of which are given in the following table:—

Names.	Localities.	Objects.
The Prince's Theatre	King St., St. James's	Operas and farces
English Opera House	Strand	Operas and farces
Auchin	Ditto	Spectacles & ballets
Strand	Ditto	Ballets
Olympic	Wych Street	Ditto
Queen's	Tottenham Court Rd.	Ditto
City of London	North Fildgate	Melodrama
Garrick	Godman's Fields	Ditto
Golden Well	Chancery Lane	Ditto
Astley's	Lincoln	Melod. & horsemans.
Surrey	Blackfriars Road	Melodrama
Victoria	Waterloo Road	Ditto.

Among these, Astley's deserves particular notice, for the excellent horsemanship displayed by M. Ducrow and his corps *dramatique*: it is certainly superior to the Franconi theatre at Paris.

The Italian Opera House, in the Haymarket, is the largest theatre in London. It scarcely, however, deserves the name of a national theatre, inasmuch as the singers, dancers, and musicians are chiefly foreigners, and as it depends for its support chiefly on the patronage of the court, nobility, and higher classes, many of whom hold private boxes, at rents, averaging from 12*l.* to 40*l.* a year. All the patronage of rank and wealth, however, cannot, owing to the enormous cost of the performances, make it a good speculation for the manager, who at the end of an anxious season has frequently to lament heavy losses. The established London concert, consist of the ancient, philharmonic, and sacred-harmonic concerts, all of which are well and fashionably attended: many others are given by professional persons, for their own benefit, in the different public rooms at the W. end. The promenade

\* Those marked with an asterisk have charters.

concerts lately introduced, in imitation of those at Paris, promise, by the high favour which they enjoy, to improve the musical taste of the people, which has undoubtedly been on the increase during the last few years.

**Benevolent Institutions.**—There are above 70 establishments in London for the cure of disease; of which, 27 are properly hospitals; 25 dispensaries, where medicine and advice are gratuitously administered; 9 are infirmaries for special diseases; and 11 lying-in charities. There are also 18 asylums for orphans and otherwise destitute persons, and various other benevolent establishments. The principal are the following:—

1. St. Bartholomew's Hospital, in West Smithfield, was first founded in the 12th century, and refounded by Henry VIII. in 1546. The building, a spacious quadrangular structure, is principally modern, having been finished in 1770. It makes up 600 beds, and receives annually about 5,000 in-patients, and 6,000 out-patients. Necessity is the only recommendation to this institution; and patients are received without limitation. The medical staff is equal to any in the metropolis. The staircase was gratuitously painted by Hogarth.

2. Guy's Hospital, St. Thomas's Street, Southwark, founded in 1721, contains accommodation for 500 in-patients, and has an excellent museum and theatre of anatomy. This magnificent hospital, which consists of two quadrangles and two wings, was founded and endowed by Thomas Guy, a bookseller, who expended 18,793*l.* upon the building, and left 219,419*l.* for its endowment—the largest sum, perhaps, that has ever been expended by any individual on similar purposes. Recently, however, Guy's Hospital has met with another benefactor, but little inferior, in point of liberality, to its founder; a citizen, of the name of Thomas Hunt, having bequeathed to it, in 1829, the princely sum of 200,000*l.* The medical school attached to this hospital, while under the superintendence of the late Sir Astley Cooper, was one of the most extensive, and probably, also, the best in the empire.

3. St. Thomas's Hospital, in High Street, Borough, was formed out of two other charities by Edward VI., and rebuilt in 1693. Additions were made in 1732, and a large part rebuilt in 1836. It contains 18 wards, and 485 beds. The annual expenditure is about 10,000*l.*

4. St. George's Hospital, near Hyde Park corner, lately rebuilt, has a fine front, 200 ft. in length, facing the Green Park. It accommodates 460 in-patients.

5. The Middlesex Hospital, near Oxford Street, founded in 1745, receives 300 in-patients, and relieves numerous out-patients.

6. London Hospital, in Whitechapel, was founded in 1749. Its wards accommodate about 250 patients.

7. Westminster Hospital, rebuilt in 1833, near the Abbey, receives 230 in-patients. The University College and King's College Hospitals, and Charing Cross Hospital, are smaller establishments of the same nature, each accommodating about 120 patients.

Medical schools are connected with the above hospitals, in which lectures are delivered by the officers, and which are attended, altogether, by about 1,200 students.

Bethlehem Hospital, or Bedlam, is appropriated exclusively to the insane poor; it was founded in 1675, in Moorfields, whence it was removed, in 1814, to St. George's Fields. The present building, received some extensive additions in 1839, and is now 697 ft. in length, being at once extensive and magnificent. The rooms are large and airy, well warmed and ventilated, and are sufficient for the accommodation of an immense number of patients. St. Luke's, City Road, established for a similar purpose in 1751, accommodates 300 persons.

The Foundling Hospital, Brunswick Square, was founded by Capt. Coram, in 1739, but the building was not commenced till 1742. It was established for the indiscriminate admission of deserted children; but the numbers were found to increase so rapidly, that the funds failed, and in 1760 the mode of admission was so much altered, that it is now nominally only a Foundling Hospital. The number of children averages about 450, and they are maintained till the age of 12, when they are either apprenticed or otherwise provided for. The revenue is about 13,000*l.* per annum.

The Magdalen Hospital, Blackfriars Road, was established in 1748, for the reformation of erring females: the object is said to be attained in the majority of cases, more than two thirds of the females admitted being either restored to their friends, or provided with the means of procuring an honest livelihood.

The Philanthropic Institution, St. George's Fields, was founded, in 1784, for the reception and reform of young criminals discharged from prison. It provides them with immediate means of subsistence, and instructs them in some trade, so as to prevent the otherwise almost inevitable necessity of their returning to their former habits.

**Hotels and Taverns.**—The hotels, taverns, and coffee-shops of all classes, may be reckoned at something more than 6,000. There are about 30 great hotels, situated

chiefly at the W. end of the town, in the neighbourhood of Piccadilly. "In these establishments," says Prince Puckler Muskau, "every thing is infinitely richer and more abundant than on the Continent." The commercial and other inns, amounting to nearly 400, are scattered throughout the metropolis. They are generally respectable establishments, some of them being quite as commodious, if not so elegant, as the fashionable hotels. The establishments of licensed victuallers, under which denomination are included all places for the retail sale of spirits, amount to about 5,000. Many of these are respectably conducted, though some are of an opposite character. The publicans furnish their guests not only with beer and spirits, but also with dining accommodation, &c. The gin or dram shops have been very much embellished of late years; and many of them are so handsomely, and even splendidly, fitted up, that they have acquired and are entitled to the name of "gin palaces." But notwithstanding the number and magnificence of these establishments, there is no real room or ground for the prevalent opinion, as to the increase of intemperance. No doubt it is much too widely diffused; but it nevertheless admits of demonstration, that, as compared with the pop., the consumption of spirits in the metropolis is now very decidedly less than in the reign of George II., and the greater part of that of George III.; and that there has been a corresponding improvement in the habits of the lower classes.

The eating-houses and coffee-rooms, where spirits are not sold, amount to about 700; and are more numerous in the city than in Westminster. There are about 600 beer-shops. Numerous private houses are let out in lodgings, and many families receive boarders. The expense of living in these establishments varies, of course, with the quality of the house and the means of the guest. A lodger at an inn can hardly be accommodated, on a decent scale, much below 10*s.* a day, including all expenses of board, food, and servants; the maximum of the scale will, of course, depend on the habits or caprice of the guest. Board and lodging in private houses may be obtained at a somewhat lower rate than at hotels; but a single man in lodgings usually dines at an eating-house, and families generally prefer boarding at their own cost. A dinner (without wine) at an ordinary eating-house costs from 1*s.* 6*d.* to 2*s.*; and seldom exceeds 3*s.* at the more elegant establishments. In most cases the guest may depend on every attention; and at the superior houses he will find all the luxuries of the season.

**Clubs.**—There are about 40 clubs in the metropolis. A few of these establishments, such as Brooks's, Boodle's, and White's, are of ancient date; but their present arrangements and constitution are of recent introduction. The accommodation they afford to gentlemen only occasionally visiting town, and to others desirous of enjoying the luxuries of a splendid establishment, at a moderate expense, and of meeting with a great variety of society, has made them popular among the upper classes. The club-houses are mostly edifices of a very superior character; and add much to the magnificence of the squares and streets in which they are situated. Each club consists of a limited number of members, varying from 1,000 to 1,500; they are admitted by ballot, pay a certain sum at entrance, from 10 to 25 guineas, and an annual subscription, varying from 5 to 10 guineas. The club-houses are fitted up with every luxury of a fashionable hotel, have excellent libraries, take in the best periodical publications, and provide dinners, coffee, wines, &c., at reasonable prices. A large building has recently been opened, in Regent Street, in the view of supplying strangers, frequenting the clubs, with beds. Some of the clubs are avowedly of a political character, and others are devoted exclusively to certain classes. Among these may be specified the Carlton, Reform, City Conservative, United Service, Oxford and Cambridge, Traveller's, Oriental, and West Indian; but most clubs are open, on election, to all gentlemen without reference to party or profession. Most of the club-houses are at the W. end of the town, particularly in Pall Mall and St. James's Street. The building erected for the Reform Club, by Mr. Barry, is the finest structure belonging to this class of edifices; and is fitted up with equal taste and magnificence. The city of London has two club-houses, which, in point of elegance and luxury, may vie with those of the W. end. The number of members in the different clubs may be about 30,000.

**Courts of Law.**—The Courts of Chancery, Queen's Bench, Common Pleas, and Exchequer (the respective provinces of which are described in the art. ENGLAND AND WALES), occupy apartments on the W. side of Westminster Hall. This hall, built by William Rufus, was long supposed to be the largest room in Europe unsupported by pillars. It measures 270 ft. in length by 74 ft. in breadth, and is 90 ft. high; and these dimensions have been much surpassed by the great plate-glass hall of Ravenhead, which is 339 ft. long, and 155 ft.

broad, with a proportional height. Westminster Hall has been used for coronation banquets, the last of which was given when George IV. was crowned. Parliaments have often met in it, and it is occasionally appropriated to important trials; among which may be specified, that of Charles I. and more recently those of Warren Hastings and Lord Melville. Ordinarily, however, it is a mere promenade for lawyers during the sitting of the courts. The Lord Chancellor sits out of term-time in the hall of Lincoln's Inn, near which is another court, occupied by the Vice-Chancellor.

The Central Criminal Court, the jurisdiction of which extends to all places within 10 m. of St. Paul's, was established in 1834. Its sittings are held at the Old Bailey, a stone building close to Newgate, once a month, and generally last five or six days at a time. There are two halls, of confined dimensions, in both of which the judges are engaged in trying prisoners during the sessions.

The Court of Bankruptcy is in Basinghall Street, within the city of London; the Court for the relief of Insolvent Debtors, in Portugal Street, Lincoln's Inn Fields; the Marshalsea and Palace Courts are in Scotland Yard, Charing Cross; the Ecclesiastical and Admiralty Courts, in Doctors' Commons, near St. Paul's; Courts of Requests, which give summary judgment in case of small debts, are numerous in different quarters. The jurisdiction of the several courts is explained in the art ENGLAND AND WALES, Vol. I. p. 783.

*Inns of Court.*—The Inns of court, originally colleges for legal study, are now little more than residences for lawyers, or, indeed for any one who chooses to hire chambers in them. They are not incorporated, and cannot, consequently, make bye-laws; but, by prescription, their customs have obtained the force of laws. A law student, before being called to the bar, has now only to be entered as member of one of these Inns, and to dine a certain number of times in the common hall, in order to qualify himself for the exercise of his profession. This is termed "eating" his way to the bar.

The chief Inns are the Inner and Middle Temple, originally built by the knights templars in Fleet Street, in the reign of Henry II.; Lincoln's Inn, in Chancery Lane, and Gray's Inn. Subordinate to the Temple, are Clifford's, Lyon's, Clement's, and New Inns. Furnival's Inn belongs to Lincoln's Inn; Staples Inn and Barnard's Inn are attached to Gray's Inn. These are called Inns of Chancery. Thavies Inn, and some others, are become mere private residences.

*Prisons.*—There are 10 criminal prisons, of which 3 are in the city of London. 1. Newgate, under the control of the corporation, is a building, the architecture of which is singularly characteristic of its destination. Newgate was a prison early in the 13th century; but the present edifice was erected in 1729, and again repaired after the riots of 1780. This, which may be called the great metropolitan gaol, contains accommodation for about 400; but occasionally upwards of 1,000 are crowded within its walls. In front of this prison all the criminals of London and Middlesex, capitally convicted, suffer the last penalty of the law. It is said to be one of the worst regulated gaols in the kingdom, "a fruitful source of demoralisation to its unhappy inmates, and a reproach to the character of the city corporation." (*Police Inspector's 4th Report*, p. 251.) 2. The Brixton, near Blackfriars Bridge (once a royal palace), is a house of correction for vagrants, pilferers, or disorderly persons, summarily convicted before the lord mayor and aldermen. The number confined averages 100; the prisoners are classified, the silent system adopted, and the tread-wheel generally used. 3. Giltspur Street compter, opposite St. Sepulchre's church, a plain edifice with a stone front, is used as a place of confinement for untried prisoners, and as a house of correction for offences less grave than those of the inmates of Newgate. Its use is restricted to offenders convicted by the city magistrates. It holds about 160, and there is no classification. 4. Clerkenwell prison, belonging to the county of Middlesex, is one of a similar character with the last. It serves, also, as an auxiliary to Newgate, receiving prisoners remanded from the police courts, or committed for trial at the general sessions. Its inmates average 280, and some attempt has lately been made at classification. 5. Cold-Bath-Fields prison, a very extensive brick building, near Gray's Inn Lane, is a house of correction for Middlesex; and contains felons, indisciplinables, and rogues and vagabonds. It is an insulated brick building, containing spacious courts and airy grounds. The classification is good, and the silent system is followed, connected with hard labour. A large tread mill employs 320 prisoners at a time. This prison accommodates upwards of 1,200. 6. The Westminster Bridewell, begun in 1831 and finished in 1834, is surrounded by a lofty wall, with a complete roadway outside; it is built on the Panopticon principle, with prisons round it in the centre 250 ft. in diameter, with prisons round it for 600 persons; but the average number confined is 350. The arrangement of the

building is said to be excellent; and the window of the governor's house commands a complete view of all the day-rooms and yards, and of the 2 tread-wheels. Instruction is given to juvenile offenders. The silent system is adopted, and a good classification maintained. 7. The penitentiary, at Millbank, Westminster, built on the Panopticon principle, has no peculiar connection with the metropolis, but is intended for the confinement and reformation of criminals whose sentence of transportation or death has been commuted. It contains accommodation for 1,120 prisoners; but the number of inmates averages about 600. The building is insulated, and is surrounded by a wall enclosing 18 acres of ground. The penitentiary is managed by a committee, nominated by the secretary of state, and the chaplain is the governor. 8. The Surrey county gaol is in Horse-monger Lane, N. W. London (one way). It contains about 250 prisoners, debtors as well as criminals; and there is little classification. The top of the building is used as a place of execution. 9. The borough compter, in Tooley Street, is also a prison for debtors and criminals. The management and discipline of this prison are stated to be exceedingly defective: the average number of inmates is about 40. 10. The Brixton House of Correction is exclusively confined to prisoners sentenced to hard labour at the assizes and sessions, or by magistrates, under summary convictions. Hard labour and the silent system are rigorously enforced. The average number of prisoners is 260. (*Inspection of Prisons*, 1836-37.)

The following Table, drawn up from the Gaol Returns and Prison Inspectors' Reports for 1839, furnishes some details respecting the economy of the Metropolitan Gaols:—

Prisons.	Power of Accommodation.	Prisoners, Mich. 1839.	Ann. Cost of each Prisoner.	Total Annual Exp.
<i>City of London:</i>	<i>Prisoners.</i>		<i>£.</i>	<i>s.</i>
Newgate	500	153	6	11
Giltspur-street	240	172	10	1
Bridewell	120	9	6	5,106
Borough Compter	40	37	4	6
<i>City of Westminster:</i>				
Tothill Fields	1,150	310	4	16
Gov. Prison, off-st.	1,120	484	10	8
<i>County of Surrey:</i>

The principal prisons for debtors are, 1. The Queen's Bench, in the borough, chiefly used for debtors on process from the Court of Queen's Bench, but also for persons committed for libels, contempts, &c. It is a spacious healthy prison, containing 224 rooms, in which 500 persons have occasionally been confined at once. The rules of the bench, a district in which prisoners may purchase the liberty of residing out of prison, include a space of nearly 1 sq. m. 2. The Fleet prison, in Farringdon Street, is chiefly for debtors under process from the Court of Common Pleas, and those committed under Exchequer process, and for contempts of the Court of Chancery. The rules of the Fleet are not so extensive as those of the Queen's Bench. 3. A White Cross Street prison, in the street of that name, in the city, is inconveniently built and wretchedly managed. Its confined extent, when compared with the average number of the inmates, and the filth and disorder prevalent in every part of it, are not a little discreditable to the corporation of London. 4. The Marshalsea prison, in the borough of Southwark, is a small prison for persons committed by the Marshalsea Court, and for debtors arrested under process in the Palace Court. It is a quadrangular building, containing about 60 rooms, and accommodation for about 100 prisoners. The debtors' prisons have been comparatively deserted since the new Act respecting imprisonment for debt came into active operation; but before that time they were often inconveniently and even unwholesomely crowded.

*Crimes.*—The crimes committed in London are both grave and numerous; but the degree of demoralisation, as compared with the pop., is not greater than in other places offering the same facility for successful depredation, and having an equal amount of poverty. The Report of the Constab. Comm. gives the following statement of depredators known to the metropolitan police in 1838:—

Burglars and housebreakers	-	217	•
Highway-robbers	-	38	
Pick-pockets and common thieves	-	4,430	
Colours and utterers of base coin	-	345	
Forgers	-	3	
Swindlers, &c.	-	320	
Horse and dog stealers	-	152	
Begging-letter impostors	-	136	
Disorderlies, habitual	-	2,786	
Vagrants	-	2,293	
Street prostitutes	-	6,371	

The annual average of convictions during several late years within the metropolis amounts to 3,300 (or about 1 in 415 of the entire pop.), more than half of which are for slight crimes, demanding six or three months' imprisonment. Capital offences, except murder, are now generally punished by transportation for life to the new penal settlement, Norfolk Island. The executions in London have averaged two annually during the last seven years. The serious crimes of the metropolis are undoubtedly on the decrease; and the frequent notification of them at present is more owing to the vigilance of the police, who detect and prosecute offenders, than to any actual increase of crime. (*Constab. P. Com. Report*, i. 13.)

The following Table exhibits the Average Annual Amount of Crimes in and about London during six Years (1834—1839), and the Proportion which the Convictions in Middlesex and the four Metrop. Counties respectively, as compared with their estimated Pop. in 1837, bear to those in England and Wales, as compared with its Pop.: the Convictions in the latter being considered as 1.

Classes of Crimes.	Average Annual Convictions.				
	Middlesex.	Ratio.	Metrop. Co.	Ratio.	Eng. & Wales.

Poaching	nil	0	7	35	113
Keeping bad houses	26.6	3.77	30	2.26	70
Various	11.6	1.90	20	1.10	76
Total of Class VI.	68	92	103	76	759
Average yearly amount of all convictions	2,198	1.54	1,270	1.42	16,062

The increase of crime in and about London has been chiefly in attempts to maim and kill (82 per cent.), in sexual offences (33 per cent.), in frauds (73 per cent.), and in larcenies (21 per cent.): there has been a decrease in robberies of 22 per cent., in riots of 33 per cent., and in poaching, &c., of 117 per cent. Independently of the offences tried by juries, many others are summarily punished by the police magistrates, amounting annually to about 17,000, exclusive of fines for disorder and drunkenness. (*Off. Criminal Tables*.)

**Police.**—Till 1820, the police of London had the reputation of being the most defective establishment of the kind in Europe. A great reformation, however, has been effected within the last few years, and the metropolis is now, perhaps, superior in this respect to any other in Europe. There are 11 police offices, 2 of which are in the city, and one in Southwark. These are—

The Guildhall, in the City.	Great Marlborough Street, Oxford Street.
The Mansion House, do.	Worship Street, Finsbury Square.
Bow Street, near Covent Garden.	Lambeth Street, White-chapel.
Hatton Garden, near Holborn.	Union Office, Southwark.
Queen Square, Westminster.	Thames Police, Wapping.
11th Street, Marylebone.	

The first two of these offices are regulated by the city authorities; the rest are under the control of the Secretary of State. Magistrates sit every day at each office, to hear and determine cases of misdemeanour and breach of the peace, as well as to examine and commit for trial all persons accused of felonies, to administer oaths, swear in constables, and perform other magisterial functions. A number of officers is appropriated to each establishment, and to the Thames office a river police is attached.

The chief instrument of preserving the peace of the metropolis is the metropolitan police, established in 1829. This body is dispersed over the whole of London, excepting the city, which is protected by a distinct body, of similar character, but less effective and worse disciplined. The city police is under the control of the corporation: the other force is governed by two commissioners, who communicate directly with the Secretary of State for the Home Department. The whole body is divided into 17 companies, to each of which is attached a conveniently situated station-house: each company is placed under a superintendent, who has under him 4 inspectors, 16 sergeants, and 144 constables. Their duties reach beyond the metropolis, extending from Brentford on the W. to the borders of Essex on the E., and from Norwood on the S. to Highgate N. The expense is defrayed by an assessment limited to 8d. in the pound on the parish rates, the deficiency being made up by the treasury. The city, as before said, is not under the charge of the metropolitan police, but is protected by a body of men organised on the plan, and in imitation of the arrangements of that body, but placed under the city authorities. The city police, consisting of 500 men, is divided into six companies, to each of which belong inspectors, sergeants, and constables, and the whole is immediately under the control of a superintendent. All the constables, both of the city and metropolitan police, wear a blue uniform, with the number of each man, and a letter designating the division to which he belongs on the collar of his coat. They are constantly on duty, day and night; but the force is increased at night. The services conferred on the community by the metropolitan police may be in some measure estimated from some details furnished in the report of the constabulary force commissioners. It is there stated, that in the years 1836-38 they saved 200 lives, and prevented 152 suicides, rendered assistance at 2,430 accidents and 775 fires, relieved or conducted to a place of safety 1,870 sick, insane, or otherwise helpless persons, and restored to their homes 2,830 lost or strayed children: during the same period, they recovered from thieves, &c., 14,420, and from careless exposure and drunkards 54,212. (*Constab. Force Com. Report*, i. 292.)

**Pauperism and Mendicity.**—London, with all its wealth, contains much misery and indigence, a large proportion of which, however, is attributable more to demoralisation than mere misfortune. Since the Poor Law Amendment Act, most of the metropolitan parishes have placed themselves under its regulations, only 11 parishes still adhering to the old system of maintaining their poor. The money expended in maintaining the poor within the metropolis in 1839 amounted, according to the last Report of the Poor Law Commissioners, to 374,711. The mendicants, a class almost wholly separate from the paupers, pursue their vocation almost as regularly and with as much success as tradesmen. The Mendicity Society have laboured usefully in exposing the impositions of mendicants; but neither their agents nor the police have been able to suppress them. Of the London beggars, nine out of ten are gross impostors and convicted vagrants; and of these the very worst are the blind and cripples. The records of the above Society afford surprising proofs of the profligacy of the regular street-beggars, and the inveteracy of their idle and dishonest habits. The metropolitan police, in 1837, apprehended 4,300 mendicants. (*Metrop. Police Off. Rep.*, 1838.) The really indigent are relieved by an excellent institution, entitled the Refuge for the Destitute, which provides a meal and a bed for those who give satisfactory proof of requiring such assistance. The private lodgings of mendicants are crowded, unwholesome, and literally sinks of iniquity.

**Water.**—The supply of London with water was anciently procured from brooks running through the city. The increase of inhabitants made these sources insufficient; while, at the same time, they became less accessible, owing to the encroachment of buildings. To remedy this inconvenience, water was brought by leaden pipes in the 13th century from Tyburn, then a mere country village, into the city, where it flowed into conduits from which the inhab. drew it at pleasure. In the beginning of the 17th century Sir Hugh Middleton projected, and, in despite of the greatest difficulties, carried into effect, in 1613, his plan for bringing the water of two copious springs in Hertfordshire to London, by an aqueduct, called the New River, 40 m. in length, including windings. The Thames has long been one of the great sources of supply; and, as early as 1581, water-wheels and other hydraulic machinery were established at London Bridge. These wheels, which at one time raised 45,000 hogs. per day, were wholly removed when the old bridge was pulled down. The greater number, however, of the existing water companies derive their supply from the Thames, the water being filtered in immense reservoirs. In 1834 the following account of the houses supplied with water, and of the quantity furnished to each, with the different rates of charge, was laid before the H. of C.:

Water Companies.	Houses supplied.	Total yearly supply.	Daily average to each.	Charge per 1,000 hlds.
		<i>hogsds.</i>	<i>galls.</i>	<i>s. d.</i>
New River Company -	70,145	114,650,000	241	17 2
Chelsea do. -	18,992	15,755,000	168	29 0
Grand Junction do. -	8,780	21,592,567	363	48 6
W. Middlesex do. -	16,000	20,000,000	185	45 6
E. London do. -	46,421	37,810,591	121	28 0
S. London do. -	12,016	8,100,000	100	15 0
Lambeth do. -	16,684	11,908,600	124	17 0
Southwark do. -	7,100	7,000,000	100	21 0
Total water supply -	191,066	237,011,761		

In every street in London there are fire-plugs or cocks, at any of which a copious supply of water should be obtained in a few minutes in case of fire; though it must be admitted that the supply has sometimes, through neglect, been very long delayed, to the great injury of property. Much of the water is also used in watering the streets and improving the drainage: indeed scarcely a third part of the supply is used for purposes strictly domestic. Abundant springs of pure water may be procured in all parts of London, by boring below the clay strata; but no public measures have yet been taken to ensure a supply from this source. (See *Metr. Water Rep.*, 1810.)

**Sewers.**—The sewers of London constitute a system of drainage unknown to any other modern city; and, though out of sight and hardly appreciable by others than engineers, they have excited the astonishment of all who have investigated the subject. Their depth is, in most cases, sufficient to drain the deepest cellars in each neighbourhood, and the size of the main branches rivals that of the celebrated Roman Cloaca Maxima. We have no means of ascertaining their length; but that portion under the commissioners of the city is 15

nearly 20m., was constructed under the Westminster board between 1807 and 1834. The sewerage, however, is still imperfect in some low neighbourhoods, especially about Wapping, Stepney, Bethnal-green, Westminster, &c., and wherever this is the case, the health of the poor is greatly deteriorated. The malignant fevers that occasionally make fearful ravages in poor districts are, indeed, mainly attributable to the absence or bad state of the drains. (See *Rep. of Commissioners on Health of Towns*, and *Dr. Arnott's Evidence*.) The sewers are under the authority of 7 boards of commissioners, whose jurisdiction extends to a circle of 10 m. radius, measured from the post-office. The first sewers were constructed in 1428.

**Paving.**—The streets of London are not only well paved for carriages, but they have also on both sides, for the accommodation of pedestrians, smooth and usually well-lagged footways, raised some inches above the carriage way. This advantage it enjoys in common with most English towns; but few cities on the Continent are provided with a similar convenience, though Paris has in some measure followed the example, in streets wide enough to admit of it. The paving is under the control of numerous boards, each of which has its particular district. It is conjectured that the amount expended in paving the streets of London exceeds 200,000*l.* per ann. Pavement was first laid down in the metropolis in 1417, in Holborn. In 1615, the plan of having footways of broad stone was begun, but it was not universal until the middle of last century. For some time past the principal streets have been paved with granite, mostly brought from Aberdeen. Very recently, however, portions of them have been paved with wood; and how singular soever it may appear, it is believed that this pavement will be more durable than granite, at the same time that it will be incomparably more advantageous, by lessening the wear and tear of carriages, the quantity of dust, and the noise.

**Lighting.**—The metropolis is excellently lighted with gas, even in its most remote and secluded parts. Without going back to the year 1416, when lanterns were first lighted before citizens' houses, or even 3 centuries later, when an act passed to compel housekeepers to light up a lamp for 5 hours during the dark nights; many may remember the old oil lamps, which were said by a foreigner to "edge the streets with two long lines of brightish little dots indicative of light, but yielding very little."

M. Simonet somewhat exaggerated the deficiency; but still the difference between the old and present plan of lighting is so great as to make it difficult to believe that the inhabit. could have been satisfied with the oil lamps, "few and far between," that are still to be seen in the less populous parts of the suburbs. Gas was first tried in London in 1807, but with little success, as no means had then been discovered for removing its impurities. Pall Mall had been for some years the only street thus lighted. When, in 1816, a charter was obtained by a gas company, which slowly but certainly extended its operations. The profit of this speculation led to the

action of other companies; but it was not till 1820 that any considerable portion of the metropolis adopted gas. From that period, however, public bodies and private traders began rapidly to introduce it into their establishments, and parochial boards adopted the luminous gas-jets in lieu of the sickly glimmering oil-lanterns. There are now 19 gas companies, who may probably produce, at an average, 10,000,000 cubic feet of gas every 24 hours. The number of lights is variously estimated: in 1823 it was stated before a committee of the H. of C. that the number was nearly 60,000. Several companies have since been formed, and some of the old ones have doubled and trebled their produce, so that the whole number at present may, perhaps, be reckoned at 100,000.

**Fires.**—London has suffered from fire oftener, perhaps, than any other capital, except Constantinople; but the precautions taken in rebuilding the city, after the great fire of 1666, were calculated to prevent the recurrence of such a calamity. The streets were made much wider, bricks and stones were substituted for wood, and party walls were built between adjacent buildings. At a subsequent period the Building Act (14 Geo. 3. c. 78.) compelled the erection of thick party-walls between the separate tenements, and obliged each parish to keep one or more fire-engines always ready for service. The various insurance offices also began to maintain fire-engines at their own expense, attended by bodies of well-disciplined firemen; and in 1821 some of the largest of these establishments entered into an arrangement, by which all their force was put under one superintendant. The fire-brigade association was gradually joined by the other offices, and at present all the London insurance offices contribute to support this most efficient establishment. One superintendent now guides the whole, aided by about 100 firemen and engineers, who are placed at 18 different stations in all parts of the town and suburbs. The firemen, who are all numbered, wear a uniform of dark grey and a strong leather helmet; a third part of their body is always on duty, and they are provided with the best means of extinguishing fires, and rescuing persons in danger. The average number of fires for the 5 years ending with 1837, was 495 per annum; of which number 340 were slight, and 29 only extremely destructive.

**Health.**—“The metropolis has in itself all the elements of a healthy city. If the tides leave the banks of the Thames exposed, that great river sweeps through the city from W. to E. and the winds rush fresh over its waters. The land rises in undulations to Hampstead Heath, and the Surrey hills; pure water is abundant, and would flow under almost every street; the artificial heat and gas, noisome as it sometimes is, ascends in a vast column to the sky, and is replaced by under-currents from the surrounding country.” (*App. to Regist. Gen. 2d Rep.*)

But notwithstanding these favourable circumstances, London was long exceedingly unhealthy, and down to 1666 was hardly ever free from the plague. This excess of mortality was, no doubt, occasioned by the wretched state of the town. The streets were then narrow, crooked, many of them unpaved, and generally filthy: the houses, built of wood and lofty, were dark, irregular, and ill-contrived: each story projected over the one below, so that they almost met at the top, thereby precluding, as much as possible, the escape of foul and the access of pure air: the shops were also furnished with enormous signs, which being suspended cross-wise in the middle of the street, tended still further to prevent ventilation: the sewers were, at the same time, in a very imperfect state, the drains which conveyed away the filth not being arched over, but running above ground; and if we add to this the deficiency of water, and the prevalence of sluttishness in-doors, which then existed to an extent not easily to be imagined, we need not wonder at the ravages made by the plague and other diseases. (See *Maitland's Hist.*

\* Erasmus, who visited England in the reign of Henry VIII., and was well acquainted with the country, ascribes the prevalence of the sweating sickness (a species of plague) and the plague to the inconmodious form and bad exposure of the houses, the filthiness of the streets, and the dirtiness within doors. In a letter to Cardinal Wolsey's physician he says, speaking of London:—“*Conclavia sola fere atrata sunt argilla, sunt arctis, palustribus, qui subinde sic renouantur, ut fundum domus manus aliquoties domo vixit, sub o frems apria, vomitus, mictum tum cunius of hominum, projectum ceruicium et picium reliquia, aliisque sordis non nominanda.*”

of London, passim; and *Heberden's Tract on Diseases*, p. 71.)

In 1593, the deaths by the plague within the bills of mortality amounted to 11,503; in 1603 to 30,561; in 1623 to 35,403; in 1636, to 10,400; and in the dreadful pestilence of 1665 they rose to 68,596! And it is impossible to say how soon it might have again burst forth, had it not been for the severe but providential visitation of the great fire by which it was immediately followed, and which, by destroying the most crowded and ill-built parts of the city, afforded an opportunity, which was luckily embraced, of rebuilding them on a better and more commodious plan. Very severe regulations were then also laid down for the enforcement of cleanliness; and the supply of water being at the same time augmented and better distributed, and the drains greatly improved and arched over, London has not since been visited by any very destructive epidemics. Still, however, the mortality during the first half of last century was very great; and Short, Corbyn Morris, Price, and other well-informed writers of the period, indulge in bitter complaints of the severe drain on the country, occasioned by the waste of life in London. The pop. appears, indeed, to have declined between 1740 and 1750; and during the 10 years ending with 1768, the deaths appear to have amounted at an average to 22,596 a year, while the births did not exceed 15,710. (*Price*, vol. ii. p. 86.) Probably, however, some portion of this enormous discrepancy is apparent only, and may be accounted for by omissions in the registers of births. But it is, notwithstanding, abundantly certain that the deaths very materially exceeded the births at the period referred to; and that they preserved this ascendancy down to a much later period. The mortality in 1765—1775 was estimated at about 1 in 20, or 5 per cent. of the existing population; but from this period a very material change for the better began to take place. In 1790 the births, for the first time, exceeded the burials; and during the 10 years ended with 1820, there was an excess in the total number of births of 51,000 over the total number of deaths. This excess has since continued to increase, so that it is plain, supposing no unfavourable change to take place, that London might go on adding indefinitely to her population, without drawing a single recruit from the country.

At present the average rate of mortality in London is estimated at about 2·8 per cent.; but the degree of mortality varies widely in different districts, increasing with the poverty and bad accommodations, and diminishing with the wealth and improved accommodations of the inhabitants. Thus, while the annual rate of mortality is 3·9 per cent. in Whitechapel and 3·2 in Southwark and St. Giles's, it is less than 2·0 in St. George's, Hanover Square, and St. Pancras. "It is found, indeed, from a comparison of the several metropolitan districts, that, *ceteris paribus*, the mortality increases as the density of the pop. increases, and that where the density and the pop. are the same, the rate of mortality depends on the efficiency of the ventilation, and of the means employed for the removal of impurities." (*App. to Regist. Gen. 1st Rep.*) Epidemic diseases in crowded parts of London are attended with nearly double the mortality that belongs to them in more airy districts; and diseases of the respiratory system are increased a half in close neighbourhoods. Mr. Farr's statements in the Report of the Registrar-general, as to the importance of ventilation and drainage, are fully corroborated

by Dr. Southwood Smith, Dr. Arnot, and other authorities. The following table represents the mean annual mortality *per cent.* in the metropolis, and in England and Wales, from 12 classes of disease. (*2d Rep. App. p. 13.*)

Classes of Disease.	Metropolis.	England and Wales.
1. Epidemic - - - - -	-	-
2. Endemic - - - - -	-	-
3. Contagious - - - - -	742	452
4. Nervous system - - - - -	437	332
5. Respiratory Organs - - - - -	770	605
6. Circulating do. - - - - -	045	024
7. Digestive do. - - - - -	160	129

13. Old age - - - - -	719	237
14. Violent deaths - - - - -	075	081
All causes of death - - - - -	2800	2203
Population to 1 square mile - - - - -	26,203	269

Summer is the healthiest, winter the most fatal season: and this rule has prevailed since the beginning of the last century. The deaths out of 100 living (1838) averaged in Jan., Feb., March, '85; in Apr., May, June, '70; in July, Aug., Sep., '60; in Oct., Nov., Dec., '66.

*Increase of Population.* — It is much to be regretted that there are no accurate accounts of the population of London previously to the census of 1801. The population of the city was, however, estimated by Graunt, the well-informed author of the famous *Treatise on Bills of Mortality*, at 384,000 in 1661, and adding 1·5th to this for the population of Westminster, Lambeth, Stepney, and other outlying parishes, he estimated the entire population at about 460,000. (*Observations*, &c. 5th ed. p. 82. and p. 105.) In all large towns, except (as in Petersburg) there be a great excess of military, the number of females is, in modern times, found invariably to exceed that of males; but, if we may depend on Graunt's estimate, the reverse was the case in the city of London at the epoch referred to, for he makes the number of males 199,112, and of females only 184,886. (p. 83.) In 1696 the population of the city and the out parishes was carefully estimated, by the celebrated Gregory King, at 527,560; and considering the great additions that had been made to the metropolis between the Restoration and the Revolution, this increase does not seem to be greater than we should have been led to infer from Graunt's estimate. The population advanced slowly during the first half of last century, and indeed, as already stated, it fell off between 1740 and 1750. In his tract on the population of England, published in 1782, Dr. Price estimated the population of London, in 1777, at only 543,420. (p. 5.) But there can be no doubt that this estimate, like that which he gave of the population of the kingdom, was very decidedly under the mark; and the probability seems to be that, in 1777, London had from 640,000 to 650,000 inhabs.\* Its population amounted, including Chelsea, as has been already seen, to 888,198 in 1801, and to 1,508,469 in 1831; and at present it is probably little short of, if it do not exceed, the prodigious sum of 1,900,000 — the greatest number of human beings ever, we believe, congregated within the same space, in any age or country.

\* "Opulent, enlarg'd, and still  
Increasing London! Babylon of old,  
Not more the glory of the earth than she,  
A more accomplish'd world's chief glory now."

London is, no doubt, principally indebted for her extraordinary rise and unexampled magni-

\* See the Tracts of the Rev. Mr. Howlett and of Mr. Wales, in answer to Dr. Price.

tude, to her admirable situation, on a great navigable river within a short distance of the sea, and in the centre of a rich and fertile country, of which she is naturally the emporium. Her river enables her to obtain abundant supplies of all the bulkier descriptions of products, not only from all parts of the United Kingdom, but also of the world, at the lowest possible cost. The advantages thence resulting have been great and obvious. A city in an inland situation never could have attained to any thing like the colossal magnitude of London. Indeed, almost all great cities, in all ages of the world, have been built either on the sea-shore or on the banks of some great navigable river. Paris is probably the largest city that ever existed without any very great command of water carriage. But her advance has been slow compared with that of London; and notwithstanding the advantage she has long enjoyed, from being the capital of a powerful monarchy, and the residence of a polished and luxurious court, her population is not, at this moment, half that of London.

The extraordinary growth of the latter during the present century seems to be mainly attributable to the same causes that have increased wealth and population in other parts of the empire, that is, to the progress of arts, manufactures, and commerce. Though not in the manufacturing districts, London is now, by means of canals, railways, and other improved means of communication, intimately connected with them; and the many advantages she enjoys as a trading and commercial port, will always secure for her a large share of the shipments of manufactured products. London has also derived a vast accession of influence from her being the place where the dividends on the public debt are paid, where all transfers of stock are effected, and where all the important pecuniary transactions of the empire are ultimately adjusted. And how paradoxical soever it may at first sight appear, it is certainly true that the very magnitude of London is an efficient cause of her continued increase. The greater a city becomes, the greater is the scope she affords for the exercise of every talent and acquirement, and for the gratification of every taste and desire; and the more powerful, consequently, are the motives by which she attracts all sorts of individuals, whether aspiring or careless, industrious or idle, grave or gay, virtuous or profligate.\*

Vast as London is, the chances are, should the country continue to prosper, that she will continue to increase in magnitude for centuries to come; and the progress she has already made, unprecedented as it has been, may, not improbably, be surpassed by that which she is yet destined to make.

*Habits.*—The peculiarities of character belonging to the inhabitants of London must be learnt from studying the manners of the middle and lower classes, as the higher classes, who reside here only during four or five months in the spring and summer, and leave whole districts almost uninhabited during the rest of the year, can scarcely be entitled Londoners. Great activity and unwearied diligence in business, a shrewd perception of character, and an ever-watchful regard of self-interest, not unmingled, however, with generosity, are the chief characteristics of the native pop. Owing to the extreme subdivision of employments, and the undivided attention

which most individuals give to their own pursuit, the citizens are, for the most part, singularly expert in it, and proportionally ignorant of every thing else. This, however, is less so now than formerly; the extensive circulation of cheap publications having diffused information as to many topics of which the bulk of the pop. had formerly the most imperfect ideas. The leading merchants and tradesmen have generally houses in the outskirts of the town, and in the country, to which they retire after business hours during summer; and many, indeed, occupy these houses during the whole year. But to the inferior shopkeepers and tradesmen summer and winter make little difference. Some, indeed, *summerize* at a hot and dusty watering-place for a week or fortnight, trying, often in vain, to rid themselves of the turmoil and anxiety of business; but of a far larger number it may be said, as of John Gilpin, that

"For twice ten tedious years still they  
No holiday had seen."

The London tradesman, unlike the Parisian, is essentially domestic in his habits, and his visits to his friends or club are only the exception to his ordinary regularity. Most classes of skilled workmen receive high wages, which having been little, if at all reduced since 1815, they are at present much better off than during the war. Their circumstances vary, of course, according to their prudence: few save money; but all live well, using butchers' meat to an extent unknown anywhere else, and dressing, on holidays at least, in a style equal to that of the classes above them. Many, not contented with one holiday in the week, keep a second, known as "St. Monday," sometimes spent in drunken revelry, but more frequently in country excursions with their families: others, however, work unremittingly from one year's end to the other, content with an annual Easter or Whit-monday's trip to Sheerness in a steamer, or with a pic-nic excursion to Hampton or Blackheath. In the bright mornings of summer large social parties may be seen leaving town in vans, provided with good fare, and not unfrequently with a minstrel ready to furnish music for a dance on the green. The lowest class of all, whose means of existence are precarious, disreputable, or dishonest, have pleasures peculiar to themselves; but cleanliness and respectability of appearance are little studied by them, and they are almost unknown to the rest of the people, except when their wants or delinquencies intrude them on the public notice.

*Environ.*—The metropolis is surrounded by a country of varied surface and great productiveness. The ground on the E.W. and S. extends in a flat along the river, which is prevented from inundating it at high water by extensive embankments, probably constructed by the Romans. But on the N. the ground rises gradually to an elevation of 300 or 400 ft., and the flat on the S. is also bounded by grounds which attain to a like elevation. The picturesque hills of Surrey, near Dulwich and Norwood, are studded with the villas of wealthy merchants and others, who retire here from the bustle of town; and Blackheath, more to the E., and nearer the river, though not so fashionable as in the days when Greenwich had a palace and a court, is still a favourite resort in summer, and the buildings have increased since the railway has furnished fresh facilities for communication with London. N. of the metropolis lie Hampton and Highbury, both of which, owing to their height, command extensive views of Hertfordshire, Surrey, and other counties: these villages, as well as Harnsey, Stamford Hill, and Walthamstow, are filled with respectable residences, chiefly occupied by persons who daily visit London in pursuit of business. This prevalent fashion among the wealthy Londoners of fixing their abode in the suburbs has been greatly encouraged by the easy communication afforded by the numerous omnibuses and coaches which run to and fro at all hours of the day, and till late at night. Owing to this circumstance, the pop. of the city proper has decreased considerably since the commencement of the present century; indeed it may now be called a collection of shops and warehouses rather than of residences for families. The suburban villas vary\* in size and grandeur, according to the means of their proprietors: but comfort and neatness are their universal characteristics.

*Corporation.*—The City of London is under the government of the lord mayor, 2 sheriffs, 25 aldermen, 206 common-councillors, a recorder, and other officers, and is divided for municipal purposes into 26 wards, each of which is under the government of an alderman. The Saxon denomination for the governor of London was *portreeve* or *portreeve*, which, about a century after the Conquest, was changed to mayor. This officer was appointed by the Crown till 1215, when the citizens obtained the right of electing their own mayor. The mode of election now followed was fixed in 1476 by an act of common-council.

The lord mayor is annually chosen from the body of aldermen, at a court held at Guildhall on Michaelmas

\* The clear and comprehensive account given by Seneca, of the mod. es which drew so great a concourse of people to imperial Rome, is so well adapted to the alteration of a syllable in London:—"Aspice municipia et colonia tuas, ex toto urbe iniquae orbis terrarum confluentem. alio maribus, alio necessitas officii pulset, alio impio legibus solium studiorum cupiditas, alio opportunitas vitia loqui quærens: alio liberos, quodam industria, laudem autem desiderant virtutis nuda materiam: quidam hominum græva conercent in urbem, et virtutibus et vitia magna premnia ponentes."—*Consult. ad Heliod. cap. 6.*

day, and is sworn in to the duties of his office on the 9th of Nov. following. A grand pageant takes place on the occasion, followed by a sumptuous dinner and ball held at the Mansion-house. In most instances, the alderman next in seniority to the lord mayor is elected his successor. He is always free of one of the great city companies, and must have served the office of sheriff. The lord mayor is second only to the sovereign within the city, and at the sovereign's death he takes his seat at the privy council, and signs before every other subject. His powers are similar to those of a lord-lieutenant of a county, and his authority extends over the whole city and a portion of the suburbs.

The division of the city into wards appears to have been made very early in the 13th century; there were twenty-four wards, which became twenty-five in the year 1393 by a division of the ward of Farringdon. In 1550 a great part of the bor. of Southwark was formed into a ward, and called Bridge Ward Without; but it is now merely a nominal ward, giving a name to the senior alderman, who on the occasion of a vacancy is removed to it from his own ward, and is then called "the father of the city."

The following is an alphabetical list of the names of the wards, with an indication of their situation, the number of common-councilmen, and the number of houses in each:—

1. Aldersgate, on both sides of Aldersgate Street, including the Post-office. Com. coun. 8.; houses 726.
2. Aldgate, at the E. end of the city, includes the E. ends of Leadenhall Street, and Fenchurch Street, and Crutched Friars, called Alegate in the old list of 1285, given by Maitland. Com. coun. 8. (6.); houses 770.
3. Bassishaw (corrupted from Basing's-haugh) includes little more than Basinghall Street. Com. coun. 4.; houses 130.
4. Billingsgate, from Billingsgate Market to near Fenchurch Street. Com. coun. 10. (8.); houses 343.
5. Bishopsgate, both sides of Bishopsgate Street. Com. coun. 14.; houses 1460.
6. Bread Street, E. of St. Paul's, and S.W. of Cheap-side. Com. coun. 12. (8.); houses 29.
7. Bridge Within, London Bridge and Fish Street Hill, includes the Monument. Com. coun. 15. (8.); houses 198.
8. Bridge Without, part of the Borough of Southwark.
9. Broad Street, between Bishopsgate Ward and Coleman Street, includes the Bank; this is apparently the Lodgingber of the ancient list. Com. coun. 10. (8.); houses 560.
10. Candlewick, between Lombard Street and London Bridge, named from Cannon Street, which was formerly called Candlewick Street. Com. coun. 8. (6.); houses 210.
11. Castle Baynard, from St. Paul's to the Thames. Com. coun. 10. (8.); houses 542.
12. Cheap, both sides of the E. end of Cheapside and the Poultry, including Guildhall. This is probably Ward Fori in the ancient list. Com. coun. 12. (8.); houses 860.
13. Coleman Street, includes Lothbury, part of London Wall, and Finsbury Circus. Com. coun. 6. (8.); houses 761.
14. Cordwainers, S.E. of Cheapside; includes Bow Church. Com. coun. 8. (6.); houses 315.
15. Cornhill, a small ward on both sides of Cornhill, includes the Exchange. Com. coun. 6.; houses 167.
16. Cripplelegate, reaches from Wood Street, Cheapside, to the boundary of the city on the N.; it includes Fore Street and the Barbican. Com. coun. 16.; houses 2,779.
17. Dowgate, between Southwark Bridge and London Bridge, includes Merchant Taylors' School. Com. coun. 8. (6.); houses 203.
18. Farringdon Within, includes St. Paul's Cathedral, part of Cheapside, Newgate Street, and Ludgate Street, and reaches the river near Blackfriars Bridge; this and the following are the "Lodgate and Newgate" of the old list. Com. coun. 17. (14.); houses 1,008.
19. Farringdon Without, includes Smithfield, the Old Bailey, the Fleet, part of Holborn, and the whole of Fleet Street. Com. coun. 16.; houses 3,030.
20. Langbourne, includes Fenchurch Street, and a part of Lombard Street. Com. coun. 10. (8.); houses 500.
21. Lime Street, includes the East India House, and a small space around it. Com. coun. 4.; houses 190.
22. Portoken, Eastward of Houndsditch and the Minories. Com. coun. 5. (8.); houses 1,216.
23. Queenchilte on the River, W. of Southwark Bridge. Com. coun. 6.; houses 350.

\* At first each ward sent 2 councillors, but the number has been gradually increased, till it reached 240 in the whole; but a regulation very recently made will reduce the number to 200; the alteration will take place at the next election (1849), and the changes are indicated by being placed between brackets:

24. Tower, from Tower Hill to Billingsgate, includes the Custom House. Com. coun. 12. (8.); houses 530.

25. Vintry, on the Thames, and both sides of Southwark Bridge. Com. coun. 9. (6.); houses 250.

26. Walbrook, S. of the Mansion House, includes the Mansion House, and the Church of St. Stephen's Walbrook. Com. coun. 8. (6.); houses 266.

Houses in the whole, 16,466.

The aldermen are chosen by such householders as are freemen, and pay an annual rent of 10*l*. Each alderman is elected for life, and has the direction of the business of his ward, under the superintendence of the lord mayor. They are all justices of the peace within the city. The sheriffs are elected every year, on Midsummer day, by the corporation and freemen, and are sheriffs of the county of Middlesex, as well as of the city of London; they enter on their duties, and are sworn in at Westminster on Michaelmas day. The common councilmen are chosen by the householders in all the several wards, except Bridge Without. The common councilmen are the representatives of the inhabitants in the "Court of Common Council," which is composed of the lord mayor, aldermen, and common councilmen. This court disposes of the corporation funds, makes laws for the regulation of the city, and nominates certain of the city officers. Its sittings are usually public, and its title is "honourable."

The Livery consists of freemen of the city, who are also free of one or other of the city companies. Each of these companies was, at its formation, intended to comprise the different individuals within the city, properly so called, engaged in the peculiar department of industry called by its name; and had powers to enact bye-laws, and to lay down regulations for the government of the trade. Thus, for example, no one could commence business within the city of London as grocer, mercer, or goldsmith, without being free of the grocers', mercers', or goldsmiths' companies. And this freedom could only be acquired by inheritance, serving an apprenticeship to a freeman, or paying a fine, or otherwise, as the company might choose to order; and after admission, all individuals had to conform in the conduct of their business to the rules and regulations laid down by the company. But the inconveniences of this system gradually became obvious; and it has, in consequence, been so much modified, that the privileges of the different incorporated companies no longer oppose any obstacle to individuals from distant parts of the country establishing themselves in business within the city, nor interfere in any degree with the management of their concerns. In fact, any one who pleases may now purchase at Guildhall a license entitling him to trade within the city for 5*l*. without being free of, or having any thing to do with, any company. The city companies have, in truth, become charitable rather than political, or even municipal institutions. Some of them have a great deal of property. The principal companies obtained very large grants of land in Ulster during the reign of James I.; and most of them are trustees for sums of money and other property bequeathed by benevolent individuals. They expend their revenues partly in festivities, but principally in pensions to widows and decayed brethren, the support of schools, &c. There are in all 81 companies, of which 40 have halls, where they transact business, keep their records, and hold festivals. Some of these halls are very fine fabrics; that of the goldsmiths, in Foster Lane, rebuilt since 1831, is a magnificent structure; and were it in a situation where it could be seen, would be one of the principal ornaments of the city.

The following 12 are called the *Great Companies*, and from one or other of them the lord mayor must be elected:—

Mercers.	Merchant Taylors.
Grocers.	Haberdashers.
Drapers.	Salters.
Fishmongers.	Ironmongers.
Goldsmiths.	Vintners.
Skinner.	Clothworkers.

There are about 12,000 liverymen, in whom, previously to the passing of the Reform Act in 1832, the right of returning the 4 mems. of the H. of C. for the city was exclusively vested. A Common Hall is an assembly of the liverymen, called together at the requisition of a considerable number of their body: the lord mayor is the president by right of office.

The Guildhall, where the Corporation meetings, festivals, and common halls are held, stands at the N. end of King Street, Cheapside. Having been replaced by damaged in the great fire of 1666, it was replaced by the present edifice, constructed of the materials of the old building. The front, added in 1789, is in length, heterogeneous style. The great hall, 153 ft. in length, by 48 in breadth, and 63 in height, built and paved of stone, is capable of accommodating 6,000 persons; at least that number were present at the grand en-

tertainment given by the corporation to the allied sovereigns in 1814. At each end of the hall is a magnificent painted glass window, in the pointed style; but the roof is flat, paneled, and inappropriate; and the whole requires to be renovated and made consistent with the original character of the building. In the hall are statues erected by the corporation in honour of Lord Chatham and his son, the Right Hon. William Pitt, Nelson, and Alderman Beckford. On the pedestal of the latter is inscribed the famous reply made, in 1770, by Beckford, who was then lord mayor, and one of the members for the city, to the answer of his majesty (George III.) to an address and remonstrance from the common-council. At the W. end of the hall are the two wooden giants called Gog and Magog, the subject of so many popular tales. In the council-chamber, where the lord mayor, aldermen, and common-council hold their courts, is a statue of George III. by Chantrey; it has also a library containing books of reference, relative chiefly to the history of London, and the affairs of the city, and various other rooms for the use of the corporation.

The city has its peculiar courts of law, most of which are held in the Guildhall. The lord mayor's court, for actions of debts and trespass, and for appeals, is composed of the lord mayor, recorder of the city, and aldermen. The sheriff holds courts of record four days every week. The Chamberlain's court, held daily, decides disputes between masters and apprentices, and admits qualified persons to the freedom of the city. Courts of Petty Session for small offences are held daily at the Mansion House, by the lord mayor and an alderman, and at the Guildhall by two aldermen. There are also several minor courts.

The revenues of the Corporation of London amounted, according to the commissioners' report, to 152,035*l.* in 1831, and to 160,194*l.* in 1832. These large funds are derived from rents of houses and land, market-tolls, bequests, interest on government securities, and a few other sources. The expenditure in the year 1831 was 194,411*l.*, and in 1832 169,256*l.*: the chief items consist of salaries to municipal officers, maintenance of police and prisons, corporation entertainments, purchase of securities, and payment of debts. The lord mayor has 8,000*l.* a year allowed him to support the dignity of his office, and a splendid official residence. This, which is called the Mansion-house, stands at the E. end of the Poultry, nearly opposite the Bank. It is a large structure, begun in 1739, and finished in 1753, in the Palladian style, with a fine Corinthian portico, on a lofty rustic basement. The ground or Egyptian hall, (in which, however, there is nothing Egyptian) the ball-room, and the saloon, are magnificent apartments; but some of the private apartments, occupied by the lord mayor, are but indifferently lighted. The plate used at civic entertainments belongs to the corporation, and is very valuable.

The city of Westminster was anciently governed by the abbot; but since the Reformation it has been under the authority of civil officers nominated by the dean. The chief magistrate is the high steward, generally a nobleman, who holds the office for life; the next is the high bailiff, chosen by the high steward, who also holds the office for life. There are 16 burgesses, whose offices are similar to those of aldermen, each having jurisdiction in a separate ward; out of these are elected two head burgesses, one for the city and the other for the liberties, who take rank after the high bailiff; each Burgess has an assistant; there is also a high constable, who has authority over the other constables. The Court of Quarter Sessions is held at the Westminster town-hall four times a year. The court of St. Martin's-le-Grand is held for the trial of personal actions relating to that part of the liberties. The court-leet is held under the authority of the dean, for choosing officers, removing nuisances, and similar matters.

Southwark was anciently governed by its own officers, but since the year 1327, it has been for many purposes subject to the lord mayor, who governs by a steward and bailiff, the former of whom holds a court of record every Monday at the Town-hall in the Borough High Street. Another court is held at Bankside for the Clink liberty, a mean densely peopled district, to the westward of London Bridge.

**Parliamentary Representation.**—Down to the passing of the Reform Act, in 1832, the metropolis sent 8 mems. to the H. of C., viz. 4 for the city, elected by the liverymen; 2 for the city of Westminster, elected by scot and lot voters; and 2 for the bor. of Southwark, also elected by scot and lot voters. In addition to the above, the Reform Act created 4 new bors., out of parts of the metropolis not included in the former bors., viz., those of Marylebone, Finsbury, the Tower Hamlets, and Lambeth, giving to each 2 mems. Hence the metropolis now returns 16 mems. to the H. of C., elected by the 10*l.* franchise, and those previously in possession of the franchise. Subjoined is an —

**ACCOUNT of the Parliamentary Boroughs in the Metropolis, with the Number of their Representatives, and the Electors registered in each in the Year 1839-40:—**

Places.	Members.	Electors, 1839-40.

Southwark - - - -	2	5,047
Lambeth - - - - -	2	6,547
Total - - - - -	16	83,062

**Historical Notice.**—Nothing is known of London previously to the Invasion of the Romans; and it may be doubted, from the silence of Julius Caesar, whether it then existed, or, at all events, whether it had attained to any considerable magnitude. But, however this may be, it is clear, from the statement of Tacitus (*Annal.* lib. xxxiii. cap. 14.), already referred to, that so early as the reign of Nero it was an important emporium, though not distinguished by the title of a colony; and it is doubtful whether it ever attained to this honour.

After the Romans had left Britain, and the Saxons had divided the country among themselves, London is supposed to have become the capital of the E. Saxon kingdom. On the introduction of Christianity into England, it was one of the first places to embrace the new faith, and early became a bishop's see. St. Paul's, and St. Peter's, in Westminster, were first founded about this time. In the paucity of intelligence concerning the period of the heptarchy, all we hear of London is, that it suffered severely from fire in 754, 798, and 801, on each of which occasions it is said to have been nearly destroyed. As soon as England had been united under one monarch, it appears to have become the metropolis of the empire; and, in 833, a wittenagemot, or parliament was held in it to consult on the best means of repelling the Danes, who were ravaging the eastern counties. It was, however, sacked by the Danes in 839; in 982 it was nearly destroyed by fire; and in 994, the inhab. purchased a temporary remission from the attacks of the Danes, by paying them a high ransom.

At the Conquest, London submitted to William, and soon after received a charter in the English language, the original of which is still preserved. Within the 60 years following the Norman conquest it suffered severely by fire on five different occasions; but being then built principally of wood, it was easily repaired from the timber furnished by the extensive forests of Islington and Hornsey, which still existed when Fitzstephen wrote in the succeeding century. London was then unpaved, and, if we may believe the statement of contemporary historians, the rafters of the roof of Bow church, which were blown off by a hurricane in 1691, struck into the ground to a depth of 20*ft.* The same hurricane caused so high a tide in the Thames, that the wooden bridge, which had stood 200 years, was carried away by the stream. On the accession of Henry I. in 1100 a new charter was granted to the city, which restored its ancient privileges, as they existed before the Norman conquest, relieved the inhab. from many oppressive services, such as compulsory entertainment of the king's household, and abolished several barbarous customs of the Saxon period. The citizens acquired by this charter the privilege of choosing their own magistrates. The Norman monarchs, it is true, seldom respected corporate privileges, even when conceded by themselves; but still this charter was valuable as furnishing a standard to which to refer in future disputes with the prerogative, and it is said to have served as the model from which Magna Charta was taken. About the middle of the 12th century, it was determined to build a stone bridge over the Thames.

The first wooden bridge having, as already stated, been carried away in 1091, was replaced by another, which was burned down in 1136. The bridge erected instead of the latter became so ruinous in less than 30 years, that it was thought a stone bridge would be less easily in the end than the continual repairs required to keep up these unsubstantial, though cheaper, structures. The new bridge, begun in 1176, and finished in 1209, was a noble work for the time, and may be said to have been the very bridge taken down in 1832, though frequent alterations, additions, and repairs, had considerably impaired its identity. Three years after its erection a dreadful loss of human life was occasioned by a fire on the bridge, described in Stowe's Chronicle:—

"The tenth of July at night the city of London upon the S. side of the river of Thames, with the Church of our Lady of the Canons in Southwark, being on fire, and an exceeding great multitude of people passing the bridge, suddenly the N. parte, by blowing of the S. wind, was also set on fire, and the people which were even now passing the bridge, perceiving the same, would have returned, but were stopped with fire, and it came to passe,

that as they protracted time, the S. end was fired, so that people thronging themselves betwixt the two fires, there came to aide them many ships and vessels, into the which the multitude so undiscreetly pressed, that the ships being drowned, it was said, there were destroyed about three thousand persons." About this time an order was made by the court of aldermen, that no house should in future be built without party walls 3 ft. in thickness, and 16 ft. in height. This order, dated in 1191, was intended to obviate the frequent fires by which London had so often been partially destroyed; but it appears to have been little, if at all, attended to, and is interesting principally for its being the first document in which the chief magistrate of London is designated Lord Mayor. He had hitherto been called the Chief Bailiff.

In the year 1211 the citizens began to form a deep ditch, 200 ft. wide, without the city wall on all sides, as a means of defence against King John. In 1218 the forest of Middlesex was cleared, and the citizens of London were permitted to purchase land, and build there. This was begun that part of the metropolis which stands N. of the city, and is now so populous. In 1221, Henry III. had the first stone of the present Westminster Abbey. In 1236, the first water pipes were laid down in the city, which had previously been supplied with water, from wells and rivulets running through it into the Thames; but these had gradually been either obliterated or converted to common sewers. The principal was the River of Wells, which, though hidden, still runs under what was lately Battlebridge, in the New Road, passes down through Clerkenwell and Turnmill Street, and falls into the Thames close by Blackfriars Bridge. This river may be yet seen, or at least heard, through the iron gratings by which it is covered, in some of the obscure streets in Clerkenwell. This stream at low tide pours into the Thames a mass of black mud on the N. side of Blackfriars Bridge. Holbourne, now a common sewer running through Holborn Hill, fell into the River of Wells. Walbrook entered the city by Winchester Street, and fell into the Thames at Dowgate; its name still remains. Spoutbourn ran with a swift stream from Aldgate to a spot near the Mansion House, where it fell into Walbrook. Several of the wells remain to this day: Holywell, in Shoreditch; Clerkswell, in Clerkenwell; Agnes le Clear, Perilous Pond, &c. The city, however, had gradually so much increased, that the supply was inadequate to the demand; in many cases, too, the new houses had encroached upon the little streams, and made it inconvenient to approach them. The water pipes now laid down brought a copious stream from six springs at Tyburn, a village on the site of the present Oxford Street, near its W. end, and conveyed it to one main pipe, 6 inches diameter, to the city of London. Afterwards various leaden cisterns, named conduits, were constructed for the reception of water; the first of these was built in Westcheap (now Cheapside) in 1285; these were taken down, not only because increasing traffic rendered ground valuable, but because they had become comparatively unnecessary, from the introduction of a mode of supplying water to every tenement.

In 1293 several buildings were added to the Tower, one of which was appropriated to three leopards, presented in 1235 by the Emperor Frederick to Henry III., who, a few years after, assessed the city at the rate of 6d. per day for the maintenance of these animals, and 14d. per day for that of their keeper. In 1242, during a great frost, such masses of ice were brought down the Thames, that 5 arches of London bridge were destroyed. In 1304 the first recorder was appointed. In 1324, in consequence of the facility with which felons made their escape from London across the bridge into the adjoining village of Southwark, which, until then, was beyond the mayor's jurisdiction, Edward III. wanted a charter assigning this village to the city for ever, and empowering the city magistrates to act in Southwark as in London. This jurisdiction still continues.

As we advance in time records of events crowd so thick upon us, that we can only notice such as have produced permanent effects; and in so doing, we must proceed rather by centuries than years. Of fires, pestilences, famines, and riots, it may be enough to say that they were extremely numerous; but except the great fire of 1666 none had any lasting consequences.

In 1354 the office of alderman, which had hitherto been annual only, was rendered more important by a law which made the aldermen irremovable for life, unless on some especial cause. In 1381 the rebellion of Wat Tyler, and his death by the hands of the lord mayor, occasioned the addition of the drawn dagger to the coat of arms of the city, where it still appears. During this century many improvements were effected in cleaning and paving the streets, and clearing out the water-courses and great city ditch; but an effectual bar was raised to these measures in 1392, when, in consequence of the refusal of a loan of 10,000*l.* to King Richard by the corporation, the mayor, sheriffs, aldermen, and principal citi-

zens were imprisoned, heavy penalties exacted, the city franchises abrogated, and the courts removed to York. Heavy bribes effected a removal of several of these grievances; but the city did not recover its proper influence till the accession of Henry IV.

In the following century the progress of improvement was still more rapid. Lamps were lighted at night in the streets so early as 1416. Holborn, a part of the Strand, and other principal thoroughfares were paved; additional conduits and water-pipes were laid down; the old wooden houses began to disappear, and were replaced by respectable edifices of brick; and the city wall was repaired. The bricks used for these purposes were made in Moorfields. The slaughtering of cattle within the walls was forbidden in consequence of the bad effects produced by it in the absence of sewers. An indication of some attention to the police of the city appears in the erection of stocks in every ward, for the punishment of disorderly persons. Guildhall, Leadenhall, and Crosby-house, in Bishopsgate Street (a portion of which has recently been restored), were built in this century.

In the 16th century the advance was much greater; an unusually long exemption from civil wars, which had so much injured London, under the Plantagenets, gave leisure to introduce those improvements which distinguish a modern town from a city of the middle ages. The city wall was now improved, nuisances were removed, street paving became more general, and regulations were made for supplying the town with provisions, so as to prevent the frequent famines which had before arisen, more from defective arrangements than from real want. The removal of monasteries had also a great effect in improving London: 54 large and many smaller establishments made way for factories, schools, charitable asylums, and hospitals. St. James's Palace was built, the park was laid out, and many fine buildings were erected in Westminster. The two cities were now first joined by a number of handsome mansions belonging to the nobility on the N. side of the river; one of which, Northumberland House, is yet in existence. The street S. of the Strand still indicate by their names the site of others that have disappeared. The Royal Exchange was built, and commerce began to flourish. Towards the end of this century water was first conveyed by machinery into private houses, and the New River was projected.

In the 17th century London assumed its present form, with the exception of that part destroyed by the great fire of 1666. Spitalfields was covered with houses; and before 1666 the space N. of the Strand as far as Holborn, and from Temple Bar to St. Martin's Lane, had been extensively built upon. The parts of Westminster, also, from Charing Cross to St. James's Palace, had assumed the appearance of a town. The New River had been completed, and each house was supplied with water. Sewers were dug, smooth pavements were laid down for foot passengers, and hackney-coaches became general.

On the 2d of Sept. 1666, the great fire broke out at Pudding Lane, near the spot where the Monument was subsequently erected in commemoration of the occurrence. It raged till the 5th, when it ceased, rather by pulling down houses in the line of its course, than by the success of the exertions to extinguish the flames. The ruins, covering 336 acres, comprised 13,200 houses, 90 churches, and many public buildings; the property destroyed being estimated at 10,000,000*l.* But, though productive of great loss, and of much temporary distress and inconvenience, this conflagration was, in its results at least, of signal advantage. It would have been all but impossible, except by some such destructive agency, ever to have got rid of the vast mass of old wooden houses, and narrow and filthy lanes and courts, that had for centuries been the permanent abode of the plague and other pestilential diseases. No doubt it must ever be regretted, that the designs of Sir Christopher Wren for the re-erection of the city were not adopted. But notwithstanding the numerous defects of the new plan, it was a vast improvement on that by which it had been preceded. Though still too narrow, the streets were materially widened; the new houses were constructed of brick instead of wood; party walls were introduced; the old practice of making each story project over that immediately below, was abandoned; obstructions and filth of all sorts were removed; and the sewerage and pavement of the streets were vastly improved. A fire which happened in Southwark ten years afterwards, afforded an opportunity for carrying the improvements into that part of the metropolis. The pop. and trade of the city now increased more rapidly than before. The revocation of the Edict of Nantes occasioned the immigration of a great number of French, who settled in Spitalfields and St. Giles's. The parishes of St. Anne and St. James were formed, the district called the Seven Dials was built, Piccadilly began to extend W., and Soho Square and Golden Square were laid out. In the year 1694 the Bank of England was built. St. Paul's Cathedral was almost completed; the parish of Wapping was formed E. of the city; the Penny Post-

Office was instituted; the number of hackney coaches was trebled; and several miscalled asylums (such as Alsatia and the Mint), where robbery and crime had been protected, were abolished.

From this period the improvement and increase of London have been constant. In the early part of the 18th century an act was passed for building 50 new churches in and about London, most of which were completed within a few years, and some of them are still among the ornaments of the metropolis. Houses sprang up on every side; and by the middle of this century the W. end of the town, as far as Horse Park, became a compact mass of building, reaching beyond Oxford Street on the N., and extending E. from Portman Square, across Tottenham Court Road, past Montague House and Gray's Inn gardens, through Clerkenwell, Finsbury Square, Spitalfields, and Whitechapel to Wapping. Before this time water-works had been formed at Chelsea, in aid of the supply furnished by the New River. Sewers had become more general, lamps had been fixed in all the principal streets, Westminster Bridge was built, St. Paul's completed, and Fleet ditch arched over. In the last half of the century Blackfriars Bridge was built, the houses encumbering London Bridge were removed, the Mansions House was finished, and Somerset House erected. At the same time, many unsightly and inconvenient buildings were removed; overhanging signposts, waterspouts, which occasionally drenched unwary passengers, dirty, stagnant gutters, ash-heaps, and other obstructions to walking the streets, were swept away; the lamps were much increased in number, and lighted during the whole night; raised footways became universal, and the shops, which before were mere stalls, assumed a size and splendour evincing the wealth of their occupiers, and greatly contributing to the ornament of the metropolis.

The citizens of London have, generally speaking, been distinguished by their orderly behaviour and respect for the laws. In 1760, however, the peace, and even, in some degree, the existence of the metropolis, were compromised by the excesses of the mob. Certain concessions made in the course of the previous year to the Roman Catholics, had provoked a good deal of religious excitement in all parts of the kingdom. The contagion spread to London; and the weakness of the government, and the folly, or rather madness, of Lord George Gordon, and other leaders of the ultra Protestant party, led to a dangerous riot. The mob were, in fact, for about two days masters of the city. They took possession of the prisons, and turned the inmates out of doors; destroyed the chapels of the ambassadors of the different Catholic powers; many private houses, including that of Lord Mansfield, were plundered and set on fire; a great distillery belonging to a Catholic firm shared the same fate; and an attack was made on the Bank, which, however, was happily repelled. At length, this formidable riot was effectually put down, though not till a considerable number of the rioters had been killed and wounded. Since this disgraceful epoch, the peace of the city has not been seriously endangered; and the troops in and about town, added to the effective police force that now exists, seem quite adequate, under ordinary circumstances, to ensure the public tranquillity and the safety of the peaceable part of the community.

During the last 30 years London has made greater advances than could reasonably have been expected in an entire century. Within that period four bridges have been built, extensive docks have been excavated, gas has been introduced into every street and alley, steam, both on the river and on railways, has given it an almost unlimited power of intercourse with every part of the kingdom, and of the world; new and handsome markets have been erected, arcades lined with elegant shops have been formed, and wide lines of communication have been opened through close and densely crowded neighbourhoods. A new park, larger and handsomer than any of the other three, has been laid out, and surrounded with houses more resembling palaces than private residences; an improved police has given additional security both to person and property; abundant supplies of water have been furnished to every separate dwelling; the paving and sewerage have been greatly improved, especially in districts inhabited by the poor; and the formation of spacious promenades in the suburbs is gradually leading to the disuse of interments within the town. At the same time the establishment of colleges and proprietary schools has materially increased the facilities for procuring good education, while the institution of a National Gallery and School of Design are contributing to improve the national taste, and to add to the innocent pleasures of the people. The spirit of improvement, moreover, is still suggesting extensive and noble works. The act (2 & 3 Vict. c. 80.), founded on the reports of the Metropolitan-improvement Committee, furnishes ground for hope, that the time is not far distant when several new and large streets shall be constructed in districts at present secluded from the observation of the wealthy and educated, and exhibiting a state of moral

and physical degradation much to be deplored." One of these streets is to form a straight line of connexion between Oxford Street and Holborn; another is intended to join Long Acre with Broad Street, St. Giles's; a third is to open a wide line through the alleys about Leicester Square to the W. end of Long Acre; a fourth is to run from the N. end of Farringdon Street to Clerkenwell Green; and a fifth will form a direct communication between the London Docks and Spitalfields church. "The amelioration of the moral condition of the labouring classes," will also be vastly promoted by the project for laying out, on the N.E. and E. sides of London, spacious pleasure grounds and public walks, the enjoyment of which will, there is reason to think, be, at no very distant period, deemed superior by the bulk of the lower classes to the debasing revelry of gin-palaces.

*Antiquities.*—London possesses few antiquities: its wall is destroyed, its gates have been demolished; the remains of its monasteries, colleges, and friaries were obliterated at the great fire; and modern improvements have swept away almost every vestige of olden times. The diligent inquirer, however, may still find a few remnants, though generally either modernised or renovated. The Tower, Westminster Abbey, the Temple church, and St. Saviour's, have been already mentioned. The priory of St. Bartholomew, founded in 1102, remains in the parish church, in Smithfield; the hospital of St. John of Jerusalem has a gateway remaining in Clerkenwell; the church of the Augustine Friars may be seen at Austin Friars, near London Wall; and portions of the churches E. of the limits of the great fire, may still be seen incorporated in the modern edifices. Several fragments of the wall exist in Cripplegate churchyard, in Allhallows churchyard, Wormwood Street, and near Tower Hill. Some ancient houses remain in Bishopsgate Street, the handsomest of which, Crosby Hall, has recently been restored to its pristine state, and now exhibits an excellent specimen of a civic palace of the 15th century. London Stone, near St. Swildine's Church, Cannon Street, is supposed to be the point whence the Romans measured the roads in Britain. Much of it has been clipped off by curious antiquaries, and what remains is inclosed within a niche to prevent further dilapidation. There are also some ancient crypts, or arched vaults under several private houses in the city; some of them are handsome, and have been either subterranean chapels, or vaulted chambers belonging to religious houses.

LONDONDERRY, a marit. co. in the N. of Ireland, prov. Ulster, having N. Lough Foyle and the Atlantic Ocean; E. Antrim, from which it is separated by the Lower Bann and Lough Neagh; S. Tyrone; and W. Donegal. Area, 518,270 acres, of which 136,638 are unimproved moorland and bog, and 9,550 water, being mostly included in the portion of Lough Neagh, belonging to this co. Surface in some parts mountainous and uneven; but there is, notwithstanding, a great extent of low, fertile ground. With the exception of lands belonging to the church and to corporations, the entire property of this co. was granted by James I. to 12 of the principal London companies, from whom most part of the land is now held, partly under terminable and partly under interminable leases. Farms vary in size from 2 to 200 acres; but the average may be from 5 to 20 acres.

Where there has been a perpetuity or a long lease, it is *split*; that is, the children are settled upon divisions of the father's farm; by which means leases of 40 acres come to be parcelled, in two or three generations, into patches of 4 or 5 acres. It seems as if the newly let lands were disposed of under some similar system of parcelling. I could give instances where whole districts are subdivided into patches of 6 or 7 acres, and rarely can boast a farm of 12 or 14." (*Sampson's Survey of Londonderry*, p. 249.) Some landlords have exerted themselves to counteract this wretched system, but hitherto without much effect. It is almost superfluous, seeing the way in which the land is subdivided, to say that agriculture is in a very backward state. Latterly, however, some improvements have been effected. Oats, potatoes, and flax, are the principal crops; but a good deal of what is now also raised. Condition of the small farmers and cottiers very unprosperous. Average rent of land, 12s. 2½d. an acre. Various minerals have been discovered, but they are of no great importance. The linen manufacture was, a few years ago, widely diffused, but has latterly been a good deal contracted, the mill-spun yarn being cheaper and better than that spun by hand wheels. Exclusive of the Bann, the principal rivers are the Foyle, Faughan, and Roe. Principal towns, Londonderry, Coleraine, and Newton-Lismavady. The co. is divided into 6 baronies and liberties, and 31 parishes; and sends 4 mems. to the H. of C., being 2 for the co., 1 for Londonderry, and 1 for Coleraine. Registered electors for the co., in 1839-40, 3,076. In 1831, Londonderry had 39,077 inhab. houses, 41,239 families, and 222,012 inhab., of whom 106,657 were males, and 115,355 females.

LONDONDERRY, or DERRY, a city, parl. bor., and

river-port of Ireland, cap. co. of same name, and a co. by itself, advantageously and beautifully situated on the W. bank of the Foyle, about 5 m. above where it falls into Lough Foyle, 121 m. N. by W. Dublin; lat. 54° 59' N., long. 7° 19' W. Pop. of pari. bor. in 1831, 14,030. The city was originally confined to the hill on which the greater part of it still stands; and which, from its projecting into the river, is called the "Island of Derry." This portion is surrounded by the old city walls, but it is now rapidly extending beyond its former limits, particularly along the river towards the Lough. There is also a suburb on the opposite bank of the river, called Waterside. The communication between the latter and the city is kept up by means of a wooden bridge, 1,068 ft. in length, and 40 ft. wide, erected in 1789 at an expense of above 16,000*l.*, and rebuilt in 1814-15 at a further cost of 16,891*l.* Derry is well built; many of the houses in the main streets within the walls are old-fashioned, with high pyramidal gables; but many modern mansions have, of late years, been erected in this part of the town; and without the walls rows of mud cabins have been superseded by respectable houses. The principal city streets are broad and clean, well paved, and well lighted; some of them however are inconveniently steep, and there are many narrow lanes and closes. In the centre of the city is an open square space, called the Diamond, from each side of which a handsome street leads to one of the four city gates. The summit of the hill is crowned by the cathedral, court-house, and bishop's palace.

The cathedral, which is also the parish church, was built in 1633: it is a large, handsome, Gothic structure, 240 ft. long, and has a tower and spire 228 ft. high, erected in 1778; but this having become dangerous, was taken down in 1802, and was soon after rebuilt, with the addition of Gothic pinnacles. The view from the top is very fine. In the interior is a handsome monument to the late Bishop Knox; and in also are displayed the colours taken at the siege of Derry. The bishop's palace is a large plain building, with extensive pleasure grounds. There are two other Protestant episcopal places of worship, the chapel of ease and the free church. The latter, which is without the city, was built in 1830, by Bishop Knox, and was intended for the use of the poorer classes, but it is no longer confined to them. There is also a R. Catholic chapel, and places of worship for Presbyterians, Primitive and Wesleyan Methodists, Seceders, Covenanters, and Independents. Among the public buildings, exclusive of churches and other ecclesiastical edifices, may be specified the Corporation Hall, in the centre of Diamond Square; it was originally constructed in 1692, but received so thorough a repair in 1823, as to be tantamount to a re-erection. The court-house, adjoining the cathedral, erected in 1813, at an expense of 30,480*l.*, is a spacious and a fine building, partly constructed on the model of the temple of Irevolu at Athens. The new gaol is a very extensive structure, being 242 ft. in front, by 400 ft. in depth; it is built on the radiating or panopticon principle, and cost above 30,000*l.* Among the chief ornaments of the city is the fluted column, erected, in 1827, in honour of the Rev. George Walker, its heroic defender. It stands on the central W. bastion, and is a well-proportioned pillar, 81 ft. in height, bearing a statue of Walker, 9 ft. high. It cost 4,200*l.*, raised by subscriptions.

The principal school, called Foyle college, stands on an eminence near the river; it is a plain but handsome building, erected in 1814, having accommodations for 80 resident pupils; it was built by subscriptions from the bishop of the diocese, the Irish Society, and other sources, and is maintained by similar means: the head master's salary, from these sources, is about 200*l.* per ann. There is a parish school connected with the church, for the education of 100 boys and 100 girls. The Presbyterian congregation also supports a free school: a school, called St. Columba's national school, was established by the R. Catholic bishop and clergy, but it is now under the National Board of Education. In 1823, a Mr. John Gwynn left the sum of 40,000*l.* for the education of as many boys as the funds will afford in the useful parts of a good English education; and, exclusive of the above, there is an infant school, and a number of Sunday and other schools. Among the charitable institutions, is the district lunatic asylum for the counties of Londonderry, Donegal, and Tyrone; it was opened in 1829, and cost 25,678*l.*; it can accommodate about 190 patients; the number admitted in 1837 was 189, of whom 109 were males, and 89 females; the expense of the establishment for that year was 2,806*l.*, being 18*l.* 10*s.* for each patient. There is also an infirmary and fever hospital, a dispensary, a charitable loan fund, a mendicity association, and a clergymen's widows' fund, with several minor institutions of a similar description. Among the literary institutions, is the Literary Association, with a reading-room and a pretty good library; the Literary Society, in which lectures are given, and discussions take place; a news-room; a mechanics' institute, &c. In 1840 the town had three

newspapers. Races take place on a course in its neighbourhood. The citizens of Derry would seem to have but little taste for theatrical entertainments; at all events, the theatre has been converted into a coach-building establishment.

The walls or ramparts by which the city proper is surrounded remain nearly in their original state, except that the ditch has been filled up; they afford a fine broad walk all round the city.

Londonderry was originally granted by Edward II. to Richard de Burgh, earl of Ulster, but the corporation now holds its privileges under a charter granted by James I. in 1613. The government of the city is vested in the mayor, sheriff, recorder, 12 aldermen, and 24 burgesses. The freedom is acquired by birth, by marriage with the daughters of freemen, apprenticeship, and by the gift of the corporation. The city sent 2 mems. to the Irish H. of C.; and since the union it has sent 1 mem. to the Imp. H. of C. Previously to the Reform Act the right of voting was in the burgesses and freemen. Registered electors in 1839-40, 1,262. The mayor, and aldermen who have filled the office of mayor, are justices of the peace within the liberties. The mayor and recorder hold a court of record every Monday, for pleas, to any amount. A court of general sessions is held quarterly, one of petty sessions weekly; there is also a court of conscience, at which the mayor presides weekly, for debts under 20*l.*, and for suits of wages. The assizes for the county and city, and the general sessions for the county, are held here twice a year.

The revenue of the corporation, arising from the tolls of the bridge, and dues on tonnage, quays, &c., amounted a short while ago to about 7,000*l.* a year; but owing to the expense of improvements, mismanagement, or some other cause, the corporation was involved in the greatest difficulties, and their property has been sequestrated, and mostly made over to other managers.

Manufactures are quite inconsiderable, if we except the conversion of grain into flour. There is a brewery and a distillery in the city, and two distilleries in the vicinity. There was here formerly a sugar-house and a glass-house, but these are now relinquished. A foundry and copper works were established here in 1821, and have succeeded. Some table-linen is manufactured; and cotton is said to be woven in the par. for the Glasgow manufacturers.

The trade of Londonderry is very extensive, and is rapidly increasing. Its fine river makes it the emporium of a large extent of country; and it is to this that its extensive commerce is principally to be ascribed. Its exports, like those of most other Irish towns, consist principally of agricultural produce, but a good deal of linen is also exported. We subjoin an

Account of the Quantity and Value of the principal Articles exported from Londonderry, in 1835.

Articles Exported.	Quantity.	Estimated Value.
Corn, meal, and flour - cwt.	416,042	120,760 0 0
Provisions - "	85,890	273,000 0 0
Sugar - "	36	144 0 0
Flax and tow - "	81,120	212,910 0 0
Feathers - "	3	15 0 0
Spirits - "	67,480	10,580 0 0
Linen - "	5,035,992	314,719 0 0
Cotton manufactures - "	968	24 0 0
Oxen and cows - "	855	5,130 0 0
Horses - "	75	1,140 0 0
Sheep - "	313	965 0 0
Swine - "	11,103	13,880 0 0
Eggs - "	33,056,000	55,094 0 0
Hides & calf-skins untanned - "	22,960	11,235 0 0
Other articles - value		21,180 0 0
Total value - "		1,010,918 0 0

Prices were uncommonly low in 1835; and making allowance for this, and the increase that has since taken place in the trade of the port, we may, perhaps, estimate the present (1840) value of the exports at 1,350,000*l.* or 1,400,000*l.* a year. The vast number and great value of the eggs exported is a peculiar feature in the above account. The imports consist principally of manufactured goods and haberdashery; iron, sugar and tea, timber, wine, coal, glass, earthenware, &c. A great portion of the increase in the trade of the port may be ascribed to the establishment of steam packets, which now ply regularly between the city and Glasgow and Liverpool.

Derry is one of the principal ports for the shipment of emigrants; as many as 5,000 to 6,000 individuals having of late years frequently sailed for the United States and Canada, in the course of a single season. The emigrants are very generally among the best behaved and most industrious, as well as most enterprising, portion of the community.

The gross customs' revenue collected at Londonderry in 1830, amounted to 72,012*l.*, and in 1839 to 98,626*l.*; the post-office revenue in 1830 was 3,038*l.*, and in 1836, 3,922*l.* The Bank of Ireland, the Belfast, Provincial, Northern, and Agricultural banks, have offices here. A savings'

bank, established in 1815, had, in 1835, 16,227. of deposits, contributed by 699 depositors.

Lough Foyle is properly the outer harbour of Londonderry. It is a triangular basin, about 18 m. long, and 10½ m. where widest; but a great part of it is occupied by sand-banks and mud-flats. The navigable channel stretches along the Donegal or Innishowen shore; and by following it, the largest men-of-war reach the anchorage at Moville, while merchantmen of 500 tons, without difficulty, ascend to the city quays, 5 m. above the lough and 23 m. from the sea. The river is navigable by barges from the city to St. Johnstone, and the Marquis of Abercorn has excavated a canal from the latter to Strabane. A portion of the wooden bridge at the city is constructed so as to open and admit the ascent and descent of vessels. It may be worth mentioning, that both the water and gas for the use of the city are conveyed across this bridge; so that the supply of both is interrupted whenever the bridge is opened.

But notwithstanding its increasing commercial prosperity, there is, we regret to say, much poverty in Derry. The contributors to the savings' bank are mostly menial servants; and the mechanics, tradesmen, and labourers are, in general, very badly off. "Among the labourers great poverty prevails, from the want of steady employment, and their consequent exposure to dissipation, with the total absence of employment for their children. The better class inhabit but which let for about 37. a year; but the poorer frequently lodge in garrets or out-houses, chiefly in the Bogside, at a rent of about 1s. 3d. a week; and yet, even in these hovels, they contrive to let shares of their rooms at 6d. a week." (*Ordnance Memoir of Londonderry*, p. 194.)

Derry was colonised and fortified in the reign of James I. by the London companies, who had purchased large tracts of the confiscated estates of the Earl of Tyrone; at which period it took the name of Londonderry. It is famous in Irish history for the memorable siege it sustained in 1689 against the forces of James II. Though ill fortified, and without any disciplined troops, the heroism of the citizen, and the enthusiasm inspired by their brave leader, the Rev. George Walker, enabled them to repel all the attacks of the enemy; and to sustain the more dreadful sufferings occasioned by the pressure of famine. The besiegers lost 8,000 men in the course of the siege, which was raised on the 105th day. Derry continued, for a lengthened period after this epoch in its history, to be, as it were, the head-quarters of Protestantism, or rather of Orangism in the N. of Ireland; but even in Derry the Catholics now outnumber the Protestants. (The reader will find, in the *Ordnance Memoir* referred to above, the most ample details as to all matters connected with the history and present state of Derry; see also, the *Boundary and Municipal Reports*; the *Railway Report*, &c.; and *Engle's Ireland*, ii. 18.)

LONG ISLAND, an island on the E. coast of the U. States, forming part of the state of New York, between lat. 40° 34' and 41° 10' N., and long. 72° and 74° W., being separated from the continent on the N. by Long-Island Sound, and on the E. by East River, New York Harbour, &c. Its length from S.W. to N.E. is about 120 m., its breadth varying from 10 to 20 m. Surface mostly a level plain, broken only by a range of hills in the N., extending for about 60 m., with an elevation varying from 100 ft. to 400 ft.; among these are Brooklyn, and other heights memorable in the revolutionary war. The soil of the plains is chiefly sandy or loamy. Long Island is not well watered; but in many parts it is well suited for raising corn, particularly maize, the climate being much milder than that of the adjacent mainland. The island has numerous bays and inlets, the principal being Sag harbour, in the N.E.; a great many smaller islands surround its shores. It is divided into 3 counties: Brooklyn, Bedford, Flatbush, N. Hempstead, River-head, and Jamaica are its chief towns. (For further particulars, see *New York*.)

LONG-ISLAND SOUND, a strait of the Atlantic between Long Island on the S., and the states of Connecticut and New York on the N. In the greater part of its extent, it is a noble expanse of water with bold shores, and many commodious havens on either side. But W. of the promontory called Lloyd's neck, the channel becomes rocky, and much interrupted by islets; and a few miles above New York is the dangerous pass of Hell-gate, where the flow and ebb tide form eddies and vortices, sufficient to dash to pieces or engulf large vessels. This formidable strait may, however, be passed with the greatest ease either at high or low water. (*New York Gaz.*, &c.)

LONGFORD, an inland co. of Ireland, prov. Leinster, having N. Cavan and Leitrim, E. Westmeath, and W. Roscommon, from which it is separated by the Shannon. Area, 93,645 acres, of which 55,247 are unimproved bog and mountain, and 15,892 lakes. The arable soil is, for the most part, level and fertile. Property mostly in large estates. Tillage farms small, the state of agricul-

ture and the condition of the occupiers being much the same as in the adjoining cos. Grazing, however, is extensively carried on. Average rent of land, 12s. 3d. an acre. It is divided into 6 baronies and 23 parishes; and sends 2 mems to the H. of C., both for the co. Registered electors, in 1839-40, 1,971. In 1831 it had 19,418 inhab. houses, 20,438 families, and 112,558 inhab., of whom 55,310 were males, and 57,248 females.

LONGFORD, an inland town of Ireland, cap. of the above co., prov. Leinster, on the Cumlin, an affluent of the Shannon, 65 m. N.N.W. Dublin. Pop., in 1831, 4,134. It is "a well-built town, and is increasing rapidly in population and wealth. There is here a very large market for grain; great quantities being exported by the Royal canal, a branch of which comes to the town." (*Municipal Boundary Report*.) It has a par. church, a R. Cath. chapel, meeting-houses for Presbyterians and Methodists, a market-house, the co. court-house, prison, infirmary, and dispensary, with large cavalry and artillery barracks. The corporation, which, under a charter of Charles II. in 1657, consisted of a sovereign, 2 bailiffs, 12 burgesses, and a commonalty, sent 2 mems. to the Irish H. of C. till the Union, when it was disfranchised. The county assizes and general sessions are held here; and courts for petty causes are held on Mondays and Saturdays. It is a constabulary station. Some linen is manufactured; and there is a tannery, a brewery, and a distillery; but the great business of the town consists in its trade in corn and other raw produce. Markets on Wednesdays and Saturdays: fairs on March 25, June 10, Aug. 19., and Oct. 22. Post-office revenue, in 1830, 1,0877; in 1836, 1,1377. Branches of the Bank of Ireland, and of the Agricultural and National Banks, were opened in 1834-35-36.

LONGORUCCO, a town of the Neapolitan dom., prov. Calabria Citra, 19 m. E.N.E. Cosenza. Pop. about 5,000, chiefly employed in working metals and burning charcoal. The horses for hunting in Naples are bred in the neighbourhood.

LONS-LE-SAULNIER, a town of France, dép. Jura, of which it is the cap., in a deep valley, 50 m. S.E. Dijon. Pop., in 1820, 7,484. It has no remarkable public buildings; but is generally well built, clean, and furnished with numerous public fountains, one of which, in the *Place d'Armes*, is ornamented with a statue of Pichegru, in white marble. At the N. extremity of the town is the salt spring from which it derived its ancient name of *Ledo Salinaris*: this spring continues to yield great quantities of table salt; four pumps are kept constantly at work, and the evaporating houses (*bâtimens de graduation*) are very extensive. Lons has a theatre, a public library with 3,000 vols., a gallery of paintings and antiquities, tribunals of primary jurisdiction and commerce, a communal college, &c. It is the entrepôt of the agricultural produce, iron goods, timber, wines, &c., of the dep., and has a fair on the 15th of every month. (*Hugo*, art. *Jura*; *Guide du Voyageur*, &c.)

LOO-CHOO, or LIEOU-KIEOU ISLANDS, a group tributary to the Chinese, in the N. Pacific Ocean, nearly midway between Japan and Formosa, and comprised within lat. 36° and 28° N., and long. 127° and 129° E. There are in all about 36 islands; but, excepting the Great Loo-Choo Island, towards the centre of the group, 70 m. in length, by from 12 to 15 m. broad, they are mostly of very inferior dimensions. These islands, which are but little known to Europeans, are reported to have a delightful climate, and a soil of great richness, producing the fruits and vegetables of countries the most remote from each other. Rice is cultivated with great care. Cattle, goats, and pigs, are said to be diminutive; but poultry are large and excellent. The islands yield sulphur and salt, and have, it is alleged, rich mines of copper and tin. Conflicting statements have been made by different travellers respecting the civilisation, political condition, jurisprudence, &c. of the natives. They appear, however, to be of the same race as the Japanese; and have not merely adopted the costume, but speak the language, of that people. Their religion is a species of Buddhism; and their government, like that of other Asiatic countries, of a despotic character. They are friendly and hospitable; but it is now sufficiently ascertained that Captain Hall was totally mistaken in the estimate he formed of these islanders; who, had his statements been well founded, almost realised the poetical fictions of the golden age. The Loo-Choo Islands were for some time subject to Japan, but were conquered by China about 1372. Kintching, the cap., is about 5 m. from its port Napking, near the S.W. extremity of Great Loo-Choo, lat. about 26° 14' N., long. 127° 52' E. (See *Hall*, *Macleod*, and *Beechey's Travels*, &c.)

LOOE (EAST AND WEST), two contiguous anc. bors. and market-towns of England, co. Cornwall, hund. West, on both banks and close to the mouth of the Looe, 12 m. S.E. Bodmin, and 210 m. W. by S. London United pop., in 1831, 1,438. They are mean, wretched places, connected by a narrow, old bridge of 13 arches;

and would be unworthy notice, were it not that each of them enjoyed the privilege of sending 2 mms. to the H. of C. from the reigns of Edward VI. and Elizabeth down to the passing of the Reform Act, when they were both disfranchised.

LORCA (an. *Chiocroca*), a considerable town of Spain, prov. Murcia, cap. of a partido of its own name, on the Guadentín, a tributary of the Segura, 42 m. W. S.W. Murcia, and 116 m. E. N.E. Granada. Pop. according to Miñano, 40,366. The vale of Lorca is remarkable for picturesque beauty and great fertility; and the town, close under the Sierra del Cano that bounds it on the left, and the fine old castle on a rock hanging over it, adds greatly to the beauty of the picture. This has evidently been a considerable place; but, the lower part of the town being concealed by trees, nothing is seen on approaching it but a number of low houses crowded on the side of the mountain, and from the similarity of colour seeming almost to belong to it. This is the old or Moorish town, and is very irregular and mean in appearance; but the new town, on the plain, is much more regularly laid out, and better built. A collegiate (once episcopal) and seven parish churches, two hospitals, an episcopal palace, and a royal college, are the chief buildings and establishments. Salt-petre is manufactured on a large scale, and soap, thread, and linens, are produced in small quantities; but the chief resources of the town consist in its great September fair, its markets, and the produce of its neighbourhood, both in flocks and agricultural produce. Mr. Inglis gives a lively picture of the market and its attendants:—"All the women here wear a square white woollen shawl, worn like a mantilla; the men are dressed in short white drawers loose at the knees, and instead of stockings use sandals made of rope; and their heads are covered with close-fitting tapering black caps, others from the higher countries being enveloped in blankets of gaudy colours. Among the numerous things exposed for sale, were dried and shell fruits, Catalonian cloths and calicoes, shoes and rope sandals, quantities of Esparto rush and rush-baskets, beads, rosaries, trinkets, &c. In short, everything that one either eats or wears in Murcia. The show of pigs was extremely fine, and nowhere in the world are these animals found in greater perfection than in Spain, fed, as they are, on the ilex nut. The price of a hog weighing 23 stone was 210 reals (*2l. 8s.*), and that of a sucking pig 14 reals. Mutton sells at 12 quartas, a fowl costs 20d., a hare 10d., and bread is 14d. per lb. The price of labour in the vale of Lorca is 5 reals or 1s. a day." (*Inglis's Spain*, ii. 206.)

Lorca, supposed to be the *Chiocroca* mentioned in Antonine's Itinerary, was exposed to frequent attacks during the contests between the Moors and the crown of Castile, and has at various times sustained sieges. It was nearly destroyed at the commencement of this century. In 1792, a speculator, with the permission of government, collected at a great expense all the waters of the district into a common reservoir (*pantano*) resembling that of Alicante. The basin was said to be "superb," and capable of containing water sufficient to irrigate for years the entire vale of Lorca. Ten years afterwards (30th April, 1802) the waters, which had for some time been undermining the reservoir, rushed out with an impetuosity that swept every thing before it, men and cattle, public buildings, and even trees and rocks. About 600 houses, a church, 2 convents, 2 hospitals, several mills and fountains, were at once swallowed up and disappeared, about 6,000 human beings, 24,000 cattle, &c. being at the same time destroyed. The agricultural districts were covered over with sand, rubbish, &c., and the total loss occasioned by the catastrophe is supposed to have exceeded a million sterling. A like disastrous event is said to have destroyed the ancient city of March in Arabia Felix, an account of which will be found in the *Modern Traveller*, Arabia, p. 28. (*Inglis*; *Laborde*, vol. ii.; *Miñano*.)

LORETTO, a town of the Papal States, cap. of a commissariat of the same name, on a bold and commanding eminence, about 3 m. from the Adriatic, and 12 m. S.E. Ancona. Pop. with its suburbs, about 5,000. It is surrounded with walls, constructed by Sixtus V. in 1587. This celebrated but poor town is wholly indebted for its fame, and even existence, to its having the good fortune to possess the *Santissima Casa*, or house occupied by the Virgin Mary, in Nazareth, conveyed by angels, first to Tersato in Dalmatia, and thence, by the same agency, in 1294, to its present site! This miraculous edifice is a mean-looking hovel, about 30 ft. in length, by 13 or 14 ft. in width, and 10 ft. in height; apparently built of Apennine limestone, with a modern vault of timber-work. It is incased in a shell of marble, sculptured with bass-reliefs, representing the history of the Virgin; the whole being under the dome of a splendid church, built to protect the sacred edifice. In a niche within the latter, once fenced in with gratings of solid gold, but now with pieces of gilt wood, is the image of the Virgin, affirmed to be the work of St. Luke, to

whose talents as an artist it does little credit, being "a little old woman about 4 ft. in height, with the features and complexion of a negro." (*Moore*.) Her dress is tawdry, and in the worst possible taste; she literally glitters in jewels and brocade, and reigns amid the continual glare and smoke of lamps and candles, held by figures of angels." The church, which encloses the *santissima casa* is said to have been designed by Bramante. According to Eustace, it is a "very noble structure;" but it is less favourably spoken of by Woods and others. Its gates, which are of bronze, are embellished with *basso-reliefs* of the most admirable workmanship; in the arch before it, is a handsome marble fountain, and a large statue of Philip VI. The riches formerly accumulated within this sanctuary, were a subject of astonishment to all travellers; and were, most probably, much exaggerated. The popes are believed to have occasionally abstracted some of the gold offerings, and to have substituted false for real gems. But, when the French acquired possession of Loretto, they acted with less reserve; and, undismayed by the sanctity of the place, rifled its repositories, and carried off every article of value, applying them to secular and really useful purposes. It has since, however, received several considerable benefactions.

A lucrative trade was formerly carried on at Loretto in rosaries, crucifixes, *agnus Dei*, and such like articles, partly taken off by pilgrims to the shrine, and partly exported. But this trade has now much fallen off. The number of pilgrims, though still very considerable, has also greatly declined; and they are now mostly of the lowest and poorest classes. On their arrival in town, they are received into an hospital, where they are boarded and lodged for three days; and this privilege has probably as much to do as superstition in attracting them to Loretto. (See *Addison's Travels*, p. 94, ed. 1726; *Moore's Italy*, i. 291; *Eustace's Classical Tour*, i. 200; *Forsyth*, 321., &c.)

L'ORIENT, a strongly fortified sea-port town of France, dep. Morbihan, cap. arrond., at the confluence of the Scorff with the Blavet at the head of the bay of Port Louis, about 3 m. from the Atlantic, and 29 m. W. by N. Nantes. Lat. 47° 45' 11" N.; long. 3° 21' 29" W. Pop. in 1836 (ex. suburbs), 15,138; but, according to recent statistics, the pop. of the town and suburbs may now (1841) amount to 19,000 or 20,000, nearly 5,000 of whom are employed in the dock-yard and its appendages. L'Orient is clean, and regularly built; the streets are wide, straight, and well paved, and the houses well constructed and handsome. One of its public squares, the *Place Royale*, is planted with lime-trees, and it has other good promenades. The principal church\* is very large, and has a lofty spire, which is a conspicuous landmark. The prefecture, auction-hall, town-hall, and theatre, are handsome edifices. The public slaughter-houses (*abattoir*) are remarkably clean; and the meat, fish, and bread-markets are next to those of Rennes, the best constructed, and most extensive in Brittany. In the centre of the market-place a granite column erected to the memory of the commander Bissou. Some years ago, a bridge, also of granite, was commenced over the Scorff, but the design was abandoned, lest the clearance of the port should be thereby impeded.

The port of L'Orient, about  $\frac{2}{3}$  of a mile in length by nearly  $\frac{1}{2}$  m. in breadth, is secure, commodious, and of easy entrance. It is bordered by fine quays, on which are some extensive buildings and establishments connected with the government dockyard; an observatory 120 ft. in height, which serves also for a telegraph and a light-house, and a very handsome public fountain. The naval establishment is on a smaller scale at L'Orient than at Brest; it has no *bagne*, but it has a place of confinement for soldiers guilty of insubordination. More ships of war are now built in the dockyard at L'Orient than at any other in France, 16, of the estimated cost of 8,652,390 francs, having been constructed here in 1840. L'Orient has ships enough for the construction of 30 vessels of all sizes: frigates are, however, the class of ships chiefly built. Towards the end of 1840, 9 ships were occupied each with a frigate in course of active preparation; and, according to the report of an English traveller, 3,000 workmen were exclusively engaged on these 9 frigates. Many of the subordinate artificers get only 26 sous a day, and few of the better workmen receive more than 40 from 30 to 40 sous a day; but taking into account, fully cheapness of living in Brittany, they are, perhaps, as well off as the workmen in the English dockyards. The foremen (*chefs d'ateliers*) are not paid by the day, but receive from 1,500 to 2,000 fr. a year, according to circumstances. L'Orient has excellent sheds for masting vessels, &c., and good block-sheds, the machinery in which, as well as a portion of that for cable-making, is wrought by steam. At the end of 1840, establishments

\* Huguio says that this church was originally planned and begun on so immense a scale, that after 30 years labour had been spent in its erection, the builders, despairing of being able to finish the work as commenced, found it necessary to demolish a portion of it to complete the rest.

were in course of being erected for the construction of steam engines for ships of war, and new forges, &c., were about to be commenced. The buildings formerly belonging to the French E. I. Company, are now converted into barracks. The arsenal and naval stores are very extensive, and the artillery barracks are capable of accommodating 1,800 men. The lazaret is on a small island to the S., between L'Orient and Port Louis. L'Orient has a school of naval artillery and a spacious artillery ground near the town, a school of hydrography, established 1771, a large and well-arranged commercial college, a preparatory school for training for the government schools, a communal college, gratuitous schools of drawing, geometry, arithmetic, &c., a public and a pretty good naval library, museums of chemistry and mineralogy, an agricultural society, and various educational societies. It is the seat of tribunals of primary jurisdiction and commerce, a chamber of commerce, &c.

The manufactures of L'Orient, chiefly consisting of bats, linens, gold lace, earthenware, &c., are not very important. Its trade, though not so flourishing as in 1789, has latterly begun to increase. In 1830, only 6 merchantmen belonged to the port; it has now (1840) more than four times that number, some of them trading to the French colonies. The chief exports are wax, honey, butter, corn, cattle, and pilchards, the latter being taken in great quantities on the adjacent coast, are sent to Nantes to be prepared for exportation.

Though at present so little eminent for trade, L'Orient owes its origin and former importance almost wholly to commerce. It was but an insignificant village when, in 1728, the French E. I. Company made it their principal naval *dépôt*; and such was the influence of the change, that in 1738 its pop. is said to have amounted to 11,000. On the dissolution of the Company in 1770, L'Orient was made one of the stations for the French navy, and a free commercial port. (*Illego*, art. *Morbihan*; *Letter in the Times*, 7th Oct., 1840.)

LORRAINE (Germ. *Lothringen*), one of the largest of the an. provs. of France, in the N.E. part of the kingdom, now distributed among the depts. of Meurthe, Meuse, Moselle, Vosges, and Bas-Rhin.

LOSTWITHIEL, or LESTWITHIEL, an an. bor., market-town, and par. of England, co. Cornwall, hund. Powder, on the W. bank of the Fowey, 5 m. S.S.E. Bodmin, and 211 m. W. by S. London. Area of bor., 120 acres. Pop., in 1831, 1,548. The houses are chiefly of stone, roofed with slate; but the streets narrow and ill-paved. The church, a curious old building, has a large E. window, and a fine tower and spire at the opposite end: the living is a vicarage, in the gift of Earl Mountbatten. It has also pieces of worship for Locksidents, Wesleyan, and Primitive Methodists, with attached Sunday schools. The corporation support a grammar and writing school; another school, for poor children, is slenderly endowed by the trustees of the late Rev. St. John Eliot; and there are a few money bequests. Near the church, an ancient building, supposed to have been either a palace of the Duke of Cornwall, or a court-house for the stannaries, was, till very recently, used as a prison during the winter and summer sessions, now removed to Bodmin. There is a town-hall, where petty sessions are held, and under it is a small gaol. Tanning and wool-stapling are the principal trades, and the town derives some importance from its situation on the Fowey, by which iron and copper ore, &c. are exported. Lostwithiel was made a free bor. by Richard Earl of Cornwall, and incorporated by James I.: it sent 2 mems. to the H. of C., from the 19th Edward II. down to the Reform Act, by which it was disfranchised. It is not included in the Municipal Reform Act; but is now, as formerly, governed by a mayor, 6 capital, and 17 inferior burgesses. Markets on Friday; cattle fairs, July 10., Sept. 6., and Nov. 13.

About 1 m. N. of Lostwithiel, on the summit of a hill, is Restormel castle, the ancient seat of the baronial family of Cardinan, and subsequently of the earls of Cornwall; it was ruinous even so early as the time of Henry VIII., but was repaired and occupied during the civil war. (*Mun. Corp. and Char. Rep.* &c.)

LOT, a dep. of France, reg. S., chiefly between lat. 44° 15' N., and long. 10° 20' E., having N. Corrèze, E. and S.E. Cantal, Aveyron, S. Tarn-et-Garonne, and W. Lot-et-Garonne and Dordogne. Area, 525,280 hectares. Pop. in 1836, 287,003. The dep. is mountainous, with a general slope towards the S.W. Its mountains are ramifications of those of Cantal, and rise in the E. about 2,500 ft. above the sea. Its chief rivers are the Lot, and the Dordogne; from the first of which it derives its name. The Lot, which rises in Lozère, about lat. 44° 30' N., long. 30° 45' E., runs with a very tortuous course generally W., through Aveyron, the S. part of Lot, and the centre of Lot-et-Garonne and Gironde; uniting with the Garonne at Aiguillon, about lat. 44° 18' and long. 0° 00' E. It is navigable during 4 months of the year, for nearly 100 m.; Mende, Cahors, and Villeneuve d'Agén

are on its banks. There are an immense number of narrow valleys, watered by small rivulets: these have frequently an alluvial soil of great fertility, but the soil in most parts is either calcareous, or stony and gravelly.

In 1834, it was estimated that 252,533 hectares were arable, 25,825 in pasture, 58,627 in vineyards, 87,256 in woods, and 71,284 occupied by heaths, wastes, &c. Lot produces more corn than is required for its own consumption; but chestnut-flour forms an important article of food among the rural pop. The corn grown is principally wheat, maize, and rye; and the total annual produce of all kinds is estimated at between 1,500,000 and 1,600,000 hectol. Agriculture is extremely backward, and there is a great want of capital, a consequence mainly of the splitting up of the land into an immense number of small properties. In 1835, of 111,948 properties subject to the *contribution foncière*, 50,471 were assessed at less than 5 fr., 18,731 at from 5 to 10 fr., and 17,652 at from 10 to 20 fr.; while the number of properties assessed at 1,000 fr. and upwards amounted to only 18. The plough employed is a fac simile of that described by Virgil, and is drawn by one or two oxen, the spade or hoe is, however, used in the culture of thin soils. The produce of winter wheat amounts to about 600,000 hectol. a year, a third part of which is consumed by the inhab., and the rest sold or converted into brandy. The wines known in the market as *vins de Cahors* are strong and very dark-coloured, and are principally employed to give body and colour to other wines, for which purpose they are principally sent to Bordeaux. Tobacco is grown in this dep., and in 1833 about 1,850 hectares were appropriated to its culture, and 933,330 kilog. produced. The climate is favourable for the mulberry, but the silkworm does not thrive. A few proprietors have flocks of Merino sheep, but the pastures are badly irrigated and attended to, and most kinds of live stock are indolent. The goats' hair of the dep. is, however, highly esteemed. The produce of sheep's wool is estimated at 500,000 kilog. a year. A great many hogs are fattened for sale in the neighbouring depts., and about 60,000 turkeys and geese are annually exported, preserved in their fat. A considerable proportion of the truffles used in *pâtés de Périgord* come from this dep. There are some iron and coal mines; but both mining and manufacturing industry are little attended to. A few copper and iron forges, woollen, cotton, and linen cloth factories, paper-mills, and tanneries, are the chief manufacturing establishments: these, however, are so few, that the inhab. are usually supplied with cloths and leather in exchange for their wool and skins from the adjacent depts. There are nearly 1,000 flour-mills in the dep. Lot is divided into 3 arronds.; chief towns, Cahors, the cap., Gourdon, and Figeac. It sends 5 mems. to the Ch. of Dep. Number of electors (1838-39), 1,356. Total public revenue, in 1831, 4,765,657 fr.; but the expenditure in the same year amounted to 5,060,508 fr. (*Illego*, art. *Lot*; *Official Tables*, &c.)

LOT-ET-GARONNE, a dep. of France, reg. S.W., formerly included in Guienne; chiefly between lat. 44° and 44° 40' N., and long. 0° and 1° E., having N. Dordogne, W. and S.W. Gironde and Landes, S. Gers, and E. Tarn-et-Garonne and Lot. Length and breadth about 50 m. each; area, 530,711 hectares. Pop. (1836) 346,400. The surface is mostly level, with a slope to the W. The Garonne intersects the dep. from S.E. to N.W., and receives about its centre the Lot from the E. The banks of these rivers may be classed among the most productive portions of France; but 265,496 hectares consist of a chalky soil, and about one eighth part of the surface in the W. of the dep. is composed of *landes*, or sandy plains, sprinkled with marshes, analogous to those in the adjoining depts. of Gironde and Landes. According to the official returns, it comprised, in 1834, 286,100 hectares of arable land, 42,322 do. meadow, 69,349 do. vineyards, and 68,613 do. woods. This dep. is principally agricultural. The corn grown exceeds what is required for home consumption: it is chiefly wheat and maize on the richer lands, and rye on the poorer. The produce of wine is estimated at about 650,000 hectolitres a year, of which nearly a half is exported. The N. part of the dep. produces about 40,000 hectol. a year of chestnuts, from 7,000 to 8,000 hect. of which are sent to Bordeaux and the neighbouring depts.: 2,630 hectares are occupied with tobacco, which produced in 1833 746,526 kilog., valued at about 560,000 fr. Excellent hemp is grown. The prunes of Agen are highly esteemed, and are exported to the value of 600,000 fr. a year: the dried figs of Clairac are also celebrated. On the *landes* are many fir plantations, which furnish about 800,000 kilogs. of resin, and 300,000 kilogs. turpentine a year, besides pitch, deals, &c. The cork tree grows in a few communes, and its produce is valuable. Artificial pasture lands are rare. According to the official tables, there were in 1830 in this dep. 188,000 head of sheep, and 107,000 head of black cattle. Large flocks of geese are reared, especially near Agen; they are fattened on maize, and preserved in their fat. In 1835, of 122,558 properties subject to the *contribution foncière*, 81,242

were assessed under 5 fr., and 19,780 at 5 to 10 fr. Mining industry is insignificant; but some iron ore is smelted by means of charcoal, there being no coal mine in the dep.: there are numerous distilleries. At Tonnelus is a royal tobacco manufactory, employing 400 workmen, who produce 400,000 kilograms of tobacco a year, for the supply of the neighbouring depas. At Nerac, Mezin, Barbaste, &c., are cork factories, which together may employ about 700 hands, and produce 130,000 metrical quintals of corks a year. At Agen is a large sail-cloth factory, with 300 looms, for the service of the French navy; and there are also extensive ropewalks. Lot-et-Garonne has also manufactures of woollen thread, serge, linen and cotton cloths, gloves, paper, starch, glass, and earthenware, besides tanneries, iron works, &c. The dep. is divided into 4 arrond.; chief towns, Agen, the cap., Marmande, Nerac, and Villeneuve d'Agen. It sends 5 mems. to the Ch. of Deps. No. of electors in 1838-39, 2,771. Total public revenue (1831), 7,811,527 fr.; expenditure for the same year, 6,924,709 fr. (*Hugo, art. Lot-et-Garonne; Official Tables.*)

LOTHIAN, an extensive, fertile, well cultivated, and rich district of Scotland, lying along the S. shore of the Frith of Forth. It is divided into the cos. of East Lothian, or Haddington; Mid Lothian, or Edinburgh; and West Lothian, or Linlithgow. We shall make a few observations on each of these, beginning with

1st. *East Lothian.*—This, which, as its name implies, is the most easterly division of the Lothians, has the Frith of Forth on the N., the German Ocean on the E., Berwickshire on the S., and Mid Lothian on the W. It is of an elliptical shape, and contains 174,000 acres, of which about 4-5ths are capable of cultivation. The S. portion of the co. is occupied by the Lammermoir hills, which divide the co. from Berwick; but with this exception, it is mostly level, or merely undulating; and when viewed from the adjacent heights, appears like an extensive, rich, and beautiful plain, gradually sloping to the sea. The district along its E. coast, comprising about 20,000 acres, has a reddish, loamy, and very fertile soil: the soil gradually becomes more clayey as it recedes from the sea; and, except in the district now referred to, its general character is that of a clay bottom. The climate is comparatively dry and early; but the E. winds, in April and May, are often very severe. This is one of the best cultivated districts of the empire, and is remarkable for the intelligence and skill of its farmers, and their superior husbandry. The best farming is seen in the district along the E. coast, the soil here is more adapted alike to the growth of turnips and of wheat. The turnip culture, indeed, is carried on here to a greater extent, on more correct principles, and with better success than in any other part of the empire. In the clayey lands, or those that have a wet, retentive subsoil, summer fallow is extensively practised, and is found to be the best foundation of a profitable system of cultivation. During the late war, when the prices of corn were so enormously high, the raising of corn in this co. was carried to an improper extent; and in many parts the land was unduly forced. But this error has since been obviated. The fattening of cattle of all kinds for the butcher is now an important part of the economy of every well conducted farm; and a greater extent of land is kept in grass, and for a longer period. Exclusive of the Lammermoir district, which is principally devoted to the breeding of sheep, the farms in the other parts of the co. extend from 60 acres up to 500 acres, or more, the average being about 250 acres. Every farm has a thrashing machine; and of these about 80 are driven by steam, 7 by wind, 30 by water, and the rest by horses. Rents are constantly fixed in corn, convertible into money at the *far* prices of the co. Six bushels of wheat may, perhaps, be taken as the average rent of the wheat lands of the district, which, taking the wheat at 7s. a bushel, will be equivalent to a money rent of 42s. an acre. In 1810, the average rental of the co. was 29s. 10d. an acre. Notwithstanding its present highly advanced and improved condition, agriculture was in an extremely backward and depressed state in this co. even so late as 1770. The land was then not well tilled; a rotation of crops was comparatively unknown; the stock and implements of husbandry were alike defective; much of the land was injured by the want of drainage; the hinds, or farm labourers, were badly fed and badly clothed; and the ague regularly made its appearance in spring in every hamlet and village, and almost, indeed, in every house. The change in the interval has been most striking and beneficial. Even within the last dozen years many important improvements have been made, principally by the introduction of furrow draining and bone manure, a better rotation of crops, and a more efficient and skilful management. The farm houses and offices are excellent; but we are sorry to have to add, that while every thing else has been vastly improved, the cottages have not, in the majority of cases, been sensibly ameliorated, and their condition is discreditable alike to the farmers and the landlords. Except, however, as respects their lodging, the labourers are well off; and the hinds, or farm

labourers, now receive each 24 bushels of oats a year more than they did previously to the commencement of the improvements. Estates of various sizes; some very valuable. There are about 7,500 acres of wood. The W. division of the co. has valuable beds of coal; and limestone is very generally diffused. If we except some considerable distilleries, manufactures are all but unknown. The Tyne, which flows through the centre of the co., is the only considerable stream. The co. sends 1 mem. to the H. of C.; and the bors. of Haddington, N. Berwick, and Dunbar, join with Lander and Jedburgh in returning 1 mem. Registered electors, in 1839-40, 740. In 1831, E. Lothian had 6,561 inhab. houses, 8,080 families, and 36,145 inhab., of whom 17,397 were males, and 18,748 females. Valued rent, 168,874l. Scotch. Annual value of real property in 1815, 250,126l. (*Robertson's Rural Recollections, passim; New Statistical Account of Scotland.*)

2. *Mid Lothian*, or Edinburghshire, has the Frith of Forth on the N., the Firth of Forth on the E., Berwickshire, Peebles, and Lanarkshire on the S., and Lothian on the W. Area, 225,560 acres, of which about 2-3rds are supposed to be arable. In some parts, especially along its S. border, it is rugged and even mountainous; the ridge of the Pentland Hills, which approaches within a short distance of Edinburgh, divides its low grounds into two portions, that unite towards the sea. Soil for the most part clayey, and not in general very fertile. Agriculture similar to that of E. Lothian, but inferior; its details being also a good deal modified by the demand of the capital for milk, butter, potatoes, &c. Improvements of all sorts have been prosecuted with great zeal and industry. In 1727, a small field of wheat, within a short distance from Edinburgh, was reckoned so extraordinary a phenomenon, that persons came from a great distance to see it. (*Robertson's Recollections, p. 267.*) But, at present (1810), wheat is the principal object of the farmer's attention; and there may be from 18,000 to 20,000 acres under that crop. There are a considerable number of rather large estates; but property is, on the whole, pretty well divided. Average rent of land, in 1810, 24s. 6d. an acre. There are large beds of coal in this co. For details as to its trade, manufactures, literary establishments, &c., the reader is referred to the articles Edinburgh and Leith. This co. has, exclusive of Edinburgh, 27 parishes: it returns 4 mems. to the H. of C., viz. 1 for the co., 2 for the city of Edinburgh, and 1 for Leith and Musselburgh. Registered electors for the co., in 1839-40, 2,315. In 1831, Mid Lothian had 19,744 inhab. houses, 47,415 families, and 219,345 inhab., of whom 99,803 were males, and 119,542 females. Valued rent of co., 191,054l. Scotch. Annual value of real property, in 1815, 770,875l.

3. *West Lothian*, or Linlithgowshire, the smallest of the divisions of Lothian, has the Frith of Forth on the N., Mid Lothian on the E. and S., and Lanark and Stirling on the W. It is of a triangular shape, and contains 76,800 acres, of which about 3-4ths are arable. Surface varied, with knolls; there are, however, but few hills, and no mountains. In the S. part of the co. the ground is moorish, and there are some morasses; but elsewhere it is comparatively fertile. Agriculture similar to that of Mid Lothian, with this difference, that more turnips are raised and fewer potatoes. Estates large; farms of a middle size. Average rent of land, in 1810, 21s. 7d. an acre. Coal is found in most parts of the co. Manufactures of no importance. W. Lothian is divided into 13 parishes: it sends 1 mem. to the H. of C. for the co.; and the bors. of Linlithgow and Queensferry join with others in returning representatives. Reg. electors for the co., in 1839-40, 710. In 1831, W. Lothian had 3,400 inhab. houses, 5,014 families, and 23,291 inhab., of whom 10,595 were males, and 12,296 females. Valued rent, 75,019l. Scotch. Annual value of real property, in 1815, 97,997l.

LOUDUN, a town of France, dép. Vienne, cap. arrond., on a hill, 31 m. N.N.W. Poitiers. Pop. in 1836, *ex com.* 4,428. It was formerly of considerable importance, and has still many large houses and wide streets; but its inhab. being principally Protestants, it suffered much from the revocation of the edict of Nantes, from the effect of which it has never recovered. It has an hospital, a theatre, the remains of an ancient castle, a tribunal of original jurisdiction, and manufactures of woollen cloth, lace, &c. (*Hugo, art. France.*) This town is famous, or rather infamous, in the history of fanatics, for a judicial murder committed in it, in 1624, when a curate, of the name of Grandier, accused and convicted of sorcery and magic, was burnt alive. The unfortunate curate appears to have had but little respect for that rule of the R. Cath. religion which enjoins the celibacy of the clergy; and he is said, and we presume truly, to have practised his arts with most success on the nuns belonging to an Ursuline convent in the town. (*See Biographie Universelle, art. Grandier; Histoire des Diables de Loudun, passim, &c.*)

LOUGHBOROUGH, a market town and par. of England, co. Leicester, hund. W. Gosceote, near the left bank of the Soar, 10 m. N. Leicester, and 98 m. N. by W. London. Pop. of township in 1831, 1,080. It is a clean and respectable-looking town, with several streets lined

with modern brick houses, meeting the principal avenue on the great London road. The market-place, in which is the town-hall, was formerly narrow and confined, but has been recently laid open by the pulling down of the old market-house. The church, a large and handsome structure in the perpendicular style, has a lofty and well-proportioned tower: the living is a rectory (value 1,444*l.*), in the gift of Emanuel College, Cambridge. There are places of worship, likewise, for Presbyterians, Independents, Baptists, Unitarians, Wesleyan and Primitive Methodists, and the Society of Friends, connected with which are 7 Sunday-schools, furnishing religious instruction to between 2,000 and 3,000 children of both sexes. Besides a well-endowed grammar-school, Loughborough has a charity-school for clothing and instructing 80 boys; a subscription-school, attended by 250 boys, and a school of industry with 108 girls. A dispensary and several charitable societies confer essential benefits on the poor, and there is also a large public library and news-room. Fleecy-hosiery and bobbin-lace are the chief branches of industry, the former occupying nearly 1,000 hands in the town and neighbourhood; several persons are employed in making cotton hose and gloves, and there are many makers of machinery, and a considerable number of shoemakers, working for the London market. In 1839 there were two worsted mills, giving employment to 213 persons. The prosperity of the town has been increased by the facility of transit afforded by the Leicester Navigation and Loughborough Canal; but much greater benefits are likely to result from the recent opening of the Midland Counties' railway, which brings this town within 4 hours' distance of the metropolis. Petty sessions every market-day. Loughborough is the election town and principal polling place for the N. division of the co. Markets on Thursday: large fairs for horses, cattle, and sheep, Feb. 14, March 28, April 25, Holy Thursday, Aug. 12, and Nov. 13; cheese fairs, Mar. 24 and Sept. 30. LOUGHREA, an inland town of Ireland, co. Galway, prob. Constant, on Loughrea Lake, 21 m. E. by S. Galway. Pop., in 1831, 4,067, mostly R. Cath. The town, which was formerly fortified, consists of several irregular streets and lanes. The public buildings are—the par. church, the spire of which was thrown down by lightning in 1832, 3 R. Cath. chapels, several large schools, and a barrack. General sessions are held twice a year; petty sessions on Thursdays. It is a constabulary and revenue guard station. Markets on Thursday: fairs on Feb. 11, May 26, Aug. 20, and Dec. 5. Post-office revenue, in 1830, 66*4l.*; in 1836, 82*4l.* A branch of the National Bank was opened in 1836.

LOUIS (St.), a town or city of the U. States of N. America, being, though not the cap., the principal place in the state of Missouri, and the cap. of the judicial district and co. of its own name; admirably situated on the Mississippi, 18 m. below the mouth of the Missouri, and nearly 200 m. above the mouth of the Ohio; lat. 38° 36' N., long. 89° 56' W. Pop., in 1830, only 5,852; but so rapid has been its progress in the interval, that it may now (1840) be safely estimated at 14,000. It extends for 2 or 3 m. along the margin of the river, from which the ground rises by a gentle ascent to a second plateau, about 10 ft. above the level of the first. Fortifications were erected on this terrace at an early period in the history of St. Louis, but these have been removed to make way for the town's buildings; and their site is now in many parts occupied by streets and houses. In the older part of the town, by the brink of the river, which is the chief seat of trade, the streets are narrow and inconvenient; but of late they have been much improved. The more modern sections, on the high grounds, are laid out in broad avenues and streets, in which are most of the residences of the merchants and professional men. A few years since St. Louis was chiefly built of wood; but the houses are now mostly constructed of a kind of limestone found on the spot, which is soft when first quarried, but becomes very hard and durable after exposure to the air. Many of the warehouses in the lower town have 3 or 4 stories, and there are some large castellated private mansions. St. Louis has a handsome Rom. Cath. cathedral, founded in 1831, 136 ft. in length, 81 ft. in breadth, with a tower 90 ft. high, surmounted by a spire, &c. This edifice is of the Doric order, and is roofed with copper. It has several bells, cast in Normandy, one of which weighs 2,600 lbs., and some paintings, which are well spoken of, one of them being said to be by Paul Veronese. There are churches belonging to the Baptists, Episcopians, Presbyterians, Methodists, Unitarians, &c., most of them large and commodious buildings. There is also an African church, under a black pastor. St. Louis university, founded and conducted by Jesuits, was, in 1837, situated in the W. suburbs, but was about to be removed to about 4 m. N. from the city. It is intended chiefly for the study of the classics and *belles-lettres*, but has also a medical department. St. Louis has a convent, an hospital, an orphan asylum, a female charitable association, several primary and grammar schools, &c. Among

the most ornamental public buildings are the court-house and market-house, with the town-hall above it. It has also two theatres. Nearly all the houses are supplied separately with water from a large reservoir. St. Louis had, in 1837, a floating dock, a yard for boat-building, a large foundry, and many flour and saw mills. Boats of the largest class come up quite close to the quays. A considerable part of the western fur trade of the U. States centres here, some of its inhab. having been the first American citizens who embarked in that branch of commerce. Coal, iron, lead, and marble are raised in the vicinity, which it is highly probable will eventually become the great emporium of the countries on the Missouri and central Mississippi. In 1835, 803 steam-boats, of the aggregate burden of 100,000 tons, arrived at the town. St. Louis is also the centre of the overland trade between the U. States and Mexico. Its inhab. are now chiefly Americans; but till lately they were principally descendants of the French, by whom the city was founded. In 1764, (*Missouri Gazetteer*, 1837, pp. 178—213; *Murray's Encycl. of Geog.*, American ed.; *Encycl. Américain*, &c.)

LOUIS (St.), a town of Western Africa, and the cap. of the French possessions in Senegambia, on an island of its own name in the Senegal, 16 m. from its mouth; lat. 16° 21' N., long. 16° 13' 45" W. Pop., in 1836, exc. garrison, 11,606, of whom 6,006 were slaves. It is laid out on a regular plan, nearly a mile in length, by about 200 yards broad. Fort St. Louis, with its esplanade, occupies the centre of the town; and from two of its opposite faces, a street is prolonged, and crossed at right angles by several others. The town has about 250 brick houses, half of which have only a ground floor; and the other half rarely more than an additional story; the other dwellers are mere huts of mud and straw. The chief public buildings are the governor's residence, the barracks, and the new hospital. The last is a superior edifice of its kind for a colony of such interior rank, and has 122 beds, a number sufficient to accommodate the greatest average number of sick. There is good anchorage in the river on both sides the island, but especially in the E. channel, where ships may lie quite close to the quay. There are neither brooks nor public fountains in St. Louis; and the water for daily use, which has to be brought from the river, is brackish. St. Louis is the seat of a tribunal of primary jurisdiction and of commerce, and a council of appeal. It is also the residence of the apostolic prefect of the colony, and the chief officers of the colonial government. Boat-building and a little weaving are its principal branches of industry. (*Hugo, art. Senegal; Dict. Geog.*)

LOUISBOURG. See CAP. BRETON.

LOUISIANA, one of the U. States of N. America, occupying the S.W. extremity of the Union, between lat. 29° and 33° N., and long. 88° 40' and 94° 37' W., having N. Arkansas and Mississippi, E. the latter state, W. Texas, and S. and S.E. the Gulf of Mexico: length N. to S. 260 m., breadth varying from 100 to 200 m.; area estimated at 48,500 sq. m. Pop., in 1830, 215,730, of whom 109,588 were slaves, and 89,440 whites. The surface, which is generally level, and slopes gradually towards the S., is traversed in its N. part by a few hill-ranges of inconsiderable height. Its shores, especially those of the delta of the Mississippi, are so very low that they are apt to be inundated by high spring tides. The delta, which comprises an alluvial flat of about 12,000 sq. m., is no where, indeed, raised much more than 10 ft. above the level of the gulph. Beyond the salt marshes and cypress swamps of the coast the land is heavily timbered; but most part of the interior, and the W. portions of the country, consist of immense prairies, generally without timber. In the N.W., and to the E. of the Mississippi, the surface is much broken, and covered with extensive pine forests. Besides the Mississippi (see that art.), which forms the E. boundary of Louisiana for 450 m., and traverses it for 320 m. more, the chief rivers are the Red River (which see), Washita, and Teche, tributaries of the former; the Atchafalaya, and Sabine rivers fall separately into the Gulf of Mexico; and Pearl River, flowing to the Atlantic, forms part of the E. boundary of the state. Lakes of considerable size are numerous in the low country: that of Ponchartrain is 40 m. in length by 24 in breadth. Lakes Borgue, Ponchartrain, and Maurepas compose a continuous water communication, though navigable only for small vessels, being shallow, except in the centre. The coast has numerous bays and inlets, but owing to their insufficient depth, it has no good harbour. There is, however, a good roadstead on the W. side of the Chandeleur Islands, in which the larger vessels of the English fleet lay during the expedition against New Orleans. Besides Chandeleur, sundry islands are scattered along the coast, as Barataria, Thomas, St. Croix, Ascension, &c. It is rather a curious fact, that these islands are a good deal more elevated than the main-land, being from 30 to 100 ft. above the level of the sea; they are covered with dense forests, abounding with deer and game.

The soil of Louisiana is of every quality, from the most productive to the most sterile. Some portions of the great alluvial plain, and of lands on the banks of the rivers, are as fertile as any in the Union; but the prairies consist for the most part of second rate lands. The red colour of the soil on Red River, and some of the other streams, is owing to an admixture of oxide of iron, which, with salt, is very largely dispersed through it. Iron is found in the W., and coal in the N.; but, except these, the mineral products are insignificant.

Both heat and cold are experienced in a greater degree than in the other states in the same lat. The orange and sugar-cane, which are cultivated on the Atlantic coast as high as 33° 30' N., are not met with here much above the 31st deg. In the S. the winter is usually characterised by a short period of N.W. winds and white frosts at night; but in the N. and central parts sharp frosts, and sometimes falls of snow, occur. In summer the climate of the N. is mild and comparatively healthy; while in the S. intense heats last for a long time, thunder-storms and hurricanes are frequent, and the yellow fever and other pestilential diseases are prevalent.

Cotton and sugar are the great staples of Louisiana; rice, maize, and tobacco come next in order; but the raising of these has been neglected for that of cotton, and the culture of indigo is now almost abandoned. The crop of cotton, which is of various kinds, is estimated to amount at present (1840) to 250,000 bales a year. It is raised principally in the N.E. part of the state. Sugar is the principal product as far N. as the 31st deg. of N. lat., except on the lands immediately adjacent to the Mississippi, which, being easily irrigated, are appropriated to rice. The cane, however, though more precarious, is raised still farther N., and its culture has latterly extended in the higher parts of the country. The crop for 1839-40 amounted to 125,000 hids., but, at an average, it may be taken at about 50,000 hids. Maize yields sometimes 70 bushels an acre, and barley and oats thrive pretty well; but the climate is not suitable for wheat and rye. The vine arrives at perfection, and many kinds of wild fruits are met with, but the apple does not succeed, and the cherry is wholly unproductive. (*Darby*). Neither the palmetto nor the long-leaved pine, which grow in the other Atlantic states, are met with. Pine-thinner is, however, an important article of export, and the pine-forests afford great quantities of pitch, tar, and turpentine. Some cotton is grown in different parts of the prairies, but these tracts are mostly appropriated to the feeding of large herds of cattle and horses. The sheep supply good mutton, but their wool is coarse. Vast herds of elk, deer, and buffaloes wander wild over the prairies on the banks of Sabine River. Louisiana is almost wholly an agricultural state, its manufactures being quite unimportant. The commerce of this state is wholly centred in New Orleans (which see). The exports to foreign parts amounted during the year ended the 30th of September, 1838, to 31,522,248 dols., being a much larger amount than the exports from New York or any other state of the Union. But, in point of fact, only a comparatively small portion of these exports really belong to Louisiana; the far larger proportion being the produce of the states of Arkansas, Mississippi, Tennessee, Kentucky, Missouri, Illinois, and other states bordering on the Mississippi, sent to New Orleans for shipment. To facilitate the internal water communication, various canals have been cut between the Mississippi and the lakes of the low country. Railways have also been completed from New Orleans to Lake Pontchartrain and Carrollton, and others of much greater extent are in progress.

Louisiana is subdivided into 2 great districts, — the E. and W.; the former comprising 22, and the latter 10 parishes, equal in point of extent to the counties in the other states. New Orleans is by far the most considerable town in the state, and is, indeed, one of the greatest emporiums not of the Union merely, but of the New World. Donaldsonville, also on the Mississippi, is the seat of government. The latter is vested in a governor, with a salary of 7,500 dollars, a senate, and House of Representatives. The senate consists of 17 members, chosen every four years, each of whom must be resident in the district, and possessed of landed property of the value of 1,000 dollars. The House of Representatives consists of 50 members, chosen every two years, each of whom must be 21 years of age, and have landed property worth 500 dollars. The right of election is in every free, white, male citizen, who has resided in the county for which he claims to vote for the year next preceding the election, and has paid a state tax in the last six months. The members of the House of Representatives receive each six dollars a day during the session. The governor is chosen, by the joint ballot of both houses, for four years, and is ineligible to office during a similar succeeding term. The resolutions of 2-3rds of the members, in both houses of the legislature, become law without the concurrence of the governor. The legal code of Louisiana is a modification of the old French

and Spanish laws, interwoven with those in force in other parts of the Union. Justice is administered in a supreme court, circuit courts, and inferior tribunals, presided over by judges appointed by the governor, with consent of the senate, and who hold office during good behaviour. The judges of the supreme court have each 5,000, and those of the circuit courts 3,000 dollars a year. Education is not conducted on any uniform plan in this state; but it has a large extent of valuable reserved school lands, and three colleges, Louisiana College at Jackson, Franklin College at Opelousa, and Jefferson College, par. of St. James, to each of which the general assembly voted, in 1835, a grant of 15,000 dollars a year for 10 years, exclusive of 48,775 dollars to Jefferson College, to assist in payment of its buildings. In 1839, 26 journals of various kinds were published in Louisiana, 10 of which were issued in New Orleans. Towards the end of the same year, the state had 16 banks of its own, and 31 branch banks, with a united capital of 41,736,728 dollars, being a larger amount than in any other state in the Union.

The region W. of the Mississippi was first explored by Europeans in 1512; but no effective settlement was made in it till about the end of the 17th century, when it was, in part, colonised by the French. The latter ceded it to Spain in 1763; but again recovered its possession in 1800. At that period, the whole territory, from the Gulf of Mexico to about the 50th deg. of N. lat., and from the Mississippi on the E. to the Rocky Mountains on the W., was comprised under the term Louisiana; and the whole of this immense territory, the possession of which was of such vast consequence to the United States, was purchased by them, in 1803, from France for 15,000,000 dollars. In 1804, the present state of Louisiana was constituted a territory under its existing limits; and, in 1812, it was admitted into the Union as an independent state. It sends 3 representatives to congress. (*Went's Geog. of the U. States*; *Darby's View of the U. States*; *Murray's Enycy. American*; *ed.*; *American Almanack*, 1837 to 1841.)

LOUISVILLE, a flourishing commercial town or city of the U. States, being the largest and most populous in Kentucky, cap. co. Jefferson; on the Ohio, above, but contiguous to, the rapids, 50 m. W. Frankfort, and 85 m. S.W. Cincinnati. The pop., which in 1800 amounted to only 600, had in 1830 increased to 10,236, and in 1835 to 19,968. The town, which is in a picturesque situation, is regularly laid out. Three broad and well paved streets, running parallel to the river, are intersected by others at right angles. The houses are compactly built of brick and stone, and, though generally of an ordinary description, many are in very good taste. In 1835, the chief public buildings were the court-house, gaol, 8 or 9 churches, a theatre, a free school, the U. States branch bank, the union-hall, an asylum for disabled boatmen, and some workhouses. The free-school, built in 1829, has accommodation for 700 or 800 pupils. A medical school has been recently instituted. There are also some excellent hotels, one of which, according to Hoffmann, is equal to any in New York. (*Winter in the Far West*.)

Louisville has manufactures of cotton-yarn and stuffs, woollen goods, cotton bagging, iron, cordage, hats, &c., in which steam-power is largely employed, and several type and brass foundries, tanneries, flour-mills, &c. The falls of the Ohio are no serious obstruction to navigation, at least when the river is full, the whole descent being only 22 ft. in 2 m. To avoid them, however, the Louisville and Portland canal has been excavated, in part through a solid ridge of limestone to the depth of 12 ft. This canal is 2 m. in length, in some places 40 ft. deep, and of sufficient width to admit the largest class of rivermen. In 1836, 1,182 steamers are said to have arrived at Louisville; and the mercantile transactions of the city in the same year were estimated to amount to 29,000,000 dollars. Louisville has, in fact, with the exception of New Orleans, a more extensive trade than any town in the western part of the Union. It was founded in 1780, and incorporated as a city in 1828. (*Stuart's Three Years in America*, i. 290-292; *Hoffmann*; *Murray*, &c.)

LOUTH, a marit. co. of Ireland, on its E. coast, being the most northerly in the prov. of Leinster, having E. the Irish Sea; N. Carlingford Bay, which separates it from Down and Armagh; and W. and S. Monaghan and Meath. Area, 206,261 acres, of which 14,916 are improved mountain and bog. Surface rugged in the N., but in other parts generally flat or undulating. Soil generally fertile. Estates of a medium size. Farms of all sizes, but the great majority small. Its crops, agriculture, &c., are similar to those of Meath, which age. Average rent of land, 10s. an acre. Minerals unimportant. The linen manufacture is carried on to a considerable extent, especially at Drogheda, but the business has materially declined. Principal rivers Boyne &c. Dec. Principal towns Drogheda, Dundalk, and Ardee. Louth is divided into 4 baronies, and 61 parishes; and sends 4 mems. to the H. of C., viz. 2 for the co., and 1

each for Drogheda and Dundalk. Registered electors for co., in 1839-40, 1,192. In 1831, it had 22,040 inhab. houses, 23,595 families, and 124,843 inhab., of whom 60,617 were males, and 64,229 females.

**LOUTH**, a mun. bor., market-town, and par. of England, co. Lincoln, in the Wold div. of Louth-Eske hnd., parts of Lindsey, 22 m. E.N.E. Lincoln, and 127 m. N. London. Pop. of bor., in 1831, 6,327. The town, agreeably situated in a fertile valley S.E. of the wolds of N. Lincoln, has of late been much improved, and is well paved and lighted with gas; it has several handsome, and a few elegant buildings, the houses generally being of brick, roofed with slate. The principal public buildings are the mansion-house, town-hall, sessions-house, and a small theatre. The church is a large Gothic structure, with a beautiful E. window, and one of the finest towers in the country, above which rises a light octagonal spire, to a height of 250 ft. from the ground. The living is a vicarage attached to a prebend, in Lincoln cathedral. A second par. church, once existing, is now destroyed; but its site is marked by the cemetery still used as a place of interment. A new district church has also been erected within the last few years. There is a Roman Cath. chapel, and the Wesleyan and Primitive Methodists, Baptists, and Independents have each places of worship; to which, as well as the church, are attached well-attended Sunday schools. The free grammar-school, founded in 1552 by Edw. VI., is endowed with landed property producing 700*l.* a year; the half going as salary to the master, the fourth to the usher, and the residue to the support of 12 poor women. A school, established in 1677, provides instruction in English and mathematics to 20 free boys, and 20 pay scholars. There is also a well-attended national school; and among the charitable institutions are dispensaries, a dispensary, Benevolent Society, and Bible Society.

Louth contains little or no manufacture, there being only one establishment of any importance, a carpet and blanket manufactory. The river Louth flows through a considerable portion of the town: it is not navigable, but feeds a canal beginning at the N.E. extremity of Louth, and communicating with the Humber. It is in a very prosperous state: the principal traffic outwards is that of corn for London, and the W. riding of Yorkshire, the inland freight being chiefly coal, most of which comes down the Humber from York. There is a paper-mill and flour-mill on the river, in addition to wind-mills; and two other mills, one worked by steam, are employed in grinding bones." (*Mun. Board. Rep.*) The town has also a soap-bolling establishment, and is famed for its excellent ale. Louth was incorporated in the 5th of Edward VI., whose charter was confirmed by other subsequent monarchs, and, lastly, by Geo. IV. Under the Municipal Reform Act, the bor. is divided into 2 wards, and is governed by a mayor, and 3 other aldermen, with 12 councillors; it has a commission of the peace under a recorder. Corporation revenues, in 1839, 1,340*l.* (exclusive of 133*l.* accruing from the sale of property). Louth is also one of the polling-places for the N. or Lindsey div. of the co., and the quarter-sessions for the co. are held here in Jan., July, and Oct., the April sessions being at Spilsby. Markets on Wed. and Sat.: considerable horse fairs, April 30., 3d Monday after Easter, Aug. 5., and a large cattle fair, Nov. 23. (*Mun. Corp. and Board. Reports.*)

**LOUVAIN** (Dutch *Leuven*), a town of Belgium, and formerly one of the most populous and industrious in that country, prov. S. Brabant, cap. arrond. and cant., on the Dyle, a tributary of the Scheldt, and on the railway between Brussels and Liege, 14 m. E.N.E. the former; lat. 50° 53' 26" N., long. 4° 41' 46" E. Pop., in 1836, 21,242. It is partly surrounded by walls, and partly by an earth rampart from 80 to 100 ft. high, with a deep fosse outside, the total circuit of both being about 7 m. A great part of the inclosed area consists, however, of fields and gardens. But its fortifications are now cut through by different roads, and are mostly converted into boulevards. The castle, now in ruins, on a hill near the Dyle, is of considerable, but uncertain, antiquity: it has long the residence of the counts of Louvain. The town, which, though regularly laid-out, is not generally well built, has several interesting public edifices. The town-hall, begun in 1440, and completed about ten years afterwards, is one of the finest specimens of the florid Gothic in Europe, has been recently repaired, or rather restored, with great skill, at the joint expense of the town and government. It is lofty, has six light and elegant minarets, and is most elaborately ornamented. The collegiate church of St. Peter, a curious old edifice has a finely carved pulpit, with some good paintings, blown down in 1604, which is said to have been of the extraordinary height of 533 ft. with two magnificent lateral towers. The university of Louvain was founded by John IV. Duke of Brabant in 1426; but it was not till 1543 that it obtained the privilege of teaching theology, Vol. II.

for which it was afterwards so celebrated. It had, in the days of its prosperity, more than 40 colleges, some of which were established in halls that had previously belonged to the clothiers. This famous seminary, after being suppressed by the French in 1797, was re-established in 1817. It has at present 20 colleges, some of which are handsome buildings. Its library, originally the drapers' hall, is richly decorated with antique wooden carvings. Edward III. of England resided for a year, and the Emperor Charles V. was brought up in the castle of Louvain. The town has 5 churches, 5 nunneries, 8 hospitals and charitable asylums, a royal college, and a college for ecclesiastics; and is the seat of tribunals of primary jurisdiction and commerce, a chamber of commerce and manufactures, a board of forest inspection, &c.

In the 14th century Louvain was one of the great seats of the woollen and linen manufacture, which supported, it is said, no fewer than 150,000 individuals within the city! (*Busching*) though this, most probably, is a gross exaggeration. But the manufacturers having revolted, in 1382, against the Duke of Brabant, many of them emigrated, on the revolt being suppressed, to foreign countries, and among others to Flanders, where, being hospitably received by Edward III., they assisted in laying the foundations of the woollen manufacture. Louvain seems never to have recovered from this disaster. It has still some inconsiderable woollen fabrics; but it is now principally celebrated for its beer, said to be the best in Belgium. The different breweries produce about 200,000 barrels a year, a large proportion of which is sent to Antwerp and into Flanders. Louvain has also manufactures of lace and cotton yarn, and several dying and cotton-printing establishments, with numerous distilleries, and glass works, and numerous oil and flour mills. It is connected with the Demer near Mechlin by the canal of Louvain, navigable for vessels of 150 tons; and has a considerable trade in corn, clover seed, flax, hemp, &c., the produce of the surrounding country. Under the French it was included in the dep. of the Dyle. (See the *Dictionnaire de Martinière*, for an elaborate article on this city; see also *Busching*; *De Cloet*; *Murray's Handbook*, &c.)

**LOUVIERS**, a manufacturing town of France, dep. Eure, cap. arrond., on the Eure, and on the road from Rouen to Evreux, 12½ m. N. the latter, and 16 m. S.S.E. the former city. Pop. in 1836, ex. com. 8,713. It consists of an old and new town; the former, consisting of three or four principal, united by many smaller streets, is built chiefly of wood; the latter, which is the residence of the principal manufacturers, has a broad and elegant main street, and many well-built brick and stone houses. The Eure, which is navigable from the Seine as far as Louviers, is here crossed by several good bridges. A large church, supposed to have been constructed during the early centuries, a hall built by the Templars towards the end of the 12th century, a theatre, and a public library are the chief public buildings. Louviers was formerly a fortress of some strength; and portions of its wall still exist. It is now, however, distinguished wholly by its industry; and ranks as one of the first seats of the woollen manufacture of France. Fine broad cloths and woollen yarn are its chief products; but of late years, other fine woollen goods have been introduced. Cotton yarn, linen thread, soap, &c. are made; and there are many dyeing establishments, and bleaching grounds, tanneries, sugar refineries, and factories for looms and other machinery. The woollen manufacture in 1831 employed 6,000 hands; and, according to Berghaus, produced, in 1840, goods of the value of between 3,000,000 and 4,000,000 fr. The work-people, according to Villermé, are in pretty much the same condition as at Elwell; perhaps their wages are a little lower, but at any rate they are in a tolerably prosperous state, and of pretty correct general habits. In 1836, spinners earned from 1 fr. 65 c. to 3 fr. 58 c. a day; women, as winders, from 1 fr. 55 c. to 1 fr. 94 c.; and children *ratacheurs* (*droussencs*), from 50 c. to 80 c. A family of three persons, one of each of the above classes, may gain together 1,600 fr. a year, or 64*l.*, certainly sufficient to maintain them in a state of comfort.

The peace between Philip Augustus and Richard I., in 1196, was concluded at Louviers. The town was taken and sacked by Edward III. and Henry V. (*Hugo*, art. *Eure*; *Villermé*; *Tableau des Ouvriers*, &c.)

**LOWELL**, a considerable and rapidly increasing town or city of Massachusetts, U. States, co. Middlesex, on the Merrimack, where it is joined by river Concord, considerably below Pawtucket Falls, 24 m. N.W. Boston. The pop., which in 1830 was only 6,471, had, in 1840, reached 20,381. The rapid rise of Lowell is wholly owing to the great extension of its cotton manufactures. Though founded so late as 1813, it is now, next to Pittsburgh, the most important manufacturing town of the Union. Its situation is healthy and picturesque; it is well laid out, with wide streets, neat and often elegant houses, and numerous and well built public edifices. The Merrimack

affords an ample supply of water-power to the cotton and other mills. A canal, 14 m. in length, 60 ft. in width, and 8 ft. in depth, extends from the head of Pawtucket Falls to Concord River, whence water is conveyed by lateral canals to the different factories. This canal is the property of a company with a capital of 600,000 dollars, which owns a large establishment for the manufacture of machinery, and by which the mills at Lowell are usually built. Including this extensive factory, there were, in 1839, 28 mills at Lowell, mostly built of brick and from 4 to 7 stories in height, besides machine shops, print works, &c.; and 10 companies, with an aggregate cap. of 8,250,000 dollars, were engaged chiefly in the cotton manufacture. It was estimated in 1839 that 150,404 spindles, and 4,861 looms, were continually employed; that 51,147,200 yards of cotton cloth were annually produced, 12,220,000 yards dyed and printed, and 16,161,000 lbs. of raw cotton wrought up. The goods principally manufactured are of a coarse description, consisting of sheetings, shirtings, drillings, printed cloths, calicoes, negro cloth, &c. Great quantities of cotton yarn also are spun. Including machinery for mills and railway engines and cars, the annual value of the goods made in the mills of Lowell was estimated in 1839 at 8,000,000 dollars. Lowell has also manufactures of gunpowder, glass, flannels, cards, whips, harness, carriages, boots and shoes, brass, copper, and iron wares, planing and reed machines, bleaching works, &c., employing about 200 hands; 8,342 hands were employed in the cotton, &c. mills, in 1839, of whom 6,295 were females, and 2,047 males. The average wages, clear of board, are females 1.75 dollars a week; males 4 dollars, 80 cents per do. The average amount of wages paid per month is 106,000 dollars: a large proportion of which is said to be paid into savings' banks; and the *moral* of the weavers is affirmed to be equal to that of any portion of the community. A railroad 26 m. in length connects Lowell with Boston. Lowell was incorporated as a town in 1821, and erected into a city in 1835. Under the amended constitution of Massachusetts of 1840, it sends, at present, 9 members to the H. of Representatives.

The progress which the cotton manufacture has made and is making at Lowell, appears to have led many persons to suppose that it is destined to become, at no distant period, a formidable rival to Manchester and Glasgow. But we are not at all the number of those who entertain any such notion. The manufactures of Lowell and of America, in general, will necessarily, for very many years, be confined to the coarser fabrics, in which, indeed, most nations have long had the advantage over us; but it is visionary to suppose that they should, under existing circumstances, be able to come into competition with us in the production of the finer descriptions of goods. The wages of labour are higher in the U. States than here; and, which is of equal importance, machinery is also more expensive, and the profits of stock higher. In fact, the only advantage on the side of the Americans is the greater cheapness of the raw material; and this, in the case of Lowell, and, indeed, of New England generally, is next to nothing; for all the cotton used in its manufacture must be brought from the S. States; and we doubt whether the cost of conveying cotton from Charleston or New Orleans to Lowell be not quite as great as the cost of conveying it to Liverpool or Glasgow.

Our manufacturers may, therefore, be of good cheer. What they have really to fear is not foreign competition, but the spread of agitation and disturbance at home. So long as these are averted, foreign competition will, by whetting ingenuity, and making the manufacturers avail themselves to the full of our superior science and resources, be productive only of advantage. (*Hayward's New England Gaz.* 1839; *Pittkin's Statistics of the U. States*, pp. 529—530.; *Mitchell's U. S. American Almanac* for 1841, &c.)

**LOWESTOFF, or LOWESTOFT**, a market-town, sea-port, and par. of Englan<sup>d</sup>, E. coast co. Suffolk, hund. Marford and Lotheringland, 22 m. S.E. Norwich, and 164 m. N.E. London; lat. 52° 24' 10" N., long. 1° 42' 11" E., being the most easterly land in Englan<sup>d</sup>. Area of par. 1,950 acres. Pop., in 1831, 4,298. The town consists of one principal street, which has a gradual descent from N. to S.; and from this main avenue proceed several other streets towards the W.; but though well paved and lighted, they are narrow and irregular. In the market-place is a building open below, the upper part of which is used for assembly-rooms and other purposes; and there is a small theatre. The church is a handsome Gothic building, with a tower and steeple 132 ft. high, the living being a vicarage, in the gift of the Bishop of Norwich. There is also a chapel of ease; and the Independents, Baptists, and West. Methodists, have each their places of worship, with attached Sunday-schools. A free-school furnishes instruction for 40 boys, and there is a good national school. A friendly and benevolent society, a lying-in charity, and dispensary, are the principal charities. Several handsome lodging-houses have been built for visitors coming here for

bathing in the summer months; and there are warm baths, reading-rooms, libraries, &c. At the S. end of Lowestoff is a battery, with 13 pieces of cannon, and two others are placed at the N. end, near which latter, on a high point of land, stands a round tower, the upper lighthouse (first built in 1676, and rebuilt in 1778). On the beach, below the cliff, is another lighthouse; and by keeping both in a line, vessels are directed safely through the sand banks, which render this coast especially dangerous. The harbour, or rather road, is defended on the E. by the Corton Sand; the channel between the latter being marked by a light vessel, and well buoyed. This, which did lately be a little better than a little fish; town, engaged in preparing red-herrings for the London market, will probably rise to considerable commercial importance. Since 1827, an artificial harbour has been formed on a grand scale at Lowestoff, which communicates with the lake Lothing to the W. of the town; and then, by a short canal, with the Waveney, which is navigable to Beccles. Another canal joins the Waveney with the Yare, which has been rendered navigable for vessels drawing 10 ft. water as far as Norwich. Owing to the flatness of the ground, no locks, except the sea-lock at Lowestoff, are required on either line of navigation. This improved communication must be of great service to the country, which it intersects, and especially to Beccles and the city of Norwich, on which, indeed, it has conferred most of the advantages of a sea-port. (*Priestly on Canals*, &c., 513.)

Still, however, the chief consequence of Lowestoff, as a port, is owing to its herring fisheries: the quantity of fish annually taken and cured is very large; while, at the same time, their quality is considered superior, and they fetch higher prices in the London market than those sent from Yarmouth. Sail-making, boat-building, and the manufacture of rope and twine, are extensively carried on; and several hands are employed in making barrels in which to pack the cured fish previous to their being sent to market or exported. Markets on Wednesday: fairs, May 12, Mich. Day, and Oct. 10.

The only historical celebrity of Lowestoff is derived from the fact, that on 3d June, 1665, a sanguinary naval engagement was fought off the coast between the English and Dutch fleets, the fleet of the former being commanded by the Duke of York, afterwards James II.; and that of the latter by Admiral Opdam, who was killed in the battle.

**LOXA, or LOJA**, a town of Spai<sup>n</sup>, in Andalusia, prov. Granada, on the Xenil, 26 m. W. Granada, and 92 m. E. by S. Seville. Pop., according to Mifano, 13,866. It stands on the S. side of a rocky gorge, by which the Xenil escapes from the fertile Vega of Granada; and its situation is peculiarly picturesque, the town being built on a steep scabdy, and surrounded in groves of fruit trees, and overlooked by a towering mountain, forming one of the effects of the Sierra Nevada. It contains 3 small and shabby parish churches, with 2 hospitals; and on an eminence at its S. extremity, is a ruined Moorish castle, once of great strength and celebrity, but now the residence of a few hermits. "Loja is proverbially noted for the fertility of its gardens, olive-grounds, and orchards, the abundance, and purity of its springs, and the loose and hard features of its rural habi<sup>t</sup>." (*Scott's Roma and Granada*, ii. 358, 359., Mifano.)

**LOZERE**, a dep. of France, reg. S. S., between lat 41° and 45° N., and long. 3° and 4° E., having N. Haute-Loire and Cantal, W. the latter dep. and Aveyron, S. Gard, and E. Gard and Ardèche. Length N.W. to S.E. 65 m.; greatest breadth nearly 50 m. Area, 514,795 hectares. Pop. (1836), 141,733. This dep. lies chiefly on the N.W. slope of the Cévennes, with the ramifications of which it is mostly covered. The surface varies from 2,500 to 5,000 ft. above the level of the sea; but its average elevation may be estimated at 3,800 ft. The dep. derives its name from the mountain Lozère in the S.E., one of the principal summits of the Cévennes, 4,888 ft. in height. The river Lot, Tarn, Allier, and Gard, have their sources within this dep., which is not, however, watered by any stream of magnitude. There are several small lakes, one of which appears to occupy the crater of an extinct volcano. The climate is cold; snow remains on the mountains during the greater part of the year, and fogs are frequent. The soil is mostly stony in the N. and S.; and calcareous in the centre. In 1834, the surface is said to have been distributed as follows, viz. arable land 298,650 hectares, meadows 35,166 h., forests 44,389 h., and heaths, wastes, &c. 179,000 h. Agriculture is very backward, and little likely to improve, from the sterility of the soil, the remoteness of most parts of the dep. from great roads, the great subdivision of property, and smallness of the farms. Rye and wheat are raised, but not in sufficient quantities to supply the consumption. In the Cévennes potatoes are pretty extensively cultivated, and form, with chestnuts, the chief food of the inhabitants. About 50,000 hectolles a year of inferior wine, and some oil and silk are produced; the sharp winds experienced in the dep. are,

however, unfavourable to the silk-worm. Hemp and flax succeed well; but the culture of madder and saffron has been abandoned. The mountain pastures are excellent, and feed many sheep; coarse woolsens and serges are made in almost every peasant's family. In 1835, of 43,847 properties subject to the *contribution foncière*, very nearly a half were assessed at less than 5 fr., and 6,635 at from 5 to 10 fr.; only 7 properties being assessed at more than 1,000 fr., and 53 at from 500 to 1,000 fr. The dep. is said to be rich in mineral products, but the mines are but little attended to. Løzere is divided into 3 arronds.; chief towns, Mende, the cap., Florac, and Marvejols. It sends 3 mems. to the Ch. of Dep. Number of electors in 1838-39, 712. Total public revenue in 1831, 2,256,376 fr.; expenditure in the same year, 1,777,870 fr. (*Hugo, art. Løzere; Official Tables, &c.*)

LUBECK, a city and republic of N. Germany: the city which is the cap. of the Hanseatic towns, and the seat of their high court of appeal, is sit. on the Trave, about 10 m. (direct distance) from Travemünde, at its mouth in the gulph of Lubeck, in the Baltic, 36 m. N.E. Hamburg, and 34 m. S.E. Kiel; lat. 53° 52' 8" N., long. 10° 41' E. Pop. estimated at rather more than 26,000. The town is built on a gently elevated ridge, on one side of which runs the Trave, and on the other the Wackerup. The environs are well wooded, and enlivened with cheerful villas, more particularly those along the banks of the Trave. The streets, which are steep, are wider than those of Hamburg. The houses generally appear to be old, and mostly built of stone; like those of Hamburg and Antwerp, their gable ends face the street. They are in general very lofty, 6 or 7 stories not being uncommon. Round the ramparts of the city, in which there are 2 handsome gateways, is a promenade shaded with fine trees. The principal buildings are the cathedral, 4 churches, and the town-hall. The cathedral is a curious old building, the spires of which being much out of the perpendicular, momentarily threaten to fall, which also is the case with the towers of St. Mary's and St. Peter's. The church of St. Mary is handsome in the interior, and well worthy a visit, were it only for the sake of the paintings, many of which are curious and of ancient date. Among them is the celebrated picture of the Dance of Death (usually attributed to Holbein, but which belonged to the town for at least 35 years before Holbein's birth). In the same edifice may be seen some fine specimens of sculpture, particularly a representation of the Lord's Supper, carved in white marble, finely designed and beautifully executed." (*Barrow's Excursions in the N. of Europe*, p. 22-24.) Behind the high altar is an old astronomical clock, constructed in 1405, which is the grand curiosity of the place. According to one of the guide-books, it exhibits at a certain hour figures representing the emperor and the seven German electors; but, according to Mr. Barrow, the figures are meant for the Twelve Apostles, who "at mid-day rally north and march in regular succession, passing a figure of our Saviour, to whom they each face round, and having made a quick and familiar nod of the head, they then march onwards to a door on the opposite side, which closes upon them the moment the twelfth apostle has entered." (P. 24.)

The cathedral, begun in 1170, and finished in 1341, has many monuments of the senatorial families of Lubeck, some of which are well executed, and, among others, a remarkably curious old picture, by Hans Henning, dated in 1471, the subject of which is the Passion of Christ, treated in 23 distinct groups. The town-hall, a turreted Gothic building, faces the market-place. It was the place of assembly for the deputies from the cities formerly comprised in the Hanseatic League; but the hall in which they held their meetings was unfortunately destroyed in 1817. Lubeck has a Calvinist and a R. Cath. church, an exchange, arsenal, and mint, several hospitals and benevolent institutions, a gymnasium, a city-school, which in 1832 had 253 pupils, ecclesiastical and teachers' seminaries, schools of surgery, midwifery, navigation, drawing, swimming, and numerous other schools, a public library of 35,000 vols., a society of useful sciences and arts, a bible society, a house of correction and prison, a theatre for operas, &c.

Lubeck, though by no means so prosperous and important as formerly, is still a thriving commercial town. Many of its modern-built houses are on a grand scale. Their basement-stories are used as magazines or warehouses, and they have commonly large court-yards into which the carriages of the proprietors are driven. (*Barrow*, p. 25.) In Lubeck and its territory are numerous breweries, distilleries, iron forges, and linen yarn factories; besides manufactures of hats, vinegar, starch, tobacco and snuff, wax lights, paper and cards, musical instruments, with numerous oil and other mills, several printing establishments, and a few woollen, cotton, and golden and silver lace factories. Its trade is principally confined to the N. and W. of Europe. Berghaus states that upwards of 1,600 vessels a year enter and leave its port; they are principally Danish,

the rest being Russian, Swedish, Lubeck, Dutch, English, and Prussian. Lubeck communicates by means of the Trave and a canal with Hamburg (which see), with which it has an extensive intercourse. The principal articles of export is corn; the principal articles of import are wines and silks, from France; cottons, hardware, and other manufactured goods, from England; colonial products, dye stuffs, &c. It has an extensive commission and transit trade, and considerable markets for wool, cattle, horses, &c. Vessels of considerable burden load and unload by means of lighters at Travemünde, at the mouth of the river, which is properly the port of Lubeck. Two steam-boats, of small draught of water, ply on the river between the city and its port. Steam-packets sail at fixed periods from the latter for Petersburg, Stockholm, and Copenhagen.

Lubeck has several fire and life insurance companies. Accounts are kept in marks of the value of 1s. 26d. each, divided into 16 schellings of 12 pennings. The Lubeckrix-dollar, equivalent to 3 marks, is worth 4s. 6-7d. The lb. = about 18 oz. avoird.; 112 lbs. = 1 cwt.

The territory subject to Lubeck consists of a district of about 80 sq. m., immediately adjacent to the city, surrounded by the territories of Mecklenburg, Holstein, and Oldenburg, and the Baltic; of numerous small detached portions of surface enclosed by Holstein; and of the *Vierländer*, and town of Bergedorf, the sovereignty over which it shares with Hamburg. United area, about 127 sq. m. Pop., in 1834, 47,200, all Lutherans, except about 300 Calvinists, 400 Rom. Caths., and as many Jews. The land is very productive, yielding good crops of corn, fruit, and kitchen vegetables; but the rearing of the live stock is the chief occupation of the rural pop. The live stock is reared in the senate and house of burgesses (*bürger-schaft*); the former consists of 4 burgomasters, holding office for life, 2 syndics, and 16 councillors; and the latter of 12 colleges or companies, only 7 of which have, however, the privilege of voting. The house of burgesses has the initiative in all deliberations relative to the public expenditure, foreign treaties, &c.; the senate is entrusted chiefly with the executive duties, but its sanction is necessary to the passing of new laws. Public revenue, in 1834, 74,504 marks; expenditure, 700,883 marks. In 1836, the public debt amounted to 5½ millions marks; but it has since been in process of reduction. Lubeck has one vote in the full council of the German Confederation, and along with the other Hanse Towns, a vote in the committee. It furnishes a contingent of 407 men to the army of the Confederation.

It is uncertain when or by whom this city was founded; but no doubt it existed *anno* 1140. Early in the 13th century, the Emperor Frederick II. made it one of the free towns of the empire; and from 1260 to 1699, Lubeck was the repository of the archives of the powerful association of cities included in the Hanseatic League, and the station of the confederated fleet. The dissolution of the League marked the epoch of the decline of Lubeck. After the battle of Jena, Blücher threw himself into Lubeck, which, after a severe engagement, was taken by the French, and sacked. In 1820, it was made the cap. of an arrond. in the dep. *Boches de l'Elbe*; but was restored to its rank, as a free city, by the Congress of Vienna in 1815. Sir Godfrey Kneller, the painter, Mosheim, the historian of the Christian religion, McDonatus, and H. Muller, were natives of Lubeck. (*Martinek, Dictionnaire Géographique; Berghaus; Allg. Linder*, &c., iv. 486-489; *Barrow's Excursions in the N. of Europe*.)

LUBLIN, a city of Russian Poland, cap. of the palatinate of Lublin, in a marshy situation, on the Bistrzyca, a tributary of the Wieprz, 97 m. S.E. Warsaw. Pop. estimated at 12,500, half of whom are Jews. It is subdivided into the old and new town, the former situated on the left, the latter on the right bank of the river.

Lublin was fortified by a wall and ditch, till these works were destroyed in the civil wars towards the end of the 18th century. It has still, however, a citadel standing on a high rock, and, according to Stein, the ruins of a castle built by Casimir the Great. Its streets are irregular and filthy, and its houses mostly of wood. The principal edifices are a handsome town-hall, the Sobieski palace, the cathedral, the churches of the Dominicans and Carmelites, and the churches belonging to the Jesuits. There are in all 18 churches and 12 convents, 6 nunneries, a spacious synagogue, an episcopal seminary, a Piarist college, several civil and military hospitals, an orphan asylum, and a theatre. Lublin is a bishop's see, and the seat of the second court of appeal in Poland. It has manufactures of coarse woollens; considerable trade in woollen cloth, corn, and Hungarian wines; and three large yearly fairs, each lasting a month, and attended by German, Greek, Armenian, Asiatic, Russian, Turkish, and other traders. (*Diet. Géog.; Stein*, &c.)

LUCCA (DUCHY OF), a state of Central Italy, being, excepting San Marino, the smallest of the Italian states; between lat. 43° 46' and 44° 14' N., and long. 10° 9' and

10° 42' E.; having (except a few small detached portions) N.W. and N. the territories of Modena and the Tuscan Lunigiana, E. and S. Tuscany, and W. the Mediterranean. Length (N. to S.) 26 m.; greatest breadth, 21 m. Arco (incl. Montignoso, &c.), 420 sq. m. Pop. (1839), 168,198. The Apennines skirt the N. part of the duchy, 2-3 ds of which they cover with their ramifications; but none of these rise to the height of 4,000 ft. The rest of the surface is a low but fertile plain, which becomes marshy towards the coast. The general slope of the country is from N. to S., in which direction it is traversed by the Serchio near its centre. This river is not navigable, but is of great use for irrigation; most of the other streams in the duchy are its tributaries. Near the shore are some small lakes. The mean annual temperature is about 52° Fah.; in the summer it rises to 80°; in winter it rarely freezes in the plain of Lucca. The soil, which is calcareous and stony in the N., is sandy in the S., and rich in the intermediate region. The pop. is chiefly agricultural, but the corn produced is not sufficient for home consumption; the deficiency being principally supplied by beans, which are largely cultivated, and partly, also, in the mountainous districts, by chestnut flour. The latter is sometimes exported to the neighbouring states, the price varying from 6s. 8d. to 10s. a sack. The culture is extending of all the articles for the production of which the soil and climate afford facilities. The number of mulberry trees has rapidly increased since the peace, and the manufacture of olive oil has been materially improved. The latter is esteemed the best in Italy, and fetches the highest price, especially that grown on high grounds. It is exported to the value of about 32,000*l.* a year; the market price being from 4*d.* to 5*d.* the Lucca pound of 12 oz. Wine is said to give a fair return to the cultivator; hemp and flax are raised, and the produce of silk is very considerable. Lucca, in fact, was early distinguished by her proficiency in the silk manufacture; and in 1319 the culture of the mulberry became an object of public attention. Rice is grown near the coast, in which neighbourhood also most of the cattle in the duchy are reared. There are nearly 25,000 landed proprietors, of whom a large part have necessarily very small properties, and belong to the class of agricultural or manufacturing labourers. The principal causes which have led to this subdivision of the land, as well as to the rapid increase and great density of the pop., appear to be the habit of dividing leasehold property equally among the males of a family, the suppression of monasteries, and the abolition of entail.

The *metayer* system of agriculture is not so prevalent here as in Tuscany and elsewhere; but *Sissimondi* represents the peasantry of Lucca as being, notwithstanding, in a very depressed condition. "Every day the *l'usabian* is reduced to buy the day's provision. Very rarely has he a reserve of corn; still more rarely, of oil or wine. The former has been sold in the press, and the latter in the tub. He has rarely any provision of salt meat, butter, cheese, or vegetables. All the kitchen utensils are of earthenware; and the whole furniture consists of a table and some wooden chairs, one or two chests, and an indifferent bedstead, on which the father and mother sleep, with their feet in one direction, and the children with their feet against the head board. When the division under General Viatrain ravaged the districts of the Val di Nievola, in 1799, the peasantry derived this advantage from their indigence, that when they had concealed their clothes, and the gold trinkets of their women, they had scarcely any thing left to lose." (*Sissimondi, Tableau de l'Agric. Toscane*, &c., pp. 213, 214.) But, according to Dr. Bowring, this statement must be either too highly coloured, or the condition of the peasantry must have improved in the interval; for he affirms that the labourers, in addition to articles of prime necessity, consume salt provisions, and sometimes fresh meat and colonial products. The ordinary wages of country labourers vary from 5*d.* to 6*d.* a day, with food; farm labourers, who dwell with their masters, get from 4*s.* to 5*s.* 5*d.* a year. The mountaineers, who depend almost entirely upon the culture of the chestnut, are said to be in a better condition than the peasantry of the hills and plains. The inhabitants of the districts of Pontito and Scelapa are in particular distinguished by their robust and healthy appearance, and by the beautiful complexion and regular features of the women. This last circumstance is the more remarkable, as, during a great part of the year, these women have to bear the whole burden of domestic labour; while their husbands, fathers, and brothers emigrate to the Tuscan maremma, and the States of the Church, in search of harvest and other work. During winter, about 2,600 labourers set out for these territories, Corsica, &c.; and return in summer, bringing with them their small savings, the aggregate of which may amount to 10,000*l.* Most of the Italian fringe and plaster cast-makers, in other countries of Europe, are emigrants from Lucca. Mining is little or not at all pursued, though

copper, iron, and lead ores are met with. Statuary marble, and other fine marbles, are found in great abundance. From 5,000 to 6,000 hands are employed in the manufacture of silk, wool, and cotton; and there are in the duchy about 30 paper factories, and others of linen cloth, straw and beaver hats, leather, glass, and iron goods.

The capital is the chief seat of manufacturing industry.

The value of the exports amounts to about 4 million *fr.* a year, more than 1-14th part of which is derived from oil and silk. These articles go chiefly to other parts of Italy, and to France, England, and the Levant. Grain, seeds, wine, liquors, live stock, lamb-skins, and fresh fish, are sent to Tuscany; and woollen goods to the rest of Italy and the Levant. The imports, which mostly come from Tuscany through Leghorn, consist principally of grain, seeds, rice, fine wines, hemp, flax, cotton, colonial products, salted provisions, pig-iron, &c. British cotton woollen and linen fabrics pay an import duty of 10 per cent. *ad valorem*, cotton twist pays 3 lire, pig and bar iron, 5 lire 15 soldi, and glass wares, 6 lire per 100 lbs. The importation of tobacco and salt is prohibited, except on account of government, which has a monopoly of those articles. The lb. (libra) of Lucca is somewhat less than the lb. Troy; the peso grosso = 11 lbs.; the coppo of oil = 24 pesi grossi, the stajo of corn = about 53 almagari. Accounts are kept in lire of 20 soldi and 240 danari. The lira = 7*d.*; the scudo = 4*s.* 5*d.*; the gold doubloon or pistole = 1*4s.* 5*d.* English. Lucca has only one seaport, Viareggio.

The government is a limited monarchy, under a duke, who exercises the executive power, nominates the ministers, and all other public officers, &c. But an estimate of the amount of the public expenditure is annually laid before the senate, and must be sanctioned by it. This body consists of 35 members, elected from among the four classes of merchants, artisans, scholars, and landed proprietors, called together by the duke for at least a month every year; and without its consent no tax or other public burden can be imposed. The council of state consists of the 2 state ministers and 6 additional councillors. Justice is administered by a local commissioner in each commune; and a tribunal of original jurisdiction, a civil and criminal court of appeal, and a court of cassation in the cap. A permanent council of war, and a court of revision, sit to decide in military causes. The military force comprises about 750 men, costing about 10,800*l.* a year. The naval force consists of only a goletta of 12 guns, and 3 gun-boats. The regular and secular clergy amount together to about 1,500 persons, under the archbishop of Lucca. There are about 120 communal and other public and private schools, educating 3,000 pupils, or 1 in 53 of the pop. The principal establishments of this kind are the college of Charles Louis, with 140 students, the archbishop's seminary, the dual lyceum with 300 students, and the conservatory of Lucca Charlotte with 40 female scholars. There are some extensive charitable institutions, costing the state annually about 12,500*l.* The public revenue and expenditure are about 83,000*l.* a year each. The civil list costs about 25,300*l.* Lucca has no public debt, except that due for pensions, &c.

Lucca, like the rest of Italy, experienced many changes in the middle ages. The cap. attained its liberty after the decease of the Countess Matilda, in 1115, when it became an independent republic. In the next century it again fell under feudal authority, and afterwards belonged successively to Lons the Bavarian, and to noble Genoese, Parmesan, Veronese, and Florentine families. In 1370, it again obtained its liberty, by purchase, from the emperor Charles IV., for 100,000 crowns; and from that date to 1805, it was governed by its own *gonfalonieri*. Napoleon united Lucca with Piombino in a principality; the congress of Vienna, in 1814, erected it into a duchy, the greater part of which is hereafter to be united to Tuscany, and the rest to the Modenese territories. (*Bowring's Report on Lucca*; *Serristori, Statistica d'Italia*, part iii.; *Hoffman*; *Rampolli*, &c.)

LUCCA (anc. *Lucca*), a city of Italy, cap. of the above duchy, in a plain near the left bank of the Serchio, 11 m. N.E. Pisa, and 38 m. W. Florence; lat. 43° 50' 49" N., long. 102° 30' 46" E. Pop. in 1829, 24,292. The city is surrounded with walls; which would form, however, but a very feeble defence against an enemy. The towers of the churches, rising above the ramparts, have a fine effect in the rich and beautiful landscape, with view being bounded by vine-clad hills spotted with a villa, over which tower the craggy Apennines. On a nearer inspection, the public buildings are less pleasing in their architecture than in their distant effect; yet many of them are very curious structures. According to Mr. Woods, "The churches are all, more or less, imitations of the cathedral at Pisa; smaller, indeed, in size, but some of them are decidedly superior in the proportions and disposition of the parts." (*Letters of an Architect*, ii. 410.) Most of the churches are built of Carrara marble. The cathedral, mostly constructed in the 11th century, has much carved, inlaid, and mosaic work; a rich display of

stained glass; a Madonna, by Fra Bartolommeo, and some pictures of the Venetian school. The churches, of San Michele, and San Frediano are both ancient. The latter belonged to a monastery restored and enriched towards the close of the 7th century. Frequent notices, both of the monastery and the church, occur in the succeeding centuries, but nothing, it is said, indicates that the latter has been ever rebuilt, or materially altered. Its curious architecture is described by Woods, ii. 411. The ducal palace is a large structure, the exterior of which presents nothing remarkable; but its interior is superbly furnished with articles of Lucena manufacture, the ceilings and walls being also adorned with frescoes by Lucchese artists. The *Palazzo Pubblico*, the residence of the *gonfaloniere*, in the days of the republic, is described by Forsyth as an immense and august edifice, which makes the city round it look little. There is a small, but handsome theatre. Lucena is generally well built: many of the private houses are very good, though their pointed roofs, gable ends, &c. give it the aspect rather of a Flemish than an Italian city. The streets, though crooked, are broad and well-paved; and the ramparts, planted with trees, form pleasing promenades. It has several colleges, a seminary, founded by Eliza, Princess Baciocchi, sister of Napoleon, for 100 young ladies, a botanic garden, a ducal library with 23,000 vols., a university library with 16,000 vols., a *deputato di mendicanti*, a *monte di pietà*, and a savings' bank. Forsyth, who visited this city in 1802, speaks of it as silent, dull, and gloomy; it enjoys, however, the title of *industriosa*, and is one of the principal inland commercial towns in Italy. Its manufactures mostly consist of silk and woollen fabrics. The usual wages paid to men vary from 1 to 2 fr. a day; women and boys earn about  $\frac{1}{2}$  fr. a day. The city has also a considerable trade in olive oil, &c. About 12 or 13 m. up the valley of the Serchio are the baths of Lucena, picturesquely situated, and frequented by numerous visitors. The temperature of the hottest spring is about 128° Fah.

Lucena was colonised by the Romans A. D. c. 575. It was a municipal town, and frequently the head quarters of Caesar, during his command in Gaul. Traces of a Roman amphitheatre are still discoverable. This city was taken by the French in 1799; and, in 1805, Napoleon made it the cap. of a principality he erected for his sister's husband, Baciocchi. (*Rampoldi*; Woods; Forsyth; *Cramer's Anc. Italy*, i. 173.)

LUCENA (an. *Elisana*), a town of Spain, in Andalusia, prov. Cordova, 31 m. S.S.E. Cordova, and 82 m. E. Seville. Pop. according to Miffano, 19,716. It stands on the slope and at the foot of a hill, comprising some respectable streets, lined with good houses; two squares, and agreeable suburbs. The neighbourhood is distinguished for the abundance of its produce in fruit and grain, which chiefly contributes to the support of the poor, but the processes of tillage are of the rudest description, and the resources of the soil are little tried.

LUCERA (an. *Luceria*), a city of S. Italy, Neapol. dom. prov. Capitanata, cap. canton, on a height adjacent towards its N. side, 12 m. N.W.W. Foggia. "The city contains 12,000 inhab., apparently in easy circumstances. The houses, which are all tiled, are generally good; but the streets are narrow, ill-paved, and dirty. Some ancient walls, in very bad condition, inclose it; and 5 gateways open from them to an outward road, which winds entirely round the town. A few gardens and convents are scattered about, and these, with some olive plantations and vineyards, in which the natives have small country houses, contribute greatly to enliven and diversify the prospect. The vines are trained low; and supply the proprietors with a good strong white wine, and a still stronger, but less pleasing red one." (*Cramer*, 41, 45.) About 4 m. from the city, on the edge of the same eminence, is the Castle of Lucera, a ruined Gothic fortress, erected by the emperor Frederick II. The extent of its walls would almost lead to the belief that they surrounded a second city; but they at present encircle only an empty area, overgrown with grass. Craven believes that there can be no doubt, from the Roman inscriptions, and pieces of sculpture found within the area of this building, that its situation is identical with that of the citadel of the anc. *Luceria*, taken by the Samnites after the defeat of the Romans at the Caudine Forks, and afterwards re-taken by L. Papius. (*Tour to the S. Provs. of Naples*, 48.) "This castle is a very conspicuous object; it has a deep moat, a drawbridge, 2 large round towers, one supporting the telegraph which communicates with Foggia, and the other a piece of masonry, built with consummate skill; in the interior of its draw are traces of extensive cisterns. The cathedral of Lucera was formerly a Saracenic mosque, and preserves, on the exterior, some marks of its origin. It has a pulpit adorned with that kind of Byzantine mosaic, of which the cathedral of Salerno offers so fine a specimen; but its principal ornaments are 13 beautiful pillars of verd antique, originally found under the cathedral itself, and supposed to have belonged to

a temple of Apollo: the capitals are modern. Facing this church is the bishop's palace, considered the finest piece of architecture in Apulia. The tribunal and other public edifices, render the appearance of this part of the city somewhat imposing. The *Tribunale* includes the criminal and civil courts for the prov. the register-office, the notarial chamber, the residences of the president and judges, and the public prisons. Lucera has a royal college, and an extensive private collection of coins, medals, and antiquities. Great numbers of cattle are kept in its neighbourhood; and its cheese is held in great repute.

Lucera is said to have been founded by Diomed, and was the cap. of Damia under the Greeks; it afterwards became a Roman colony. Having fallen into decay, it was renovated in 1339, by Frederick II., who transported thither a colony of Saracens from Sicily, to whom he gave great privileges. In 1359, however, Charles of Anjou expelled from the Neapolitan dominions such Moors as refused to embrace Christianity, and converted the mosque of Lucera into a church. Numerous antiquities of various ages have been discovered in and about Lucera. (*Cramer's Tour*, &c., pp. 43—51; *Neuburger*, i. 157—160; *Cramer's Ancient Italy*, ii. 246, &c.)

LUCERNE (CAN. *PON*), a large canton of Switzerland, ranking third in the Confederation between lat. 46° 47' and 47° 17' N., and long. 7° 56' and 8° 29' E.; having N. Solothurn and Aargau, E. Zug, Schwytz, and Unterwalden, and S. and W. Bern: length N.E. and S.W. 36 m., breadth varying from 8 to 30 m.; area 587 sq. m. Pop., in 1838, 124,521, all R. Catholics, except about 50 Calvinists. The surface in the N. is generally plain, undulating in the centre, and rising gradually towards the S., where are several mountain ranges of considerable height. The principal of these is M. Pilate, between Lucerne and Unterwalden, its highest summit, the Tomlishorn being estimated at 7,125 ft. above the level of the sea. The S. and E. parts of the canton are watered by the Reuss and Little Emmen; the other rivers are the Wigger, Sur, Vion, &c., all having a N. course, and joining the Aar in Aargau. The Lake of Lucerne (which see) forms a part of its E. boundary, and the cant. comprises several small lakes, as that of Sempach, 4 m. in length, and memorable for the battle fought on its banks 9 July, 1386 (see *SEMPACH*), those of Baldegg, 3 m. in length, Maun, &c. The climate is mild, and the soil more favourable to agriculture than that of most of the neighbouring cantons. According to Edel, more corn is grown than is required for home consumption. Inglis, however, affirms that the surplus is very trifling, and that the greater part of the grain brought to the corn-market in the town of Lucerne comes from the canton of Aargau. "I have never seen," says he, "any where more abundant crops than are produced in Lucerne, where time and industry are bestowed upon the lands. In no part of Switzerland might the inhab. be more at their ease than in this canton; and yet there is not a commerce in which they are not to be found." Industry is not nearly so active as in the neighbouring cantons of Bern and Zurich. The vine flourishes in some parts, fruit is plentiful, and wine and cider are produced; but the chief occupations of the people are cattle breeding, and dairy-husbandry. The Entlebuch, or valley of the Little Emmen, about 25 m. in length, affords pasturage for about 7,000 head of cattle, and 11,000 sheep and goats; the inhab. make large quantities of cheese, which, though not so good as that of the Emmenthal in Bern, is exported as the produce of the latter district. The inhab. of this valley are remarkable for their vigour, intelligence, and independent spirit, and are usually richer than those of the rest of the canton; but they are neither so well clothed nor have such neat cottages as the peasantry of the Emmenthal. (*Coe's Letters on Switzerland*, lett. 25.) Traces of various metals, coal, &c. are met with in this canton, but no mines are wrought. Manufacturing industry is unimportant, and is mostly confined to domestic linen weaving and spinning. The inhab. are more occupied in the transit trade from N. Switzerland across the St. Gothard, than in any commercial dealings of their own.

The government is vested in the Council of One Hundred, 50 of whose members are chosen from among the citizens of the cap., and 50 from the inhab. of other parts of the canton. The 18 arrondissements into which the cant. is subdivided, and the three municipalities of Sursee, Sempach, and Villisau, send 1 mem. each to the council, and the remaining 29 mems. from the rural districts, are chosen by the council itself. The council also nominates 40 of the depts. from the town of Lucerne, the remaining 10 being sent by that municipality. The right of election belongs to every native (bourgeois) of the canton 20 years of age, having property to the amount of 400 fr., and who has not been penally condemned, or is bankrupt. Members of the council must be 25 years of age, and pay taxes on property to the amount of 4,000 fr., or have rendered important services to the state. A body of 36 members, 30 years of age, chosen from among the council, and holding office for life, forms the senate, to which is confided all the executive power. The council

meets regularly three times a year, but may be convoked oftener, at the pleasure of the senate. Two *angere*, or presidents, are chosen annually from among the senate, by the council, one to preside at the council and the other in the court of appeal. The latter tribunal is composed of 12 *meins*, chosen from the senate, and has authority in all legal causes, except in cases of capital punishment, when the senate is assembled to pronounce judgment. The council of state for the Swiss Confederation is chosen from among the senate, when Lucerne has the directorial power, which occurs once every three years. In ecclesiastical matters, Lucerne is subordinate to the bishop of Basle; but being at the head of the Rom. Cath. cantons of Switzerland, it was the permanent residence of the papal nuncio till 1835, when, in consequence of a dispute with the government, the nuncio removed into the canton of Schwytz. Public instruction is under the direction of a commission of senators: it has been till lately indifferently conducted, but is improving. The public revenue amounted in 1832 to 366,132 Swiss fr., the public expenditure to 359,283 fr. A contingent of 1,734 troops is furnished to the army of the Confederacy, and 26,000 Swiss fr. money.

LUCERNE, a town of Switzerland, cap. of the above canton, and one of the three seats of the Swiss diet, on both sides the Reuss, where it issues from the W. extremity of the lake of Lucerne, 25 m. S. S. W. Zurich, and 43 m. E. N. E. Berne. Lat. 47° 3' 27", long. 8° 18' 35" E. Pop. 7,000. Its situation is highly picturesque, and its environs abound with pleasant promenades. The town is surrounded by a circle of watchtowers, and on the land side is inclosed by a continuous wall. It is pretty well built, and has several fine public edifices. The cathedral, founded in 605 (*Ehrl.*) has a painting of Christ on the Mount of Olives, by Lanfranc, and an organ with nearly 3,000 pipes. The churches of St. Peter and the Jesuits are handsome buildings; and there are several convents; that of the Jesuits has, however, been happily converted into a lyceum. The most remarkable objects in Lucerne are the 4 bridges over the Reuss, connecting the great and little towns. Some of these are of considerable length; all of them are covered and ornamented with pictures illustrative of Swiss and Scripture history, or copied from the "Dance of Death." The town-hall, where the diet and cantonal council meet, erected in 1606, is, though small, a handsome building. In the arsenal are several suits of ancient armour, including the coat of mail worn by Leopold of Austria, killed at the battle of Sempach. Lucerne has 2 hospitals, an orphan asylum, a mint, a jail, a theatre, public libraries belonging to the town, the Jesuits, Cordeliers, Capuchins, &c., and a lyceum, with 14 professors of theology, law, natural and moral philosophy, history, mathematics, and the fine arts. Attached to the lyceum is a large public school. "Into this school every child until the age of 12 is admitted, upon payment of 6 francs a year, and is taught reading, writing, arithmetic, and the first principles of Latin; and this privilege of acquiring, in early years, the rudiments of learning, is not confined to the city of Lucerne, nor even to the canton; persons may claim admittance from any other of the Swiss cantons, and even from foreign countries. The college and the school are one establishment; and every one who has received his education in the school is immediately received as a pupil of the college, and pays nothing for his instruction there. The original fund for this establishment amounted to 400,000 fr., but has subsequently been greatly increased by donations." (*Angla*, 116, 117.) The institutions for the intellectual and moral improvement of the inhab. are on a scale of great liberality, though education be far from being widely diffused either in the city or the canton generally. In the town is the celebrated model in relief of Switzerland, made by General Pflyffer; and in the Pflyffer Garden, outside the walls, is a monument, from a design by Thorwaldsen, to commemorate the Swiss guards who fell at Paris in the memorable attack on the Tuilleries, on the 10th of August, 1792. "It represents a lion of colossal size, wounded to death, with a spear sticking in his side, yet endeavouring with his last gasp to protect from injury a shield bearing the fleur-de-lis of the Bourbons, which he holds in his paws. The figure, hewn out of the sand-stone rock, is 28 ft. long, and 18 ft. high, and its execution (which is by Horn of Constance) merits great praise." (*Murray's Handbook*.)

The weekly corn market held here is one of the most extensive in Switzerland. Lucerne has a casino and a theatre open in winter. Dancing is prohibited by the authorities, except during the last three days of the carnival and on a few other special occasions. This prohibition is strictly enforced in Zurich; but it appears less absurd there than in a Catholic canton.

The city of Lucerne was given by Pepin in 768 to the abbots of Murbach in Alsace; to whom it belonged till towards the end of the 13th century, when it was sold to the House of Hapsburg. But in 1332, the citizens, impatient of the Austrian yoke, rebelled, and joined the

three primitive cantons of the Swiss Confederacy. In less than 30 years they conquered the territory which now forms the canton. The town was taken by the French May 1, 1798, and was for eight months the cap. of the Helvetic government.

LUCERNE (LAKE OF) (Germ. *Waldstätter See*, or the Lake of the Four Forest Cantons), a lake of Switzerland, in nearly the centre of that country, between the cantons of Lucerne on the W., Schwytz N., Uri E., and Unterwalden S. It is the largest and decidedly the finest lake in the interior of Switzerland, and one of the most picturesque in Europe. It is of a singular cruciform shape, with an addition to its E. end, termed the Lake of Uri. Its greatest length is about 25 m.; but the breadth of any of its arms is seldom more than 2 or 3 m. Area estimated at 43 sq. m.; height of its surface above the level of the sea, 1,380 ft.; depth varying from 300 ft. near Lucerne to 900 ft. near its E. end. The Reuss traverses this lake in its entire length, emerging from it near its W. extremity. Its banks exhibit every gradation of scenery, from a gently rising and fertile country at its W. end, to rugged and savage sublimity on the Lake of Uri. Its E. and S. parts are surrounded by mountains rising to many thousand feet above the sea, the chief of which are Mounts Pilate and Righi. Its shores abound in localities memorable in early Swiss history. At the N. extremity of what is called the Lake of Uri is the little town of Brunnen, where, in 1315, a treaty was entered into by Uri, Schwytz, and Unterwalden, which gave birth to the Helvetic Confederacy. Like all mountain lakes, it is subject to violent tempests; and in consequence of the different positions of its different arms, and the influence of the surrounding mountains, different winds seem to prevail in different parts of its extent at the same time. A steam-boat plies 8 times a week in summer, and 5 times at other seasons, between Lucerne at its W. and Fluelen at its E. extremity, calling at the intermediate ports. (*Ehrl. Voyageur en Suisse*, 368—381; *Picot's Statist. de la Suisse*, 212—233; *Coxe's Switzerland*; *Angla's Switzerland*, &c.)

LUCIA (ST.), one of the British W. India islands, belonging to the Windward group; in lat. 14° N., and long. 61° W., about 20 m. N. N. E. St. Vincent, and 25 m. S. Martinique. It is of an oblong shape, being nearly 32 m. in length by about 12 m. in its greatest breadth. Its area has been differently estimated, but may amount to about 360 sq. m. Pop., by the last census, 16,017, of whom 13,348 were blacks. The central and E. parts of the island are occupied by the table-land, called Capisterre; the W. part, which has a much less elevation, is called Basseterre. These two districts differ widely in physical aspect; but each, in an eminent degree, is subject to the operation of those agencies which are supposed to exert a baneful influence on the health of Europeans in tropical climates. St. Lucia has, in fact, always been noted for its unhealthiness. At an average of the 20 years, ending with 1836, the annual deaths amounted to upwards of 122 per thousand of the white, and 42 per thousand of the black troops.

Basseterre, the best cultivated portion of the island, abounds in swamps and marshes. Capisterre consists of a succession of abrupt mountains of the most picturesque and fantastic shapes, covered to the summit with forest trees and dense underwood, and intersected by numerous ravines, which, being too narrow to admit of free ventilation, are at all times replete with moisture, and choked up with decaying vegetation in every stage of decomposition. "The climate is principally characterised by extreme moisture and variability. During several months, but particularly in Oct. and Nov., rain is incessant and showers are frequent for at least 9 months of the year. Cool dry weather generally sets in about Christmas, and continues 3 or 4 months, at which time the climate is exceedingly pleasant, though not more healthy, since it is at that period of the year that the greatest mortality prevails. During the rest of the year the weather is sometimes dry and sultry, at others cold and damp, exhibiting a difference of 10 or 12 degs. of temperature in a few hours." (*Tulloch's Report on Mortality*, &c. in the *W. Indies*.) The range of the thermometer is much the same as at Dominica. Nearly 9,000 acres are under crops, and 4,700 in pasture. The mountains are feathered to the top with tall forest trees, and the valleys at their feet abound with excellent timber.

St. Lucia has several good harbours, the chief being the Carriacou on the W. coast, within which 30 ships of the line may lie in perfect security, without even, as is stated, being moored. The wish to command this admirable harbour was, in truth, the motive which made the island be formerly so much coveted by the European powers.

The quantities of the principal articles imported into the United Kingdom from St. Lucia in 1838 and 1839, were:—

Years.	Sugar.	Rum.	Molasses.	Coffee.	Cocoa.
	<i>Cuba.</i>	<i>Galla.</i>	<i>Cuba.</i>	<i>lbs.</i>	<i>lbs.</i>
1878	61,691	7,463	4,786	145,266	16,222
1879	59,215	11,051	11,029	81,000	35

The total value of the exports from St. Lucia, in 1836, amounted to 69,040*l.*; and that of the imports in the same year to 60,344*l.* During that year 371 ships, of the aggregate burden of 13,044 tons entered, and 379 of the aggregate burden of 13,166 tons left the ports of the colony.

The island is divided into 9 parishes. Castries, the cap., lies in a low and marshy situation, at the extremity of a long and winding bay of the same name. The fort, where most of the troops in the island are stationed, is built on the summit of a steep hill, called Morne Fortin, about 1½ m. from Castries, and 850 ft. above the level of the sea. Near it is the principal hospital. Another hospital, and some barracks, are erected on Pigeon Island, a small, conical, and islets, towards unhealthy islet, near the N. extremity of the island. St. Lucia is governed by a governor and council, acting under orders from England. The mutual jealousies of England and France prevented, for a lengthened period, a permanent settlement being made on the island, which was then regarded as a sort of neutral territory. At length it was ceded to the French in 1763. But being taken by the English in 1803, it was definitively assigned to us by the Treaty of Paris. (*Parl. R. ports, &c.*)

LUCIA (STA.), a town of Sicily, intend. and distr. of Messina, cap. cañon, in a healthy situation on the c. of Mt. Dinamare, 7 m. S. by E. Milazzo. Pop., in 1841, 6,270.

LUCKIPOOR, a town of Hindostan, prov. Bengal, distr. Tipperah, a few miles from the mouth of the Brahmaputra, with which it communicates by a small river, 1 m. E. N. E. Calcutta; lat. 25° 56' N., long. 90° 43' E. Coarse cotton cloths of a substantial kind are made here, and the neighbourhood is so fertile and productive, that Luckipoor is one of the cheapest towns in British India.

LUCKNOW (Hind. *Lakshmanavate*), a large city of Hindostan, prov. and kingdom of Oude, of which it is the cap., on the Goomty, a tributary of the Ganges, about 140 m. N. W. Benares, and 265 m. S. E. by E. Delhi; lat. 26° 51' N., long. 80° 50' E. Pop. formerly estimated at 300,000; but now probably under 200,000. This city is interesting from its being the cap. of one of the most powerful native states in Hindostan, with which the British power in its rise and progress in India, has been more intimately connected than any other; and it is also one into which European habits have been very extensively introduced by the late reforming sovereign of Oude, Saadet Ali. "When viewed from the summit of a lofty edifice, Lucknow presents a confusion of gilded cupolas and pinnacles, minarets, and arches, bounded by the winding Goomty, and so thickly interspersed with the richest tropical foliage, as apparently to realise the most fantastic visions of oriental splendour. A nearer inspection, however, does not fulfil the anticipations which a bird's-eye survey is calculated to excite. This capital may be divided into 3 quarters. The first is the city, properly so called, containing the shops and private dwellings of the inhabs. connected with the court and residency. The streets here are sunk 10 or 12 ft. below the surface, and are so narrow that two carts cannot pass; besides being filthy in the extreme. The chowk, and one or two bazaars in its vicinity, are good streets; but on the whole, this extensive quarter is more meanly built than, perhaps, any city of the same rank in Hindostan.

"The second quarter of Lucknow was built mostly by the late nabob, Saadet Ali. It stands near the Goomty, towards the S. E., and consists of one very handsome street, after the European fashion, above a mile in length, with bazaars striking out at right angles, and a well-built new chowk or market-place in the centre, with a lofty gateway at each extremity, which presents a Grecian front on one side, and a Moorish one on the other. The houses that compose the remainder of the street belong to the king, and are occupied by members of his family, or officers of his household. These are, for the most part, in the English style; but with a strange occasional mixture of Eastern architecture. The same remark applies to the palaces, &c. that occupy the space between this street and the river. All these palaces are filled with European furniture and pictures, and may rank with comfortable English houses, but none is on a scale of royal magnificence. The king's peculiar residence only excels the others in being approached through 6 spacious courts, with reservoirs, fountains, and innumerable pieces of cast statuary, China figures, and other toys that decorate its area. The adjacent buildings of the British residency terminate the street to the N. At its opposite extremity is the entrance of the Delhiwala park, an artificial wilderness

of high grass, with which Saadet Ali clothed the arid tract between Lucknow and Constantia, and well stocked with deer, antelopes, and peacocks.

"The third quarter of the city adjoins the Goomty to the N. W., being only separated by a wretched bazaar from the second. It consists chiefly of palaces and religious buildings; and being in a style more purely oriental than the modern portion of the city, is by far the most interesting quarter to a stranger. The magnificent pile of *Imam-ud-daulah*, with its noble gateway, called the *Rumi-dervassch*; the new palace built, but never finished, by Saadet Ali, the *Dowlat-khanah*, &c. are the chief ornaments of this division of Lucknow." (*Hamilton's E. I. Gaz.*, ii. 130, 131.)

There are many stately khans, and some handsome mosques and pagodas scattered in different parts of the wretched alleys, of which the city chiefly consists; but the most striking buildings, as in other Mohammedan capitals, are the royal tombs and mosques. Of these the *Imam-ud-daulah*, or tomb and mosque of Asaphud Dowlah, is the chief. It is said by Lord Valentia to be the most beautiful building he had seen in India. "The approach to the building is through a very large quadrangle to a garden, elevated a small height; on one side of which is a very beautiful mosque, and on the other the *Botee* palace. The *Imam-ud-daulah* itself is built on an elevated terrace, and consists of 3 long and finely-proportioned apartments, running parallel to each other; in the middle one is the tomb, level with the ground." (*Valentia's Trav.*, i. 157.) The central room is, according to Hamilton, 167 ft. in length, by 52 ft. in breadth, with an octagon room at each end; and in the rear of the centre, a raised set of rooms, open arches, with fountains and basins of water under each arch. Lord Valentia says, that a range of six or ten temples or cenotaphs also extends from one end to the other of the room, raised on platforms about 3 ft. from the ground, and each valued at from 50,000 to 100,000 rupees. The *Rumi-dervassch*, so called from being supposed a copy of one of the gates at Constantinople, is in a light and elegant, though fantastic style, and a mixture of Gothic and Moorish architecture. A good engraving of it and a part of the city, is given in Lord Valentia's Travels (i. 173.) Near it is the Fivelfold palace, a large fortified building, appropriated to the wives, &c. of deceased sovereigns.

Two bridges have been erected over the Goomty at Lucknow; one a heavy bridge of masonry, the other a bridge of boats. The erection of an iron bridge was projected by Saadet Ali, but the materials arrived from England too late for the accomplishment of the work during his lifetime; and his heir, conformably to a prejudicial universal among the Mohammedans of Hindostan, declined the unwholesome task of completing the unfinished undertaking of a deceased predecessor. About 3 m. from Lucknow is Barom, a country seat of the last-named chief, built by himself. It is in a Grecian style of architecture, and has, as might be expected, many faults; but it is ornamented by a very fine portico, rising the whole height of the house in front. Near the city is also Constantia, the former residence of a general in the E. I. Company's service, and erected at an expense of 7 lacs of rupees; but this building is in wretched taste, and only imposing at a distance. It has, however, or had, some fine gardens attached to it.

Lucknow is traditionally said to have been founded by Lakshman, the brother of Rama; who had his residence here, to extinguish the recollection of which Aurangzeb erected a mosque with 2 minarets on its site. After the battle of Buxar, Shuja and Dowlat removed his court from Lucknow to Fyzabad; but on his death, in 1775, his successor made this city again the cap. of Oude. (*Lord Valentia's Travels*, i. 135-175; *Mod. Trav.*; *Hamilton's Hindostan* and *E. I. Gaz.*, &c.)

LUCKPUT-BUNDER, a town of Hindostan, prov. Cutch, of which it is the chief port after Mandavee, on the Khoree, or most easterly branch of the Indus, on the high road from Mandavee to Hyderabad and Tatta. 82 m. S. E. by S. the last-named city, and 67 m. W. N. W. Bhoj. It is defended by a good fort. Early in the present century, it had but 2,000 inhabs., and owing to the shallowness of the river, could only be approached by very small craft; but, by an earthquake in 1819, the Indus was deepened at Luckput to more than 18 ft. at low water, and there is now 20 ft. water in its channel from the ocean to Busta, 8 m. below this town. (*Geog. Journal*, iii. 113.) This must, no doubt, have contributed to the commercial prosperity of Luckput-Bunder, though we have not learned the particulars.

LUDLOW, a mun. and parl. bor., market town, and par. of England, co. Salop, hund. Munslow, on the Teme, 24 m. S. Shrewsbury, 32 m. W. by S. Birmingham, and 126 m. W. S. W. London. Pop. of parl. bor., in 1831, 5,332. The town is noted for a well built, and the streets are generally wide, well paved, and lighted. On a bold rock, overhanging the river, at the N. W. angle of the town, stands the castle, supposed to have been built in 1130. The walls and towers which still remain present a mass

of extensive and magnificent ruins; and round the castle are public walks shaded with trees, from which there is a fine prospect of the surrounding country. Near the centre of the town is "the Cross," a handsome stone building, with rooms over it used as a school; and in Castle Street is the market-house, the lower part of which is open, and serves as a corn-market, the upper part comprising several large rooms, used for corporation meetings, assemblies, public balls, &c. The guildhall, where the quarter sessions and court of record are held, is a neat and commodious modern structure; and there is a prison called Gaoiford's Tower. Performances are given in a small theatre during the races, which are held in the neighbourhood. The church, which stands at the upper end of the town, is a large cruciform building of perpendicular architecture, surmounted by a square embattled tower, rising from the intersection. The interior is very beautiful: lofty pointed arches divide the nave from the aisles; and at the E. end of a very spacious choir is a noble window, entirely filled with painted glass: the whole church is ceiled with fine oak, and embellished with carving. The S. entrance is peculiar, consisting of a hexagonal porch richly ornamented. The living (valued at 160*l.* a year) is a rectory, in the gift of the lord chancellor. There are three places of worship for dissenters, and to both the church and chapels Sunday schools are attached, furnishing religious instruction to upwards of 500 children. The grammar-school, founded in the reign of Edward VI., is intended to give free instruction, in English and classical learning, to the sons of all residents within the bor. The pupils comprise about 30 free boys, and nearly the same number of pay scholars boarding with the master, who receives a yearly salary of 100*l.*, and is assisted by an usher. The master holds, also, the office of preacher, with a salary of 4*l.* a year. A national school, under the superintendence of the rector and a committee, is attended by 150 boys and 100 girls; and is liberally supported, partly by contributions, and partly, also, by the funds of a blue-coat charity recently merged into it.

Ludlow, as a place of trade, is of little importance. The glove trade formerly employed several hundred hands; but of late years it has greatly diminished. A small flannel-mill employs about 20 hands, and there is a considerable paper-mill. Malting and tanning are also carried on to some extent; but the chief business is confined to the retailing of goods consumed in the town and neighbourhood. The corporation charter was granted by Edward IV., and has been subsequently confirmed by 9 different monarchs. Under the Municipal Reform Act, the government is vested in a recorder, 4 aldermen, and 12 councillors. Corporation revenues in 1839, 864*l.* The bor. has returned 2 mems. to the H. of C. since 12 Edward IV.; the right of election, previously to the Reform Act, being nominally vested in the resident burgesses (made so by birth, marriage, or gift), but substantially in the lord of the manor, Earl Powis. The electoral franchise was enlarged by the Municipal Act, so as to include, with the old bor., the townships of Ludford, and a part of the par. of Stanton Lacey. Registered electors in 1839, 40, 422. Market (well attended) on Monday; fairs, chiefly for horses, cattle, and pigs, Mon. before Feb. 13., Tues. before Easter, Wed. in Whitson week, Aug. 21., Sept. 28., and Dec. 6.; on the two last of which large quantities of hops are exposed for sale.

The history of Ludlow is closely connected with that of its castle, which, being erected by the barons of Montgomery in the 12th century, continued in a habitable state till the suppression of the council of the Marches of Wales by William III. To all lovers of English poetry this castle is interesting, as having been the scene where Milton's "Comus" was performed in 1631, by the family of the Earl of Bridgewater.

LUDWIGSBURG, a town of Württemberg, circ. Neckar, of which it is the cap., on rising ground, about 1 m. W. of the Neckar, and 8 m. N. Stuttgart. Pop. in 1837, 6,900. It is one of the best built and handsomest towns of the kingdom; but is dull. Charles Street, by which it is traversed from end to end, is 1 m. in length, and, like most of the other streets, is lined with rows of trees. From 1727 to 1733, Ludwigsburg was the chief residence of the court; its palace, though now deserted, is one of the largest and finest in Germany; and it has a gallery of old German, Dutch, and Flemish pictures; and a theatre. The palace-gardens, formerly celebrated for their beauty, are now falling into disorder from neglect. Ludwigsburg has a Lutheran parish church, three other churches, an arsenal, a military school for 20 officers' sons, a lyceum, an orphan asylum, and workhouse, house of correction for females, school for poor children (*Kinderehreranstalt*), a cannon-foundry, and manufactures of woollen cloth, earthenware, and buttons. In the neighbourhood are the royal summer palaces of Favorite and Monrepos, and the fine statue of Count Zeppelin, erected by King Frederick of Württemberg. About 5 m. distant is Marbach, the

birthplace of Schiller, and the mathematician Mayer. (*Memninger; Beschreibung von Württemberg*, 523—24; *Berghaus; Stein.*)

LUGANO (TOWN AND LAKE OF). The town of Lugano, being with Bettinzoro and Locorno, a cap. of the Swiss canton of Tessin, stands on a bay on the W. bank of the lake of same name, 15 m. N.N.W. Como. Pop. 3,800. It is a well built, handsome town, finely situated round the curve of a beautiful bay, surrounded by an amphitheatre of hills, having their slopes studded with villas, vineyards, gardens, and forests; while in the distance are seen the snowy pinnacles and craggy masses of the Alps. Among the principal public buildings are the church or cathedral of San Lorenzo, on an eminence above the town, commanding a fine view, with a finely sculptured portal and a facade, said to be by Bramante; the church of the Franciscan friars, remarkable for two paintings of first-rate excellence by Bernardo Luini. It has also some pretty extensive silk manufactures, a large theatre, and an hospital. Several establishments for the printing and sale of books newly published or prohibited in Italy; and no fewer than 3 newspapers, which occasionally advocate doctrines that are but little to the taste of the Austrian and Sardinian governments. Perhaps, however, the town may derive its principal support from its being on the route, and one of the entrepôts, of a considerable portion of the trade carried on between Italy and Switzerland, and Germany, by the pass of St. Gotthard. Though nominally and politically Swiss, the Luganese are Italians in dress, language, manners, and appearance; in every thing, in short, but their greater activity and enterprise; and for this distinction they are mainly indebted to their comparatively free institutions and free press. Monte Caprino, near Lugano, has a great number of natural caverns or grottoes, which, on account of their coolness, are used by the inhabs. in summer as cellars in which to keep their wine, meat, and other provisions.

The Lake of Lugano (formerly the *Lacus Ceresinus*), is principally within the canton of Tessin, in Switzerland, but partly also in Lombardy, between the Lago Maggiore and the Lago di Como. It is of an extremely irregular figure; its greatest length from Belforzo to N. of Porto at its S. extremity, is about 16 m., but in addition to its main body, it has two great arms, one stretching S.S.E. to Lago, and the other N. to Agno. It is nowhere above 2 m. in width, and is mostly surrounded by high mountains, overhanging woods, and bold, abrupt precipices. One of the mountains, San Salvador, on a promontory, washed on two of its sides by the lake, rising to the height of nearly 2,000 ft. above its level, is a sublime object from the lake, and commands from its summit a most magnificent and varied prospect. In some parts, however, the banks of the lake slope gently down to the water's edge, and are covered with villages, vineyards, gardens, &c. The bay of Lugano on its W. side, with its surrounding amphitheatre of hills, is particularly fine. Its waters are quite transparent, and so very deep, that in some places no soundings are said to have been attained. It is about 120 ft. above the level of the lakes of Como and Maggiore, into the latter of which the Tresa conveys its surplus waters. (*Cander's Italy*, i. 314; *Eustace*, iv. 60.; *Coe's Switzerland*, iii. 368; *Murray's Handbook*, &c.)

LUGGEISHALL, or LUDGEISHALL, a decayed bor., market town, and par. of England, co. Wilts, hind. Amesbury, 25 m. N.E. Salisbury, and 68 m. W. by S. London. Area of par. and bor., 1,660 acres. Pop. in 1831, 535. The town, now in a wretched and decaying state, contains nothing worth mention, except an old ruinous church, and a place of worship for Baptists; the inhabs. are chiefly supported by agricultural labour. Formerly, however, it must have been a place of more importance; for a large castle existed here soon after the Conquest; it was also one of the most ancient parl. bors., and notwithstanding its insignificance in modern times, sent 2 mems. to the H. of C. down to the passing of the Reform Act, by which it was disfranchised.

LUGO, a town of Spain, prov. Galicia, and a bishop's see, on the Minho, 47 m. E.S.E. Coruña, and 142 m. N.N.E. Oporto. Pop., according to Miñano, 7,299. It occupies an eminence on the E. bank of the river, and is surrounded by an ancient wall of great thickness, with circular projecting towers. The streets are mean and irregularly built: the chief buildings are a Gothic cathedral, 4 convents, 2 hospitals, a singular-looking prison, a foundling asylum, and public seminary. The climate is alleged to be colder than that in other parts of Galicia: snow is frequent, and N. winds are common during the winter months. The place appears to be in a languishing condition; the only fabrics are those of thread stockings and Morocco leather. In the neighbourhood are bred great numbers of cattle, horses, mules, sheep, and hogs, which meet with a ready sale at the monthly fairs, and the great fair in October.

Lugo is a place of great antiquity, having been the cap. of a *conventus*, or district, under the Romans, who called it *Lucus Augusti*. Many monuments of Roman art were

existing in the time of Ponz; but they have nearly all been since destroyed. The Roman medicinal baths are still, however, used, and the works formed to protect them from the floods of the Minho may yet be traced. Alonzo the Catholic wrested Lugo from the Moors, and re-established its bishopric. (*Milano, Mon. Trav.*)

LUND, a city of Sweden, near its S. extremity, prov. Mahne, 20 m. N.E. Mahne. Pop. 4,120. It is open, and irregularly built, but clean. It is an archbishopric, and has a cathedral, an ancient irregular building, raised at different periods. But it is chiefly remarkable for its university, founded in 1666. This institution has 22 regular and 7 assistant professors, and is attended by about 600 pupils. In 1834 it had 596 pupils, whereof 108 were students of divinity, 130 of law, 50 of medicine, and 169 of philosophy, the sciences, &c. It has a library of 30,000 printed vols., and 1,000 MSS., with museums of natural history and mineralogy, antiquities and medals, &c.; an observatory, a chemical laboratory, and a botanical garden. Puffendorf, who, next to Grotius, is the grand authority in matters of public law, was appointed Professor of the Law of Nature and Nations in this university in 1679, and here, in 1672, he published his great work *De Jure Naturæ et Gentium*. "Without," to use the words of a distinguished authority, "the genius of Grotius, and with very inferior learning, he has yet treated this subject with sound sense, with clear method, with extensive and accurate knowledge, and with a copiousness of detail sometimes indeed tedious, but always instructive and satisfactory." (*Macintosh on the Law of Nature and Nations*, p. 21.) Linnaeus was for some time a pupil in the University of Lund. The town has manufactures of woollen cloths and tobacco, tanneries and sugar refineries, a discount bank, and some foreign trade. The ancient kings of Scania were chosen on the hill of Lybyra, near the town. (*Stein; Coxe's Travels*, iv. 298; *Dict. Geogr.*, &c.)

LUNEBURG, a town of the kingdom of Hanover, capital of the distr. and principality of Lüneburg, on the Ilmenau, 67 m. N.N.E. Hanover, and 27 m. S.E. Hamburg. Pop. in 1838, estimated at 11,800. It is surrounded by walls of no great strength, and entered by 6 gates. It has dark and narrow streets, and old-fashioned houses. The castle, or palace of the prince, the town-hall, council house, military academy for young nobles, gymnasium, exchange, and cavalry barracks, are the principal public buildings. The military academy has a library of 14,000 vols., and in the town-hall is another library. Lüneburg has 4 churches, in one of which are the tombs and monuments of many of the ancient dukes of Lüneburg, several superior schools, an orphan asylum, and a *mont-de-piété*.

Lüneburg was formerly a Hanse Town, was governed by magistrates of its own selection, and had an extensive trade. It took its part in the Baltic herring-fishery, and had numerous breweries and manufactures of woollen stuffs, &c., now much fallen off. Lime-burning and the making of salt are at present the chief branches of industry. A large and singular rock of gypsum, rising nearly 170 ft. above the Ilmenau, in the immediate vicinity of the town, furnishes abundant materials for the former business. About 20,000 tons of lime a year are sent to Hamburg, Altona, and Holland. About 160,000 centners a year of salt are procured from some adjacent salt-springs: the evaporation is effected by means of turf, and is conducted under a special commission, the government having a monopoly of the article. The price of the dried salt is 40 dollars, and of the dried, 46 doll. the last of 400 lbs. (*Berghaus*.) Lüneburg has some fabrics of woollen and cotton and linen goods, tobacco, paper, cards, and soap; with distilleries, breweries, &c. It also trades in horses; and is the seat of a transit trade between Hamburg and the Elbe, and the interior provs. of Hanover. About 200,000 centners of merchandise are said to have passed in *transitu* through Lüneburg in 1838. (*Von Reden's Hannover*, ii. 87, &c.; *Berghaus; Stein; Hodgskin's N. Germany*.)

LUNEL, a town of France, dép. Hérault, cap. cant., on the canal of Lunel, 14 m. E.N.E. Montpellier. Pop. in 1836, ex. com., 6,021. It has a fine promenade, infantry and cavalry barracks, numerous liqueur and brandy distilleries, and a brisk trade in corn, wines, and raisins. The muscadine wine, produced from vineyards situated on gently rising grounds to the N. of the town, and bearing its name, is reckoned by some connoisseurs as the best of its class, and is rivalled only by the Frontignan. "It is a very delicate wine, of a bright yellow colour, with a less distinct flavour of the grape, and less cloying than the Frontignan. The vineyard called the Clos Mizet, which has been long known to afford the first-rate growth, makes about 100 hls. a year, being one third of the total quantity supplied from the territory of Lunel. Several of the more ordinary muscadine wine, however, come into the market as Frontignan and Lunel; but they may be easily detected by their deeper colour, and the want of the characteristic flavour and perfume,"

(*Henderson on Wines*, p. 177.) According to Julien, the wines of Lunel, "*Sont plus précoces et plus fins que ceux de Frontignan; mais ils ont moins de corps, un goût de fruit moins prononcé, et ne conservent pas aussi longtemps.*" (*Topographie de Vignobles*, p. 250.)

LUNEVILLE, a town of France, dép. Meurthe, cap. arrond., on the Vezouze, and on the road from Paris to Strasbourg, 16 m. S.E. Nancy. Pop. in 1836, ex. com., 12,661. It is generally well built, and has a good square, a *château* erected by Leopold, duke of Lorraine, early in the last century, and long the residence of Stanislaus, king of Poland, a handsome par. church, very extensive cavalry barracks, a parade ground of 200 hectares, a large covered riding arena, two hospitals, a synagogue, theatre, and manufactures of woollen cloth, woollen and cotton yarn, gloves, &c. Luneville is one of the principal cavalry stations in France. The origin of the town is uncertain, but its name seems to indicate that Diana was anciently worshipped here; and several Roman medals, with the impress of that divinity, have been found near a fountain in the neighbourhood. The peace between France and the German Confederation, in 1801, by which the former acquired the territory on the left bank of the Rhine, was concluded in this town. (*Diigo, art. Marthe; Berghaus; Guide du Voyagier*, &c.)

LURGAN, an inland town of Ireland, co. Armagh, prov. Ulster, about 3 m. from the S. border of Lough Neagh, and 18 m. W.S.W. Belfast. Pop., in 1831, 2,842. It is a neat, clean, and well-built town, consisting principally of one wide street. It has a par. church, a R. Cath. chapel, meeting-houses for Presbyterians and Quakers, a court-house, and a bridewell. A manor-court is held every three weeks, and general sessions and petty sessions every Friday. It is a constabulary station; and has 2 schools on the foundation of Erasmus Smith, and a subscription school. The linen manufacture, particularly that of diapers and damasks, is extensively carried on, as is that of tobacco; there are 22 breweries and an extensive distillery. Markets on Fridays; fairs, Aug. 5, and Nov. 22. The nearness of the town to the point where the Lagan and Newry navigation joins Lough Neagh, affords great facilities for inland traffic. Post-office revenue, in 1830, 406*l.*; in 1836, 533*l.* Branches of the Belfast, Northern, and Provincial Banks were opened in 1834; by the Agricultural Bank, in 1836; and of the Ulster Bank, in 1837.

The town is on the estate and in the immediate vicinity of the residence of the Brownlow family, to the head of which it gives the title of baron.

LUTON, a market town and par. of England, co. Bedford, hund. Flitt, 16 m. W.N.W. Hertford, and 28 m. N.W. London. Area of par., 15,500 acres. Pop. in 1831, 5,093; do. of township, 3,561. The town, pleasantly situated between two hills in the Chiltern chalk range, is irregularly built with three long streets, running from a market place, in which is an old town-hall, in the form of the letter Y. The church is an interesting specimen of Gothic architecture, with a square embattled tower surmounted at the angles by hexagonal pinnacles, and a handsomely decorated W. door: the interior contains, besides some painted windows, a curiously carved font, and some fine old monuments. There are also places of worship for Wesleyan Methodists, Baptists, and the Society of Friends. Three well-attended Sunday schools, a national and Lancasterian school, furnish instruction to the children of the poor; and there is a well endowed hospital for lodging and clothing 24 aged widows. The inhab. are principally engaged in the manufacture of straw hats, and especially of the variety called the Tuscan grass-plait. Lace-making used also to be carried on to a considerable extent; but this business has been all but extinguished by the rise of the Nottingham frame-lace trade. Two miles E. of the town is Luton Park, a seat belonging to the Bute family, erected by Lord Bute, the favourite of George III. Markets on Monday; large cattle fairs, April 18, and Oct. 18.

LUTTERWORTH, a market-town and par. of England, co. Leicester, hund. Guthlaxton, 12 m. S. Leicester, and 79 m. N.N.W. London. Area of par., 1,800 acres. Pop., in 1831, 2,262. The town, situated on the Swift, a tributary of the Avon, comprises one main and well built street, with others of inferior size: there are some good houses, but a large proportion of the tenements are mere mud-walled thatched cottages. The church is a large and very handsome structure, in the pointed style, with a high square tower having turrets at the angles: the interior is elegantly fitted up. But it is principally remarkable from having been the scene of the pastoral labours of John Wycliffe, and from containing his pulpit and portrait. This early and illustrious reformer and eminent divine was appointed rector of Lutterworth in 1374, where he expired 10 years afterwards, on the 31st of December, 1384. Luckily, however, his doctrines did not die with him. In 1415, the Council of Constance vainly endeavoured to gratify their impotent rage against his memory, by ordering his remains to

be disinterred and cast upon a dunghill. This disgraceful sentence was carried into effect: for, the bones of Wycliffe being taken up, were burned, and the ashes thrown into the Swift. "Thus," as Fuller has ingeniously expressed it, "this brook (the Swift) has conveyed his ashes into Avon, Avon into Severn, Severn into the narrow seas, they into the main ocean; and thus the ashes of Wycliffe are the emblem of his doctrine, which now is dispersed all the world over."

Lutterworth has 3 places of worship for dissenters, 4 Sunday-schools, an endowed free-school, attended by 100 boys, and 3 smaller subscription schools. Its chief manufacture is that of coarse hosiery, but it is not extensive. It has a considerable trade in farm and dairy produce, chiefly carried on at its 7 annual fairs. Markets on Thursday: fairs Thursday after Feb. 19., March 10., April 15., July 23., and Oct. 10.; also on Holy Thursday.

LUTZEN, a town of the Prussian states, prov. Saxony, circ. Merseburg, 12 m. S.W. Leipzig. This town, the pop. of which is under 1,500, would be unworthy notice were it not that its environs have been the scene of two of the most memorable conflicts of modern times. The first, which occurred on the 16th of November, 1632, took place between the Imperialists, under Wallenstein, and the Swedes, under their heroic monarch, Gustavus Adolphus. The latter were victorious; but the victory was dearly purchased by the death of their king, who fell (it has been alleged by treachery) in the action. Besides their king, the Swedes lost about 3,000 men; but the loss of the Imperialists amounted to double that number, and their artillery fell into the hands of the conquerors.

The other great conflict took place nearly on the same ground on the 2d of May, 1813, between the French, under Napoleon, and the allied army, encouraged by the presence of the emperor Alexander and the king of Prussia. The struggle was most obstinate and bloody; but in the end victory declared in favour of the French. The allies lost 20,000 men, killed and wounded, and that of the French was also very severe.

LUXEMBURG (GRAND DUCHY and PROVINCE OF), a territory of W. Europe, between lat. 49° 25' and 50° 28' N., and long. 5° and 6° 20' E.; having N. the Belgian prov. of Liege, W. that of Namur, E. Rhenish Prussia, and S. France. Greatest length and breadth about 65 m. each. Area, 2,799 sq. m. Pop., in 1839, 327,885. By the treaty of the 19th of April, 1839, this territory was definitively partitioned between Holland and Belgium; the E. portion, with an area of about 1,000 sq. m., and a pop. of 165,000, being assigned to the former, and the W. portion, with an area of 1,700 sq. m., and a pop. of about 162,900, to the latter. The title of Grand Duke of Luxembourg, with the suzerainty of the councils of the German Confederation, are enjoyed by the king of the Netherlands.

A chain of hills, branching from the Ardennes, traverses the country from S.W. to N.E. It no where rises to more than 2,000 ft. above the sea; but it forms the dividing line between the basins of the Meuse and the Moselle. The best-named river, and the one that forms the E. boundary of the grand duchy, is the Our, the principal streams are the Ourte, Our, Alzette, Sonoy, &c., tributaries of either the Meuse or the Moselle. The valleys are fertile, but the rest of the country has mostly a stony and barren soil; and in some parts, especially about the centre of Belgian Luxembourg, a good deal of the surface is occupied with marshes, heaths, and poor waste land. The entire surface is estimated at 690,000 *bonniers* (a measure nearly answering to hectares), of which about 210,000 are supposed to be in tillage, 211,000 in woods, 127,000 in heaths, wastes, &c., and 112,000 altogether unproductive, or occupied by roads, rivers, &c. It is mostly divided into small properties. Rye, barley, oats, and wheat are the principal corn crops; and potatoes, with flax, hemp, and beet-root, are raised. The agricultural course almost invariably occupies 3 years; the first year, wheat, rye, or rye is sown; in the second, oats, barley, or potatoes; and in the third, the land is left fallow. The vine is grown on the banks of the Moselle; and the annual produce of wine was estimated, in 1837, at 75,563 hectol. The chief branch of rural industry is, however, the rearing of cattle for exportation. The sheep yield indifferent wool, but their flesh is excellent. Horses are good. A great many hogs are reared, and in the first half of 1836, 367,700 were exported to France. The meadow-lands, especially in the valleys of the Alzette, Chiers, and Semois, are carefully irrigated and manured. The woods are an important source of wealth, the annual produce of timber and fire-wood being estimated, according to Vandermaelen, at nearly 1,100,000 *steres*. Nearly 93,000 hectares of woods belong to communes, there being scarcely a commune without a certain portion of forest land. There are few countries in which iron is more abundant; and about 9,200,000 kilog. of metal are produced annually: from the want of coal, it has to be smelted with timber.

Since 1837, however, coal has been admitted into Bel-

gian Luxembourg (where this branch of industry is principally conducted), from Ithenish Prussia at the reduced duty of 1 fr. per 1,000 kilog., and the production of iron is probably on the increase. The slate of Luxembourg is of a superior quality. Viel-Salm, in the N. of Belgian Luxembourg, furnishes about 4 millions of slates a year; and in the S., the quarries of Herbenmont and Geripont produce about 10 millions a year, mostly exported to the neighbouring countries. Slate-pencils, marble, and a little lead, zinc, copper, and manganese are the other chief mineral products. Next to forges and potteries, woollen cloth, lace, leather, and glue factories, distilleries, and breweries, are the most numerous manufacturing establishments. The commerce of Luxembourg, however, except in iron, slate, and cattle, is insignificant. The inhabs., partly of Saxon extraction, and partly Wallons, are all R. Catholics. The whole territory is subdivided into 3 districts; those of Luxembourg, Diekirch, and Grevenmacher: each has in it a tribune of original jurisdiction; and the first, which is identical with the Dutch prov., is placed under a Prussian military governor, and a Dutch civil commissary. Belgian Luxembourg is governed in the same way as the other Belgian provs. Dutch Luxembourg has the 11th place in the German Confederation, with 3 votes in the full council, and one in the committee. It has, since 1839, furnished a contingent of 1,850 men to the army of the confederation; the contingent previously to the division of the duchy having been 2,556 men.

LUXEMBURG (Germ. *Lützelburg*), a town belonging to the kingdom of the Netherlands, the cap. and only place of any importance in the above Grand Duchy, and one of the strongest fortresses of Europe; on the Alzette, a tributary of the Sur, 22 m. S.W. Treves, and 77 m. S.S.E. Liege; lat. 49° 37' N., long. 6° 7' 30" E. Pop., in 1830, 11,242. It is built partly on a steep rocky height, and partly in the valley beneath; being, consequently, divided into the upper and lower towns, which communicate by flights of steps, and streets running zigzag, so as to be passable for carriages. Both towns are fortified, and the works, which are partly excavated in the solid rock, have been greatly strengthened by the successive possessors of the town—Spaniards, Austrians, French, and Dutch. Great improvements have recently been made in them; and since 1837, a new fort has been constructed outside the Treves gate. The casemates of that part of the fortifications called *Le Bonc*, resemble those of Gibraltar, and are capable of accommodating 4,000 men. Luxembourg is tolerably well built, but has no remarkable public buildings. It has some iron forges, and manufactures of linen fabrics, leather, and tobacco. It is at present garrisoned by 2,000 Prussian troops.

The territory of Luxembourg was governed by its own counts from the time of the Carolingian Frankish kings to 1354, when the Emperor Charles IV. erected it into a duchy. It was taken by the French in 1794, and subdivided among the depts. of For, Ardennes, Sambreville, Meuse, and Gonthier; but, in 1814, it was erected into a grand duchy, and given to the king of Holland, in exchange for the renunciation of his claims upon Nassau. (*Vandermaelen's Luxembourg; Berghaus, &c.*)

LUXEUIL (an. *Luxovianum*), a town of France, dcp. Haute-Saône, cap. cant., on the Breuchin, 15 m. N.E. Vesoul. Pop. in 1836, ex. com., 3,628. It is well built and clean, and has a good town-hall, a large hospital, a communal college, and manufactures of hats, leather, tin and iron goods, &c.; but it is chiefly remarkable for its hot or thermal springs, which are usually frequented by from 500 to 600 visitors. The hot baths of *Luxovianum* were known to the Romans, who are said to have decorated them with fine buildings. (*D'Anville, Notice de la Gaule*, p. 430.) The traces of several Roman roads, aqueducts, and edifices, with various statues, medals, &c., have been discovered in and round the town. (*Hugo, art. Haute-Saône; Dict. Grog.*)

LUTON, the largest and most N. of the Philippine Islands, which see.

LYME-REGIS, a parl. and mun. bor., market-town, sea-port, and par. of England, co. Dorset, in Bridport div. of Lib. Lodges and Botherhampton, 20½ m. S.S.E. Taunton, and 132 m. W. S.W. London. Area of parl. bor., which comprises the two parishes of Lyme and Charmouth, 1,980 acres. Pop., in 1831, 3,345. "Lyme is a small and irregularly built town, situated among hills, which, by rendering it difficult of access, effectually preclude it from becoming a place of importance. This place, as well as Charmouth, is frequented in the summer as a watering place, and many respectable families are settled in the neighbourhood; but the streets are very irregular, and not lighted, so that, on the whole, it has the appearance of a poor and inconsiderable place." The pier or goli (originally erected in the reign of Edward III., and greatly lengthened in 1826, at the expense of government) is 680 ft. long and 12 ft. broad, furnishing good shelter for shipping between Start Point and the Isle of Portland; and close to the pier is the

custom-house. "The regular trade of the place, however, appears to be altogether inconsiderable; and it is chiefly valuable as a port of refuge for small vessels in bad weather." (*Parl. Boundary Rep.*) In 1836 there belonged to the port 19 vessels, of the burden of 1,187 tons: the customs revenue in 1839 amounted to 2,580*l.* indicating a great diminution since the close of the last century, when they amounted to about 16,000*l.* a year. This change is ascribed partly to the decay of its once considerable Newfoundland fishery and Mediterranean trade, and partly also to the separation of Bridport, united with Lyme till 1833. An old church, three places of worship for dissenters, a house used for assemblies, and an old town-hall, are the chief public buildings. Two schools for poor children are supported by subscription, and there are almshouses and other charities for the sick and aged.

The bor. of Lyme is undoubtedly very ancient, and claims to be one by prescription. Its first charters are dated 12 Edward I.; and its early consequence as a port is shown by the fact, that in the war with France under Edward III. it furnished four ships to serve at the siege of Calais. The mun. bor. is now governed by a mayor, 3 other aldermen, and 12 councillors, but has no commission of the peace. Corporation revenue, in 1839, 374*l.* The bor. sent 2 mems. to the H. of C. from the reign of Edward I. down to the passing of the Reform Act, which deprived it of one mem.; previously to that act the right of election was vested in the cap. burgesses and freemen. The Boundary Act enlarged its limits, so as to include the entire pars. of Lyme and Charmouth. Reg. electors in 1839-40, 277. Markets on Friday; large cattle fairs, Feb. 13. and Oct. 2.

LYMINGTON, a parl. and mun. bor., sea-port, and market town of England, co. Hants. in the E. division of the New Forest, close to the mouth of a river of its own name, which falls into the Solent, 25 m. S.S.W. Winchester, and 61 m. W.S.W. London. Pop. of parl. bor. (comprising the par. of Lymington and a part of the par. of Boldre), in 1831, 5,361. The town, situated on the W. bank of the river, is well paved and lighted with gas, and consists of one well-built and wide street, crossed by two others of an inferior description. On the E. bank is the village of Undershore, comprising several villas and houses of a superior kind, inhabited by persons of independent fortune; it is connected with the town by a bridge, and clearly forms a suburb of Lymington. Among the public buildings are a town-hall, a theatre, and a custom-house; the port, though sufficient for vessels of 300 tons, and provided with wharfs and storerooms, is subordinate to that of Southampton. The church is an irregular building of brick and stone, the living being a curacy dependent on the vicarage of Boldre. There are likewise three places of worship for Wesleyan Methodists and other dissenters. A free school for both sexes, a girls' national school, and an infant school, provide instruction for the children of the poor, and there are several minor charities.

"The town is considered to be in an improving state, and several large outlays of capital have taken place in the last few years. A company has been formed for the purpose of supplying steam navigation to and from Portsmouth and the Isle of Wight; 3,000*l.* have been subscribed for the formation of gas-works, and the same sum for the erection of baths; dwelling-houses, also, have been and are now being built on an improved scale, the principal object of these improvements being to induce visitors to resort to the town during the summer. Little or no commerce is carried on here; and the only manufacture of the neighbourhood is that of salt, which some years ago was carried on to a very large extent, but latterly has decreased. A large yearly fair is held for the sale of cheese, exported to various places along the Sussex coast." (*Mun. Corp. Rep.*)

Lymington is a bor. by prescription, its corporate officers since the Municipal Reform Act being a mayor, 3 other aldermen, and 12 councillors; but it has no commission of the peace. Corporation revenues in 1839 (chiefly from quay and river dues), 100*l.*

Lymington has sent 2 mems. to the H. of C. since the act of 1 Elizabeth, the right of election being vested, till the Reform Act, in the resident burgesses, of whom there were only 38 in 1831. The Boundary Act enlarged the limits of the bor., so as to include the entire par. of Lymington with a part of the par. of Boldre. Registered electors in 1839-40, 305. Lymington is also a polling place for the S. division of Hampshire. Markets on Saturday; large fairs for cheese, bacon, and cattle, May 12 and Oct. 2.

LYNCHBURG, a town of the U. States, cap. Campbell co., in Virginia, on James River, here crossed by two bridges, about 20 m. below its great falls, and 90 m. W.S.W. Richmond; lat. 37° 30' N., long. 79° 22' W. Pop., in 1830, 4,626. It is mostly on the declivity of a hill, and has a court-house, a gaol, a market-house, several churches, a Friends' meeting-house, a Lancas-

trian school, &c. A large proportion of the houses are of brick, and of 2, 3, and 4 stories. Lynchburg is one of the most flourishing commercial towns in the state, as, from its situation, it commands an extensive trade not only with the W. part of Virginia, but with N. Carolina, Tennessee, Kentucky, and Ohio. It is one of the largest marts for tobacco in the Union, from 10,000 to 16,000 bbls. having been inspected in it annually for the last 10 years. (*Bradford, 1837.*) It has many tobacco factories, and warehouses for dry goods; and manufactures of cotton and woollen goods are carried on, and there are extensive flour-mills in its vicinity. The chief articles brought to its markets are tobacco, wheat, flour, hemp, butter, peach and apple spirits, whisky, elder, beef, live hogs, lead, iron, &c., a considerable proportion of which is sent down the river to Richmond for further exportation. (*Encyc. Americana; Davenport's Gazetteer, &c.*)

LYNN-REGIS or KING'S LYNN, a parl. and mun. bor., sea-port and market town of England, co. Norfolk, locally situated in humil. Freebridge-Lynn, at the mouth and on the E. bank of the Ouse, 3 m. W. by N. Norwich, and 90 m. N. by E. London. Lat. 52° 48' N., long. 2° 6' E. Area of parl. bor., 2,620 acres. Pop., in 1831, 11,905. The town, about 1 m. in length, by ½ m. in breadth, comprising two principal, with other smaller streets, "is, generally speaking, well built, and contains many excellent houses, and extensive premises calculated for trade. It is well paved, lighted with gas, supplied with good water, and very clean. The public walks, also, in the E. part of the town deserve notice, for their extent, and the neatness with which they are kept." (*Mun. Bound. Rep.*) Lynn was formerly encompassed on the land-side by a wall and deep wet ditch, defended by 9 bastions: these fortifications yet remain, but the wall and bastions are much dilapidated; it is also divided into several parts by 4 small streams here called *gleets* (from the Dutch *sluice*) over which are 11 bridges. The market-place, called by way of distinction the Tuesday's market-place, is an area of 3 acres, situated at the N. end of the town, having a sculptured stone cross in its centre, and surrounded by good houses. A smaller market is held on Saturday in an open space near St. Margaret's church, and outside the town is a cattle-market. The custom-house, built in 1683, and intended for a merchant's exchange, is a handsome building of freestone, with an ornamental front, and a statue of Charles II.: the guildhall is an old-fashioned building of stone and flint, with suitable apartments for the transacting of municipal business, &c.; and near it is the borough gaol, a respectable stone structure, which "seems to be on the whole well regulated, and admits, to a certain extent, of the classification of prisoners." (*Mun. Corp. Rep.*) A new theatre has recently supplied the place of an older one, now converted into warehouses. The parl. bor. comprises 2 pars., that of the St. Margaret's (the living of which is a perpetual curacy in the gift of the dean and chapter of Norwich), and that of All-Saints (a vicarage in the patronage of the Bishop of Ely). St. Margaret's church in N. Lynn, built in the 12th century, is alleged to be one of the largest par. churches in England, and had formerly a lofty steeple blown down by a tempest in 1741: its W. end is still distinguished by 2 square towers of dissimilar architecture, the upper parts of which are of modern construction. St. Nicholas, a Gothic structure, with a bell-tower and light octangular spire 170 ft. high, is a chapel of ease to the above parish church. All-Saints' church, in S. Lynn, is a well-built cruciform edifice, occupying the site of an old convent of Whitefriars. On the opposite side of the Ouse in W. Lynn, but not within the bor., is another parish church, that of St. Peter's. There is also a Rom. Cath. chapel, and the Wesleyan Methodists, Independents, Baptists, Unitarians, and the Society of Friends, have their respective places of worship, with large attached Sunday-schools. The grammar-school is in the patronage of the corporation, from which its master receives a salary of 63*l.* a year: it has two or three small exhibitions in the University of Cambridge. Various charity-schools have likewise been established, which, with a well-conducted Lancasterian school, furnish instruction to numerous children of both sexes. Gaywood's hospital provides lodging, and a weekly stipend of 5*s.* to 53 poor widows: there are also 3 other well-endowed sets of almshouses, and many minor bequests, &c. for the relief of the aged poor.

"Lynn contains an iron-fomdery and 4 building-yards for ships from 400 tons downwards; but there are no other manufactures. A considerable and increasing trade is carried on, coast-wise, in exporting corn, with other natural products of the fens; and importing principally coal: there is also a coast-trade with Canada and the Baltic in timber; as well as with Portugal in wine, fruit, &c.; but this is of much less extent and importance than the coasting-trade." There belonged to the port, in 1836, 120 ships, of the aggregate burden of 15,283 tons; besides which, upwards of 2,000 coasters,

chiefly colliers, come thither, each year, from other ports. Gross customs' revenue, in 1839, 67,253*l*. The harbour is capacious; but the approach to it is rendered both difficult and hazardous by numerous and perpetually shifting sand-banks, occasioned by the action of the tide on the light silt and sand forming the bed of the river. The estuary of the Ouse is nearly 1,000 ft. broad, and there is accommodation in the port for about 300 merchant-ships. Spring-tides rise about 18 ft., and during the prevalence of N. and N.E. winds, are thrown in with such violence and rapidly as sometimes to do damage the shipping. "The harbour has also been injured since the completion of the Eau-brink cut, which has caused a great accumulation of alluvial soil along the King's staith and other quays lining the E. bank of the river; but this evil is now somewhat lessened by the erection of jetties on the opposite shore, which direct the course of the river more to the E. bank, by means whereof these deposits are scoured away." (*Mun. Bound. Rep.*)

King's Lynn, (called Bishop's Lynn before Henry VIII. conferred on it its present name,) received its first charter from King John, in return for valuable services done him by its inhabitants during the baronial wars. Its corporate privileges were confirmed and enlarged by several monarchs, and lastly by Charles II. The bor. is now divided into 3 wards, the municipal officers being a mayor and 5 other aldermen, with 18 councillors. Quarter and petty sessions are held under a recorder, and a court sits monthly for the recovery of debts under 40*s*. Corporation revenues, in 1839, 8,615*l*. Lynn has sent 2 mems. to the H. of C. since the 6th of Edward II., the right of election down to the Reform Act being vested in freemen by birth, servitude, gift, or purchase. Registered electors, in 1830-40, 950. Lynn is also a polling-place for the W. division of Norfolk. Markets, principally on Tuesday, but also on Saturday. Large fairs for London goods, Feb. 14, and five succeeding days, also for cheese a week after old Michaelmas, lasting two days.

LYONS (*Fr. Lyon*; an. *Lugdunum*), a large city of France, being the principal manufacturing town of that kingdom, in the dep. of the Rhone, of which it is the cap., 275 m. N.E. E. Bordeaux, 172 m. N.W. W. Marseilles, 245 m. S.E. Paris, and 70 m. W.S.W. Geneva; lat. 45° 45' 58" N., long. 4° 39' 24" E. Pop. of the city proper, in 1836, 147,223; but, including its suburbs, the pop. is about 200,000. It is situated at the junction of the Rhone and the Saône, which on a tongue of land or peninsula between those two rivers, the length of which is nearly 3 m. and its average breadth about 3 furlongs, though in the N. part of the city increasing to upwards of 1 m. Some extensive and important quarters, as St. Just, St. George, St. Irénée, Vaise, &c., are, however, situated on the W. or right bank of the Saône, on and round the hill of Fourvières; and in the E., on the left bank of the Rhone, are the *Faubourg Guilloière* and the *Quartier des Brotteaux*. S. of the city, the handsome and regular suburb of *Perache* is rapidly extending towards the extremity of the peninsula; while on the N., beyond the fortifications, on the declivity of a hill extending from one river to the other, is the municipal commune of *La Croix Rousse*, comprising the suburbs of *Serin* and *St. Clair*. A tower on the hill of Fourvières, 680 ft. above the Saône, commands a landscape which combines the rich and the grand in the highest degree. At the spectator's feet is Lyons, with its two noble rivers; its bridges, squares, quays, and public edifices, the vessels that crowd the Saône, and the busy activity that pervades its streets, announcing a highly civilised, prosperous, and opulent community. "Unlike Paris and many other French towns, which stand isolated, as it were, in the country, with ploughed land and meadows coming close up to the barriers, Lyons appears as the nucleus of a vast population, melting gradually by its suburbs into clusters of villages, which break up into smaller villages, hamlets, villas, and manufactories. Even at the distance of 10 m., the country is pretty thickly dotted with buildings, some of which are seen sweetly perched on the S. and W. declivities of the hills which enclose the plain. The high and mountainous land on the W. side of the city is scarcely an exception; for sterile as it seems, it is enlivened by country-houses, villages, and manufactories. Beyond the hills which bound the plain on the N.E., is seen Mount Jura; on the E. we have part of the Alps; above which, at the distance of 100 m. from the town, Mont Blanc is distinctly seen like a white cloud or a mass of snow." (*MacLaren's Notes*, p. 35.)

The interior of Lyons exhibits little regularity, and chiefly consists of narrow, winding, and dirty streets, rendered dark by the extreme loftiness of the houses. These, though of stone, and solidly built, are old and *triste*, and several of the streets leading up steep declivities are inconvenient for carriages. The *quartier St. George* is disgustingly filthy, and greatly inferior in appearance to the suburbs of *Croix Rousse* and des

*Brotteaux*, which, like it, are chiefly inhabited by the working classes. But the wretched aspect of some parts of the city is in some degree counterbalanced by the magnificence of others. Three ranges of quays, two on the Saône and one on the Rhone, interspersed with 17 bridges, nearly all of modern construction, with the glacis and hill of Fourvières, encompass all that is situated between the two rivers, and form a noble and imposing outline. The Saône, which is far more useful to Lyons in a commercial point of view than the Rhone, is lined with numerous wharfs and landing-places; and along the Rhone from the *Faubourg St. Clair* to *Port Perache*, a distance of a league, is a line of elegant public and private edifices, and a public walk, planted with a double row of trees, commanding a fine prospect over the fertile plain to the E. The waters of the Rhone are rapid, cold, and clear, and it forms in every respect a remarkable contrast to the Saône, which has a sluggish current, and a muddy stream. The Rhone is very liable to sudden inundations, to prevent the devastating effects of which some extensive embankments have been raised on its left bank. Still the river, when swollen, frequently does much damage, as was fully evinced in the autumn of 1840, when the inundations carried away some of the bridges, laid a considerable portion of Lyons, and of the surrounding country, under water, and occasioned great damage. There were previously 10 bridges within the city, 3 of which crossed the Rhone. These were the *Pont de la Guillotière*, originally built in 1190, 539 yards in length by 24 feet wide, with 17 stone arches, but of these only 8 are over the water; the *Pont Morand*, constructed of wood in 1774, 228½ yards long by 14 wide; and between the two the *Pont Lafayette* (formerly *Charles X.*), a handsome bridge, 235 yards in length, the piers of stone, and the upper part of wood. The bridges over the Saône vary in length from 120 to 140 yards; the principal is the *Pont de Tassin*, leading from the centre of the city, a stone bridge of 5 arches, 130 yards long by 15 wide, erected at a cost of 3,000,000 fr., or 120,000*l*. sterling. (*Hugo*.) Lyons has 55 places or squares, some large and regular, but, as may readily be inferred from their number, the great majority are very much the reverse. The *Place Bellecour* (formerly *Louis-le-Grand*), one of the largest and handsomest in France, and perhaps in Europe, in the very heart of the city, has two of its sides nearly 340 yards in length, the two others measuring 246 and 218 yards. One of the principal streets forms part of its N. face; its two shorter sides consist of symmetrical ranges of handsome buildings; and on its S. side is a fine plantation of linden trees. This square is ornamented with an equestrian bronze statue of Louis XIV., and forms, with the quays, the favourite promenade of all classes. The *Place Louis XVIII.* leads into the *Cours du Midi*, a broad and fine thoroughfare, planted with trees, which separates the city from the new town of *Perache*. The other principal squares are the *Place des Terreaux*, containing the town-hall and *Palais des Arts*; *des Cordeliers*, with a fluted column upwards of 60 feet in height, supporting a colossal statue of Urania; *de Comédie*, in which is the entrance to the *Grand Théâtre*; *Sathonay*, the *Place Louis XVI.* In the *quartier des Brotteaux*, &c. In the N. part of the city a covered arcade has been formed, called the *Galeries de l'Arcade*, nearly 500 feet in length, and containing many good shops. Lyons is supplied with water from the Rhone, and has numerous public fountains, but none worth notice.

The town-hall holds the first rank among the public buildings. This edifice, the finest of its kind in France, was erected between 1646 and 1655. It has a front nearly 160 ft. in width, flanked with a square tower and dome at either end. Its balustrade is ornamented with two large statues of Hercules and Minerva, and in the centre is a clock tower, surmounted by a cupola, which rises to the height of 157 ft. above ground. The depth of the building is 383 yards, at the end of which another handsome front faces the *Place de Comédie*. Its interior contains a vestibule, in which are two colossal bronze groups emblematical of the Rhone and Saône; a fine staircase, and a saloon, 87 ft. long by 40 wide, which formerly contained many fine paintings, destroyed during the Revolution. Of the 18 churches, none is very remarkable either for size or elegance. The cathedral of St. John, on the right bank of the Saône, was begun in the 7th century, but not completed till the reign of Louis XI. It is a Gothic edifice, having at its four corners, 4 heavy square towers, in one of which is a bell, weighing 35,000 French lbs. The W. entrance is very much ornamented; in the interior is characterised chiefly by simplicity. In this church is a remarkable clock, constructed at the end of the 16th century by a native of Basle, which formerly indicated besides the year, month, day, hour, minute, and second, the sun's place, the phase of the moon, and the saints' day, as they occurred. This curious piece of mechanism has been suffered to fall into decay. The church of *Ainay*, erected on the site of an ancient temple dedicated to the emperor Augustus, has 4 granite co-

lunns and a bas-relief, originally forming parts of that edifice. Several of the churches date from the time of Charlemagne. Here is also a Protestant church and a synagogue.

The hospitals are the largest public buildings in Lyons. The *Hôtel-Dieu*, the most ancient and finest establishment of its kind in France, was founded by Childelbert and his queen at the beginning of the 6th century: the present edifice consists of a continuous range of building, extending along the Rhone. It has a noble front, a fine entrance, and two domes, which, as well as the distribution and arrangements of its interior, are generally admired. This establishment receives annually 12,000 in-patients, besides affording medical aid to many persons without its walls. The *Hospice de la Charité*, also on the banks of the Rhone, apparently occupies little less space than the former, and is an asylum for 400 infirm persons of both sexes, besides many orphans, foundlings, and women *enceinte*. The *Hospice de l'Antiquaille*, for syphilitic and insane patients, stands on the hill of Fourvières, on the site of the Roman palace in which the emperors Claudius and Caracalla were born. The *Hospice de la Providence* has established numerous schools of instruction with the view of checking mendicity, &c.

The prefecture occupies a spacious building, formerly a Dominican convent; its interior is well adapted to its present purpose, and attached to it are some fine gardens. The hall of justice, and the archbishop's palace, present little deserving of notice. The *Palais des Arts*, formerly the Benedictine convent of St. Pierre, consists of a large pile of building, enclosing a square court: different portions of this edifice are devoted to the exchange, and chambers of commerce, the museums of painting, antiquities, and natural history, a cabinet of medals, gallery of casts from the antique, *dépôt* of machinery for the silk manufacture, the academy, schools of drawing and natural history, society of agriculture, &c. The collection of paintings comprises some works of great excellence; and that of antiquities is rich in Roman and middle age specimens of art found in and about Lyons, mosaics, and Egyptian antiquities. The public library, and library of Adamy (so called from having been presented by a citizen of that name), are deposited in the royal college, and together comprise 100,000 vols. (*Hugo*), among which are some valuable oriental works, an old MSS. The prefecture, mint, grand theatre (an elegant structure), theatre des *Célestins*, court of justice, archbishop's palace, new prison, *condition*\*, salt-magazine, &c., are among the other chief edifices. The botanic garden is situated within the city, and is a favourite place of public resort. About 1½ m. above Lyons is the beautiful *île Barbe* in the Saône, connected with its left bank by a handsome new suspension bridge.

**Manufactures and Commerce.**—Lyons is in France what Manchester is in England. And notwithstanding the active competition of Zurich, Basle, Crefeld, and other places on the Continent, and of Coventry, &c., in England, she still maintains her rank as the first silk manufacturing city of Europe. Her position is peculiarly favourable: she is situated at the point of junction of two large navigable rivers, and has a ready communication with the Mediterranean on the one hand, at the same time that she is the *entrepôt* of a vast extent of inland country. The districts of France which produce the largest quantities of silk, are immediately adjacent, while Lyons is the natural *dépôt* and place of transit for the silk of Italy, in its way to the great manufacturing countries. Added to which, the manufacture has here had, for centuries, its principal seat: the pop. have been thoroughly trained and habituated to it; so that, though frequently disturbed by political events, and once or twice nearly annihilated, it has never failed, on tranquillity being restored, to return to its former locality. The silks manufactured here, are distinguished by the equality and perfection of the fabric; the brilliancy, though perhaps not the durability, of their dyes; and by the unrivalled superiority of their patterns, and the taste displayed in the designs. This superiority has been ascribed, with what justice we shall not stop to inquire, to the School of Arts (*Institution de la Martinière*), and the liberal encouragement of this branch of science by the city authorities, and the government. About 180 students are gratuitously instructed in the various branches of drawing and modelling, and there is a professor, who teaches the *"mise en carte,"* that is, the adaptation of designs to the loom. The trade of Lyons, like that of all manufacturing towns, is subject to frequent crises, and periods of distress: a very serious one occurred in 1836-37, which led to formidable riots. But though many workmen implicated in the insurrections have settled in the rival towns of Switzerland, &c. there never, perhaps, were so many looms at work as at present, nor was the manufacture

ever more flourishing. The gross produce of the Lyonnese looms, in 1838, was estimated at 135 millions of francs, being considerably more than half the estimated value of all the silk goods manufactured in France. (*See FRANCE*, Vol. I. p. 857.)

According to M. Villermé, there were, in 1833, in Lyons and its neighbourhood, 40,000 silk looms; 17,000 in the city-proper, 9,000 in the suburbs of la Croix Rousse, la Guillotière, and Vaise, 6,000 in the neighbouring parts of the *départ.* Rhone, and 8,920 in the adjacent parts of Loire, Saône-et-Loire, Ain, Isère, and Drôme. Dr. Bowring was furnished with an estimate in 1834, which made the number of looms in the city 16,000, of which 4,000 were for figured stuffs; in the suburbs 3,000, half for figured silks; and in the country, for 12 or 15 leagues round, 7,000, almost wholly for plain silks: making in all 32,000 looms. According to an official estimate in 1835, the master weavers (*chefs d'atelier* or *maitre-ouvriers*) in Lyons and its suburbs amounted to about 8,000; and the journeymen, or *compagnons*, to 30,000; in all, 38,000 weavers: but the *compagnons* include the wives and children of many of the master weavers. The number of individuals employed in accessory occupations, that is, in the culture of silk, the manufacture of looms, &c., cannot be ascertained; but it has been estimated by M. Villermé and M. Giroud de l'Ain at from 27,000 to 30,000. Hugo says that, altogether, 80,000 persons in or about Lyons are supported, directly or indirectly, by the silk manufacture.

Silk weaving at Lyons is not conducted in large buildings or factories belonging to the silk merchants (*fabricans*)†; but on the domestic system, in the dwellings of the master weavers, each of whom has usually from 2 to 6 or 8 looms, which, with the greater portion of their fittings, are his own property. Himself and his family keep as many of these looms at work as they can, and employ *compagnons* for the remainder. The latter are not settled in Lyons; but visit it, and stay a longer or shorter time according to the demand for their labour. Apprentices and *lanciers* make up the remainder of the working classes. The former are usually apprenticed from the ages of 15 to 18; the latter are children from 9 to 14, who prepare bobbins, and weave fabrics demanding less skill than others. About 3-7ths of the looms are wrought by master weavers, nearly an equal number by *compagnons*, and the remaining 7th by apprentices and children. The *fabricans*, or silk merchants, of whom there are between 500 and 600 in Lyons, supply the patterns and silk to the owners of looms, to whom is entrusted the task of producing the web in a finished state. Half the wages paid by the silk merchants go to the owner of the loom, and half to the labouring weaver. A master weaver may gain by his own labour from 2 to 3½ fr. a day; and he who has 3 looms is supposed to receive from the two at which he does not himself work, about 900 fr., or 36l. a year. His rental may be about 150 fr.; the cost of lodging his two journeymen 80 fr.; and there remains besides his own labour a surplus of 670 fr. Those weavers are, of course, the most prosperous, who have 3 or 4 looms, employ their children to weave on them, and thus receive the whole wages paid by the manufacturer. 3 looms will clear to a family from 1,500 to 1,600 fr. (60 to 64l.) a year.

Wages have risen considerably of late years. In 1838, the price per ell paid for common plain velvets was 54 fr., for *gros de Naples* 60 to 90 c., and for common figured silks from 1 to 1½ fr. A master weaver who made 2 fr. a day in 1834, could make at least 2½ fr. in 1838; and the journeymen need never earn less than 1fr. 75 c., and may frequently get 2 fr. The hours of work usually vary from 12 to 16 hours; but when the demand is brisk, they reach to 16, 18, and even 20. The weaving pop. is ill lodged, the master weavers generally having but two rooms at most, and these kept in a disgracefully filthy state. But they live very well; that is, they have abundance of nourishing food, much more than the pop. of other manufacturing towns in France. Most of the journeymen are boarded by their employers at from 45 to 50 c. a day; and have about 1½ lb. of good bread, a litre of wine, a dinner of soup, butchers' meat, &c., with cheese or salad at supper. They rarely save money, and few of the *compagnons* raise themselves to become *chefs d'ateliers*. The weavers, speaking generally, are very ignorant; some years since not 1-4th part of the children in Lyons could read or write. But after all, according to M. Villermé, there is less prodigality in Lyons than in many other of the French manufacturing towns. (*See Villermé*, 1,365 60.) The proportion of illegitimate to the total number of births in 1835 was indeed as high as 1 in 3; but, in point of fact, a good many of the connections out of which these births arise are really but little different from matrimonial connections. The weavers, to escape the *octrois*, frequently visit the *cabarets* beyond the barriers,

\* This is an establishment where, by the agency of heat, the unwoven silk is relieved of its equable weight and dryness. In 1837, the weight of silk, submitted to this *condition*, amounted to 500,505 kilogrammes.

† There is one exception: on the bank of the Saône, opposite the *île Barbe*, is a factory called *la Sauvagerie*, employing from 400 to 500 hands, who may sleep in the building on payment of 30 sous a month, and board there also at a low rate.

to drink their wine, play billiards, &c., on Sundays and Mondays; but they are not addicted to intoxication or rioting, and it is affirmed, and we believe truly, that they are at present improving in morals, manners, and cleanliness; and certainly they have much room for amendment. Notwithstanding their good wages and liberal supplies of food, the best French authorities admit that the Lyonsese weavers are physically an inferior and degraded race, remarkably subject to scrofulous and scorbutic complaints, spinal diseases, and rheumatism; and according to M. Charles Dupin, half the young men in Lyons liable to military service are exempted on account of weakness, deformity, or deficiency of height, though the standard for recruits or conscripts in the French is considerably below what it is in the English army. (See Vol. I. 864.)

Happily, however, the upper and middle classes of Lyons, the latter comprising most part of the shopkeepers, and many of the master weavers, are eminently comfortable, rich, and thriving. Mr. Maclaren states that there are three times more villas round Lyons than round Paris; and the number of private and public works erected in and near the city during the last 20 years sufficiently evince the rapid increase of wealth and enterprise. The want of coal is the greatest obstacle to the improvement of the manufactures of the city, and to the extension of its industry. But despite this disadvantage, Mr. Maclaren states that the district of which Lyons is the centre is "advancing with great strides." (P. 36.)

Lyons has numerous dyeing establishments and printing offices, and manufactories of jewellery, liquors, &c.; but all these are insignificant compared with its chief branch of industry. It is the seat of a royal court, of tribunals of primary jurisdiction and commerce, a chamber of commerce, one of the five royal libraries of the kingdom, a university, academy, royal college, and academy of sciences, &c.; and has schools of theology, medicine, veterinary medicine, and rural economy; a royal society of agriculture, &c.; societies of medicine, jurisprudence and literature, a Protestant Bible society, deaf and dumb asylum, a *mont-de-piété*, savings' bank, maternity, and many other charitable institutions.

The early history of Lyons is involved in much obscurity. But it appears certain, from the statement of Dion Cassius, that Minutius Plancus, about *anno* 40 n. c., settled in it fugitives from some adjoining towns. (lib. xli.) Augustus made Lugdunum the cap. of a prov., and being embellished and enlarged by succeeding Roman emperors, it became one of the principal cities of the Roman world. The old city was principally built on the hill of Fourvières, which, in fact, is merely a corruption of its ancient name of *Fourm' Vetus*. (*D'Anville, Notice de la Gaule*, p. 123.) Among the Roman antiquities which still exist at Lyons, are the remains of a aqueduct, several cisterns, a theatre, traces of a palace, and a naumachia, recently discovered within the limits of the botanic garden.

From the 5th to the 13th century, Lyons belonged successively to the Burgundians, Saracens, Franks, its feudal archbishops, and its municipal council. In 1312 it was annexed to the crown of France; and in the same century, owing to the immigration of many merchants from Italy, it began to be distinguished by its manufactures. It suffered much during the religious wars of the 16th century; but far more from the revolutionary frenzy of 1793. Its ancient fortifications were then destroyed; but it has been since enclosed on the N. by a line of earth ramparts. Among the distinguished individuals, natives of Lyons, were, in antiquity, the emperors Claudius and Caracalla, and Sabinus Apollinaris; and, in modern times, Jussieu, the botanist; J. B. Say, the economist; Jacquard, the inventor of the loom which bears his name; Degerando, the author of the able and elaborate work *Sur la Renaissance Publique*, &c. (*Hugo, arts. Rhone, Lyons*; *French Official Tables, Bouring and Synodal Reports*; *Villermé's Tableau Physique et Moral des Ouvriers*; *Inglis*; *Maclaren*, &c.)

## M.

**MAAD** (*Hung Madan*), a town of Hungary, co. Zemplin, in the Hegyalja mountains, about 6 m. N.W. Tokay. Pop. 5,640, partly Lutherans and partly R. Caths. It is one of the places at which the Tokay wine is grown in the greatest perfection, and near it is the imperial vineyard of Theresienberg.

**MAASSLUIS**, or **MAASLANDSLUIS**, a town of S. Holland, on a branch of the Maas, 9 m. W. by N. Rotterdam. Pop. 4,500. It has manufactures of sailcloth, cordage, leather, &c., and some building docks; and its inhab. take an active share in the herring and cod fisheries.

**MACAO**, a sea-port town and settlement of the Portuguese in China, prov. Quang-tong, on a peninsula pro-

jecting from the S.W. corner of the island Macao, on the W. side of the estuary formed at the mouth of the Tigre or Canton river, 84 m. S. by W. Canton; lat. 22° 11' 30" N., long. 113° 32' 30" E. The pop. is stated in the "Chinese Repository" to amount to upwards of 30,000; but we incline to think that 20,000 is nearer the mark, of whom about 15,000 are Chinese, and the rest chiefly Portuguese and slaves imported from Timor, &c.

The peninsula on which Macao stands is less than 2½ m. in its greatest length from N.E. to S.W., and not 1 m. in its greatest breadth. It is connected with the rest of the island by a long, low, and sandy neck, in one part 400 yards broad, but generally less. Across this isthmus a wall is erected, having in its middle a gate and a guard-house, called *Casa branca*, for Chinese soldiers; by means of which barrier, all communication between the peninsula and the rest of the island is cut off at the pleasure of the Chinese authorities. The Portuguese inhab. of Macao are rarely permitted to pass beyond this wall. The town has a very imposing appearance from the sea. It is built chiefly on the declivities of two hills, meeting each other at a right angle, in front of a small semicircular bay forming the harbour. A handsome row of houses faces this bay, with a parade in front embanked with stone to resist the encroachments of the sea, and interrupted once or twice by granite quays with steps leading down to the water. Behind this terrace the houses are arranged in a confused manner, and the gable ends of European residences and the steeples of the churches appear curiously intermixed with Chinese houses and temples. Macao has 12 churches, one of which, that of St. Joseph, is collegiate. There are few other edifices of any note. A spacious senate-house, in the heart of the town, forms a termination to the principal street. The Portuguese governor's residence, near the landing-place, is likewise remarkable, and the contiguous English factory is a plain commodious building. The Chinese live chiefly together in the central and back parts of the town, and along the inner harbour; some of them have well furnished shops, and they principally supply Europeans with provisions. Besides the college of St. Joseph, there are in Macao a royal grammar-school and several other Portuguese schools, a female orphan asylum, and other charitable institutions. It is defended by 6 forts, two of which are placed on a lofty height at either end of the harbour, and it is usually garrisoned by about 400 Portuguese soldiers. At one extremity of the town is a mansion called the *Casa*; in the grounds belonging to which is the celebrated cave of Camoens, sheltered on one side by a lofty rock, and on the other by a grove of lumbos, above which a tower commanding a fine view has been erected. In this sequestered retreat Camoens is said to have composed great part of the *Lusiad*, while holding the office of Portuguese judge at Macao. The land immediately without the town is fertile, and is appropriated to vegetable gardens and rice-ground.

The harbour is on the W. side of the town, between it and Priests' Island, a small circular island, which formerly belonged to the Jesuits; but it has not depth enough to admit large ships, which accordingly anchor in the roads on the other side of the peninsula, from 5 to 10 m. E. of the town. All foreign vessels coming into the roads send their boats to the custom-house and pay a duty for all goods landed, however trifling. When a ship arrives among the islands, she is generally boarded by a pilot, who reports to the Chinese custom-house officer the nature of her cargo, and obtains a *chop* or permit allowing her to enter the Rague or Bocca Tigris, with the understanding that she has nothing on board that is contraband. All females must, however, be landed at Macao, as the ship will not be allowed to proceed to Whampoa with them on board. The Chinese regulations do not allow any vessels, except such as belong to Portuguese or Spaniards, to trade at Macao. But the Portuguese inhab. hold the name for a trifling consideration to such foreigners as wish to be associated with them for the purpose of trading from the port; and vessels of other nations seldom experience any difficulty in obtaining the connivance of the Chinese officers to the landing or receiving of goods in the roads by means of Portuguese boats. Vessels of other nations, if in distress, and not engaged in the contraband trade, are admitted into the harbour for repair, on application to the senate. The latter is composed of the bishop, the chief justice, the military commandant, and several of the chief Portuguese inhab.; but a Chinese mandarin has substantially the supreme authority in the town. Except during the period of the year when the merchants of Canton are obliged to leave that city and repair to Macao, the latter is said to be dull and uninteresting. At that season, however, the carnival is celebrated with more than its usual sumptuousness in Catholic countries; and balls, masquerades, and concerts follow each other in rapid succession. Macao was given to the Portuguese by the Chinese emperor in 1586, in return for assistance afforded by them against pirates that had infested the

coast. (*Hamilton's E. I. Gaz.; Commerce. Dict.; and Private Information.*)

MACASSAR. See CELEBES.

MACCLESFIELD, a large manufacturing town, par. and mun. bor. of England, co. Chester, locally situated in Prestbury div., of the hund. of its own name, on the Bollin, 16 m. S. by E. Manchester, and 143 m. N. N.W. London. Pop. of par. bor., which includes, with the old bor., parts of the townships of Huddersfield and Sutton, nearly 30,000 in 1831; and at present the pop. is estimated at 40,000. The town, which is pleasantly situated on a slope near the borders of Macclesfield forest, has greatly increased in size during the last 20 years, and is now about 14 m. long by 1 m. in breadth, consisting of one principal thoroughfare on the London road, crossed by two others leading to numerous subordinate streets. The buildings, in the more conspicuous parts of the town, are of superior construction; the streets also are well lighted, and the inhabs. have plentiful supplies of good water, conveyed from springs in the adjacent hills. An open market-place, with excellent shambles, and a covered corn-market, stand near the centre of the town; and the newly erected town hall is a commodious and handsome building, tastefully decorated, and containing, besides courts of justice, offices, &c., a large assembly and concert room. The old church is a large structure, partly Gothic, with a handsome tower, formerly surmounted by a lofty spire; it was originally erected by Edward I. in 1278, but has, at different times, been almost rebuilt, so that no parts of it can lay claim to any great antiquity. It affords accommodation for about 1,700 persons, and has an adjoining chapel containing several interesting monuments; the living is a perpetual curacy, till very lately in the gift of the corporation, but now in private patronage. Christ-church was erected, in 1775, at the private expense of Charles Roe, Esq., who endowed it with 100*l.* a year: it is a regular building, with a neat tower, having, in the interior, an elegant marble monument of the founder, by Bacon. Trinity church, in Huddersfield, a very recent erection, is beautifully situated on an eminence, and may accommodate about 900 persons. St. George's in Sutton (built in 1822) has accommodation for 1,500, and in the S. suburbs of the town, is a fifth church, remarkable for its neat construction, and light spire. There are also several places of worship for Wesleyan Methodists, and other dissenters. A free grammar-school, originally founded in 1502, was endowed by Edward VI. with property then producing only 2*l.*, but now estimated at 1,300*l.* a year, and rapidly increasing in value. A head and under-master, who have salaries of 300*l.* and 175*l.* a year (the former having a house and school-field, free of rent and taxes), give instruction in classics, elementary mathematics, history, geography, &c.; the average number of scholars being about 60. This school enjoys certain advantages at its various College, Oxford, and it has been proposed to set aside a portion of its property to found 4 exhibitions of the annual value of 50*l.* each, tenable for 4 years at any college either in Oxford or Cambridge. The wishes of the trading classes have likewise been consulted by the very recent establishment of a separate school, called the "Modern Free School," endowed with 350*l.* a year, and furnishing good instruction in those branches of knowledge best calculated to enable the scholars to carry on the trades, and support the commerce of Macclesfield. A charity school, national school, and several Sunday schools, with others maintained by voluntary subscription, furnish instruction to the children of the poor; and there are almshouses, various penny charities, a dispensary, lying-in charity, and provident society.

"The silk manufacture of Macclesfield affords employment to the largest part of the pop.; a few, however, are employed in the cotton factories that have been lately established. This place participated deeply in the general distress occasioned by over-trading in 1825, and for several years subsequent to that period the silk trade was in a most depressed state. The effects of that shock, however, seem at length to have subsided, and business has resumed a healthy aspect." (*Mun. Board. Rep.*) The trade has greatly increased since the date of this report, but is subject, more than other branches, to sudden shocks, productive of great distress to the working classes. There were at work in the par. of Prestbury (and chiefly in Macclesfield and its immediate vicinity) in 1839, 16 cotton mills and 48 silk-mills, employing 10,863 hands. The wages of the work-people employed in these mills vary, at present (1841), from 2*s.* 6*d.* to 1*s.* a week. About 4,500 hand-loomers are engaged in weaving silk fabrics, chiefly silk handkerchiefs and scarfs of every description, sacqueets, Persian, silk-ferret, and gailloom, with a new class de-Naples, giving employment altogether to about 9,000 persons, whose wages amount to from 6*s.* to 1*s.* a week; but there are a few industrious and expert weavers, who earn weekly as much as 2*s.* when in full work. The cotton manufacture, which was

introduced only a few years ago, is in a thriving condition, employing a pop. of about 3,000 in factories only; and hat-making is carried on to some extent. Numerous mechanics, makers of machinery, &c., depend indirectly on the staple trade of the town. The Bollin turns several mills, and the neighbourhood furnishes abundant supplies of excellent coal. Stone and slate also are quarried near the town, and form a considerable object of trade with the surrounding districts. The transit of heavy goods is facilitated by the Macclesfield canal, which connects it N. and S. with the great canal lines of England. There are two private banking establishments, with a savings bank. A newspaper is published weekly, and there is a good news-room.

Macclesfield, which was incorporated by a charter of Prince Edward, son of Henry III., and subsequently by various sovereigns of England, has been divided by the Mun. Reform Act into 6 wards, and is now governed by a mayor and 11 other aldermen, with 36 councillors. Corp. revenues in 1839, 2,551*l.* It enjoys also a commission of the peace, with petty sessions, under a recorder. This important manufacturing town had no voice in the legislature, till the Reform Act conferred on it the privilege of sending 2 members, to the H. of C. Registered electors in 1841, 894. Macclesfield is also one of the polling places for the N. division of Cheshire. Markets on Tuesday and Saturday: cattle, wool, and cloth fairs, May 6, June 22, July 11, Oct. 6, and Nov. 11. (*Parl. Reports, &c.*)

MACERATA, a city of Central Italy, Papal States, cap. deleg. of same name, on a hill between Chieti and Potenza, 21 m. S. by W. Ancona, and 170 m. N.E. Rome. Pop. in 1832, 15,600. It is well built, surrounded with walls, and entered by 6 gates. In the centre of the town is an irregular open space ornamented with several good buildings, including the cathedral, the palace of the delegate, and the theatre. Including the cathedral, there are 7 churches, in one of which are some good paintings, 13 convents, several literary associations, and a secondary university for theology, philosophy, and medicine, founded by pope Leo XII. in 1824. This city presents nothing antique, and its most interesting feature is the fine view it commands of the Adriatic, and occasionally of the mountains of Dalmatia.

"Macerata," says Forsyth, "contains a number of palazzi, and therefore aswain of provincial nobility. The peasants observe an established uniformity of dress, of which orange appears the prevailing colour. So constant are the women of this class to local costume, that the female head becomes a kind of geographical index. At Macerata they adhere to the ancient mode of plaiting and coiling the hair, which they transfix with long silver wire tipt at both ends with large knobs, evidently the antique *acus crinalis*—

"Figit as ut tortis sineuque comas."

MART.

Macerata is a bishop's see, and the seat of a court of appeal for the delegs. Macerata, Camerino, Ancona, Ascoli, Fermo, and Urbino. Its manufactures and commerce are insignificant. Under the French, Macerata was the cap. of the dep. Musone. About 2 m. to the N., on the Potenza, are the remains of a theatre of considerable size, with vaults and foundations of other edifices, supposed to indicate the site of *Helvia Ricina*, colonised by Septimius Severus, and destroyed by the Goths. (*Travels. Ital.* p. 320; *Rampoldi.*)

MACHYNLETH, a market town and par. bor. of N. Wales, co. Montgomery, near the Dyfi, 30 m. W. Montgomery, and 175 m. W.N.W. London. Area of par. bor. about 500 acres. Pop. of the town in 1831, 858. Machynlleth is an ancient, well-built town, superior to most in N. Wales for cleanliness and respectability, the streets being remarkably broad and regular. The town-hall, a plain building, was erected by the Wyn family, in whom the manor is vested; the co. sessions are held alternately here and at Montgomery, and the magistrates sit here occasionally in petty sessions for the hundred. The church, a handsome structure, was rebuilt in 1827; the interior is conveniently fitted up, and the W. tower is embattled, and surmounted with crocketed pinnacles. There are places of worship for Independents, Calvinists, and Wesleyan Methodists, with attached Sunday schools, and a well-endowed national school furnishes instruction to poor children of both sexes. There is also a savings bank. "The flannel trade has long existed at Machynlleth, being chiefly carried on at farm-houses: the fabrics are sent for sale to Newtown. Weavers' wages (when on full work) vary from 7*s.* to 9*s.* a week, and with respect to their moral condition, it is remarked as being much higher than that of operatives in general, in other districts, but yet not better nor worse than that of the labouring classes generally in the par. The truck system is partially practised in this vicinity, being fostered by the impvidence of the weavers, few of whom make any provision for emergencies. The prices of provisions are as follows:—flour 1*s.* for 5 lbs., potatoes

2s. for 40 quarts, mutton 5d. per lb., bacon 9d., butter 11d., and oatmeal 2d. per lb. This town formerly possessed an excellent shipping trade, and was, in fact, the port of Montgomery; but since the canal was brought to Newtown, and facilities were opened direct between Wales and the commercial districts of England, the carrying trade is in barges, and few ships now come to Machynlleth." (*Hand-loom Weavers' Report*, part 5.) This bor. unites with Montgomery and others in sending 1 mem. to the H. of C. Registered electors in 1839-40, 78; ditto in the entire district, 1,021. Machynlleth is celebrated in the history of the principality as the place in which Owen Glendwr, in 1402, convoked a parliament, where he was inaugurated Prince of Wales.

MACON (an. *Matiscus*), a town of France, dép. Saône-et-Loire, of which it is the cap.; on the Saône, here crossed by a bridge of 13 arches, 38 m. N. Lyons; lat. 46° 18' 27" N., long. 4° 50' 8" E. Pop. (1836), 11,544. It is pleasantly situated, but is generally ill built; the streets are narrow, crooked, and paved with rounded pebbles, painful to walk upon; the squares, though clean, are mostly small, and destitute of ornament; and the houses, though mostly of stone, are *tristes et mesquines*. It was once partially fortified, but the works were never completed, and they are now laid out in public walks. A handsome quay borders the Saône, and is continuous with a planted promenade at either extremity. The ancient *hôtel de Montreuil*, now occupied by the town hall, theatre, and public library, with 9,000 vols.; the general hospital, two *hospices*, some of the churches, the prefecture, and the new prison, are the chief public buildings. Maçon is the seat of tribunals of primary jurisdiction and commerce, a communal college, schools of mutual instruction and linear design, and of a society of agriculture, arts, and *belles lettres*; and has manufactures of coverlets, clocks and watches, copper and earthenware, pump machinery, barrels, &c. But Maçon is principally dependent on its wine trade. The same chain of hills that overhang the rich vineyards of the Côte d'Or extends through the dep. of the Saône-et-Loire, and the part of the dep. of the Rhone called the Beaujolais. But whether it be from some difference of exposure or of soil, or other unknown cause, the wines produced in the district now mentioned are, though in many respects excellent, inferior to those of the Côte d'Or. In commerce the wines both of the Maconnais or district round Maçon, and of the Beaujolais, are known by the name of Maçon wines, from Maçon being the emporium where they are mostly sold. They are strong and durable, *corde, spiritueux, quelque fois trop fumeux, et toujours agréables* (*Julien*); and in general may be regarded as ranking next to the Beaune wines. The best growths are those of Torins, Romanèche, Chenas, and Pouilly. (*Henderson on Wines*, p. 166.) Many Roman antiquities have been found at Maçon, and the ruins of its cathedral, destroyed during the revolutionary frenzy in 1793, form a very picturesque object. On the opposite bank of the Saône is the flourishing suburb of St. Laurent, the seat of a large corn-market. (*Hugo*, art. *Saône-et-Loire*; *Dict. Géog.*, &c.)

MACQUARRIE RIVER. See AUSTRALIA, Vol. I. p. 222, 223.

MACHROOM, an inland town of Ireland, co. Cork, prov. Munster, on the Sullane, 20 m. W. Cork. Pop. in 1831, 2,058. It is a poor, mean place, consisting of a single street, mostly of cabins. It has a par. church, a R. Cath. chapel, a large school, a court-house, market-house, and a constabulary barrack. A manor-court for the recovery of debts to the extent of 2*l.* is held every three weeks. General sessions are held in Dec., and petty sessions on alternate Tuesdays. Markets on Saturday. Post-office revenue, in 1830, 226*l.*; in 1836, 235*l.* Near the town is a large cavern, the interior of which has not been thoroughly explored.

MADAGASCAR, a large island of the Indian Ocean, off the E. coast of Africa (from which it is separated by the Mozambique Channel), between lat. 12° 2' and 25° 40' N., and long. 44° 20' and 51° 30' E. Length, 930 m.; average breadth, 300 m. Area estimated at about 234,400 sq. m., being somewhat greater than that of France. This country, of which only a few years ago we had scarcely any knowledge, has recently been visited and explored by missionaries and other travellers; so that we now possess very satisfactory information respecting the island and its inhabitants. The coast is generally flat and low; but the interior is considerably diversified, and, though it is not traversed by any continuous chain, many parts, especially the E., N., and S. districts, may be called mountainous, the highest point, Ankaratra, in lat. 19° 40' N., long. 47° 20' E., is about 11,000 ft. above the sea. These mountains consist of granite, sienite, and quartz, covered in the lower parts with clay-slate, primitive limestone, and old red sandstone; volcanic rocks occur in several places, and coal strata, abounding with iron, are widely distributed through the island. Rock-salt and nitre occur near the coast; and iron pyrites, oxide of manganese, and plumbago, have

been found in some districts. The rivers of Madagascar are numerous, and many of considerable size, the greater number flowing into the sea on the W. side; but most of them are choked with sand, have frequent falls and rapids, and are almost entirely unnavigable. There are likewise numerous lakes, not only in the central parts of the island, but also in the low alluvial districts near the sea, some of which are remarkable for their size and beauty. The most fertile parts are the valleys, most of which produce rice or other vegetables, or else are clothed with a rich and luxuriant verdure. The climate of Madagascar is extremely diversified; that of the coast being oppressively hot, while in the interior the temperature seldom exceeds 85° Fahr. The heat at Antananarivo, the cap., fluctuates between 40° and 85°; the middle of the day in summer is often extremely sultry, but the mornings and evenings are always pleasant. From May to October (the winter months of this island) the ground is often covered with hoar-frost, and the heat seldom exceeds 44°. At other seasons, however, the fluctuations between heat and cold are extreme and sudden, the temperature in the morning being seldom more than 40°, whereas, in the same day, the afternoon heat often exceeds 80°. The climate of Madagascar is extremely prejudicial to Europeans, in consequence chiefly of the effluvia rising from stagnant lakes and swamps near the coast; but in the central parts, and especially in Ankoava, the metropolitan prov. of the island, the marsh-fever does not exist. The weather on the coast is usually hot and damp or rainy; but in the interior the rains are periodical, in a great measure regulating the divisions or seasons of the year. The trade winds from the E. and S.E. prevail during the greater part of the year; but the rains are often accompanied by violent gales from the N.W., W., and S.W. Earthquakes are occasionally felt, and the capital has more than once suffered considerable damage from such visitations.

Among the animals peculiar to Madagascar, may be mentioned five varieties of the monkey, foxes, wild dogs and cats, hogs, goats, a peculiar kind of cattle and sheep similar to those of the Cape of Good Hope; crocodiles swarming in nearly all the rivers and lakes, and are objects of great dread to the natives; serpents, also, some of large size, abound in the woods, and lizards, scorpions, and centipedes, are very numerous and troublesome. Birds also, of various kinds, are found in the forests, the principal of which are the parouet, flamingo, falcon, kite, turtle-dove, pigeon, turkey, and different varieties of land and water fowls. The sea abounds with fish of various kinds, and oysters are numerous on the coast. The soil in many parts is prolific and highly susceptible of improvement, and the island produces numerous and highly valuable plants. The forests yield abundance of trees of varied durability and value; some used as dye-woods, others in building, with ebony, betel, mangrove, dragon-tree, bamboo, sugar-cane, locust-tree, *Urania speciosa*, caoutchouc tree, plantain, banana, zahava (*Bignonia articulata*), hiliscus, minosa, castor-oil plant, longozza (*Curcuma zedoaria*), cotton, indigo, and tobacco plants, allspice, pepper, ginger, turmeric, and rice. Various other vegetable productions have been introduced, such as the cocoa-nut, bread-fruit, yam, manioc, lemon, orange, peach, mulberry, guinea, fig, and pomegranate. Several varieties of the Cape vine have been found to thrive well, the coffee-plant has been brought from the Mauritius, and the potato is largely cultivated as well as highly esteemed; but the common European cerealia have met with little encouragement. The Flora of the country is abundant; but the brilliant aspect usual to the gardens of tropical countries is here missed, in consequence of the rapid alternations of heavy rains and extreme drought.

The husbandry of Madagascar, pursued by a distinct class, consists, in a great measure, of the cultivation of rice, which is conducted with great care and success. Seed time is in September; at which season the grain, after being steeped in water, and subsequently kept in a warm place till it begins to sprout, is very thickly sown in a fine mould, almost covered with water artificially introduced into the fields. The water is afterwards drained off, manure is thrown over the seed, and as soon as the sprouts appear above the surface, moisture is again applied. The average produce in inferior grounds is said to be about 50 for 1; but the best cultivated grounds are alleged to produce seventy and even one hundred fold, the harvest being in January and February. Each rice field is separated from those adjoining by banks rising about 6 inches above the field, and affording great convenience to the labourers. Neither waggon, cart, sledge, nor beast of burden, is used in getting in the harvest, and the threshing is conducted either against a stone, or on the floor, by simply beating the ears with the hand. The secure storing of the grain, however, is an object of special attention; the Ovahs, the prevailing tribe of the island, have underground storehouses, made with extreme ingenuity; but other tribes have granaries above ground, bee-hive shaped, about 16 ft. high, made

of thick, clay-built walls, and entered only from the top. Manioc is another great object of farming industry; it is raised from cuttings, and about 18 months elapse between the planting and harvest. The roots, usually about 10 inches in length by 3 in diameter, are prepared for use by scraping and boiling, and are sometimes made into cakes. Cotton is cultivated to a considerable extent; and the pigeon-pea (*cytius cajun*) is raised for the purpose of rearing silk-worms. The European cerealia have been introduced by the missionaries; the plough and harrow have likewise been brought into use, and oxen broken in to cultivate the ground; but the natives prefer their old and imperfect methods of preparing the soil, to the adoption of readier plans, and superior implements. Next to the cultivation of the soil, the working of iron is the most important occupation of the people. In some parts the iron ore is found in large quantities on or near the surface, whence it is gathered in baskets and smelted for use; but when it is dug out of the ground, numerous small pits are made about 6 ft. in depth, and no further attempt is made to explore the riches of the interior. The ore is first crushed, then broken into small pieces, and afterwards submitted to the action of a charcoal fire in a rude furnace of stone-work, built up to the height of 2 or 3 ft. without mortar, and thickly plastered with clay on the outside, the blast being obtained by means of wooden cylinders, in which a rude sort of piston is fitted to drive the air through a bamboo cane into the fire. The native forges are equally simple; the anvil, about the size of a sledge hammer, is fixed in the ground near the fire, the water-trough is close by, and the smith, when at work, squats on a piece of board while his attendants surround him, armed with large hammers, and ready to strike the metal according to his directions. The articles thus manufactured comprise spears and javelins, knives, hatchets and spades, chisels and hammers, a rude sort of plane-irons, files, pots, spoons, lamps, and nails; besides which they have been taught by the English to make hinges, screws, and locks, as well as to draw copper and iron wire. The manufacture of swords and firearms was introduced by the French a few years ago, and the native goldsmiths and silversmiths evince considerable ingenuity in making rings, chains, and other gold ornaments, silver dishes, mugs, spoons, &c. The felling of timber (which appears to be a monopoly of the government) employs about 700 men; the pit-saw has been brought into general use, and the native carpentry has been so much improved by the application of European tools, that their work may be justly styled "strong, neat, and well finished." (*Ellis*, vol. i. p. 317.) The art of turning wood is practised by the best workmen of the capital; earthenware is made with considerable skill and taste, and many hands are employed in making rope and twine, as well as in tanning leather. The chief occupation of the people, however, next to the cultivation of rice, is the spinning and weaving of silk, cotton, and linen fabrics, but all the processes are so extremely simple, imperfect, and tedious, that it is a matter for surprise that the threads of their cloth are even and well-twisted, the weaving regular, and the patterns regular, and exhibiting fancy and good taste. The art of dyeing is also practised, and several of the native dyes produce bright and durable colours.

The pop. of Madagascar consists of 4 chief political divisions, the numbers of which are estimated to be as follows:—

The Ovahs (in the central table-land)	800,000
Sakalavns (W. side of the island)	1,200,000
Betsileo (S. of the Ovahs)	1,500,000
Betaninana and Betsimasarka (on the E. coast)	1,200,000
	<hr/> 4,700,000

It is said, also, that this amount of pop. is considerably less than it was a few years back, owing chiefly to wars between the different tribes, the prevalence of the slave-trade, &c. It is also, supposed that the practice of infanticide, which is alleged to have prevailed from time immemorial, has contributed to reduce the population. But most probably the influence of this practice is greatly overrated; and it is evident it cannot at all account for the recent decrease. The inhabs. differ materially in appearance and character, nor is there any doubt, though the people are nominally comprised in one political empire, and speak one language, that they include several distinct and peculiar nations. The distinction of colour separates the pop. into two great classes, the Ovahs, and a few other tribes, having olive complexions, handsome features, graceful persons, and dark hair, whereas the inhabs. of the shore, and indeed the majority of the people greatly resemble the Papuas, being short and stout, almost black, with low foreheads, broad flat faces, large eyes and mouth, and long crisped hair. There are differences also in the languages spoken by various sections of the pop., and many of their customs vary so much, as to make it clear

that, however amalgamated, they are not one nation, but a combination of several distinct races. With the exception, however, of the Ovahs, they are little better than barbarians, run almost naked, despise a fixed life, are extremely superstitious, and practice most of the vices so generally prevalent among the savages of the neighbouring continent. Circumcision is universal, marriages are formed in very early life, and divorces are very common, and easily effected. The law permits polygamy, restricting the husband to 12 wives; but few have more than two, or at most three. Fidelity to the marriage-engagement, however, forms no part of the female character, and modesty is a virtue almost unknown. Their houses are usually of rude construction, except in the cap. of the Ovah country, where European improvements have been partially introduced. The diet of the people consists, in great part, of rice and manioc, with smaller portions of beef, poultry, &c., and the cookery is extremely simple.

Pedlary and hawking are favourite, though not profitable, occupations. The markets are favourite places of resort for all classes, and not only is there a daily general market at Tananarivo, but 4 or 5 large markets are held in different parts of the province, and well attended by a vast concourse of people from the adjoining districts. Animal and vegetable productions, native and foreign manufactures and cattle are exposed promiscuously; and in no nation are there more clever and persevering bargainers than in Madagascar. The slave-trade, also, which a few years ago was nearly extinct, is now said to be pursued on a large scale. Money has not been coined on the island: dollars are more or less known in all parts, through communication with Europeans; but the trade is more generally carried on by barter. Most goods are sold by measure: rice by the bushel, meat by the *eye*, snuff by the spoon, fuel by the bundle, &c. Rice, which may here be considered the standard of value, costs about 1s. a bushel; 20 ducks or fowls may be purchased for a dollar, geese cost about 9d. each, and a fine turkey may be got for 1s. A bullock costs from 3 to 8 dollars, sheep average about 1s. 6d. each, and 20 good pine apples may be had for 3d. Labour is also extremely low, many working for mere food, and others gaining only 2d., or at most 4d. a day. An intercourse has long been carried on with Madagascar by Arabs from Muscat, Indians from the presidency of Bombay, Europeans from the Cape of Good Hope, and Americans from Brazil and the United States. The taste of the people for foreign goods was also on the increase a few years ago; and horses, saddles and bridles, scarlet cloth, gold lace, red satin, purple, green, and yellow silk, silk handkerchiefs, sewing silk, calico and printed goods, hosiery, gloves, finger rings, watches and musical boxes, hardware, salt, and, above all, arrac and rum, fetched very high prices in the markets of Ankova; but since the death, in 1828, of Radama, the most enlightened monarch that ever bore sway in Madagascar, the foreign trade has greatly declined, and the policy of the present government seems to threaten the entire cessation of all trade with Europeans.

Madagascar is divided into 28 provinces, all of which have their separate chiefs; but for some years past the Ovahs have been reckoned the prevailing tribe, the chief of which is, in effect, the king of the island, receiving tribute from, and exercising sovereignty over, all the rest. The government is despotic, and the succession to the throne is commonly hereditary, the monarch having the right not only to appoint his immediate successor, but also to settle the line through future generations. He is the father of his kingdom, appoints every subordinate officer, enacts laws and orders their execution, decides cases and raises armies; but he often convokes assemblies of the people, for the purpose of obtaining information or advice on matters requiring mature deliberation, or in cases where the wishes of the aristocracy have to be consulted. The royal family is highly honored, and no people can be more tenacious of etiquette and the respect due to rank. The judges, who rank next to the blood royal, hear causes, decide disputes, and are exclusively privileged to communicate between the sovereign and people. Subordinate to these are the *farantana*, the police and tax-gatherers of the country; the *ambouin-jats*, or local magistrates; the *maroserana*, or military governors of provinces (a very powerful and important body; and the *radintany*, or royal courtiers, who not only carry government dispatches, but constitute a general patrol for the country. The king receives tithes of all produce, enjoys the monopoly of timber, and is exceedingly rich both in slaves and cattle, receiving also a considerable *ad valorem* duty from the possessors of these valuable articles. The sovereign is also high-priest of the realm, and presides over the great national sacrifices. The religion of the country is a rude species of polytheistic idolatry, and the people almost without exception believe in witchcraft and the efficacy of charms. Christianity was introduced with temporary success by English missionaries, in 1818—1830; but it is believed that at present

It is almost powerless, in consequence of the royal edict of 1835, which not only forbade its public profession, but legalised the persecution, and even enslavement, of all natives becoming its adherents.

Madagascar, the earliest accounts of which were given by Marco Polo, from the narrative of others, was discovered, in 1506, by the Portuguese, who established a settlement close to the S. end of the island, and soon after tried, though with little success, to introduce the Rom. Cath. religion. It was at first resorted to merely as a place of refuge and provisioning station for ships; but in 1642 an attempt was made by the French to make it one of their colonies, which however proved futile, in consequence of its extreme unhealthiness; and in 1664 most of the colonists removed to the neighbouring island of Bourbon. The Jesuits meanwhile continued to exert themselves in the establishment of Christianity; but owing to the injudicious zeal of Father Stephen, the superior of the mission in Madagascar, the natives were exasperated at the innovations of the foreigners, some of the missionaries were massacred, and the rest were glad to escape from the island. Various attempts have subsequently been made by the French to establish a permanent settlement, and since the general peace of 1815 they have formed four small colonies on the E. coast, as well as on the contiguous island of Madame St. Mary. The English missionaries were allowed to visit Madagascar in 1818—1825, with full permission to disseminate their moral and religious views, and the sovereign Radama was favourable to the establishment of schools and the introduction of improved methods both of agriculture and manufactures. Since his death, however, there has been a stagnation in the trade with England, the missionaries have been forbidden to approach the island, all possible means have been adopted to destroy the effects which the exertions of Europeans had accomplished in eight years, and Madagascar may now be ranked among the barbarous countries of E. Africa. (*Rochon's Voyage to Madagascar*; *Ellis's Hist. of Madagascar*, vol. i. *passim*; and *valuable private information*.)

**MADDALONI**, a town of S. Italy, king. of Naples, prov. Terra-di-Lavoro, cap. canton, 14 m. N.N.E. Naples. Pop. 10,500. It has several churches and convents, a house of refuge, a royal college, and a noble aqueduct, which conveys water to the royal palace at Caserta.

**MADERA**, a great river of S. America, a tributary of the Amazon (which see).

**MADEIRA**, a famous island in the N. Atlantic Ocean, belonging to Portugal, Funchal, its cap., on its S.E. side, being in lat. 32° 38' N., long. 16° 54' 26" W.: length of Madeira, about 46 m.; breadth about 7 m. Area, estimated at above 300 sq. m. It is a mass of basaltic rock, presenting to those approaching its N. coast, numerous disjointed crags, and tall isolated peaks, interpersed here and there with less elevated spots of verdure, the whole being based on enormous, dark-looking columns, rising perpendicularly several hundred ft. from the sea; which is usually so deep, even close in shore, that soundings are not found in less than 50 fathoms and upwards, except in Funchal road, where ships anchor in from 30 to 35 fathoms. The cliffs on all sides are very lofty; the *Ponta d'Agria* (eagle's rock) on its N. coast, a black culm-shaped mass of rock, is upwards of 1,000 ft. high; and C. Pargo, at the N.W. extremity of the island, rises 4,000 ft. above the sea; but the most curious feature on the coast is the Punta S. Lorenzo, at its E. extremity, a ledge of rock 6 m. in length by 1 m. in breadth, which, though less lofty than other parts, is remarkable for its bold projection into the sea, and its fantastically-broken cliffs and peaks. The rapid declivities of the island are furrowed by deep and narrow valleys, at the bottom of which flow rills of pure spring water; and up their sides vineyards are formed by means of successive terraces, to the height of 2,300 ft. above the sea. The mountain scenery of the interior is bold, and highly romantic; one part, a few miles N.W. of Funchal, being called, by way of distinction, "the Switzerland of Madeira." Here is a deep valley, or crater, inclosed on all sides, except seaward, by a range of magnificent precipices, rising upwards of 1,000 ft. above the vale, the summits and sides of which are broken into every variety of dark beetling pinnacle, or flattened and tree-clad buttress; while far below smiles a fair region of cultivation and fruitfulness, rich in every species of vegetation, though itself rather more than 2,000 ft. above the sea level. The culminating point of the island is Pico Ruivo, rising 5,450 ft. above the sea, and covered with vegetation to its summit. Three rivers, or rather torrents, rise on its sides, and cross the island in several directions, contributing greatly to its fertility. The streams are carefully collected, and rendered more available for the purposes of agriculture, by means of artificial channels, or *levadas*, with sluices, constructed with vast labour. At present (1840) a great work of this kind is in the course of being completed, by which a copious stream, which is precipitated from the top of a cliff 1,000

feet in height, will be made subservient to the purposes of irrigation.

The climate of Madeira fluctuates less than that of any country N. of the equator: its mean annual temperature having been found, in a period of 18 years, not to exceed 65° Fahr., that of the hottest months (Aug. and Sept.) being 74°, and that of the coldest (Dec. and Jan.) 63°, the glass seldom falling below 53° even in the severest weather. The heat of summer, however, is considerably higher, being increased from 102° to 150° during the prevalence of the hot and parching E. winds (the *scirocco*) that blow off the African continent. The temperature of Funchal, however, is considerably higher than that of the island in general: there dews are slight, and the rains few and far between; but in the higher parts of the island, a cool climate is rendered more delicious by frequent dews and rains enriching vegetation, and rendering the air fresh and salubrious. This remarkable equality of climate, not only through the year, but during the days and nights, constitutes the chief recommendation of Madeira to invalids. Persons subject to chronic pulmonary complaints, unattended by any material disorganisation, have derived much benefit from a voyage to Madeira; as have others afflicted with diseases of the windpipe; and a still greater number who are the victims of dyspepsia, or other maladies of the stomach, the cure of which is hastened by the regular habits and exercise usually taken by invalid residents in the island. The efficacy of the climate, however, in cases of confirmed *tubercular* consumption has been absurdly exaggerated. It may then, indeed, lengthen life a little; but it cannot effect a cure. During the last half century, vast numbers of invalids, of whose recovery no rational hope could be entertained, and who should have been left quietly to expire at home, have been hurried off to this island, at an expense which they could often but ill afford, for no purpose unless it were to amuse them with false hopes, or that they might occupy a place in Funchal church-yard. Invalids should not attempt the voyage before the middle of June, nor later than the end of September; spring is a trying season, owing to the prevalence of N.E. winds; and October is the first month of the rainy season of autumn.

Every part of Madeira, not encumbered with rocks, is extremely fertile; the hills are covered with luxuriant vegetation, and the most delicate flowers grow on their summits, which are constantly moistened with dew from the clouds overhanging the island. Trees and shrubs of the finest kinds are every where abundant, and tropical plants which have strayed from the gardens soon become naturalised to the soil. "Here," says Mr. Wilde, "all is sunshine: the green bananas, with their beautiful feathery tops, tell the visitor, that he has bid farewell to Europe; the orange trees hold out to him their branches, laden with golden fruit. Plantations of coffee trees fill the spaces between the houses, the splendid coral tree hangs over his head, and the snowy bells of the tulip tree mingle with the scarlet hyacinths. If he wish for exercise, he has the most inviting walks, and the most tempting shades to shelter him: wide-spreading plane trees, and willows of gigantic growth, bend their slender arms over the streams that murmur from the hills. As he begins to ascend from Funchal, the beauty increases, and the sea-view opens to his sight. The roads, though steep, are well paved, and the horses trained to an easy pace. He rides through a perfect vineyard, where in many places the vines are carried on trellises over the road, and large bunches of grapes hang within his reach. Hedges of geraniums, fuschias, and heliotropes, border the narrow paths, and shade him from the sun; the *Ficus indicus* clothes the cottages, the *Saleia fulgens* and Guernsey lily are sprinkled over the vineyards, and the *Camelia japonica*, with its delicate white flower and waxy leaf, adorns every quinta. Higher up grow the yam, prickly pear, dragontree and cedar, the aloe, agave and hydrangea, the sweet potato, and the *Phormium tenax*; and heath and pines crown the highest summits of the island." (*Narrative*, l. 89—91.) Thus it appears, that below the elevation of 1,240 ft., many of the most useful tropical plants, as the date, palm, guava, banana, coffee-plant, &c., are found, with numerous others peculiar to the warmer part of the temperate zone. Up to 2,500 ft. the fruits and grains of Europe, especially maize and corn, are raised; and nearly the whole of this district is covered with vineyards. "The chestnut, which is extremely abundant, the beech, and other European trees, with the mahogany, attain an elevation of 3,400 ft. above which rise pines, heath, ferns, and grasses. Pasture is scanty: few cows are kept, and the products of the dairy are here expensive luxuries. Horses are little used, their place as beasts of burden being supplied by mules and asses of the Spanish breed. Goats and hogs are very numerous, and are allowed to run wild on the mountains, where also are found large quantities of rabbits. Poultry is abundant, and sheep; and small birds of magnificent

plumage occupy the groves. Myriads of finely variegated lizards crowd the gardens and vineyards, occasionally doing much damage to the grapes; but there are no venomous reptiles, and the inhabs. are free from that insect plague that is usually one of the drawbacks of warm countries. The honey bee is abundant, and produces fine honey. Many varieties of fish are caught on the coast, especially tunnies and eels, which are the favourite food of the island.

Agriculture is chiefly confined to the raising of vines. Land is usually let out in small holdings, varying from 10 to 40 or 50 acres, and the rent is estimated, on the *metayer* principle, at half the produce, according to a yearly valuation of the crops. Wheat, barley, and rye are produced; but the crops average little more than a third part of the annual consumption. The wheat grown in 1837 is said, though we attach little credit to such statements, to have amounted to 6,787 qrs., the barley to 2,664 qrs., and the rye to only 570 qrs. Wheat is sown in Oct., and reaped in June, this crop being followed by another of beans or sweet potatoes. Rice is cultivated more as an ornamental grass than for any useful purpose; and Indian corn, which is admirably adapted to the climate, and is much used as an article of food, has till very lately been little grown.

Considerable attention has lately been devoted to the cultivation of the coffee plant, which, should the demand for wine not increase, may, perhaps, become of considerable importance. Fruits and vegetables are raised with little trouble, and the show in the fruit-market of Funchal, in a grove of noble palm-trees, would astonish any untraveled European, even from Italy or Spain. Here, besides all the ordinary fruits and garden vegetables of S. Europe, are oranges and lemons, green figs, grapes, pomegranates, water and Valencia melons, pumpkins, &c., one may see bananas and guavas, finer even than those grown in the W. Indies, custard-apples, alligator pears (the fruit of the *Laurus Persea*), numerous tribes of cucurbit, the exquisitely flavoured fruit of the *Cactus triangularis*, the Cape goose-berry, sent as a preserve to Europe, and the *Ichoo-teloo*, said to be "delicious." But its wine is the great glory of Madeira. The grape is not indigenous to the island; and it is said to have received its first plants from Crete, carried thither by order of the famous Prince Henry of Portugal, under whose auspices it was settled by the Portuguese in 1421. Many other varieties of the grape have since been carried to the island, its mild climate and volcanic soil being especially suitable for their growth.

The steepness of the hill-sides, on which the vines chiefly grow, and the necessity of economising valuable space, have led to the practice of raising the vine-beds on successive terraces, supported by retaining walls. The vines are trellised on bamboo and other supports for the purpose of exposing the grapes to the ripening influence of the sun, and the bunches are frequently of enormous size. The usual method of cultivation is to trench the ground from 4 to 7 ft. deep, according to the soil, and to lay a quantity of loose or stony earth at the bottom, to prevent the roots from reaching the clayey soil beneath, which would otherwise hinder their growth. The ground is watered three times, if the summer be very dry, and each time it is thoroughly saturated; but the less it is watered the better is the wine, though the quantity, of course, be diminished.

The N. side of the island, though sufficiently fertile, being the most exposed to cold winds and fogs, is not so favourable to the culture of the vine as the S., where all the finest growths are raised. The best Madeira-malmsey, or *Malvoisio*, is produced on rocky grounds exposed to the full influence of the sun's rays, the grapes being allowed to hang till they be dead ripe. The *Sercial* grape will, also, only succeed on particular spots. The wine made from it is, when new, harsh and austere, and requires to be long kept. The best Madeira wine is produced on the S. side of the island; but it is alleged that not less than two-thirds of the wine grown even in this quarter is of secondary quality; so that in Madeira, as in all wine countries, the first growths (*premiere crus*) are both scarce and dear. The process of making the wine is very simple. The grapes are picked from the stalk, thrown into a vat, pressed, first with the feet, and afterwards with a weighted wooden lever. The proprietor of the land, and the collector of taxes for the crown, both attend at the press; the latter takes out of the tub his *tenth* of the whole *must*, the remainder being equally divided between the landowner and the tenant. Each takes with him a sufficient number of porters to carry away their respective shares, sometimes in barrels, but more frequently in goat skins, *borrachas*, to the cellars in Funchal, where the English merchants have extensive yards and vats for storing the wine, and carrying it through the different processes of fermentation, mixture, &c. They usually advance money beforehand to the growers, to enable them to defray the expenses of cultivation. (*Barrow's Voyage to Cochin China*, p. 22.)

Though naturally strong, a quantity of brandy is added to Madeira wine when racked from the vessels in which it has been fermented, and another portion is added when it is about to be exported. The demand for Madeira wine in the E. and W. Indies, where it is highly esteemed, first led to a knowledge of the improvement it derives from being carried to a warm climate; and it has long been customary for ships outward bound for India and China to touch at Madeira, and take large large quantities of wine on board, which they bring home to England. But it must not be supposed that all the Madeira wine that has gone to Calcutta and Canton is necessarily better than any brought direct from the island, as much must obviously depend on the quality of the wine sent to the East. But, if due care be taken in the selection of the wine sent to India and China, it is very much improved and matured by the voyage; and it not only fetches a higher price, but is in all respects superior to the direct importations. Most of the adventitious spirit is dissipated in the course of the Indian voyage, and the full flavour of the wine is evolved.

Madiera wines may be kept for a very long period. "Like the ancient vintages of the Surrentine hills, they are truly *firmissima vina*, retaining their qualities unimpaired in both extremes of climate, suffering no decay, and constantly improving as they advance in age. Indeed, they cannot be pronounced in condition until they have been kept for ten years in the wood, and afterwards allowed to mellow nearly twice that time in bottle; and even then they will hardly have reached the utmost perfection of which they are susceptible. When of good quality, and matured as above described, they lose all their original harshness, and acquire that agreeable pungency, that bitter sweetness, which was so highly prized in the choicest wines of antiquity; uniting great strength and richness of flavour with an exceedingly fragrant and diffusible aroma. The nutty taste, which is often very marked, is not communicated, as some have imagined, by means of bitter almonds, but is inherent in the wine." (*Henderson*, p. 253.)

The wines of Madeira have fallen of late years into disrepute in England. The growth of the island is very limited, not exceeding 15,000 or 18,000 pipes, of which a considerable quantity goes to the East and West Indies, and America. Hence, when Madeira was a fashionable wine in England, every sort of deception was practised with respect to it, and large quantities of spurious trash were disposed of for the genuine vintage of the island. This naturally brought the wine into discredit; so that sherry has been for several years the fashionable white wine. It is difficult, however, to imagine that adulteration should ever have been practised to a greater extent upon Madeira than it is now practised upon sherry. It is not, therefore, improbable that a reaction may take place in favour of Madeira, which has sunk to a much lower place in the public estimation than it deserves to hold. In 1827, 308,255 gallons Madeira were entered for home consumption, whereas the quantity entered in 1839 amounted to only 118,715 gallons, being less than 3 per cent. of the sherry entered for consumption in the same year! Such is the power of fashion, for there cannot be a question that really good Madeira is one of the very best of wines.

The commerce of Madeira is very considerable; the exports consist principally of wine. Among the minor articles of export are fruits, both fresh and preserved, dragons' blood (the gum of the *Calamus draco*), honey and wax, orchil (a white lichen used in purple-dyeing), tobacco, and provisions for ships. Its imports comprise manufactured goods, sheep, salted provisions, fish (especially herring and cod), oil, corn, and some tropical productions. We subjoin a statement of the vessels, and their tonnage, which arrived at and left Funchal in 1837; specifying the countries whence they came, and for which they cleared out, with the value of their cargoes:—

Countries.	Arrived.			Departed.		
	Ships.	Tons.	Value of Cargoes.	Ships.	Tons.	Value of Cargoes.
Gt. Britain	130	29,432	£5,226	131	29,370	£131,608
Portugal	75	5,839	34,478	75	5,839	6,355
C. States	35	5,321	27,201	36	5,505	71,253
Sardinia	23	4,936	20,151	33	4,996	315
Denmark	10	1,921	6,261	9	1,726	15,080
France	7	945	5,781	7	945	3,308
Holland	5	507	1,840	3	507	11,100
Other countries	14	1,361	9,090	14	1,364	1,200
Total	306	50,271	159,254	307	50,272	240,200

The imports from England, in 1838, comprised cotton, woollen and linen fabrics, and haberdashery, to the value of 22,370*l.*, with coal, earthenware, butter and cheese, salt meat, rice, sugar, &c., making in all a total value of 35,000*l.* The Americans send timber, whale-oil, salt fish

and meat, spermaceti candles, with other articles, in small quantities, to the value, in 1834, of 41,057 dollars.

The government of Madeira has at its head a lieutenant-governor, whose power is so extensive that the comfort and happiness of the inhab., especially the British, are greatly dependent on his character and acquaintance with the island. Justice is administered by a tribunal in whose favour little can be said, from which there is an appeal to the courts at Lisbon. The crown revenues are derived partly from a duty of 20 per cent. on all imports, except provisions; but the most productive source is the tithe of wine, with an additional duty per pipe on the quantity exported. A revenue is also derived from the monopoly of snuff, cards, and soap. The revenue is sufficient to defray the expenses of the civil, military, and ecclesiastical establishments; considerable sums are likewise expended in public works, roads, &c., and frequently there remains a surplus which is remitted to Portugal. The number of clergy, including monks and nuns, is stated to be somewhat under 300. They are partly supported by the crown revenues, the tithe on wine being originally intended for their maintenance; but the present government allowance, which they receive in lieu of it, is extremely small; so that the monks and clergy traffic in wine, or engage in other secular business, while the nuns gain a considerable income by making artificial flowers of wax and feathers, which are justly admired for their delicacy and beauty, and purchased by visitors and shippers at high prices. It would be well, however, were both monks and nuns suppressed. According to Sir John Barrow, who is by no means disposed to be over censorious, "The clergy are not very rigid in exacting from others the duties of religion, nor in setting an example of pious conduct in their own persons. On the contrary, the loose manners, the intemperate mode of life, and the free conversation of many of the monks, are a disgrace to the sacred office which they hold." (P. 14.)

The pop. of Madeira, which, including Porto Santo (see post), was ascertained by a late census to amount to 12,500, is a mixed race, sprung principally from Portuguese and Moors; but in Funchal many of the labouring classes show, by their English faces and complexions, that there has been a considerable intermixture with British settlers. Negro slaves, also, are still numerous; but they seldom intermarry with those of European origin. On the whole, the natives are a finer and more comely race than the Portuguese; they are of the middle size, well formed, and strongly knit, with masculine features, hair, and complexion. The women are almost universally under the standard height, and, when young, display handsome features, which, however, soon become coarse and unattractive, owing to their laborious field occupations. The men are dressed, somewhat in the costume of English sailors, with large full leather boots, and a little funnel-shaped cap on their heads. This curious head-gear is worn also by the women over the white muslin handkerchief, which covers the head and hangs down over the shoulders, and their gay clouts, gowns and scarlet peleries give them a light and picturesque appearance. "It is delightful," says Mr. Wilde, "to see groups of these peasantry in companies of eight or ten sitting in some places under the umbrageous palms, eating their morning's meal, or completing their toilet, before entering the town, while others are hastening along, loaded with the various produce of their gardens, consisting of bunches of yellow bananas, strings of crimson pomegranates, &c., or carrying fowl, firewood, and fish to the market of Funchal, each little party preceded by its mandolin-player, who at times accompanies the wire-strung instrument with his voice, and is joined at intervals by the hearty chorus of the whole group." But the condition of a people is not to be learned from such holiday descriptions as this; and the truth is, that the native inhabitants of Funchal are meagre, sallow, and short-lived. "This," as Sir John Barrow has stated, "is not to be attributed to the climate, but to the poverty of their food, which chiefly consists of pumpkins, sour wine, or pernicious spirits, to a life of drudgery and exposure to the great vicissitude of climate, by daily ascending the steep and lofty mountains in search of fuel; and, above all, to a total disregard of cleanliness." In fact, almost all the natives of the island are infected with a species of itch, which they regard as incurable, and which is accompanied with a great degree of inflammation. (Barrow, p. 11.) Among the richer inhabs. are many Portuguese *fidalgo*s; but by far the larger part are merchants and private residents belonging to almost every commercial country, especially Great Britain. These hold little intercourse with the other inhabs., but live either in their town-houses at Funchal, or at their villas or *quintas* higher up the island, where they exercise the most liberal hospitality. A small tax on wine sent to England is levied by our consul, to form a fund for charitable purposes, which is further increased by the benevolent contributions of the merchants, who also support an English episcopal church, the present

minister of which (Mr. Lowe) is at once a zealous clergyman, and a scientific naturalist.

Funchal, the only town of Madeira requiring any special notice, is situated on the S.E. side of the island, and stretches nearly a mile along the margin of the bay. It is irregular, inconvenient, and meanly built, with narrow, crooked, steep, and dirty streets, some of which being paved with sharp-pointed pebbles, are extremely painful to walk upon. Streamlets of water run down some of the streets from the overhanging mountain; but when Sir John Barrow was here, the inhabitants washed their clothes, cleaned their fish, and threw their filth, offals, &c. into these streamlets; so that, in fact, they were rendered rather a nuisance than any thing else; but it is stated in late works on the island, that these inconveniences have been in part obviated, and the filth of the town materially abated. The houses are commonly low, not often exceeding one story in height, with white outside. Those belonging to the *fidalgo*s or rich merchants are comparatively large and handsome, having at the top a *torinha* or turret, commanding a view of the harbour, used for reconnoitring vessels as they arrive in the offing. The governor's castle is a large clumsy-looking Gothic structure, near the bench. The cathedral, has a *parvis*, or open space, before its W. door, and beyond it is the *Torreira da Sr.* a pleasant promenade under several parallel rows of trees, enclosed by a low wall, and overlooked by pretty houses with balconies. In one of the wings of the Franciscan convent is a chamber, the walls and ceiling of which are formed or covered with human skulls and thigh-bones! The English church in the suburbs is an elegant and commodious building, literally embosomed in ever spreading roses and white daturas. The convent of *Nossa Senhora do Monte*, amid groves of chestnut-trees half way up the mountain, commands a very fine view. Funchal roads labour under several disadvantages: the anchorage is in 35 or 40 fathoms; land equals are often extremely violent; a heavy surf on the beach, especially in spring, makes a landing at all times unpleasant, and sometimes unsafe, except in the shore-boats, in manning which the natives are very skilful. From the autumnal to the vernal equinox, when strong southerly gales throw in a heavy sea, the roads are peculiarly dangerous, and many accidents have then occurred.

A few inconsiderable islands in the vicinity of Madeira are included under its government. Of these Porto Santo, 35 m. N.W., is the only one that is inhabited. It has a parched barren aspect, and has but one fountain of good water. Its products comprise wine of an inferior quality, good barley, water-melons, and other fruits; but it is wholly destitute of wood. The town is insignificant, and is occasionally used as a place of exile from Madeira. The entire pop. of the island may be about 1,400. The little islands called the Desertas, are occasionally visited by a few fishermen and smugglers, and the rest are mere rocks.

Madeira is said to have been discovered in 1344, by Machau, an Englishman, who was wrecked, and cast on its shores. But this story is very doubtful; and it seems most probable, that Juan Gonzalez, who had been despatched on a voyage of discovery by Prince Henry of Portugal, and who fell in with this island in 1419, was its real discoverer. When discovered, it was uninhabited, and covered with wood, and was on that account called *Madreia*, that being the Portuguese term for timber. It was settled by the Portuguese in 1421, and has since continued in their possession. (Robertson's *America*, book 1.) Its occupation by the English during the late war with France, being merely in order to prevent its falling into the hands of the French, it was restored to Portugal at the peace of 1814.

MADELEY, a market town and par. of England, co. Salop. franchise Wenlock, on the banks of the Severn, 13 m. E.S.E. Shrewsbury, and 126 m. N.W. London. Area of par. 2,750 acres. Pop., in 1831, 5,822. The town, which is of considerable antiquity, was celebrated in history as having given refuge to Charles II. after the battle of Worcester, derives its present importance from its proximity to the great coal and iron district of Coalbrookdale. The church is a handsome modern structure, the living being a vicarage in private patronage. The Hon. Catha, Wesleyan, and Primitive Methodists have also their respective places of worship, and there is a meeting-house for the Society of Friends. A national school is connected with the church, and there are four Sunday schools. The iron trade, carried on here to a considerable extent, is much facilitated by means of the Shropshire canal, which joins the Birmingham and Liverpool junction canal, and connects Madeley and the Ketley iron-works with the great manufacturing districts of Dudley, Wolverhampton, Birmingham, &c. About 2 m. W. of the town, and near the romantic village of Coalbrookdale, is a cast-iron bridge, erected in 1750, of one arch, 100 ft. in span, 40 ft. above the river, and containing 375 tons of metal, being the first structure of the kind raised in the kingdom. This beautiful rural district, embosomed

between high and well-wooded hills, has within the last half century been converted into one of active mining and manufacturing industry, the furnaces now (1841) at work in this vicinity being estimated to produce 20,000 tons of iron a year. A Coalport, about 2 m. from the above-mentioned bridge, is a considerable manufactory of china. Markets on Friday: fairs May 29. and last Tuesday in Oct.

The neighbourhood of Madley is remarkable for an extraordinary convulsion of the earth, that took place in 1773, when about 30 acres of land were shifted from their site, and broken into irregular chasms, large oak trees were uprooted, and the Severn, backed up for more than 20 yards by the displaced soil and fallen trees, was compelled to find a new channel, in which it now flows.

MADRAS (PRESIDENCY OF), an extensive division of British India, being the second in rank and the most southerly of the three presidencies. It comprises, with its tributary states, the whole of Hindostan S. of the river Krishna, the N. Circars, and Canara. It extends from 8° to 20° N. lat., and from 74° to 85° E. long. It is of a triangular shape; the base of the triangle being formed by a line drawn from Ganjam, on the coast of Coromandel, to Sadashargur, near the 15th degree of lat., on the coast of Malabar, the sides by their coasts, and the apex by Cape Comorin, at the southern extremity of India. It is consequently bounded on two of its sides, the E. and W., by the ocean, while on the third, or N., it has the dom. of the Nizam and the Rajah of Berar, part of the presids. of Bengal and Bombay, and the Portuguese territory of Goa. Its greatest length, N. to S., is about 950 m. Its area, pop., subdivisions, &c. are specified in the following Table:—

Districts.	Area in sq. m.	Pop. 1836-7.	Pop. to Land Revenue, sq. m. 1836-7.	Remarks.
Ganjam	3,700	588,079	118	953,967

**Physical Geography. Mountains.**—The surface consists of a central table-land, surrounded on all sides by an undulating or plain country gradually diminishing in elevation as it approaches the sea. The mountain-ranges bounding the table-land on either side are the E. and W. Ghats, which diverge from each other at the knot of mountains termed the Nellocherries, in about 11° N. lat., and from 76° 30' to about 77° E. long. The W. Ghats approach much nearer to the sea than the E., so that there is a much greater extent of plain country in the E. than in the W. portion of the presid. The Nellocherries Hills, which may be considered the nucleus of the mountain system in S. Hindostan, extend 34 m. E. to W. by 15 m. N. to S., having numerous peaks rising to between 5,000 and 6,000 ft., and one, Dodabetta, estimated at 8,760 ft. above the level of the sea. The W. Ghats are more continuous and generally more elevated than the E.: the latter, even in the district of Salem, where they are highest, seldom attaining to an elevation of 6,000 ft., while the former frequently rise 2,000 ft. higher. The table-land above or between the Ghats averages in Coorg nearly 5,000 ft. in elevation, and, in Canara, Balaghat varies from 3,000 to 5,000 ft. and it decreases rapidly in height as we proceed E. and N., and even in Mysore, Bangalore is only 2,807 ft., and Hurrylies, in the Palghat-Cherry Pass, in Coimbatore, 16 m. in width, extending from sea to sea, and forming a complete break in the mountain-system of S. India. S. of this pass, a mountain chain, little inferior in height to the Nellocherries, stretches nearly due S. to Cape Comorin. This chain separates Cochin and Travancore, on the W., from the district of Madurai and Tinnevely, on the E. The Ghats elsewhere form the chief line of separation between the British territories and those of the subsidiary states.

The principal rivers are the Godavery and Krishna, with their tributaries; and the Pennar, Palair, Pinnair, Cavery, Coleroon, and Vaghey. These have all an E. course, and disembogue on the Coromandel coast. The three principal have been already described. (I. 571—913., II. 126.) The only other river worthy any particular notice, the Coleroon, is the N. branch of the Cavery, which, having separated from the latter, opposite Trichinopoly, bounds the district of Tanjore on the N., and falls into the sea about lat. 11° 30'. The streams running W. have short courses; the longest is the Pennar, which traverses the Palghat-Cherry Pass, but it is of little use for navigation, being very shallow in the dry season. There are no lakes of any importance; that of Colair, in Masulipatam, is the principal. There are numerous salt lagoons, or inlets of the sea, on the Coromandel coast, but they are of little use for navigation; and the whole of the Coromandel coast has a shelving shore, and is beat by so heavy a surf, as to be at all times difficult to reach, and during the monsoon it is quite unapproachable. The inlet of Cochin, on the Malabar coast, is not within the British territory. The Malabar coast within this presidency is also very destitute of good harbours.

**The Climate.**—differs widely in the different portions of this presidency. The W. coast is exposed to all the fury of the S.W. monsoon, during which the rains are excessive, and often accompanied by heavy squalls and thunder storms. On the opposite coast, the rains are, on the contrary, brought in by the N.E. monsoon, a circumstance explained by the fact, that the Ghats are elevated enough to intercept the passage of the clouds. The N.E. monsoon lasts from October to March; but the monsoon rains are over in December; and much less rain falls on the Coromandel than the Malabar coast, where, as in Canara, the annual fall of rain is sometimes 114 in. The quantity falling in Coimbatore, in 1836-7, was only 9 in., and in 1837-8, 22-1 in. The heat is much more oppressive on the E. than the W. side of S. India, owing to the greater prevalence of dry weather and parching winds. If we may depend on the statement of Berghaus, the average annual temperature of Pondicherry, lat. 12° 55', is no less than 84° 7° Fah. (29-6 centig.), that of Madras being 82° (Allg. Länder, &c., i. 230.) At the month of the Krishna, in the N. Circars, in about 16° lat., the thermometer has been known to stand at 100° Fah. at midnight! (*Hamilton's E. I. Gaz.* i. 418.) The plain country, in the E. part of the presidency, is frequently very unhealthy; but on the Malabar coast this is not the case. The country above the Ghats, which has a mean temperature many degrees below that of the plains, is decidedly salubrious; it derives rain from both monsoons, having an equable climate, and an atmosphere usually clear, serene, and highly invigorating.

**The Geology.**—of S. India has been noticed with that of the rest of Hindostan. (I. 993.) Silex, granite, quartz, greenstone, mica, and hornblende are among the chief primitive rocks, in the Ghats, Nellocherries, &c. The upper soil on the coasts is usually sandy, and not very productive; but in the valleys of the interior, it frequently consists of a rich alluvium or loam. The soil of the Balaghat districts, N. of Mysore, consists principally of the red and black earth, so prevalent in the Deccan.

**Natural products.**—Many portions of the soil in the table-land are highly impregnated with carbonate of soda, nitre, and other salts; iron is generally plentiful, and the iron ore of the district of Salem is extremely rich. Copper is found in Nellore, and a few other districts, and diamonds near Cuddahp. The presidency yields no other mineral products of much value. A considerable extent of surface, especially in the upper part of the country, is covered with forests, comprising teak, sandal, ebony, and other valuable timber trees. Teak grows on the E. as well as the W. Ghats; but that of the Malabar coast is the most available, and best known, in the market; a good deal being floated down to the coast by the small rivers, and sent to Bombay and elsewhere for ship-building. The toddy-palm (*Borassus flabelliformis*), cocoa-nut tree, the products of which form important articles of export from the W. districts; and other palms flourish on the sandy coast lands, which supply few other useful articles. The sugar cane, areca, yam, plantain, tamarind, jack, mango, melons, and various other fruits, ginger, turmeric, cotton, hemp, &c., some of which are indigenous, are pretty generally grown; pepper is an important article of culture on the Malabar coast, and Coimbatore is celebrated for the excellence of its tobacco. Rice, paddy, wheat, barley, maize, and all the other grains common in India, both wet and dry, are here cultivated; the first is grown chiefly on the plains of the coast; but it forms also the chief export of Coorg, though a high country, and is the great staple of Canara. The Balaghat districts are almost wholly appropriated to dry grain cultivation.

**Animals.**—The elephant, tiger, cheetah, bear, bison, elk, spotted deer, antelope, jackal, wild hog, jungle sheep, &c., inhabit this as well as other parts of India; tigers, however, are not so numerous as in the countries watered by the Ganges, and other low and jungly portions of Hindostan. Ivory is a product of some consequence in Coimbatour; from 700 to 800 elephants being destroyed in that prov. between 1832 and 1836. Domestic animals are most numerous in the E. and S. districts: Guntoor is celebrated for its cattle; and Coimbatour for its sheep, which are not hairy and long-legged like those of the Carnatic, but small, yielding good mutton and coarse wool, made into common sorts of clothing, carpets, &c. Live stock, above the Ghauts, is scarce and inferior.

**Land-tax, &c.**—With the exception of the N. Circars, (see CIRCARS, NORTHERN.) the greater portion of the territories included in the Madras presidency, are assessed for the land-tax on what has been called the *ryotwar* system. It is unnecessary, however, after the copious details we have already given in the article on British India (see *ante*, p. 223), to enter, in this place, into any farther investigation with respect to the nature and operation of that settlement. It is sufficient to say that the land-tax in Madras is oppressive in amount; and that the system under which it is assessed, being subject to perpetual changes is, in fact, subversive of the security of property, and consequently of all industry, except what is indispensable to meet immediate wants. We do not mean to impeach the motives, or to depreciate the talents, of Sir Thomas Munro, and the other individuals most instrumental in the establishment of this system; but we do not well see, supposing they had set about devising a scheme for paralysing enterprise, and creating an insuperable obstacle to all improvement, how they could have hit upon one better fitted to accomplish such objects than the *ryotwar* assessment. It appears to have every quality that an assessment should not, and not one that it should, have; and it were idle to expect that either the revenue of the presidency, or the industry and condition of the inhabitants, should be materially improved, so long as it is permitted to shed on all sides its withering influence.

**Agriculture, &c.**—The imposition of an oppressive assessment is the more severely felt, as the land in the Madras presidency is generally much less fertile than in Bengal and many other parts of British India. Tanjore may be said to be the granary of the presidency, and produces the greatest land revenue. The widest breadth of cultivated land is met with in Rajahmundry, Tanjore, and Coimbatour. The modes of agriculture pursued in the different provinces will be found briefly noticed in the articles which have especial reference to them. Generally, however, it may be said that agriculture is at a very low ebb; that the occupiers, ground down by oppressive taxes, are for the most part miserably poor, and their implements and stock alike bad. Irrigation is extensively practised; and wherever a sufficient supply of water (whether from rivers, tanks, or wells) can be commanded, as in the delta of Tanjore, S. Arcot, &c., the crops of rice are very heavy. The land under dry grains is generally manured; and cow dung used as fuel in this presidency being subject to a tax, it is generally used as manure. Opium is rarely or not at all grown; and indigo only in small quantities, principally in the N. districts. Coimbatour exports annually upwards of 4,000 candelis of tobacco to Malabar, Cochlin, and Travancore; and large quantities to Trichinopoly and Mysore. The superiority of the tobacco grown in this province is attributed to the soil containing much saltpetre and peroxide of iron, as well as to the attention bestowed on its culture. The exhaustion of the land, from its cultivation, is, however, very great; the ground consequently requires frequent and regular manuring, and is cultivated every other year with dry grains. Tobacco costs on the spot where produced about 25 rupees per candy. Cotton is a staple product of Tinnevely; and it and sugar are raised in various other places.

**Manufactures, &c.**—The chief are those of cotton cloth; and formerly cotton fabrics and other piece goods were largely exported, especially from the N. Circars; latterly, however, the lower price and better quality of British piece goods have enabled them, to a great extent, to supersede those of India in most foreign markets; though the latter are still exported, especially from Tinnevely to the W. Indies and America. The natives have recently turned their attention to the imitation of English cottons, and, in some instances, it is said, with considerable success. The muslins of Chicacole, the woollen carpets of Ellore, and the silks of Berhampore (Ganjam), are of old celebrity; but in general manufacturing industry flourishes most in the S. districts, and the cloths of Madura are highly esteemed for their fine red dye. The state of manufactures appears to depend in a great degree on the state of the roads, and means of communication.

In the S. provs. the government has completed several good carriage roads, and in the N. they are also pretty good. Canara, on the other hand, may be said to be wholly without roads, and vehicles are unknown. The Malabar coast has a singular paucity of manufactures: its chief wealth arises from its large exports of rice to Arabia and Bombay, and of pepper and other spices, areca, cocoa-nuts, &c. A good deal of iron is made in Tinnevely; and saltpetre and salt are made in various parts; but the latter are inferior to those of the Bengal presidency. Above the Ghauts the arts are in a very rude state.

**Weights and Measures.**—At Madras, the *maund* of 40 seers or 8 ris = 25 lbs. avoird.; the *candy* of 20 maunds = 500 lbs.; the *garce* for grain = 12.8 mds. At Trichinopoly, the *seer* for metals = 9 oz. 8½ dr. In Malabar, the *tolam* of 40 seers = 23 lbs. 3 oz.; the foot = 10.46 in. At Madras, the *mauney* = 2,400 sq. ft.; the *cavney* of 24 mauney = 1.3223 acres. (*Madras Almanack*, 1839.)

The government is vested, as in Bombay, in a governor, subordinate to the governor-general of India. He is assisted by a council of 3 members, one being the commander in chief, and 2 secretaries, placed over the revenue and judicial, political, and military departments. In each of the 20 districts there is a European collector, who exerts also the chief magisterial power. Zillah courts are holden in the principal towns of most of the districts; and there are four provincial courts of appeal at Chittoor, Masulipatam, Trichinopoly, and Tellicherry. In Madras is a court of Sulder and Foudwar, Adawlut, an admiralty court, and the high court of judicature for the presidency. The Church of England ecclesiastical establishment consists of the bishop and archdeacon of Madras and 19 chaplains, in different parts of the presidency. There are numerous Protestant-dissenting and Rom. Cath. chapels, Madras being the see also of a Rom. Cath. bishop. According to the government returns of 1836, about 188,600 children were receiving instruction at the schools within the presidency. The Madras military force, according to recent returns, consists of 50,257 men, of whom about 3,500 are Europeans.

ACCOUNT OF THE REVENUES OF THE PRESIDENCY OF MADRAS during the Four Years ending with 1838-39.

Heads of Revenue.	1835-36.	1836-37.	1837-38.	1838-39.
	<i>Rupers.</i>	<i>Rupers.</i>	<i>Rupers.</i>	<i>Rupers.</i>
Mint duties	15,397	-	23,557	23,501
Post-office collections	3,01,876	3,20,259	3,19,577	3,50,616

*History.*—In the art. INDIA, BRITISH, will be found a table, showing the dates of the successive augmentations to the British possessions in the East. The city of Madras, with a territory 5 m. along shore by 1 m. inland, granted us in 1639, formed the first nucleus of our Eastern Empire. But we may here notice the chief successive acquisitions under the Madras presid. The Jaghire, or Chingleput, was obtained by the E. I. Comp. from the nabob of Arcot, in 1750 and 1763. In 1752, Malabar, Canara, Coimbatore, Dindigul, Salem, the Barramahli, &c., were acquired by conquest from the sultans of Mysore; in 1840 the Balahant districts were ceded; and in 1801, the remainder of the nabob of Arcot's territories were added to the foregoing. (*Madras Almanac for 1838-39; Parl. Reports and Papers; Hamilton's Road-stan and E. I. Gazetteer.*)

MAHASA, a marit. city of Southern India, cap. of the above presidency, in the distr. of the same name, on the Coromandel coast, 650 m. (direct distance) S.E. Bombay, and 870 m. S.W. Calcutta; lat. 23° 4' 42" N., long. 80° 21' E. The area of the district or collectorate of Madras is only 30 sq. m.; but its pop. in 1836-37 amounted to 63,400; and the pop. of the city and its immediate environs, within a radius of perhaps 24 m. round Fort St. George, is usually estimated at upwards of 400,000.

Madras is in all respects badly situated: it is almost wholly unapproachable by sea. "There being no indentation on the coast, nor any island to break off the surge, a heavy swell rolls in throughout the year. Vessels anchor in the open roads; the large ones keeping a tole or two from shore. The swell keeps them pitching and rolling as uncomfortably as when at sea. The danger is so great, during the S.W. monsoon, that vessels are not allowed to lie here for several months, and the anchorage seems deserted. Cargoes are loaded and unloaded by boats adapted for passing through the surf; these, called *catamarans*, consist of three flattened timbers, 8 or 10 ft. long, tied together horizontally, and sharpened a little at the point. One or two men propel it with a paddle, flatted at both ends, and dip first on one side and then on the other. When no boat could live five minutes, these catamarans go about in perfect safety. The men are often washed off, but instantly leap up again without alarm. A waterproof cap, for the carriage of letters to and from newly arrived vessels, is almost their only article of dress. The boats used are large and deep, made without ribs or timbers, of thin wide planks, warped by fire to a proper shape, and fastened together by strong twine. Against the seams straw and mud are fastened strongly by the twine, which ties the planks together. No nails are used, for none would keep a boat together with such a thumping. The boatmen display energy and skill scarcely to be surpassed. Kicking the oars to a rude tune, they now take long, and now short pulls; as the waves run past; they at length push the boat forward on a foaming surf, and she is thrown upon the beach." (*Malcolm's S. E. India*, i. 53.) There being no pier of any description, passengers and merchandise have all to be landed in the rough way now described.

Madras presents, from the sea, nothing to create great expectations. Only a few public buildings are visible, and not much of the town, as the site is quite level. It is, however, a noble city, and has many fine streets. Fort St. George may be considered the great nucleus and centre of Madras. It is neither so large nor so regular as Fort William, at Calcutta; but it is strong, and has the advantages of requiring a smaller garrison, and of being easily relieved by sea. It occupies a semicircular area, rather more than 4 m. in length, by from 2 to 3 furlongs in width, in a commanding situation, immediately on the beach; and is surrounded by an esplanade traversed by roads, and shaded public walks. Within it were formerly, besides many public offices, some streets of private European dwellings, shops, and stores; but these have been mostly cleared away, and the Fort now contains only the barracks, arsenal, a bazaar for the sup-

ply of the garrison, the council-house, the old church, the exchange, on which a light-house with a lantern 90 ft. high is erected. The merchants and tradesmen have mostly removed their establishments to the new streets, opened in the N.E. quarter of the Black-town, and along the skirts of the esplanade. The Black, or native town, which is N. and N.E. the fort and esplanade, is well laid out, and is defended by a substantial brick wall. "The houses are far better, at an average, than those of the natives in Calcutta. Though there are not so many fine residences of rich *babus* as in that city, there are some scarcely surpassed in elegance by any in America." (*Malcolm*, i. 54.) It has probably been improved of late years. Hamilton, in his *E. I. Gazetteer* says, it is irregular and confused, being a mixture of brick and bamboo houses, and makes a better appearance at a distance, than when closely inspected. A fine range of public edifices, including the custom-house, office for the Board of Trade, court-house, granary, and many store-houses, &c., forms its frontage towards the beach, protected from the fury of the surf by a breakwater of massive stones. The front of this terrace, and the drives on the esplanade, form the chief promenades of the inhabitants.

Madras differs from Calcutta, in having properly no European town, except the few houses within the fort. Most of the European settlers reside in suburban houses, and repair in the morning to their offices in the Black-town, returning in the afternoon. Their residences are chiefly on the Choultry plain, a large extent of surface, S.W. of the fort, and separated from it by the river Triplicane, which, in the neighbourhood of the city, is crossed by numerous bridges. The houses all stand in large plots of ground, shaded by trees, and divided by hedges of bamboo or prickly pear. Few are of more than one story, but they are in a pleasing style of architecture, having their porches and verandahs supported by stucco pillars. According to Heber, the rooms are not quite so large as those of the houses in either Calcutta or Bombay, but they are more elegant and agreeable. On the Choultry plain, near Fort St. George, is the governor's residence, a large building, with a spacious banquetting-hall; but opinions vary greatly as to its architectural merit. Heber says, it has some bad paintings of Coote, Cornwallis, Meadows, &c., and one good one of Sir R. Strange, but all are fast going to decay from the moisture of the sea-breeze. Near it are the Chepauk Gardens, in which is the residence of the Nabob of the Carnatic; and adjacent to these, is a mosque of grey stone, with 5 arches in front, and 2 handsome minarets, the only Mohammedan structure of any note at Madras. The descendants of the former Portuguese inhabitants chiefly reside at San Thomé, a suburb on the shore about 3 m. S. from the fort, with a small cathedral, and 2 neat chapels under the charge of a Portuguese bishop, and a few priests from Goa. The Protestant places of worship are St. George's cathedral on the Choultry plain, 4 other episcopal churches and chapels, a Scotch and an Armenian church, and independent, Wesleyan, and Unitarian chapels. There are also 3 Rom. Cath. churches. The number of native Christians is, however, stated to be very small, though increasing. There are male and female orphan asylums, many schools, and other charitable institutions, conducted in a manner that has been highly eulogised; and numerous missionary establishments, both European and American.

Madras is the seat of all the chief government offices for its presidency, of the supreme court, a board of revenue, marine board, &c. In consequence of its unfortunate maritime position, it has less foreign trade than the capitals of either of the other presidencies. Its commerce is still, however, considerable, as it is the principal emporium of the Coromandel coast, and trades direct with Great Britain, and other European countries, the United States, the South American States, China, the Eastern Islands, the Birman Empire, Calcutta, and Ceylon. The principal articles of import are rice, and other grain, chiefly from Bengal; cotton piece-goods, iron, copper, spelter, and other British manufactures; raw silk, from Bengal and China, with betel or areca nut, gold dust, tin, and pepper, from the Malay countries; and rice and pepper from the coast of Malabar, with teak timber from Pegu. The exports consist of plain and printed cottons, cotton-wool, indigo, salt, Ceylon pearls, chank shells, tobacco, soap, natron, some dyestuffs, and coffee, from the tableland of Mysore, the quantity of which is increasing. The great staples of sugar, rice, opium, salt-petre, and lac dye, of such importance in Bengal, are hardly known as exports here. The importation of sugar from foreign countries is prohibited at Madras. (*See Report on N. India Produce*, 1840.)

In Madras roads, large ships moor in from 7 to 9 fathoms, with the flagstaff of the fort bearing W.N.W. 2 m. from shore. From Oct. to Jan. is generally considered

the most unsafe season of the year, in consequence of the prevalence of storms and typhoons. On the 15th of Oct. the flagstaff is struck, and not erected again till the 15th of Dec., during which period a ship coming into the roads, or, indeed, any where within soundings on the coast of Coromandel, violates her insurance. The light within the fort may be seen from the deck of a large ship at 17 m. distance, or from the mast-head at a distance of 26 m. By the port regulations, no articles are to be shipped or landed without a permit, or after 6 P.M. Any merchandise attempted to be landed without the prescribed forms, or that is not entered in the manifest, is liable to double duty; and where a fraudulent intention shall appear, to confiscation. All goods (except on account of the E. I. Company) are to be shipped or landed at the wharf opposite to the Custom-house, or pay double duty. Goods exported in British or native vessels are exempted from duty, but they must, nevertheless, pass through the customs' books.

Meat, poultry, fish, and other provisions, are to be procured for shipping at Madras, but they are neither so good nor so cheap as in Bengal. Wood and fuel are rather scarce, and dear in proportion. Water is of very good quality. On account of the dearth of provisions, wages are considerably higher than at Calcutta, and comparatively few servants are kept. The style of living is much the same in Madras as at Calcutta, but visiting is not carried on upon so extensive a scale. In the cool season monthly assemblies are held in the Pantheon, a building erected in the suburb of Vepery, and occasional balls take place throughout the year. During the cool season, also, races are held at St. Thomas's Mount, about 7 m. from Madras. The road to the racecourse is certainly the finest in India, and shaded by trees through its whole length. At the foot of Mount St. Thomas is the principal cantonment for the artillery of the Madras army, with a noble parade ground, considered one of the best military stations in S. India.

Madras experiences less extreme heat than Calcutta, taking the average of the year, though so much nearer the equator. The minimum temp. in Jan. 1837, was 65° Fah.; the maximum in May of the same year, 99°; the mean annual temp. was 81·72. Several extensive tanks and some swamps surround the city and its territory; but Madras is not said to be particularly unhealthy.

The territory on which Madras is situated formed the first acquisition made on the continent of India by the British, who obtained it by a grant from the rajah of Binagur in 1639, with permission to erect a fort thereon. The latter, which was forthwith built, was besieged in 1702 by one of Aurengzebe's generals; and in 1714 by the French under M. de Bourdonnais, to whom it surrendered after a bombardment of three days. It was restored to the English at the peace of Aix la Chapelle, and sustained, with credit and success, a memorable siege by the French under Lally in 1758-9; since which it has experienced no hostile attack. (*Hamilton's E. I. Gaz.*; *Modern Traveller*, x.; *Malcolm's Travels in S. E. Asia*; *Madras Almanack*; *Parl. Reports*; *Commercial Dict.*, &c.)

MADRID, a celebrated city, and the modern cap. of Spain, in the centre of the kingdom, on the Manzanares, a tributary of the Tagus, 39 m. N. by E. Toledo, the former cap., 320 m. N. E. Lisbon, and 240 m. S. W. Bayonne; lat. 40° 25' N., long. 3° 38' 15" W. Pop., in 1825, according to Miñano, 181,400, exclusive of about 20,000 occasional residents designated *forasteros*; but this was much beyond the mark; and the present (1840) pop. does not exceed 170,000, including 10,000 troops and foreigners. This city, which, till the time of Philip II., was little more than an obscure country town, stands in a stony barren district, more than 2,000 ft. above the sea, having no navigable river near it, and scarcely any potable water, and being, at the same time, extremely cold in winter and unbearably hot in summer; the thermometer, at the former season, falling to 18°, and during the latter, rising to 110° or 115° Fahrenheit. This variability of temperature, combined with the prevalence of piercing E. and N.E. winds, during the greater part of the year, renders the climate very unhealthy, and especially prejudicial to persons threatened with pulmonary complaints, some thousands of whom are said to have died during the winter of 1829-30. (*Cook's Sketches*, i. 176.) All authors, indeed, agree that it would have been difficult to fix on a more unfavourable site. "From the Somo-Sierra," says Inglis, "to the gates of Madrid, a distance of nearly 30 m., not a tree, garden, nor country house, is to be seen, scarcely an isolated farm-house or cottage, and only three or four very inconsiderable villages. The land is chiefly uncultivated, and even that part, under tillage and producing grain is mostly covered with weeds and stones. In the midst of this desert, stands Madrid, which is not visible more than two leagues' distance. From this side it appears small and not striking; and although we may count upwards of

50 spires and towers, none are so elevated or imposing as to awaken curiosity, like that felt on first discovering the towers of churches in other Spanish cities." Even  $\frac{1}{2}$  m. from the gate, the traveller might still believe himself to be 100 m. from any habitation: the road stretches away, speckled only by a few mules; there are no carriages, no horsemen, scarcely even a pedestrian; there is, in fact, not one sign of vicinity to a great city." (i. 133.)

It occupies a space of nearly 4 sq. m., on a slope inclining S.S.W. towards the Manzanares, usually an insignificant stream crossed by two magnificent bridges, the size and beauty of which contrast so strongly with the river beneath as to have given rise to the saying that "the kings of Spain should sell the bridges, and purchase water with the money." The river, however, sometimes swells to a great height, and pours down a magnificent volume of water. (*Swinburne*, ii. 184.) The town is surrounded by a shabby brick wall, in which are 15 stone gates, the handsomest being those of Alcala, San Vincente, and Toledo. The interior comprises an old and a more modern quarter, the former, built before Madrid, was the metropolis of Spain. The E. and more modern part is certainly not devoid of beauty; and its wide and well-paved streets, lined with handsome and lofty houses, chiefly built with brick and grey granite, the extensive and well-planted walks, the squares with their elegant fountains, and the many large and well-built public edifices, remind the traveller that he is in one of the finest, though perhaps the dullest, capitals in Europe. The best entrance to the city is by the Saragossa road, through the gate of Alcala, a noble Ionic structure, with three arches, the central one being 70 ft. high. Within the walls, right and left, is the long, wide Prado, with its rows of trees stretching in fine perspective for more than  $\frac{1}{2}$  m., and in front is the *Calle de Alcala*, reaching into the heart of the city,  $\frac{1}{2}$  m. in length, wider than Regent Street, and flanked by a splendid range of unequal buildings, but all of large size, and good proportions. At its end is the great centre, in which most of the better streets terminate, and, now at least rather inappropriately, designated the *Puerta de Sol*. Here, close to the *Bolsa*, or exchange, is the great morning rendezvous, either for business or pleasure. The best streets uniting in this point are the *Calle Mayor*, the *Calle de la Montera*, and the *Calle de las Carretas*, all busy thoroughfares, with good and showy shops. The *Calle del Arsenal* leads to the palace, and the *Carrera de San Geronimo* is the direct road to the gardens of the Buen Retiro. Among the squares of Madrid, the largest, with the exception of the space fronting the palace, is the *Plaza Mayor*, a rectangular area, 430 ft. in length, and 330 ft. broad, surrounded by a uniform range of stone buildings, 5 stories high, the lower part being open in front, and supported by pillars forming a handsome colonnade. The chief streets running into it are those of Atocha and Toledo, the latter passing through the *Plaza de Chada* (formerly the place of execution for criminals), and through the gate to the bridge of its own name. None of these streets, however, will bear any comparison with the *Calle de Alcala*; many are good, and very many respectable, tolerably wide, and formed with lofty and well-built houses; but there is no other magnificent street. The bye-streets are narrow and crooked, especially in the S.W. quarter, where decay of material, closeness of building, and extreme filth, are the almost unvarying characteristics.

Among the public buildings, the most conspicuous is the royal palace, occupying, with its gardens, a space of nearly 80 acres, on the E. bank of the river. It stands on the site of the old Alcázar of Philip II., burnt down in 1734, and has 4 fronts of white stone (each 47 ft. in length and 100 ft. high), enclosing a spacious quadrangle. The interior is fitted up in a style of costly magnificence, perhaps not surpassed in any palace of Europe. The ceilings are *chef-d'œuvre* of Mengs, Velasquez, Corrado, and Tiepolo; the richest marbles of Spain adorn its walls, and the rooms are hung with paintings by the best masters, and noble mirrors from the manufactory of St. Ildelfonso. (*Swinburne*, ii. 164-177.) Many of the best pictures, however, have been removed to the royal picture-gallery in the Prado. Its armoury is especially curious, and presents numerous specimens of arms and accoutrements taken from the Moors by Ferdinand the Catholic and his victorious generals. (*Sir C. Brown*, ii. 295.) The other chief public buildings are—the custom-house, a handsome range of building, 320 ft. in length; the Buenavista palace, now used as a museum of civil engineering; and the palace of the council of Castile, in the *Calle de Alcala*; the post-office, in the *Puerta del Sol*; the king's printing-office, in the *Calle de las Carretas*; the duke of Liria's palace, containing a fine collection of pictures, near the gate of St. Bernardino, in the N. quarter of the city; the palace of the duke of Berwick; and the national gallery, in the Prado. Madrid, though a bishop's see, has no cathedral; but there are 67 churches; among which, however, the churches of San Isidro and the

Visitation are alone worthy of notice, the rest being externally and internally barbarous. "No mad architect," says Swinburne, "ever dreamt of a distortion of members so capricious, of a twist of pillars, cornices, or pediments so wild and fantastic, but that a real sample of it may be produced in some one or other of the churches of Madrid." They are, with two or three exceptions, small and poor both in marbles and pictures. Their altars are piles of wooden ornaments heaped up to the ceiling and stuck full of wax-lights, which from now and then have set fire to the whole church." (Swinburne, ii. 164.) Previously to 1834 there were 66 convents; but several have since been pulled down to widen the streets, while others have been converted to different and, no doubt, more useful purposes than the maintenance, in pampered idleness, of hundreds of dissolute monks and nuns. The great walks constitute another grand feature of the city. The *Prado*, or public promenade, is as fashionably attended, especially on Sunday, as Hyde Park in London. It is nearly 2 m. long, and comprises a broad walk, called the *salon*, flanked by several of less width, thickly shaded with elm trees; contiguous to it is the garden of the *Buen Retiro*, the palace of that name having been demolished; and still further S. are the shady gardens called *Las Delicias*, leading to the Canal de Manzanares, which was once intended to connect Madrid with the Tagus at Toledo. These walks, in the afternoons of autumn, are crowded with the most respectable inhab., nor can any better idea of the out-of-door appearance of the pop. be got than by observing them on the *Prado*. In the spring, however, the scene is varied by visits to Aranjuez, a beautiful park near the Tagus, forming a verdant oasis in the midst of a desert. "The ladies," says Quin (p. 114.), "wear, with few exceptions, black silk dresses and shawls, or rather mantillas, of various colours, while their head-dress consists only of a slight veil attached to the hair by a comb, and falling on the shoulder; and the graceful manner in which they wear the mantilla and veil gives to them all a smart and attractive air. The dress of the men is in every respect similar to that of the French or English, but they usually cover their persons with large cloaks, which, from the manner of wearing them, have rather a graceful appearance."

The state of education in Madrid cannot be satisfactorily ascertained. Mifano, indeed, mentions the existence of 106 primary schools and 2 colleges; but nothing can be inferred from such a statement, as every thing depends on the sort of instruction and the number of the pupils. The schools being generally, however, at least till very recently, under the guidance of the priests, there can be no doubt that the education they afforded was of the very worst description; and that, instead of expanding and improving the mind, it was only fitted and intended to imbue it with the grossest prejudices. Schools on the Lancasterian system have recently been introduced; but they are opposed by large classes, and at this moment the bulk of the pop. is involved in the grossest ignorance. The *Colégio Imperial* and the *Seminario de Nobles*, the two schools or colleges frequented by the better classes, are but little superior to the others: no choice is, however, left to parents as to the education of their children, the only alternative being the government school or no school. The instruction given to females is most superficial: reading, writing, and a little geography are taught, in connection with music and other accomplishments; but few ladies attain to any thing like literary distinction, and the majority are "ignorant almost beyond belief." Closely connected with the educational establishments are the various literary and scientific societies, most of which are under the protection of the crown. The Academy of History, which has a handsome mansion in the Plaza Mayor, was instituted in 1735, for the purpose of collecting authentic materials for the history and geography of Spain and her possessions, and has published, amongst other useful works, an historical-geographical dictionary of Spain and Navarre. The *Academia de la Lengua* has for its object the perfection of the Castilian language, and with this view has published a dictionary, grammar, and other works on Spanish philology. There are also academices of science, the fine arts, medicine, and rural economy, all of which are more or less useful in promoting their respective objects. The public collections comprise,—1. the royal library, with 200,000 printed volumes, besides many valuable Arabic and other MSS., and a fine collection of coins; 2. the library of San Isidro, formerly belonging to the Jesuits, and containing upwards of 60,000 vols.; 3. the museum of natural history, in which, besides other good specimens, is the great *megatherium*, described by Cuvier; 4. the botanical garden and library; and, 5. the national picture-gallery, equal in extent, and perhaps little inferior in excellence, to the largest in Europe. "To the lover of the Spanish school," says Inglis, "this gallery possesses attractions which no other can offer. Besides 42 pictures of Murillo, it contains 35 of Velasquez, 29 of Espanolette, 17 of Juanes, 6 of Alonso Cano,

and many by other native painters; there are also nearly 500 pictures of the Italian schools, and about 300 of the Flemish school; and in the *Sala Reservada* are several *chefs-d'œuvre* of Titian and Rubens. A full description of these pictures is given by Inglis in ch. vi. of his valuable work; also by Cook, vol. i. 166-170.

Several newspapers are now published at Madrid, many of which are violent and abusive in the expression of their political sentiments; but few are sufficiently well conducted to exercise much influence on the public mind. The reprinting of Spanish works has been during some years conducted with great spirit, and translations have been made of popular English and French novels, scientific and eleментар works, &c.; and many light writings, with a few more solid productions of unquestionable talent by Castilians of our own day, indicate a gradually increasing taste for literature, which, however, is far from general, even among the better classes.

The theatrical amusements of Madrid are confined to two small establishments, managed by the *ayuntamiento* or city council. At these theatres, called the *Teatro de la Cruz* and the *Teatro del Principe*, Spanish comedy and Italian operas are indiscriminately represented; the musical department is on the whole well conducted: the plays are of the most trifling description, more resembling low farce than regular comedies; but, at any rate, they represent pure and unadulterated pictures of the intrigues and low life of Spain, and exhibit a truth and spirit unknown on any other stage. A large theatre, begun some years ago near the palace, has not been completed. The great and all-absorbing amusement, however, of the people of Madrid (called by their countrymen *Madridenos*), is the bull-fight, held on the Monday afternoons during the season, in a large open amphitheatre, outside the gate of Atocha. Monday in Madrid is always a kind of holiday, and in the afternoon all the avenues leading to the bull-ring are in commotion: the street of Atocha is filled throughout its whole extent with a dense crowd of all ranks, some on foot and others in carriages, all hastening to the same point. The amphitheatre will accommodate 17,000 spectators: the central area has a diameter of 230 ft., and is surrounded by a double fence, behind the exterior of which the benches rise tier above tier to the outer wall, where, at the top of all, and shaded with awnings and blinds, are the boxes occupied by persons of rank and property. The intense interest which the spectators of all classes, women as well as men, feel in this butcher-like sport, is visible throughout, and often loudly expressed; and, says Inglis, "it is certainly a fine spectacle to see thousands of spectators sit simultaneously, as they always do when the interest is intense: the greatest and most crowded theatre in Europe presents nothing half so imposing as this." The expenses of these exhibitions are very heavy; but the receipts are greater, leaving a handsome sum for the General Hospital, which, it is said, draws from them a revenue of 300,000 reals, or 3,000, sterling.

Inglis says there is less wretchedness in Madrid than in Paris, London, and other great towns of France and England; but the condition of the lower orders has been since much altered for the worse, by the suppression of the convents, on which they were greatly dependent: many of the ecclesiastics have also fallen into the most abject distress, though distress arising from this source, in so far at least as the public are concerned, can only be temporary. There are numerous benevolent institutions for the relief of indigence, and the cure of disease, many of which are supported by handsome endowments. The royal hospital of San Fernando, a very large establishment somewhat like an English workhouse, and the mendicity institution for the reception of beggars, formerly the greatest nuisance in Madrid, are doing much good; and the General Hospital not only gives relief to the sick poor, but serves as a practical school for the students of the Academy of Medicine. A *mont de pieté*, like that in Paris, lends money on security, with this difference, that at Madrid no interest is taken, the expense of the establishment being borne by the government.

Madrid has scarcely any manufacturing industry, nor is it possible, from its situation, at a distance from any navigable river, and in the midst of a stony, unproductive desert, that it can, in this respect, materially improve, even if that love of the *dolce far niente* should be given up, which seems to be the *summum bonum* of the Madrilenian. As it is, the workmen of the city are Catalans, Valencians, Aragoneses, Asturians, and Galicians: in short, every article in Madrid, whether of manufacturing or farming industry, is exotic. Its fruit comes from a distance of 50 m., butter from Aragon, oranges and lemons from Valencia, and dates from Murcia. A manufactory of porcelain and another of carpets are carried on at the expense of the government, and, most probably, with as little profit as the mirror manufactory at St. Ildefonso and the salt-petre works described by Townsend, as entailing a heavy annual loss (vol. i. p. 269-278.). The consumption of Madrid, in

1825, is stated, by Ingalls, to have been as follows:—230,000 sheep, 12,500 oxen, 70,000 hogs, 800,000 bushels of corn, 18,000 bushels of salt, 2,417,357 arrobas of charcoal, 4,800 arr. of oil, 13,250 arr. of soap, and 600,000 arr. of wine. (The arroba is equal to 25 lbs. avoird.) The price of provisions, and the general expenses of living, are very high. In consequence of the necessity of bringing almost every article from a distance, and the want of water carriage. The markets are well supplied with meat, poultry, and vegetables; but fish and milk are scarce. Beef and mutton are sold at about  $\frac{1}{4}$ d. the lb. of 14 oz., veal fetches  $\frac{3}{4}$ d., and pork  $\frac{5}{8}$ d. per lb.; bread of the best quality (and finer can nowhere be had than in Madrid) is  $\frac{3}{4}$ d. per lb., ordinary wine of La Mancha about 6d. the arroba ( $\frac{1}{4}$  gallons). Fowls are sold from 2s. to 3s. 6d. the couple, ducks at 2s. each, geese at 3s. 6d., and turkeys from 4s. to 10s., according to the season. Coffee is about one third cheaper than in England; but tea and sugar are scarce, dear, and bad. Fruit is abundant, and very cheap. Fuel is one of the most expensive articles, and lodgings fetch as high rents as those in the best situations in London.

The state of society in Madrid will be best learnt from viewing the habits of the middle classes; for, indeed, it is next to impossible for a stranger, even with good introductions, to know enough of the aristocracy to form a correct judgment of their domestic habits, owing, we believe, in a great measure, to the general poverty, which, with the high rate of living in Madrid, is a very effectual bar to hospitality. Almost all families, except those in the very highest ranks, live as in Paris and Edinburgh, in stories or flats, each story being a distinct house. The outer door, which is of enormous strength, has a small window or grating, with a sliding shutter, and the usual salutation from the porter, when one rings for admittance is *¿quien es?*—to which the proper reply is *Gente de paz* (people of peace); and the door, in ordinary cases, is opened. This precaution of surveying strangers before admittance is, perhaps, attributable to a feeling of personal insecurity, consequent on bad government and religious persecution. A suite of apartments usually consists of a large, well-lighted, and respectably-furnished saloon, with a recess on one side, in which is a bed, wholly unconcealed, and without curtains; and at another side is a door-way leading into a smaller chamber, similarly furnished to that just described. The lady's boudoir is always handsomely decorated; and the worst rooms in an establishment are invariably the library or study, and the dining-room, both of which are small, and wretchedly furnished. The apartments are always kept remarkably clean. The manner of living in Madrid is somewhat more generous than in the N. provs. A rather rich soup is usually added to the everlastingly *olla*, or *cocido*, which is much better made and more highly seasoned than in the west of Spain; and dinner is always followed by cakes, sweetmeats, and fruits, accompanied by a moderate supply of Valdepeñas and other good native wines. The inbabs., except the tradespeople, rise late, and breakfast on chocolate between 10 and 11. Lounging, reading, or a stroll to the cafés (where, however, they spend nothing) occupies the men, dressing and visiting the ladies, till dinner (about three), after which follows the siesta, a season of almost universal repose in Madrid. The shops then are either shut, or a curtain is drawn before the door: the shutters of every window are closed; scarcely a respectable person is seen in the streets; the stall-keepers spread cloths over their wares, and go to sleep; groups of the poor and idle are seen stretched in the shade; and even the Galician water-carriers, seized with the general drowsiness, make pillows of their water-casks. The siesta over, the ladies, in the balconies, and the gentlemen smoke their cigars, till the time for the lounge on the Prado; and then comes the *tertulia*, a very pleasant and social meeting for chit-chat and music, closing the day of Madrid. Dinner parties are seldom or never given, and there are no regular *parties* except balls; and those not frequent, and unaccompanied by any refreshment beyond *agua fresca*. The best national manners are not, as in other countries, to be found in the cap., where every thing is sacrificed to the rage for imitating the French and English—a feature which distinguishes the *Madridenos* from all other Spaniards. Morals in all classes, especially the higher, are in the most degraded state. Veils, indeed, are thrown aside, and serenades are rare; but gallantry and intrigue are as active as ever. The men think little of their marriage obligations, and pay no real respect to the other sex: the women make dress and show the business of their lives; court admiration, and are willing victims of unprincipled gallantry. Infidelity in married women is perhaps more frequent than in any of the towns of Italy, scarcely any married lady is without her *cortejo*. The connection, however, if not less sensual, is more lasting than in Italy—and intrigues

\* The curious reader is referred to Sir A. C. Brooke's entertaining travels through Spain and Morocco (ii. 245), for a recipe for making this dish in its different varieties.

are usually carried on unknown to the husband, who is generally too proud to connive at his wife's dishonour. Sexual immorality is common also among the lower orders; but there is not that drunkenness, brutality, and insolence which characterise the *canaille* of Paris and London; and the stranger may now walk about the streets in any part of Madrid without fear of being stabbed or plundered, a circumstance attributable more to the improvement of the lower orders than to the excellence of the police, which certainly deserves no eulogium. (Swinburne, ii.; Ingalls, i. 36–240.; *Quin's Travels in Spain*; *Cook's Sketches of Spain* in 1829–31, vol. i. c. 8.; *Giuliano's Lectures on Spain. Lit. in the Athenæum* of 1834; *Journ. of Educ.*, vol. ix.; and *Private Information*.)

Madrid occupies the site of the ancient *Mantua Carpetanorum*, a fortified town belonging to the Carpetani. It was afterwards called Majoritum, was taken and sacked in 1109 by the Moors, who gave it its present name. Henry III. repaired and enlarged it at the beginning of the 15th century, and Philip II. made it the capital of Spain. Its subsequent history to the time of the French war is unimportant. On the 23d of March the city was entered by the French troops under Murat, and the royal family was induced to remove into France, Joseph Bonaparte was then made king; but both he and the French army were, two months afterwards, obliged by the inbabs., who rose in a body, to evacuate the town. In the December following, Madrid was occupied by Napoleon in person, and his brother Joseph was reinstated. The English troops occupied it for a short time in 1812, and it was again visited in 1823, by the French under the Duc d'Angoulême.

MADRIDEJOS, a town of Spain in New Castile, prov. La Mancha, 39 m. N.N.E. Ciudad-Real, and 65 m. S. Madrid. Pop., according to Mifano, 6,800. It is situated in an extensive and exposed plain on the great road from Madrid through Aranjuez to Jaén and Granada, the neighbourhood being rendered not only unhealthy, but also, in some parts, unproductive by the inundations of the Amarguillo, which often greatly injure the town and deprive the people of their means of support. The only public buildings are 2 par. churches and an hospital; nor are there more than a dozen good houses in the place. A manufactory of serge is the only branch of industry in the town; but the neighbourhood is remarkable for its rich crops of saffron and for extensive sheep-farming. (Mifano.) Ingalls describes the inbabs. as "almost a population of beggars," and states that the agriculture of this district is in the lowest state, a great part of the soil being poor and barren, while the indolence and absurd prejudices of the farmers render the rest all but unproductive. (Voy. ii. p. 12.)

MADRASA and DINDIGUL, a collectorate of British India, presid. Madras, prov. Carnatic, near the S. extremity of Hindostan, between lat. 9° and 10° 45' N., and long. 77° 10' and 79° 10' E., having N. Trichinopoly and Coimbatore, W. Cochin and Travancore, S. Tinnevely and the Gulph of Mannar, and E. the latter and Tanjore. Area 7,656 sq. m. Pop. (1836–37) 1,135,411, chiefly Hindoos of the Sudra caste. The N. and W. parts of this district are mountainous, the S. and E. level. The hilly parts are interspersed with fertile valleys, the principal being that of Dindigul; but the plain country of Madura is by far the most productive portion of the surface. It is intersected by the river Vaghey, which rises in this district, and after a course eastward for about 146 m., falls into the Gulph of Mannar. A few swamps exist on the shore. The island of Rameswaram belongs to this district. The climate of the hills is cool and healthy, but the wind often blows with great violence; in the S. it is much warmer, the temp. in April and May ranging between 70° and 98° Fahr. Different kinds of paddy are grown in the low country, irrigation being there facilitated by plenty of streams and tanks; the husbandry is tolerably good, though not so perfect as in Tanjore. In Dindigul, the dry culture is to the wet as 4 to 1; and the inbabs. are in much less comfortable circumstances than those of the S. Property is much subdivided; some individuals occupy only the 20th part of an acre, and few have more than 135 acres. Madura is celebrated for its piece goods, and its dyers; and its artisans in gold, silver, &c., are in many places much above mediocrity. Its chief exports are piece-goods, cotton, paddy, and chanks; its chief imports, betel nut, clay, root, cocoa nuts, and oil seeds. The roads, bridges, and other public works in this district, have been of late put into very efficient repair by the government. Total public revenue (1837–38) 219,064*l.*, of which the land-tax made 163,363*l.* This district is supposed to be the *Rigya Pandionis* of Ptolemy, having been anciently governed by a Pandian family, and is one of the holy countries of Southern India. It has numerous fine temples and other monuments of former Hindoo grandeur. It was transferred to the British by the nabob of Arcot in 1801.

MADURA, a town of S. Hindostan, cap. of the preceding

district, on the Vighy, 136 m. N.N.E. Cape Comorin, and 270 m. S.W. Madras: lat.  $9^{\circ} 55' N.$ , long.  $74^{\circ} 14' E.$  It is surrounded by a bastioned but dilapidated stone wall; streets wide and regular, public edifices magnificent, but private dwellings mean and wretched. It has some of the most extraordinary specimens of Hindoo architecture extant. The palace is a vast pile, with a dome 90 ft. in diameter; but it is much dilapidated: the great temple, with its spacious areas, choultries, and 4 colossal porticoes, each a pyramid of 10 stories, covers an extent of ground almost sufficient for the site of a town. In front of the latter is a celebrated choultry, or inn, 312 ft. in length, ornamented with polished green stone columns, and grotesque sculptures. During the Carnatic wars, from 1740 to 1760, Madura underwent many sieges. The British civil station, and seat of the collector, &c., is in a pleasant situation, about 14 m. S. the town. (*Hamilton's E. I. Gaz.*; *Madras Almanack*, 1838-39.)

MADURA, an island of the Eastern Archipelago, immediately adjacent to the N.E. coast of Java, with which island it is politically included, under the Dutch government. (See JAVA.)

MAESTRICHT, *an. Trajectum ad Mosam*, a fortified town of Holland, prov. Limburg, of which it is the cap., on the Maese, 14 m. N. by E. Liege, and 57 m. E. Brussels; lat.  $50^{\circ} 51' 7'' N.$ , long.  $5^{\circ} 41' E.$  Pop., in 1834, 22,000. It is one of the strongest towns in Holland, being defended by numerous bastions, trenches, &c.; it is well built, with wide, clean, and well-paved streets. The market is held in the great square, the centre of which is occupied by the *hôtel-de-ville*, built in 1652, and said to be one of the finest structures in the kingdom: the *place d'armes* is also a fine open space planted with rows of trees, and much frequented as a promenade. Among the other public buildings are comprised the exchange, the church of St. Servais, the *ci-devant* college of Jesuits, the arsenal, and the theatre; and in the town are 10 churches, 2 hospitals, 2 orphan-asylums, a lyceum, an academy, fine public library, and society of agriculture. Maestricht is the residence of the governor of the prov. and the seat of a court of assizes and primary jurisdiction, as well as of a chamber of commerce, and it sends 6 deputies to the States of the prov. The industry of the town comprises the manufacture of woollen cloths and flannels, cotton and woollen yarn, fire-arms, pins, starch, and tobacco; besides which there are soap-factories, tanneries, breweries, and dyehouses. A considerable trade is carried on with various places on the Maese by means of barges, and packets ply daily between Maestricht, Liege, Namur, &c. Three large fairs are held here during the year for horses and cattle. On the other side of the river (crossed here by a stone bridge) is the citadel or fort of Petersberg, in the suburb of Wyk, famous for its extensive subterranean stores of arms, containing numerous intricate galleries, and passages, and abounding with curious marble and mineral fossils, some specimens of which may be seen in the museum of the Jardin des Plantes at Paris. (*Lander's Dict. de Limburg*, &c.)

MAGDALENA, a river of S. America, and next to the Orinoco the principal in the republic of New Granada, through the centre of which it flows, from S. to N., through 9 deg. of lat. It rises in the small lake of Papas, in the Andes, about lat.  $2^{\circ} N.$ , and long.  $76^{\circ} 25' W.$ , and runs for at least 500 m. between the middle and E. chains of the Cordillera. Its entire course may be estimated at about 800 m.: it enters the Caribbean Sea about 63 m. N.E. Cartagena, and 40 m. S.W. Santa Marta. Its principal tributary, the Cauca, flows between the central and W. chains of the Cordillera, and joins it from the W., between 150 and 200 m. from its mouth. Its other affluents are the Sogamosa, Sesar, and Bogota. The towns of Nariño, Honda, and Monpo are on its banks. The descent of the Magdalena is said to be as much as 20 inches a mile (*Dict. Géog.*); and the strength of its waters is such, that they preserve their freshness to a considerable distance from its mouth. The Magdalena is navigable as far as Honda, in lat.  $5^{\circ} 14' N.$ , near which the navigation is interrupted by cataracts; but its rapidity is such, that a distance of 10 leagues a day is reckoned very good progress in ascending the river, for a *champan*, or flat-bottomed boat, manned by 24 *bogas*, or rowers. The oppressive heat of the climate, the abundance of caymans, and the swarms of mosquitos and other insects that infest the river, contribute to render the navigation both dangerous and unpleasant; but the Magdalena is, notwithstanding, the main route for the commercial and other intercourse of the inland prov. of New Granada with the ocean.

MAGDEBURG, a fortified city of Prussian Saxony, of which prov. it is the cap., on the Elbe, 74 m. S.W. Berlin, and 50 m. E.-S.E. Brunswick, lat.  $52^{\circ} 8' 4'' N.$ , long.  $11^{\circ} 34' 46'' E.$  Pop. in 1837, with its suburbs (ex. garrison), 51,347. Magdeburg is a fortress of the first class, and, from the augmentation and improvement of its defences since the war, it is now considered one of the

strongest in Europe. The citadel, on an island in the Elbe, serves also as a state prison, Baron Trenck and Lafayette having, among others, been confined in it.

Magdeburg is divided into the Old town, with the suburb Friedrichstadt, together composing the ancient fortress; and the New town and suburb of Sudenburg. The latter, however, has been for the most part surrounded with walls, and the fortifications are now so extensive that it is said it would require an army of 50,000 men to invest the city. Magdeburg has one good and spacious street, called the Broadway; but all the other streets are narrow and crooked. There are two large public squares, in one of which is the cathedral. This, which is one of the finest Gothic structures of N. Germany, was erected between 1211 and 1363, and has been recently repaired at a cost of 300,000 dollars. It has two towers, each 340 ft. in height, a lofty vault, a handsome high altar, and numerous tombs and monuments, among which is that of Otto the Great and his empress.

Magdeburg has in all 12 churches, one of which is for R. Catholics, a synagogue, an ecclesiastical seminary, a female high school, or royal boarding house for the education of girls, a teachers' seminary, with schools for agriculture, commerce, surgery, &c.; 5 hospitals, a lunatic asylum, a workhouse, a humane institution, a savings' bank, and various charities; an arsenal, extensive barracks, and other military establishments; several public libraries, and a theatre. It is a bishop's see, and is the seat of the government, of the board of taxation, the superior courts of justice, the council, and the military commandant of Prussian Saxony. From its position on the Elbe, it is an important *entrepôt* for the merchandise imported into and exported from the central parts of Germany by that river. In other respects, also, it is very favourably situated for commerce. A canal, commencing about 20 m. below the city, connects the Havel with the Elbe, giving Magdeburg a direct water communication with Berlin and Frankfort on the Oder; and it is also the centre of a number of great roads which lead to all the cities and towns of importance within a radius of 50 m. Its manufactures, which are pretty considerable, consist of silk, linen, cotton, and woollen fabrics; oil-cloth, hats, gloves, tobacco, soap, earthenware, refined sugar, chicory, vinegar, &c., with numerous tanneries, breweries, and distilleries. A large quantity of salt is made in its neighbourhood. It has several native banking establishments, and a branch of the royal bank of Berlin. Several newspapers are published in the town; which has uniformly an air of bustle and activity.

Magdeburg was repaired by Charlemagne, and improved and enlarged by Otto the Great. It has suffered numerous sieges. In 1631 it was taken by assault by the Imperialists under Tilly, by whom it was given up to military execution, and was nearly burned to the ground. It is the birthplace of the celebrated natural philosopher Otto de Guericke, and of the poet Schultz. (*Von Zedler's, Der Preussische Staat*, iii. 204, 205; *Berghaus's, Allg. Länder, &c.* iv. 655, 656; *Stein Handb.*)

MAGELLAN, or MAGELHAENS (STRAIT OF), a strait at the S. extremity of S. America, separating Patagonia from Tierra del Fuego, Clarence Island, and the Isle of Desolation. It extends from Capes de las Virgins and Espíritu Santo, on the Atlantic, to Capes Victoria and de los Pilares, on the Pacific Ocean, a distance of about 300 m., having a breadth varying from  $\frac{1}{2}$  to 40 m. It has an additional communication with the Pacific by Cockburn's channel and Magdalen Sound. Its shores are lofty and generally rugged, and its depth is in some parts very great, no bottom having been found with upwards of 1,800 ft. of line. Some safe and excellent bays communicate with it; but, generally speaking, its passage is extremely dangerous, both from the violence of the currents and the sudden and heavy tempests to which it is subject. It was discovered by Magellan, a famous Portuguese navigator in the service of Spain, in 1520. Drake traversed it in his voyage round the world, and it has since been frequently explored by British navigators.

MAGGIORE (LAGO DI), or Lake of Locarno, (an. *Lacus Verbani*), a famous lake of N. Italy, lying partly between Piedmont and Lombardy, and partly within the Swiss canton of Tessin. It is long and narrow, stretching above 40 m. from Magadino at its N., to Sesto-Caldente at its S. extremity, while in its widest parts, opposite to the mouth of the Toce, it is about 6 m. across, but its ordinary breadth does not exceed from 2 to 3 m. Its general direction is S.S.W. and N.N.E., and it may, in fact, be considered as an expansion of the Tessino, which enters it at its N. and leaves it at its S. extremity. In addition to the Upper or N. Tessino, it receives on its W. the waters of the Toce, and on its E. side those of the Tresa, flowing from the Lago di Lugano. Its only outlet is the Lower or S. Tessino. In some places it is not less than 300 fathoms deep; its waters, which are clear and of a greenish tinge, are well stocked with fish; and, like all Alpine lakes, its navigation is dangerous from sudden squalls.

The scenery of the Lago Maggiore is very varied. That of the upper part is bold and mountainous, its northern branch opening into one of the most beautiful valleys of the Rhœtan Alps, which form a magnificent amphitheatre in the back ground. Towards the E. and S., the mountains gradually decline to the plain of Lombardy; and the lower part of the lake is of a more quiet and softened character, yet still very beautiful. Its immediate shores are richly fringed with wood, occasionally broken by picturesque crags, topped with castles and churches, and with numerous villages stretching along the water's edge. Though inferior in wildness and sublimity to the lake of Como, and perhaps, also, to that of Lugano, the softer beauties of this lake are generally allowed to be the more attractive, contrasted, as they are, with the distant grandeur of the Alpine chain. (*Conder's Italy*, i. 313.)

The Borromean islands, from which this lake has derived a great portion of its celebrity, are situated in a bay, on its W. side, opposite to the mouths of the Toce. Of these the *Isola Bella* and the *Isola Madre*, are the most famous. They are of small size, and, previously to the middle of the 17th century, were little better than bare rocks; but being the property of Count Vitaliano Borromeo, a descendant of the celebrated St. Carlo Borromeo, he resolved to make them his residence, and to convert them, according to the taste of the time, into a sort of Italian paradise. They were consequently covered with earth brought from the adjoining mainland, formed (especially the *Isola Bella*) into splendid terraces, lined with trees and statues, and ornamented with superb palaces. Unluckily, however, nothing is natural, all is art.

"On every side you look, behold the wall!  
No pleasing intricacies intervene,  
No awful wildness to perplex the scene;  
Grove nod to grove, each alley has a brother,  
And half the platform just reflects the other.  
The soft'ning eye inverted nature sees,  
Trees cut to statues, statues thick as trees!"  
*Pope's Moral Essays*, iv. l. 114.

For a lengthened period, however, these islands were the theme of universal admiration; but as a simpler and purer taste began to prevail, they came to be regarded with very different feelings, and have latterly, perhaps, been too much depreciated. These are now usually looked upon by Englishmen, at least, as little better than "quarries above ground;" and as evincing only the wealth, extravagance, and bad taste of their founder. (*Lustace's Italy*, vol. iv., 8vo. edit.; *Simms's Italy*, p. 2, &c.)

MAGINDANAO, or MINDANAO, the most S. of the Philippine Islands, which see.

MAGNESIA *ad Sipylum* (now MANISA), an ancient town, of some celebrity, in Asiatic Turkey, 28 m. N.E. Smyrna. Pop. according to Elliott about 30,000, of whom 4,000 are Greeks, 2,000 Armenians, and a few Jews. It is situated near the Kodus, or an *Hermus*, embosomed in hills long noted for the production of basaltstones, and is one of the cleanest and neatest towns of Asia Minor, being in the midst of its streets, and other respects, far superior to Smyrna. The principal buildings are two mosques, with double minarets, indicating a royal foundation, and the interior of each is adorned with paintings, lamps, ivory balls, ostriches' eggs, &c., such as are to be seen in the mosques of Constantinople. There are 24 other mosques, and the Armenians, Greeks, and Jews have their respective places of worship. A Jewish college, lunatic asylum, and the mausoleum of Amurath II. are the only other public edifices, except the khans, which are numerous, and well built. The manufacture of cotton and silk goods, and goats' hair shawls, employs many of the inhab., and the town derives some importance from being on the great road between Smyrna and the interior of Asia Minor. (*Elliott*, ii. 56—64.; *Chandler*, i. 308.)

Magnesia was in all probability colonised by the Magnesians of Thessaly, not long after the foundation of Cyme and Smyrna, two other Æolian cities. It is celebrated as the scene of a signal victory obtained by the Romans, under the two Scipios, over the forces of Antiochus the Great, who was consequently obliged to retire beyond the chain of Taurus, and leave Asia Minor at the disposal of the conquerors. The inhab. afterwards displayed great bravery in defending their town against Mithridates. In the reign of Tiberius, A.D. 17, Magnesia, in common with 11 other cities, was all but destroyed by an earthquake, and owed its restoration in a great measure to the emperor's generosity. *Duodecim celebres Asia urbes collapsæ nocturno motu terræ; quod improvisum, gravioque præstiti fuit: neque solum in tali casu effugium subiecit in aperta prorumpendi, quia diuicis terris hauriebantur. Asperissima lues in eodem misericordiam traxit: cænes scelertum pollicitus Cæsar et quantum aerario pendebant in quinquentium remisit. Magnesia a Siplylo proximi damno ac remedio habuit.* (*Tac. Ann.* i. 47.)

It was a flourishing city at a late period of the Roman

empire, but at the commencement of the 14th century passed into the hands of Sarkian, sultan of Ionia, and finally was annexed. In 1448, to the dominions of Mahomet II., the conqueror of Constantinople.

The above city must not be confounded with *Magnesia ad Maandrum*, close to the modern Inck-bazar, and about 50 m. S.S.E. Smyrna, which, though a place of some consequence, was greatly inferior to the *Magnesia ad Sipylum*. It is remarkable, however, for the ruins of a theatre, stadium, and magnificent octastyle Ionic temple, said to have surpassed in the harmony of its proportions even the temple of Diana at Ephesus. (*Leake's Asia Minor*, p. 245.)

MAHA BALIPOORAM, or MAVALIPOORAM, a village and a curious assemblage of rock temples in Hindustan, on the Coromandel coast, distr. Chingleput, about 33 m. S.S.W. Madras; lat. 12° 36' N., long. 80° 16' E. The temples in their general character closely resemble those at Ellora and elsewhere, on the W. side of Hindustan; but, from their being cut in a granite rock, they are in better preservation. They have been chiefly consecrated to Vishnu, whose worship appears to have predominated on this, as that of Siva on the opposite coast of India. At the foot of a hill N. of the village is a pagoda, about 26 ft. high, nearly as long, and about half as broad, hewn from a single rock, and covered with sculptures. Near this temple, the surface of the rock, about 90 ft. in extent, by 30 in height, is covered with bas-reliefs, including a gigantic figure of Krishna, another of his favourite Arjoun, and representations of a number of animals. Opposite to this, and surrounded by a stone wall, are 2 brick pagodas of great antiquity; adjacent to which are 2 excavations in the rock, one supported by pillars, in a manner somewhat like the cave at Elephanta, and the other fronting a sculptured group, supposed to represent one of Krishna's adventures. Still proceeding S., the traveller crosses a rocky hill, in which is a spacious excavation, in the middle compartment of which is a figure of Siva between Brahma and Vishnu; while at one end of the temple is a gigantic figure of Vishnu sleeping upon a cobra-de-capello, and at the other an eight-armed goddess, mounted on a lion, rescuing a human figure from a buffalo-headed demon. Several of the figures are executed in a very superior style. About a mile further S. are other sculptured rocks, said to surpass those already noticed. One pagoda is about 40 ft. in height, by 29 in length and breadth; and another 49 ft. in length and breadth, and 25 ft. in height, but rent, as by some violent convulsion, from top to bottom; besides which there are three smaller structures, and large figures of a lion and an elephant, the last extremely true to nature. E. of the village, and washed by the sea, is an ancient stone pagoda, which, also, are several sculptured figures. The sea has obviously encroached on this part of the coast, and it has probably submerged many temples that formerly existed here. Mahabalipooram is believed to have been anciently of considerable importance as a metropolis of the kings of the race of Pandion, in Hindoo mythology. (*Goldingham in Asiat. Researches*, v.; *Heber*, &c. *passim*.)

MAHADEO TEMPLE, a celebrated place of Hindoo worship in British India, prov. Gundwanah, on the Norbudda, 60 m. S.E. Hussingabad; lat. 22° 22' N., long. 78° 35' E.

MAHANUDDY (*Maha Nadi*, the great river), a considerable river of Hindustan, having its source in the prov. of Gundwanah; lat. 21° 30' N., long. 81° E., and flowing mostly E. to the Bay of Bengal, which it enters by numerous mouths, about lat. 20° N., and the river, in K5° 30' and 87° E., after a course of more than 500 m. At Cuttack, about 70 m. from the sea, and between, in the rainy season, has a breadth of about 2 m.; but it is, notwithstanding, fordable at this point from Jan. to June. During the rains it is navigable for a distance of almost 300 m. from the sea. Its deposit is a coarse sand, hostile to vegetation, but frequently containing diamonds of the first quality, and which are occasionally of considerable size. (*Hamilton's E. I. Gaz.*)

MAHEE, a sea-port town of Hindustan. It belongs to the French, and was formerly their principal settlement on the coast of Malabar, but is now of little importance. It is admirably situated on rising ground, beside a small river, navigable for boats to a considerable distance inland, 40 m. N.E. Calicut. Pop. in 1835, 3,355, nearly all of native races. The town is well built, and has several handsome houses, 3 churches, &c. Its commerce is, however, small; and mostly confined to cocoa-nuts, pepper, arrack, &c. (*Official Returns*.)

MAHIM, a town of Hindustan, prov. Aurangabad, on the island of Bombay, near its N. extremity, in lat. 19° 27' N., and long. 72° 58' E. It has a Portuguese church and a R. Cath. college, and, in 1816, its pop., with that of some adjacent villages, amounted to 15,400.

MAIDA, a small town of the Neapolitan dom., prov. Calabria Ultra II., 8 m. S. by E. Nicotro. It is chiefly noted for an engagement fought in its vicinity, on the 4th July, 1806, when an English army under Sir John

Stuart entirely defeated a greatly superior French force under Regnier.

MAIDENHEAD, a mun. bor. and market town of England, co. Berks, hund. Bray, on the S. bank of the Thames, 11½ m. E. by N. Reading, and 27 m. W. London. Pop. of the bor., in 1831, about 2,400. The town consists almost entirely of one street extending from the river about 1 m. along the high road to Oxford, and lined with numerous respectable and a few handsome houses: it is tolerably well flagged and macadamized, but only partially lighted with gas. The guildhall, in the market place, is a spacious stone building: there is also a handsome chapel of ease, and the Wesleyan Methodists and Baptists have their respective places of worship. A national and infant school, with 3 Sunday schools, furnish instruction to the children of the poor, and there are almshouses and other charities for the sick and aged. The Bristol, Bath, and Exeter branch of the great western road is here carried over the Thames by a handsome stone bridge of 13 arches, and about 500 yards S. from it is another bridge of 3 arches, forming part of the Great Western Railway, which skirts the town in its whole extent. Maidenhead appears to be in a thriving condition: it has no manufactures, but is in the centre of an opulent neighbourhood, and derives considerable trading importance from its position on one of the most frequented roads of the empire. The bor. was first chartered by Edward III., and the corporation now comprises a mayor and three other aldermen, with 12 councillors. Corporation revenue, 2,723. Markets on Wednesday: horse and cattle fairs, Whit-Wednesday, Sept. 26, and Nov. 30.

MAIDSTONE, a parl. and mun. bor., market-town, and par. of England, co. Kent, hund. of its own name, in the E. div. of the lathe of Aylesford, on the E. bank of the Medway (crossed here by a bridge of five arches), 30½ m. E.S.E. London, and 35½ m. W. Canterbury. Area of par. and parl. bor., 4,420 acres. Pop., in 1831, 15,387. The town, which is about 1 m. in length from N. to S., and ½ m. in breadth, consists principally of a well-built street, leading N.E. from the bridge to a long and narrow street, along the road from Rochester to London; but exclusive of these there are many smaller streets. Among the principal public buildings are the co. hall, a modern structure well adapted for the business of the assizes, the new gaol, an immense structure, erected, in 1818, at an expense of 200,000*l.*, covering more than 13 acres of land, and ranking as one of the largest and best arranged in England, the barracks near the gaol, the county ball-rooms, and a small but pretty theatre. The market-house, the lower part of which is appropriated to the sale of corn, stands in the centre of the town, and behind it is a new market-place, conveniently arranged for the sale of provisions. The church, one of the largest in the kingdom, is an extremely handsome embattled edifice, with a lofty tower, formerly surmounted by a spire, destroyed by lightning in 1730: it was made collegiate in the reign of Richard II., and attached to an ecclesiastical college, destroyed with many others at the Reformation; the living is a perpetual curacy, in the gift of the Archbishop of Canterbury. There is also a new district church, erected, by the church-building commissioners, at an estimated cost of 13,000*l.*, the incumbency of which is in the gift of the curate of Maidstone. Places of worship are also supported by the Wesleyan Methodists, Independents, Baptists, Unitarians, and the Society of Friends. A free grammar-school was founded, in the reign of Edward VI., by the corporation, which has two exhibitions at University College, Oxford: freemen have the privilege of sending their sons here gratis, for classical instruction, the master making a charge for other branches of education. This school is not in a very flourishing state, and its inefficiency has led to the establishment of a proprietary school, which is well supported and attended. A blue-coat hospital was founded, in 1711, for the clothing and education of 53 boys and 43 girls, and there are three other endowed charity schools, and a Lancasterian school. Four sets of almshouses furnish lodging, clothing, and money allowances to 20 old women, and various bequests and charities exist for the relief of the sick and aged poor. A philosophical society was instituted here in 1824, a good library and reading-room is established, and a newspaper is published once a week.

Maidstone is in a very prosperous state, and there is no want of employment. There is a demand for houses of a superior class, and many have been built since the census of 1831; but many of the cottages are unoccupied, owing to the completion of public works, which had been going on for some years. The only manufacturing importance is that of paper: there are six paper-mills in the par., employing about 800 hands. The felt, blanket, and hop-bag manufactories are of much less extent. There is a considerable traffic on the river, which has been for many years gradually increasing; and the annual tonnage of vessels passing through Hal-

lington lock, about 2 m. from the town, is, at present, supposed to average 120,000 tons, on which tolls are paid to the amount of about 2,600*l.* The principal articles of merchandise brought up the river, are coals and timber for the supply of the neighbourhood, and also of Tunbridge, Seven-Oaks, and the whole world of Kent. A portion of the latter article is imported direct from the Baltic and America. The neighbourhood is celebrated for its abundant produce in hops and fruit, both of which are carried down the river with paper and stone." (*Mun. Corp. Report.*)

Maidstone received its charter of incorporation from Edward VI., in 1549, but forfeited it in the following reign, owing to the connection of its inhab. with the insurrection of Sir Thomas Wyatt. Queen Elizabeth granted another charter, with increased privileges; but this also became void, by a *quo warranto*, soon after the Revolution of 1688; and a new charter was granted in 1748, by George II. Under the Mun. Reform Act of 1837 the borough is divided into 3 wards, the corporate officers being a mayor and 5 other aldermen, with 18 councillors. Corp. revenues in 1839, 4,137*l.*, exclusive of 32*l.* resulting from the sale of property. The Lent and summer assizes are held here, as also the quarter-sessions for the W. division of Kent. The recorder holds, also, quarter and petty sessions within the borough; and there is a court for the recovery of small debts. This borough has sent 2 mems. to the H. of C. from the 6th of Edward VI. Down to the Reform Act, the right of election was vested in the freemen (by birth, apprenticeship, and purchase) not receiving alms. The limits of the borough were not altered by the Boundary Act. In 1839-40, it had 1,687 registered electors. Maidstone is also the chief place of election for the mems. for the W. division of the county. Large markets on Thursday for hops, corn, horses, and cattle: fairs for cattle, &c. 1st Tuesday in each month, Feb. 13., May 12., June 20., and Oct. 17.

MAILCOTTA, a town of Hindostan, prov. Mysore, and a celebrated place of Hindoo worship, on a rocky hill, 17 m. N. Seribapatam: lat. 12° 39' N., long. 76° 42' E. The town, which is open and paved, has about 400 good houses, mostly occupied by Brahmins, and several rich pagodas, choultrys, &c. The most striking edifice is a temple dedicated to Narasimha (the man-lion), which stands on the highest pinnacle of the mountain, and is approached by a staircase cut in the rock, and ornamented at intervals with smaller temples and arches. It has, besides, a temple to Krishna, a square building of vast dimensions, entirely surrounded by a colonnade, and which is said to be extremely rich in jewels and other articles of value; and held in such esteem that Tippoo did not venture to outrage the prejudices of his Hindoo subjects by plundering it. There is also a large and fine reservoir at Mailcotta, surrounded by numerous buildings for the accommodation of devotees. Near this town the Mahtrats defeated Hyder Ali, in 1772. (*Hamilton's E. I. Gazetteer.*)

MAINE, one of the U. S. of N. America, being at once the most northerly and easterly state in the Union, extending from lat. 43° N. to an uncertain distance northwards (see *post*); and between 67° and 71° W. long., having N.W. and N. Lower Canada, E. New Brunswick, W. New Hampshire, and S. and S. the Atlantic. Neither its length, breadth, area, nor pop. can at present be accurately determined; since about a third part of its surface, as claimed by the Americans, forms the territory in dispute between the U. States and Great Britain. Including this territory, the total area would be about 32,000 sq. m., and the pop. about 485,000. Maine has a greater extent of coast, and more good harbours than any other state of the Union. Its shores are all along indented by deep bays; and the opposite sea is studded with numerous fine islands, some of considerable size. Near the coast the surface is level, but it rises on proceeding inland, and most part of the state is hilly. In the N.W. a mountain chain forms the watershed between the streams that join the St. Lawrence, and those that fall into the Atlantic; and a lateral branch from this chain, between lat. 46° and 46° 30' N., separates the basins of the Kennebec, Penobscot, &c. on the S., from that of the St. John's on the N. Several of the mtns in Maine reach an elevation of 4,000 ft.; and Mount Katahdin, near lat. 46°, which rises to 5,335 ft., is reckoned the highest ground between the Atlantic and the St. Lawrence. It has been estimated that 1-6th part of the surface of Maine consists of water: there are numerous lakes, chiefly in the N., the largest of which, Moosehead, is 50 m. in breadth. The St. John's river is elsewhere noticed (*ante*, p. 89.): the Penobscot, Kennebec, Androscoggin, St. Croix, &c., have all a general S. direction, and several are navigable for the greater part of their length. The climate is cold: ice and snow last, in the N. and central parts, from October to April, and the summer is short; but the atmosphere is generally clear, the weather uniform, and the country salubrious. The soil on and near the coast is sandy and poor; but it improves greatly as it recedes inwards, especially along

the banks of the rivers. The greater portion of the state was originally covered with dense forests of fine fir, beech, &c. In the S., and some of the central parts, these have been mostly cleared; but they are still nearly unbroken in the N., though the value of the lumber cut down annually in the state is estimated at 10,000,000 dollars. Wheat, maize, rye, barley, potatoes, peas, beans, and flax, are among the chief agricultural products. Apples and pears grow to perfection; and cherries, plums, and grapes grow in the woods. E. of the Kennebec, and along that river, are some excellent arable lands; and between Kennebec and Penobscot are some of the finest grazing lands in New England. Till lately the rearing of sheep has been the most important branch of rural industry, the annual value of the clip of wool being estimated at about 2,000,000 dollars. Good marble is found in some districts, and lime burning is extensively carried on. Iron ore is abundant, and some lead has been discovered. Maine has manufactures of cotton and woollen cloths, hats, shoes, leather, cordage, nails, spirits, maple sugar, &c. The annual value of its manufactures has been estimated at 10,000,000 dollars. Its exports consist chiefly of lumber, great quantities of which are shipped for the West India islands, as well as for the neighbouring states; dried fish, pickled salmon, beef, pork, butter, wool, grain, hay, pot and pearl ashes, marble, &c. In 1838, the value of the exports amounted to \$35,532 dollars, and that of the imports to \$93,363 dollars. A canal 204 m. in length, from Portland to Sebago Pond, was completed in 1829; and the railway from Bangor to Orono, 10 m. in length, in 1836. Other railways have been projected, and some have been incorporated. In 1839, Maine had 50 banks, with an aggregate capital of 4,959,040 dollars. The legislative power is vested in a senate of 25 members, and a house of representatives of 187 members, who, together with the governor, are chosen annually by all the white male citizens above 21 years of age, who have resided in the state during the 3 months preceding the election, and paid taxes. The governor is assisted by an executive council, of 7 members, elected by the legislature. The general assembly of the 2 houses convenes annually at Augusta. The Supreme judicial court has all the usual powers of a court of chancery. The judges are appointed by the governor with the consent of the council, and hold office during good behaviour. All judicial offices are, however, vacated at the age of 70 years. Each town is required by law to raise annually a sum equal to 40 cents for each inhabitant, which is distributed among the town schools in the ratio of the number of scholars in each. The state has 30 academies, a Baptist college at Waterville, theological seminaries at Bangor and Readfield, and Bowdoin College, with a medical school at Brunswick, established in 1794, and which, in 1839, was attended by 113 students. Maine is divided into 10 counties. Augusta is the political cap., but it is inferior in point of size to several other towns, as Portland (which see), Bangor, &c. Bangor, at the head of the tide-water, has lately become the most important place on the Penobscot. In 1837, its pop. amounted to 8,000, having nearly trebled since 1830; and it was then said to export annually between 300,000,000 and 400,000,000 feet of lumber. The militia of the state, which is in 8 divisions, consisted, in 1838, of 49,500 men. Maine has a smaller public debt than any other state of the Union, Georgia excepted, the amount in 1839 having been only 554,976 dolls. This state sends 8 members to congress. Maine was first permanently settled by the British in 1635, previously to which it had only been transiently occupied by the French. It subsequently became a proprietary government; but in 1652 it was annexed to Massachusetts, to which it remained attached as a subordinate district till 1820, when it was constituted a separate state of the Union.

The N.E. territory, disputed between Great Britain and the U. States, consists of the upper valley of the St. John river, chiefly between lat. 46° 30' and 48° N., and long. 67° and 70° W., including an area of above 10,000 sq. m. The limits claimed, as well by the British as by the Americans, are laid down in the map of the British possessions in N. America, prefixed to the article CANADA in this work; and there, also, is indicated the line between the possessions of the contending parties, as laid down by the late king of the Netherlands, to whose decision as arbiter the question was once referred. It will be seen, by an inspection of the map, that the arbiter did not adopt the views of either party, but decided on an intermediate boundary. It is much to be regretted that this decision was not acquiesced in. The disputed territory is very fertile, and is well watered; but it is obviously more valuable from its position, than for any thing else. It is to be hoped that the negotiations with respect to it may come to a pacific termination; for, certainly, it would make but a miserable compensation to the successful party for the mischiefs that would be occasioned, even by a single campaign. (*New England Gazetteer*; *Encyc. Americana*; *Murray's Encyc.*, American edit., &c.)

MAINE, a river of W. Germany. (See MAYN.)

MAINE, one of the old provs. of France, now distributed between the depts. Mayenne and Sarthe.

MAINE-ET-LOIRE, a dep. of France, rég. W., formerly comprising the greater part of the prov. of Anjou, chiefly between lat. 47° and 47° 50' N., and long. 0° and 10° W., having N. the dep. Mayenne and Sarthe, E. Indre-et-Loire, S. Vienne, Deux-Sèvres, and Vendée, and W. Loire-Inférieure. Greatest length, E. to W., about 70 m., breadth usually about 40 m. Area, 722,163 hectares. Pop. (1836) 477,270. Surface undulating. The Loire intersects the dep. from E. to W., dividing it into two nearly equal parts; and is joined within its limits by the Maine, Anthion, Thonot, Layon, &c. The Maine is a continuation of the Mayenne, which changes its name after it has been joined by the Sarthe. It passes by Angers, and unites with the Loire about 5 m. below that city. Its entire length is 8 m., throughout which it is navigable. In 1835, 440,196 hectares of the surface of this dep. were estimated to be arable, 80,023 in pasture, 38,240 in vineyards, 61,338 in woods, and 48,271 in heaths, wastes, &c. More corn is produced than is required for home consumption. Nearly 2,128,000 hectolitres are said to have been harvested in 1835, of which 1,005,000 were wheat, and 547,680 rye. Agriculture, as in the contiguous departments, is very backward: the lands in lease are all held on the *metayer* principle, the rent being a certain proportion, usually about half the produce: the occupiers are poor, uneducated, and, of course, strongly attached to routine practices. Hemp and flax, prunes, melons, walnuts, apples, and various other fruits, are said to be of superior quality. The produce of wine is estimated at about 500,000 hectol. a year. Some of the white wines are rather well esteemed; but the greater portion of the vintage is either converted into brandy or vinegar. The latter, which enjoys a high reputation, is known in commerce as *vin blanc de Saumur*. Exclusive of wine, this dep. produces annually from 30,000 to 60,000 hectol. of cider. The industry of the rural pop. is, however, chiefly exercised in rearing and fattening cattle for the Paris markets, and in breeding swine. In 1830 there were stated to be 223,539 head of cattle in Maine-et-Loire—a greater number than in any other dep. of the W. of France; but, on the other hand, the stock of sheep (180,000) was comparatively small. In 1835, of 140,411 properties subject to the *contribution foncière*, 68,586 were assessed at less than 5 fr., and 21,645 at from 5 to 10 fr. At the same time 332 properties were assessed at more than 1,000 fr. This dep. has the largest and most important slate quarries in France. These are situated near Angers, and are extensive excavations, in one place to the depth of 450 ft. below the surface. They employ more than 3,000 workmen, and several steam-engines, and are said to yield about 80 millions of slates a year. At Chollet (which see), and other parts, some extensive woollen, cotton, and other manufactures are established, employing a large number of hands, and producing goods of the estimated value of 20,000,000 fr. a year. At Angers is a large sail-cloth factory; wooden shoes are made at Montléon; and the dep. has numerous sugar refineries, breweries, distilleries, paper-mills, dyeing-houses, &c.; and at Angers is one of the two royal schools of arts and trades established in France (the other is at Châlons-sur-Marne), at which about 450 pupils are supported partly or wholly at the expense of government. Maine-et-Loire is divided into 5 arrond.: chief towns, Angers, the cap., Baugé, Beaupréau, Saumur, and Segré. It sends 7 mem. to the Cham. of Dep. Number of electors (1834-39), 2,744. Total public revenue (1831), 11,104,025 fr. (*Hugo*, art. *Maine-et-Loire*; *Official Tables*, &c.)

MAINLAND. See SHETLAND ISLES.

MAJORCA (Span. *Mallorca*), the largest of the Balearic Islands in the Mediterranean Sea belonging to Spain, from the E. coast of which it is 110 m. distant, Palma the chief town being in lat. 39° 38' N., long. 2° 43' E. Greatest length, 48 m.; do. breadth, 42 m.; estimated area, 1,340 sq. m. Pop., according to Minano, 181,805. Its shape is that of an irregular four-sided figure, the angles of which are formed by W. by Cape Tramontana, N. by Cape Formentor, E. by Cape Perla, and S. by Cape Salinos. The surface is extremely uneven and is divided into two pretty equal parts by a range of mountains, the highest of which, the Silla de Torillos, rises 5,114 ft. above the sea. These mountains are not volcanic, but consist chiefly of granite, sienite, and porphyry, over which lie beds of graywacke, clay, slate, and coal; lead and iron are found, but not in sufficient abundance for mining purposes. The rivers or rather torrents of Majorca are short, rapid, and very numerous, affording great facilities to irrigation. The climate is exceedingly mild, salubrious, and agreeable; the thermometer during winter scarcely ever falls below 45°, its average height being 65°, and cold and strong N. winds are of rare occurrence. The temperature of summer varies between 84° and 89° Fah.; but the heat is seldom oppressive, owing to the constant sea-breezes. The red,

loamy soil of the mountains, though stony, is extremely rich, producing spontaneously great numbers of wild olives, grapes, &c.; in the plains it is much less fertile, owing to the superfluity of moisture, and the absence of any system of drainage. Agriculture is in a very rude and debased state; and the growth of corn, which in wet years totally fails, meets only half the consumption of the island, the annual imports of this article being about 6,000 fanegas, chiefly from Catalonia and Valencia. Olives are raised in very large quantities, the crops averaging about 180,000 arrobas yearly; the fruit is smaller than that of Andalusia, but as juicy as the best of the growth of Provence. Wine, both red and white, is abundant, especially near Banalbufar and Falanche; considerable quantities are exported, and much is likewise used in the distillation of brandy. Fruit and vegetables, especially oranges, figs, melons, carobs, pumpkins, and cauliflowers, grow plentifully, and attain a large size. Large quantities of saffron also are produced, of preferable quality to that of La Mancha. There is no want of fine pasture in the island; but little attention is paid to cattle-breeding. The sheep are large, and hogs sometimes attain the weight of 600 lbs. or about 38 stone. Mules and asses are reared in great numbers, and sent to Valencia and other parts in the S. of Spain. Hares and rabbits, partridges, quails, snipes, &c. are abundant, and the coast swarms with fish of various kinds and good quality.

The trade of Majorca is, relatively to its size, very considerable, chiefly with Spain, France, and England; its exports comprise oil, wine, brandy, oranges, and other fruits, capers, saffron, wine, mules, and asses, with smaller quantities of home-made goods, as palm brooms and baskets, turnery wares, and water-proof hats for sailors, its imports consisting of wheat, salt beef, iron, sugar, groceries, woollen and cotton goods, hardware, &c., chiefly from France, England, and the N. of Europe; but the precise amount of the trade of Majorca cannot be ascertained.

The inhabitants are described by Fischer as bearing a striking resemblance, "both in their external appearance and general character, to the Catalans, being equally hardy and courageous, equally blunt and jealous of their honour, equally industrious and ingenious, equally good sailors and skilful farmers, with their continental neighbours; and their language is, in fact, nothing but a corrupt dialect of the Catalan."

Majorca comprises only two towns of any importance, and 28 villages, the rest being mere hamlets. Numerous detached farms and country houses, however, are scattered over different parts of the island; and in all the valleys one may meet with numbers of elegant villas, in which the higher classes, who are usually much attached to a country life, spend the greater part of the year. The roads have also been considerably improved within the last eight years, and there is a tolerably good communication between different parts. The cap. of Majorca is Palma (sometimes also called Majorca), situated in a bay, of its own name, on the S. side of the island, and having a pop. (according to Miñano) of 34,343 persons. It is agreeably placed in a delightful country, and is pretty strongly fortified; the houses are large and well built; but the streets, being narrow, dark, and ill-paved, give it a wretched and mean appearance.

The chief public buildings are the governor's palace, a large structure with extensive gardens, a cathedral, exchange, town-hall, and theatre. The inhab. are active, enterprising, and laborious; and almost the whole trade of the island is concentrated in its port. The road of Palma affords excellent protection for shipping, except during storms from the S.E.; but the little harbour, called Puerto-Pi, is more secure, and furnishes anchorage for the largest frigates: the port is defended by two well-fortified castles. Among the other towns of Majorca, the largest, with their respective pops., are Lluçmajor (8,630), Campos, remarkable for its mineral waters and salt-pans (4,881), Santany, celebrated for its stone-quarries (3,680), Falanche, where is made the best brandy of the island (6,800), Manacor (8,905), Pollença (7,223), and Soller (5,614). The small island of Cabrera lies 8 m. S.S.W. of Cape Salinas: it is covered with trees, and wholly uninhabited, except by convicts, of whom there is here a small *dépot*.

The *Balearic Islands*, of which Majorca is the chief, were more anciently known as the *Xagædic*, so called, probably, from rising out of the sea, like the backs of gulls. The Phœnicians made settlements in them at a very early period; and they were succeeded by the Carthaginians under Hanno, who founded *Mago* (Mahon), and *Jamnia* (Ciudadela), both towns of Minorca. The islands were celebrated as the most expert slingers in the Carthaginian service during the Punic wars, and were afterwards equally noted as successful pirates, till Quintus Metellus subdued them, and hence obtained the surname of *Balearicus*. He was the founder also of two cities in Majorca, *Palma*, the present cap., and *Pollentia*, now Pollença. Under the Roman empire, these

islands belonged to the judicial district (*conventus juridicus*) of New Carthage in Tarraconensis, and from the reign of Constantine I. to that of Theodosius I., they had their own government. On the breaking up of the W. empire, they became an easy conquest for the Vandals and Huns, from whom they were afterwards wrested by the Moors. The people becoming notorious as pirates and robbers on the coast of Christian Europe, Charlemagne headed an expedition against them, and succeeded, not only in taking the islands, but in keeping possession of them for six years, at the end of which, they were retaken by the Moors: nor were the latter finally expelled till 1285, when the entire group was formally annexed to the crown of Aragon.

MALABAR. This term is usually applied to designate the whole W. coast of Hindostan from Cape Comorin to Bombay, but, strictly speaking, Malabar only extends as far N. as the Malabar language is spoken, or to lat. 12° 30'. The British prov. of Malabar is a district or collectorate under the Madras Presidency, extending between lat. 10° 12' and 12° 15' N., and long. 75° 10' and 76° 50' E., comprising several portions of territory, as Wynaud, &c., not belonging to Hindoo Malabar; and having N. Canara, Coorg, and Mysore, E. Coimbatore, S. Cochin, and W. the Indian Ocean. Length, N.W. to S.E., about 150 m.; average breadth about 42 m. Area, 6,262 sq. m. Pop. (1836-37) 1,140,916, of whom 844,466 were Hindoos, 282,027 Mohammedans, and 14,403 Roman Catholics. In the E. the surface is mountainous, comprising a portion of the range called the W. Ghats: the coast is low, and indented by many shallow inlets. Between these two regions the country mostly consists of undulating hills, separated by narrow valleys in general watered by a rivulet. Nearly all the rivers have a W. course. The chief are the Cuchin, Beypoor, Ballapatnam, Ponany, &c.: the bar of the first is navigable for ships drawing 15 ft. water; and the mouth of the second will admit vessels of 300 tons. Lakes and tanks are innumerable. The year is divided into three seasons; the hot, from February to May; the wet, from May to October; and the cool, during the remaining months. Dense fogs are rare on the coast, but they usually envelope the ghats from April to the end of the year. The soil on the coast is sandy, but well adapted for the culture of the cocoa-nut, jack, araca, plantain, cinnamon, and other trees, pepper, coffee, the sweet potato, and other farinaceous roots, garden vegetables, &c. In the interior the soil is of the red kind common in the S. of India, and highly favourable for rice, which frequently yields two and sometimes three crops a year. The rice lands are sown after the first rains in April, and in four months the grain is ripe for the sickle. The second crops are raised by the transplantation of plants a month old, and are reaped in three months. The third crop is assisted by small reservoirs and tanks, and by turning water from streams. About 738 sq. m. are estimated to be under rice, and 120 in gardens and inclosures of productive trees. The sides of the hills are often formed into terraces for cultivation. The rest of the surface, especially in the uplands, is chiefly covered with forests, among which the teak-tree is very prevalent, and an important source of wealth to the district, the teak of Malabar being considered, upon the whole, superior to every other variety. Besides the above articles of culture, the mulberry, mango, tamarind, sugar-cane, ginger, turmeric, mustard, arrow-root, hemp, cotton, &c., are grown, and wheat and barley on the hills. There are few cattle. The elephant and wild hog do great damage on the borders of the forests they inhabit: the tiger, bison, elk, deer, &c., are also met with. Towns are rare in the interior, and villages there are spread over a large space, families usually living separate from each other within gardens inclosed by ditches and high banks. Iron is pretty generally found, and gold, though in small quantities, in the sands of some of the rivers. Coarse cotton cloths are manufactured in a few places from the raw produce of the district; coir is made from the fibrous covering of the cocoa-nut; oil from its kernel, and arrack from the toddy in very large quantities. The chief exports consist of the products of the cocoa-palm, amounting to about 805,500 rupees annually. From 10,000 to 15,000 candies of pepper, betel-nut to the value of 550,000 rupees, and cloth from the districts to the E. to the value of from 1,700,000 to 2,300,000 rupees, are annually exported. At Calicut, Tellicherry, Cananore, and Ponany, the chief commercial towns, there are numerous Parsee and other opulent merchants. The roads throughout the district are in good order, and have convenient bungalows every 10 or 15 m. Public revenue (1836-37), 310,296*l.*, of which the land-tax amounted to 161,162*l.* In Malabar, as in S. Canara, inheritance goes by the female line, among the Nairs and other Hindoo castes which inhabit the country. On the coast, a large proportion of the inhab. are Mohammedans, and many Moynabs, a people originally derived from Arabia. The Christian religion appears to have been planted in this part of India at a very early period, and many churches were found existing by the Portuguese. Ma-

lahar was governed by various Nair dynasties, previously to its conquest by Hyder Ali, in 1761; on the fall of Tippoo Saib, it became subsidiary to the British, and was incorporated with the Madras Presidency in 1803. (*Madras Almanack* for 1838 and 1839; *Hamilton's E. I. Gaz.* vol. li.)

**MALACCA AND NANING, a British colony,** on the W. coast of the Malay peninsula, between lat. 2° and 3° N., and long. 102° and 103° E.; having N.W. the territory of Singapore, N.E. those of Hambow and Johore, S.E. that of Johore, and S.W. the straits of Malacca. Area estimated at 1,000 sq. m. Pop., in 1826, 37,706, of whom about 21,000 are Malays, 4,000 Chinese, and 2,400 Europeans, chiefly English, Dutch, and Portuguese. Surface mostly undulating; the hills are covered with jungle, and the valleys rendered swampy by the rains. The coast also is swampy S. of the town of Malacca, but to the N. it is generally hold and rocky. There are several rivers; but the largest is only navigable by small vessels for 10 or 12 m. from its mouth. Opposite the coast are many small granitic islands, which serve for burial places to the Malay inhab. of the colony. The country is geologically composed of a granitic formation, overlain by laterite, and this again by a layer of vegetable mould, which becomes thicker the nearer the coast. The soil near the sea-shore is very productive, but in the interior it is otherwise; and Naning is much more valuable for its mines than for the products of its agriculture. The climate is more salubrious perhaps than that of any other British coast settlement in the East. It has been found that during a period of seven years, the deaths among the troops stationed here amounted to less than 2 per cent.; and instances of longevity are frequent among both Europeans and natives. The mean annual temperature is about 77°/8° Fahr.; and there is but little change throughout the year in the barometer, which stands at about 30". Rain falls continually at intervals of a few days; but as rather more occurs between September and January than at any other time, that period is termed the wet season. Violent squalls and storms of lightning, &c. occur during the S.W. monsoon. The produce of Malacca consists chiefly of rice, jagcery, sago, pepper, rattans, timber, coconuts, a few nutmegs, cloves, dammer, gambier, ginseng, lac, ivory, gold dust, tin, fruits, poultry, and cattle. A few years since the rice raised in the colony was scarcely sufficient for four months' consumption, the additional supply being brought from Acheen, Java, and Bengal. A principal cause of this was the former policy of the Dutch, who, while Malacca belonged to them, prohibited the raising of any kind of grain, in the view of rendering the inhab. wholly dependent for their supplies on Java. The British government, however, has given every encouragement to native agriculture; and, in 1835, the crop of rice amounted to two-thirds the annual consumption. Cocoa-nuts form a considerable portion of the food of the lower classes of natives, who also subsist partly by fishing. For the trade of the colony, see *post*.

This settlement is included in the presidency of Bengal, and is governed by a resident, with an assistant resident at Malacca, and a superintendent at Naning. The Dutch drew from it a surplus revenue, but since it came into our possession, the expenditure has always exceeded the income by about 100,000 rupees a year. In 1837-38, the revenue only amounted to 53,543 rupees, or 5,354*l*.

**MALACCA, a town** on the W. coast of the Malay Peninsula, cap. of the above British colony, at the mouth of the river of the same name, lat. 2° 14' N., long. 102° 12' E., about 100 m. N.W. Singapore, and 220 m. S.S.E. Pinang. Pop., in 1832, 12,120, of whom about 4,000 were Chinese, 3,000 Malays, 2,000 Chulials, and 2,000 Europeans. "The town of Malacca is divided by the river above mentioned into 2 parts, connected by a bridge. On the left bank rises the verdant hill of St. Paul, surrounded by vestiges of an old Portuguese fort. Around its base lie the barracks, lines, and most of the houses of the military; the stadhous, court-house, gaol, church, civil and military hospitals, the site of the old institution, containing the police-office, the school, post-office and master attendant's office. On its summit stand the ruins of the ancient church of our Lady del Monte, erected by Albuquerque, and the scene of the labours and miracles of that 'Apostle of the East,' St. Francis Xavier; also the light-house and flag-staff. A little to the S. rises the hill of St. John's, and in the rear rises that of St. Francis. On these eminences are the remains of batteries erected by the Portuguese and Dutch, commanding the E. and S. entrances to the town. Smaller knolls intervene, covered with the extensive cemeteries of the Chinese. The tombs are white, and constructed with much care, and surrounded by low walls of brick and chunan, in shape resembling a horse-shoe. The bazaars, and by far the greatest part of the town, are situated on the right bank of the river. The anchoring ground in the roads is secure; and though large vessels are obliged to lie at a distance of 2 m. from the shore, accidents have been rarely known to happen. Native craft anchor much

nearer, under the lee of one of the islets close in-shore." (*Newbold's Malacca*, l. 109-111.)

The principal public institution at Malacca is the Anglo-Chinese College, established in 1818. Its main objects are the cultivation of Chinese literature by Europeans, and of European literature by the Chinese, Malays, and surrounding nations, and the diffusion of Christianity. The college has a library, well stocked with European and Chinese books, Siamese MSS., &c.; and attached to it is an English, Chinese, and Malay press. This college was founded by Dr. Morrison, the Chinese scholar, from whom, also, it received a small endowment. But at present it depends almost wholly on the fees paid by the pupils; and its funds are by no means in a prosperous state. Such an institution would, however, appear to be deserving of public support. There are also in the town 5 Chinese schools, with about 100 scholars, besides several Hindoo and female schools, and schools established by the Malays, for their own instruction in English. A full account of the mode of education in the Chinese schools may be seen in Newbold's work on Malacca.

Malacca was formerly a place of considerable trade; but, owing to the superior advantages of Pinang and Singapore, its commerce has rapidly decreased within the last 40 years, and it is now very limited. It exports small quantities of gold dust, balachong, hides, hogs, fowls, jagcery, pepper, dammer, cordage, a little ebony and ivory; iron implements, fire-arms, nails, &c. manufactured by the Chinese smiths at Malacca, with rattans, lac, and aloo-wood. The gold and tin are not the produce of the British territory, but of the adjacent native states, whence they are brought to Malacca by native boats, or overland by coolies. The principal imports are earthenware, iron, rice, sago, opium, nutmegs, European and Indian piece-goods, woollens, paper, provisions and liquors, for the European and Chinese inhab.; salt, sugar, tea, tobacco, &c., partly for home consumption and partly for re-shipment. The total value of the imports, in 1831-32, amounted to 467,459 doll.; total do. of exports 236,122 doll.

Malacca is said to have been founded in 1252, by Iskander Shah, a chief from Singapore; and it soon became a large and flourishing city, its influence extending over all the peninsula and the adjacent islands. It was first visited by the Portuguese in 1508, and captured by them in 1511. In 1641 it was taken by the Dutch, and in 1795 by the English. The latter held it till 1818, when it was restored to the Dutch; but in 1825 the latter finally exchanged it with us for the settlements of Bencooloon, &c., on the coast of Sumatra. But we much doubt whether its possession be of any material advantage, or, at least, whether the advantage be at all adequate to countervail the expense it occasions. (*Newbold's British Settlements in Malacca*; *Hamilton's E. I. Gaz.*, &c.)

**MALACCA (STRAITS OF), a channel** of the Eastern Seas, extending from lat. 1° and 6° N., and long. 98° and 104° E., between the Malay Peninsula on the N.E. and the island of Sumatra on the S.W. Its length, N.W. to S.E., may be estimated at about 520 m.; its breadth varies from 25 m. opposite the Nanding territory, to nearly 250 m. at its S. extremity. It is the best and most frequented passage from the Indian Ocean to the China Sea.

**MALAGA, an important city and seaport** of Spain k. Granada, and prov. of its own name, at the bottom of a deep bay, on the Mediterranean, 68 m. N.E. Gibraltar and 254 m. S. by W. Madrid: lat. 36° 43' 30" N., and long. 4° 25' 30" W. Pop., according to Mifano, 51,889; but little dependence can be placed on this statement, and the pop. is believed to amount to near 65,000. It is built along the shore, at the foot of mountains gradually descending towards the sea; westward is the Vega, watered by the great river of Malaga, which delivers a large body of water from the E. end of the Serrania de Ronda; and on the other side rise naked rugged mountains, overhanging the shore, and scarcely leaving room for the town. But the most imposing view of Malaga is from the sea. "It stands in the centre of a wide bay, flanked by mountains, and by the picturesque ruins of its ancient fortifications and castle, which cover the hill rising immediately to the E., and seem, from their great extent, like the remains of a former state." (*Inglis*, li. 136.) The streets, as in all Moorish towns, are very narrow, many being only 8 ft. wide, with others still narrower, badly paved, and dirty to a proverb; the houses are high and large, built round a court, the interior having a clean and neat appearance, owing to the abundant use of whitewash. There is only one square in the town, and the churches, as well as convents, are so crowded among the houses, that their beauty, if they have any, is effectually concealed. "Indeed," says Mr. Inglis, "the only handsome feature of the town is the Alameda, or public walk, the buildings round which are certainly magnificent: the other parts present a labyrinth of narrow intricate streets, inhabited by the tradespeople." (*vol. li. p. 136*.) The chief public buildings and establishments are a cathedral, with a chapter, 4 par. churches,

a bishop's palace, 4 hospitals (one of which is for military), a legal seminary, royal college of medicine and surgery, a foundling asylum, a large *dépôt* for convicts, a custom-house, and 2 endowed schools. Among these, however, the only edifice worth notice is the cathedral, a large building, having a spire 270 ft. in height: like that of Granada. It is in the transition style, between the Gothic and classic; the roof, instead of being groined, is divided into numerous small circular domes, somewhat like the marigold windows of Gothic architecture; and the modern additions to the building, though not quite in keeping, are on the whole designed with good taste. (Cook's *Sketches in Spain*, ii. 100.) The high altar and the pulpit are of flesh-coloured marble; "but the part which most rivets the attention is the choir, called by the biographer Palomio the eighth wonder of the world, and admirable for the perfection of its carved works, representing in very bold relief the twelve apostles, and most distinguished of the saints." (Tivens, *ibid.* 12.) On a sharp point of rock commanding the city stands a fine old Moorish castle, in good preservation, called the *Gibalfaro* (prob. *Gib-el-faro*, the great watch-tower), built on the site of a Roman fortress, but still wholly of Arabic architecture: it is altogether, both from its shape and situation, a very curious structure, and, if fortified on the modern system, might be rendered impregnable. Another Moorish building, in tolerable preservation, was formerly the *darsena* or dock for the ancient galleys, now used as a storehouse. (Swinhurne, i. 322.) The *Alcazaba*, an Arabian palace, once occupied a site near the shore; but the greater part of it was pulled down to make room for the custom-house. At a short distance from Malaga is one of the magnificent but unfinished undertakings of Charles III., a bridge and aqueduct over the great river of Malaga, which flows about a league distant from the city; but this work, on which a great outlay was incurred, was abandoned less than a few years afterwards, by a work undertaken by a bishop, who, at his own expense, brought water into the city by a much shorter line. (Cook, vol. i. p. 19.)

Malaga is probably entitled to rank as the third or fourth port of Spain; but owing to the want of official returns, and the prevalence of smuggling, it is impossible to obtain any accurate account of its trade. The principal articles of export are wines and fruit, particularly raisins, almonds, grapes, figs, and lemons: there is likewise a considerable, though smaller, exportation of olive oil, with brandy, anchovies, cummin-seed, aniseed, barley, soap, &c. Lead is also brought thither for shipment from the mines of Alora in Granada. The imports comprise salt-fish, iron hoops, bar-iron, and nails; cotton fabrics, hides, earthenware, &c.; with woollen cloths, all sorts of colonial produce, butter and cheese from Holland and Ireland, linens from Germany, &c. The trade with England has been for some time diminishing, owing to our small demand for Malaga wine; but the trade with America has considerably increased, owing to its pretty large consumption both of the fruit and wine shipped at this port. Mr. Inglis has given the following details with respect to the trade of this port, which may be interesting to some of our readers:—"The wines of Malaga are of two sorts, sweet and dry; and of the former of these, there are three varieties: 1st, the common 'Malaga,' known and exported under that name, in which there is a certain proportion of burnt wine, which communicates its peculiar taste to the 'Malaga'; the grape from which this wine is made is white, and every butt of Malaga contains no less than 11 galls. of brandy; 2dly, 'Mountain,' made from the same grape as the other, and, like it, containing colouring matter and brandy, the only difference between the two being, that for 'mountain' the grape is allowed to become riper; 3dly, 'Lagrimas,' the richest and finest of the sweet wines of Malaga; it consists of the droppings of the ripe grape hung in the sun, and is obtained without the application of pressure. The dry wine of Malaga is produced from the same grape as the sweet wine, but pressed when greener: in this wine there is a more brandy than in the sweet wine; at least 1-12th part of the dry Malaga being brandy. The whole 1-12th of the Malaga vineyards is estimated at 300,000 butts; but, owing to the increasing price of old wine in the cellars, it is impossible to be precise in this calculation. The export of Malaga wines has been at about 27,000 butts. The principal markets are in the United States and the states of S. America, to which countries the exports are rather on the increase. The average price of the wines shipped from Malaga does not exceed \$3 dollars per butt; but wines may occasionally be exported at so high a price as 170 dollars per butt. Attempts have been made at Malaga to produce sherry, but not with perfect success. The Xeres grape native soil; and the sherry made at Malaga might be introduced into the English market as sherry, nor, from its cheapness, could it fail to command a sale. One reason of the very low price of the wines of Malaga, is the cheapness of labour; field labour is paid by 2½ reales a

day (3½d.), wages during the fruit and vintage time being about double.

Next to its wines, the chief exports of Malaga are fruits; as raisins, almonds, grapes, figs, and lemons. During Sept. and Oct. 1830, the export of raisins amounted to 268,845 boxes, and 31,916 smaller packages. Of this quantity, 125,334 boxes were for the United States; 45,513 for England; the remaining quantity being for France, the West Indies, the Spanish Ports, S. America, and Holland. The raisins are of three kinds, muscatel, bloom, or sun raisins and lexias. The muscatel raisin of Malaga is the finest in the world, and in its preparation no art is used, the grape being merely placed in the sun, and frequently turned. The bloom, or sun raisin, is a different grape from the muscatel, but the process of preparing it is the same; like the other, it is merely sun dried. The lexias acquire this name from the liquor in which they are dipped, and which is composed of water, ashes, and oil; these, after being dipped, are also dried in the sun. All muscatel raisins are exported in boxes, and also part of the bloom raisins. In 1829, the number of boxes of muscatel and bloom raisins exported amounted to 320,000, each box containing 25 lbs., 8,000,000 lbs. in all. This quantity is independent of the export of bloom raisins in casks, and of lexias, the annual export of which does not exceed 35,000 arrobas. The export of raisins to England has fallen off; the export to America has constantly increased. In 1829, 75 ships cleared from Malaga for England, with fruit. In 1830, up to the 1st Nov., 34 vessels had cleared out. Of the other fruits exported from Malaga, grapes, almonds, and lemons, are the most extensively exported. In the months of Sept. and Oct., 1830, 11,612 jars of grapes were sent to England; 6,429 to America; and 1,650 to Russia. During the same period of time 5,335 arrobas of almonds (133,375 lbs.) were exported to England; and this constituted nearly the whole export; and during these months, also, there were exported to England 3,750 boxes of lemons; to Germany, 4,201 boxes; and to Russia, 840 boxes. There is also a large export of oil from Malaga." (Spain, ii. 145-149.)

Malaga has an excellent harbour, formed by a fine mole, 700 yds. in length, at the end of which is a lighthouse, furnished with a powerful light, revolving once a minute. A shoal that had grown up round the mole-head has been removed by dredging. The harbour, which will accommodate more than 450 merchant ships, may be entered with all winds, and affords perfect shelter. The port dues to a Spanish ship of 300 tons amount to about 1½d. 10s.; those to an English vessel of the same burden being about 2½d. Goods may be warehoused for any time not exceeding 12 months, on paying 2 per cent. *ad valorem* in lieu of all charges; but at the end of the year they must be either entered for consumption or re-shipped. (For weights and measures, and commercial details, &c., see *Com. Dict.*, art. *Malaga* and *Spain*.)

Malaga, independently of its export trade, has manufactures of linen and woollen cloths, sail-cloth, ropes, paper, leather, hats, and soap; an iron foundry and a cigar manufactory; but, excepting the latter, they are all on a small scale, and insufficient for the consumption of the inhab. Pilehard and anchovy fisheries also give employment to a considerable number of the lower classes. The market is well supplied, the show of fruit in particular being unequalled in Spain. Mr. Inglis quotes the prices of several leading articles, as follows: Beef and mutton, 10 quartos (about 3½d.) per lb.; pork, 14 quartos; a fowl, 7 reales (15s.); a duck, 15 reales; a turkey, from 20 to 30 reales; a rabbit, 10 reales; and a partridge, 4 reales. Poultry, however, is here not only exposed whole, but also cut up into joints, like butchers' meat. A barrel of anchovies may be bought for 2 reales (4½d.), and many other varieties of fish are remarkably cheap and plentiful. Potatoes are sold for 7 quartos the 6½ lbs.; and excellent wine may be procured for 2 reales a bottle. Bread, one of the dearest articles of food, fetches 12 quartos (3½d.), per lb., and eggs are sold for 1d. each. Melons, pomegranates, and prickly pears, which, with fish, constitute the principal food of the lower orders, are so cheap as scarcely to form an article of expenditure.

The general aspect of the pop. of Malaga is even more Moorish than that of Seville, and affords innumerable pictures of idleness. Hundreds of the lower classes are seen in the streets doing nothing, sitting on the ground, leaning against a wall, or lying on the steps of church doors, wrapped in brown, ragged, and patched cloaks. In fact, Malaga is noted for idleness and demoralisation. The necessities of life being so cheap, there are few motives to industry: begging is very common, and has been encouraged by the ill-judged bounty of the monasteries, which, however, were suppressed in 1835; but, when deprived of their legitimate resources, the *mala gente* (such being the sobriquet of these people) are at no loss to find, owing to the inefficiency of the police, a few quartos in some other way. The whole of them, indeed, are thieves; and in so degraded a state is public justice in this city, that crimes of the darkest hue pass unpunished.

The clasp-knife is in frequent use to gratify revenge, and murders often follow acts of robbery. (Compare *Inglist*, ii. 138, with *Townsend*, iii. 18.) This degraded state of morals is attributed, by Sir C. Brooke, partly at least, to the fact that convicts, called *presidiarios*, are detained here previous to their departure for, and after their release from, the penal settlement of Ceuta, in Africa, which see. (i. 574.) An efficient government would, however, speedily change the whole aspect of society; the impunity that crime has so long enjoyed in this miserable country being the great cause of its prevalence. The more respectable classes of the people are described as agreeable, hospitable, and generally fond of society, the ladies being equally witty and high-spirited with those of Seville, quite as showy in dress, and not a whit more strict in morals. The Italian Opera is a favourite resort, and many ladies are good musicians. Numerous foreigners also reside in Malaga, especially English and Americans, who constitute, with a few of the government officers and merchants, the *élite* of society. Most of these have country seats in the environs, the beauty of which is not surpassed in any part of Andalusia. The weather during summer is intolerably hot, and at this season, especially during the prevalence of the S. winds, the inhab. exclude the sun as much as possible, and remain at home during the day; but when the heat is succeeded by the refreshing coolness of the evening, the whole pop. is astir, and after nightfall the young people bathe for hours in the sea, a practice quite as conducive to health as pleasure. Nervous and epidemic fevers are still, however, very prevalent, and sometimes carry off great numbers of people.

Malaga, like most other cities of Spain, has had various masters. Built by the Phenicians, and called by them *Malakka*, it came successively into the hands of the Carthaginians and Romans, both of whom procured from it considerable supplies of salt-fish and provisions. It then passed into the hands of the Goths; and from them, in 714, to the Moors, who were at length driven hence by Ferdinand the Catholic, in 1487. The yellow fever carried off nearly 22,000 of its inhab. in 1803, and recurred, though attended with less fatal consequences, in 1813. Malaga was taken by the French in 1810, after an obstinate conflict with a body of Spaniards, ordered by monks, and commanded by a Capuchin friar; and remained in their possession till 1812. (*Inglist's Spain*, ii. 136-153; *Townsend's Journey*, iii. 10-42; *Cook's Sketches*, i. 18-24; *Steiburne*, i. 320-327; *Sir A. de Capell Brooke's Spain and Morocco*, i. 202-207.)

MALAY PENINSULA, a long and narrow territory, forming a part of India beyond the Brahmaputra, and the most N. portion of continental Asia, lying chiefly between the 1st and 8th degs. of N. lat., and the 98th and 104th of E. long.; it has N. Lower Siam, with which it is connected by the Isthmus of Kra; and is on all other sides surrounded by the sea, called on the W. and S. the Straits of Malacca and Singapore; and on the E. the China Sea and Gulf of Siam. Length, N.N.W. to S.S.E., 450 m.; breadth varying from 50 to 150 m. Area estimated at 14,000 sq. m. As far as lat. 6° S. the country is claimed by the Siamese; but beyond that point the peninsula is subdivided among indep. native states and British colonies, which may be enumerated as follows, with their probable pop., as estimated by Lieutenant Newbold:—

Exterior Native States.	Pop.	Interior Native States.	Pop.
Quedah and Ligor	50,000	Rumohwe	9,000
Perak	35,000	Sungai-ujong	3,500
Selangore and Calang	14,000	Johole	3,000
Johore (including Sec. Janet and Muar)	25,000	Jelidu	2,000
Pahang	10,000	Siempacati	8,000
Kemaman	1,000	Arizones scattered over the Peninsula	9,000
Nelaman	50,000		
Tromau	10,000		
Patani	10,000		
	275,000		36,600
<b>British Possessions.</b>			
Malacca and Nanning (1852)	-	-	77,706
Province Wellesley (1854)	-	-	46,880
Total Population, 374,266			83,586

**Physical Geography.**—The central and longest of the mountain chains, passing S. from the table land of Yunnan, through the Ultra-magetic peninsula, traverses this territory in its entire length. This mountain chain diminishes in height as it approaches the equator; and its highest peaks in Rumohwe and Johore probably do not exceed 3,000 ft. in elevation; while many peaks in the N. part of Quedah are supposed to rise to upwards of 6,000 ft. above the sea. M. Ophir, a detached mountain in about lat. 2° 30' N., and long. 102° 30' E., has been roughly estimated at nearly 5,700 ft. in height, but it is much more lofty than any other summit in the S. part of the peninsula. Between the above mountain chain and the coast, the surface is undulating, covered with dense

primeval forests, or interspersed with grassy plains, which are by far the most numerous and extensive in the N. An abundance of rivers descend to either coast, in their progress frequently forming marshes and lakes, some of which are of considerable size. These banks are generally low, swampy, and covered with mangrove and other thickets; and though several of them are broad, and moderately deep, the sand-banks, coral reefs, &c. at their mouths, usually preclude their navigation by vessels of any magnitude. A number of verdant islets stud the coasts, especially the north-western and the southern.

**Geology and Minerals.**—The Malay mountain chain, as far as it has been hitherto explored, consists chiefly of grey stanniferous granite and clay-slate. At its S. extremity, porphyry occurs; hornblende is met with near Malacca; and quartz is very abundant around M. Ophir, and elsewhere. The geology of the E. coast is almost wholly unknown; but along the W., laterite, similar to that of the Malabar coast, is a very prevalent formation. Clay-slate, sandstone, argillaceous schist, jasper, limestone, greywacke, and limestone, are the other most prevalent rocks. Limestone composes a portion of several of the islands off the W. coast, while those off the S. coast are chiefly of granite or similar. The Elephant rock in the Quedah territory is a mass of calcareous breccia, having many stalagmitic caverns, and interspersed with an abundance of fossil remains. At the S. extremity of the peninsula are evident traces of volcanic action; and numerous thermal springs, scattered over the country, testify the activity of subterranean heat at no great distance below the surface. These are sulphureous and saline. The springs at Ayer-pannas, near Malacca, were found by Newbold to have a temp. of 120° Fahr. at noon, and of 113° at 6 A. M.

The Malay peninsula produces tin, gold, and iron: tin is, in fact, among its principal articles of export. Mr. Crawford observes, that tin, wherever found, has a limited geographical distribution; but that, where it does exist, it is always in great abundance. The tin of India has, however, a much wider range of distribution than that of any other region, being found in considerable quantity from long. 98° to 107° E., and lat. 8° N. to 3° S. (*Indian Archip.*, iii. 450.) It has been latterly stated that it is found in abundance at Sakima, in the interior of Tavoy, lat. 12° 40', and in Siam even as far N. as 14°. At any rate the Malay peninsula appears to be the centre of the region in the eastern seas in which tin is distributed; and, including the island of Junk-caylon, it has been roughly estimated that its annual produce of this metal amounts to 34,600 piculs of 133 lbs. avoird. The ore of the peninsula is extremely pure, being that which is called stream. The ore of Sumpo-ujong, Nanning, and Perak, is reported to yield 76 per cent. metal, whereas the ores of Cornwall, with all the advantages of European science and industry, do not yield more than 75 per cent. But the process of smelting, as conducted by the Malays, being very defective, and adulteration frequent, the peninsular tin fetches only from 14 to 15 dollars the picul; while the tin of Banca, wrought by Chinese, sells at from 16 to 16½ dollars. The export of peninsular tin may amount to about 2,000 tons a year, including from 400 to 500 tons received from the Malacca Straits and Banca. A large portion is brought to England, Malay tin being now very extensively imported for warehousing; large quantities are also carried to Holland, where there are refining houses.

The Malay peninsula does not by any means so well merit the term *Aurea Chersonesus*, which has been before applied to it, as the neighbouring island of Sumatra. The exports of gold from the S.W. coast of that island amount, according to Marsden and Hamilton, to 26,000 oz. a year, while the annual produce of the peninsula is roughly estimated at less than 20,000 oz. It comes chiefly from the E. coast, and M. Ophir, where it occurs disseminated through quartz, in thin granular veins, and in alluvial deposits. Iron is found in Quedah, but only in small quantities.

**The Climate** is remarkable for its continual moisture, to which circumstance the perpetual verdure of the peninsula is mainly owing. The year is divided into the wet and dry seasons; but the term "dry season," must not be understood in the same sense as when applied to the climate of Hindostan; for, during its continuance, even three successive days rarely pass without a shower. On the W. coast the dry season comes in with the S.W. monsoon in May; the wet season, with the N.E. monsoon in October. Thunder storms, whirlwinds, water-spouts, and other atmospheric phenomena are frequent, especially during the S.W. monsoon.

**Vegetable Products** are both numerous and valuable. They include a host of trees, the timber of which is adapted for house and ship-building; the finest fruits of tropical climates, bamboos, canes, rattans, &c., of which the jungles are in great part composed; the areca, sago, and gomuti palms, the entechu, dragon's blood, and India

rubber plants, the upas of the Javanese, &c. It has been denied that teak is indigenous to the country; but, according to Newbold, the inland Malays affirm that it is occasionally found, and is known under the name of *jati*. The wild nutmeg is a native of the country. The true nutmeg, cinnamon, and clove have been long introduced, and thrive well. Tobacco, coffee, sugar, cotton, and the true indigo (*Indigofera tinctoria*), are cultivated with much success. Mr. Crawford (*Embassy to Siam*, &c., i. 178.) estimates that the Malay peninsula produces 28,000 piculs of pepper a year, or about 1-13th part of the total produce of the E. Rice, and other kinds of grain, are not grown in quantities sufficient for home consumption, and are therefore imported chiefly from Bengal and Sumatra.

Elephants roam over the peninsula in great numbers; the rhinoceros, tapir, wild hog, the royal and the spotted black tiger, 2 kinds of bears, and 2 species of bison, the axis, plandok, musk-deer, and several other kinds of deer, the vampire, and many varieties of bats, and numerous monkeys, are among the wild animals. The buffalo is a native, and is domesticated; but neither the ox, camel, horse, nor ass, are met with in a state of nature. The great density of the jungles is considered unfavourable to the increase of feathered game; but waterfowl are plentiful, and there are a great many pheasants of the richest plumage. Crocodiles, alligators, and several kinds of formidable serpents, are met with. The dugong, many turtles, and a plentiful supply of fine fish, are caught in the surrounding seas.

*People.*—The Malays have been ranked by some authors as one of the five great families, or varieties, of the human race. But this opinion is by no means generally entertained. Newbold says, "Both their features, and those of the aborigines in the native state around Malacca are decidedly characterised by the Mongol stamp." (i. 422.) And independent of the Malays having no peculiarity of form or feature to entitle them to be called a distinct variety, there appears to be sufficient evidence to show that they are a mixed race, of comparatively recent origin. Antecedent to the 12th century of our era, the coasts of the peninsula, and the adjacent islands, were inhabited, though thinly, by a tribe of *ichthyophagi*, and the interior by a race of negro savages, by whose descendants it is still occupied. In the course of the above century, a body of colonists, the ancestors of the present race of Malays, arrived on the continent, from Menangkabow, in Sumatra; and whether by intermarriage (as traditionally reported) or by conquest, extended their dominion over the whole peninsula. During the succeeding centuries they conquered Sumatra, the Sunda, Philippine, and Molucca Isles, with many smaller groups; and are now found in all those regions, and in Borneo, &c.; but without any centre of unity or power. The chief physical characters of the Malay race consist in a brown colour, varying from a light tawny to a deep brown; black hair, more or less curled, and abundant; the head rather narrow; the bones of the face large and prominent; the nose full, and broad towards the apex; and the mouth large. The average height of the men is about 5 ft. 2 in. A general character can hardly be assigned to a people so widely distributed. The Malay inhab. of the peninsula are, however, active, restless, and courageous; but their courage is not of a steady, deliberate character, but is rather a sudden ungovernable impulse, arising from a paroxysm of rage. "To their enemies they are remorseless, to their friends capricious, and to strangers treacherous." (Hamilton.) Perhaps, their treachery to strangers may, in part at least, be occasioned by the behaviour of the latter, or the antipathy excited against them by the behaviour of former strangers. Malcom, who remained for some time in this region of Asia, says, that "in their intercourse with each other, domestic and private virtues prevail to as great an extent as among the adjacent nations. A propensity to gambling is a distinguishing trait in the Malay character; and more especially a taste for cock-fighting, to which sport the Malay is so passionately addicted, that his last morsel, the covering of his body, his wife and children, are often staked on the issue of a battle to be fought by his favourite cock." Malcom admits that a "disregard of human life, revenge, idleness, and piracy may be considered common to Malays. The universal practice of going armed makes thoughts of murder familiar. The right of private revenge is universally admitted, even by the chiefs; and the taking of life may be atoned for by a small sum of money." (Travels, ii. 124.) In the arts of peace they are greatly inferior to their neighbours of Java, Japan, Cochinchina, and Siam. The Malay language coincides with monosyllabic tongues in its general construction and analogies, but is properly polysyllabic in its form. It consists chiefly of Polynesian, an intermixture of Sanscrit and Arabic, and a dialect purely Malayan, which last, however, constitutes little more than 1-4th part of the written and spoken language. The literature of the Malays is almost entirely

derived from Hindostan, Persia, Arabia, Java, and Siam. Arabic is exclusively their sacred language; and their religion also has been derived from Arabia, all the Malays, with trifling exceptions, being Mohammedans.

The negro tribes which inhabit the interior of the peninsula are called by the Malays *Orang Benua*, men of the soil. They appear to be a distinct variety, differing from and being inferior to both the African and Papuan negro. The average height of the men is only 4 ft. 8 inches. The Malay negroes are thinly spread over a considerable extent of territory in and behind Malacca, and thence N. to Mergui; but they probably amount in all to only a few thousands. They are divided into several tribes, some of which are said to dwell altogether in trees or clefts in the mountains. A few have learned a little Malay, and occasionally venture among the adjacent Malay tribes, to purchase tobacco and utensils; but of letters they know nothing. Copious accounts of both the Malays and this people may be found in *Newbold's Malacca*, &c., vol. ii. ch. 12, 14, 15.; and various details respecting the races inhabiting the Malay countries are given in the art. E. ARCHÆOLOGY, in this Diet. (i. 149.). For the *Commerce* of the British settlements, see MALACCA, SINGAPORE, &c.

The principal articles of export from the native states are tin, gold-dust, spices, elephants' teeth, pepper, sago, sugar, canes, timber for ship and house building, dammer, ebony, bees' wax, betel nut, sapan, and eagle-wood, hogs, poultry, buffaloes, tiles, and an immense variety of fruits; in return for which, opium, salt, cotton, cloths, tobacco, rice, and some European manufactures, are the chief imports. The trade is principally with the British and Dutch settlements in the East, Siam, China, and the adjacent parts of the E. archipelago.

In the 15th century a large proportion of this peninsula appears to have been under the sway of the Siamese, but since that time it has been mostly divided into the petty states before enumerated, the historical details of which are destitute of interest. The successive settlements made by the Portuguese, Dutch, and British at Malacca, &c., are elsewhere noticed. The only recent event worthy of mention has been the subjugation of Quedah (or Keddah) by the Siamese, begun in 1821, and completely effected within about 10 months afterwards. (Newbold's *Malacca*; Crawford, *Malcom*, *Hamilton's E. I. Gaz.*; *Lawrence's Lectures on Man*, &c., *passim*.)

MALDA, a town of Hindostan, prov. Beng., district Dinagepore, on the Mahanunda, built chiefly of the ruins of Gour, from which it is distant about 12 m. Early in the present century it had 3,000 houses huddled together along the bank of the river, which, during the rainy season, nearly isolates the town. The E. I. Company established a factory here as early as the 17th century; and there were formerly some prosperous French and Dutch silk and cotton factories in the town; but the trade of Malda has now sunk into irreparable decay, its manufactured goods being unable to withstand the competition of those introduced into India from Europe.

MALDIVÉ ISLANDS, or MALDIVES, a chain of islands in the Indian Ocean, extending between the 1st deg. of S. and the 7th of N. lat., a distance of about 560 stat. m.; and between 72° 48' and 73° 48' E. long. The Laccadive Islands, to the N. of the Maldives, may not improperly be considered a continuation of this island-system. They are of coralline formation, arranged in round or oval groups called *atolls*, separated by several channels, which may be safely navigated by ships of the largest size. The different groups are surrounded by coral reefs, on which the surf beats violently; but between the islands the sea is perfectly smooth, and forms safe harbours for small craft. These islands have been rarely visited by Europeans, though lying in the direct route to India. All that are of any extent are richly clothed with palms and other trees; but no edifice has been seen in sailing past them, whence it may be concluded that none exists higher than a cocoa tree. The Maldives produce millet and other small grains, of which they have two harvests a year; but they are unsuitable for rice and wheat, which are imported. Esculent roots and fruits are found in the greatest profusion; and poultry is extremely abundant, and bred with little or no attention. There are neither horses nor dogs, and but few horned cattle. Fishing is an important occupation, especially that of cowries, a species of shells used as money in small payments in Hindostan and other Asiatic countries, and in extensive districts of Africa. The inhab. trade with Hindostan, Sumatra, &c., arriving at Belasore and other ports of British India during the S.W. monsoon with cowries, coir, the produce of the cocoa tree, salted fish, tortoise-shell, &c.; and sailing homeward with the N.E. monsoon, taking rice, sugar, manufactured goods, tobacco, &c. The people of the Maldives are Mohammedans, and probably of an Arabic stock. They live under a sultan, who, according to Hamilton, resides in Male, an island about 3 m. in circuit, fortified by walls and batteries,

on which above 100 pieces of artillery are mounted. The Sultan, however, considers himself dependent on the British government of Ceylon, to which he sends an annual embassy. (*Geog. Journ.* ii. 72-92.; *E. I. Gaz.*)

**MALDON**, a parl. and mun. bor., river port, and market-town of England, co. Essex, hund. Deingey, on the Chelmer, 14½ m. S.W. Colchester, and 37 m. E.N.E. London. Area of parl. bor. (which includes the par. of Heybridge with the old bor.) 4,719 acres. Pop., in 1831, 4,896. "The town, which is neither paved, lighted, nor watched, and does not appear to be in a flourishing condition, occupies the ridge of a hill on the S. side of the Chelmer, and consists principally of one long street, running parallel to the river, the E. end of this street forming the portion called 'the Hythe'; two other streets, one from the centre of the town, and the other from its W. end, unite at the bottom of the hill, and extend across the Chelmer into an almost insulated flat called 'Potman's Marshes.'" (*Mun. Bound. Rep.*) The town-hall is an old building near the junction of the streets at the W. end of the town, and not far from it is an extensive range of barracks: there is also a small bor. gaol. Maldon had formerly 3 parishes; but two of them have been long consolidated. The largest church, that of All Saints, near the town-hall, is an ancient and very large edifice, with a square tower, surmounted by a curious triangular spire. St. Mary's is a spacious building, at the lower end of the town, said to have been founded before the Norman conquest; but the tower and W. end were rebuilt in the reign of Charles I. The united vicarage of All Saints and St. Peter's is in private patronage, the rectory of St. Mary's being in the gift of the dean and chapter of Canterbury. St. Peter's tower is the only part now standing of that dissolved par. church, and annexed to it is a building formed of the old materials, which has been long used as the depository of a valuable library containing 5,330 vols., bequeathed to the town, in 1704, by Archdeacon Plumbe, founder of the Plumian professorship of astronomy in the university of Cambridge: the tower part, which has since been much enlarged, is occupied by the national school, furnishing instruction to about 700 poor children, both sexes. The grammar-school, founded in 1621, received an additional endowment from Dr. Plumbe, who also gave it an exhibition in Christ's College, Cambridge. The estates vested in the hands of trustees yield about 52½, which, after some slight deductions for land-tax, and repairs, are paid over to the head-master: 6 free-scholars receive classical instruction gratis, paying a fee for other branches; and there are, besides these, about 12 pay-scholars. Dr. Plumbe left also a considerable property (the annual produce of which amounts to about 180*l.*) for the clothing and instruction of 15 poor boys, and the foundation of a week-day lecture in the church; besides which, he built a workhouse, lately sold under the provisions of the Poor-law Amendment Act. There is also a large Lancasterian school, with two or three minor charities, and money bequests. (*Char. Comm.* 32d Report, p. 1.) The R. Catholics, Wesleyan Methodists, and Baptists, have their respective places of worship, attached to which, as well as to the churches, are respectively-attended Sunday-schools. "Maldon is not a manufacturing town; but it carries on a considerable home trade in coal, iron, chalk, and timber, which it exchanges for corn, and other farming produce. There belonged to the port, in 1836, 136 ships, of the aggregate burden of 6,955 tons. Gross customs revenue, in 1840, 6,129*l.*" The trade of the town, however, is said to be declining; and the principal cause assigned is the new navigation to Chelmsford, which has been carried 1½ m. of Maldon along the adjacent village of Heybridge to the Blackwater. (*Mun. Corp. Report.*)

Maldon claims to be a bor. by prescription; but its first charter dates as far back as 1155, and was confirmed by Edward I. and subsequent monarchs. The present municipal officers comprise a mayor and 3 other aldermen, with 12 councillors; a commission of the peace is held under a recorder. Corporation revenues in 1839, 783*l.* Maldon has sent 2 mems. to the H. of C. since the reign of Edward I. Down to the Reform Act, the franchise was vested in the resident and non-resident freemen, by birth, marriage, servitude, gift, or purchase. The Boundary Act enlarged the limits of the bor., by including in it the par. of Heybridge. Registered electors, in 1839, 40, 876. In cases of succession to borough tenures, the custom of borough-English prevails here. Markets, well attended, on Saturday; cattle-fairs, Sep. 13. and 14. (*Parl. Rep.* 3c. &c.)

**MALDONADO**, a fortified sea-port town of the Banda Oriental in S. America, on the N. bank of the Plata, not far from the mouth of its estuary, and 85 m. E. Monte Video. Its harbour is sheltered from S.E. winds by the small island of Gorriti, but it has little depth. Pop. uncertain. "Maldonado is a quiet, forlorn, little town, built with the street running at right angles to each other, and having in the middle a large plaza or square, which, from its size, renders the scantiness of the popu-

lation more evident. It possesses scarcely any trade, the exports being confined to a few hides and live cattle. The inhabs. are chiefly landowners, with a few shopkeepers, and the necessary tradesmen, such as blacksmiths and carpenters, who do nearly all the business for a circuit of 50 miles round. The town is separated from the river by a band of sand-hills, about a mile broad: it is surrounded on all other sides by an open, slightly undulating country, covered by one uniform layer of fine green turf, on which countless herds of cattle, sheep, and horses graze." (*Darwin's Voyage of the Adventure and Beagle*, vol. iii. p. 45.)

**MALLOW**, an inland town and parl. bor. of Ireland, co. Cork, prov. Munster, on the Blackwater, and on the high road between Cork and Limerick, 18 m. N. by W. the former, and 37 m. S. the latter city. Mallow, properly so called, is built on the N. side of the river, being united by a bridge of 11 arches, with its suburb of Ballydaheen on the S. side of the river. The latter is included in the parl. bor. as fixed by the Boundary Act, which comprises an area of 350 acres, and had, in 1831, a pop. of 7,099. It consists principally of one main and well built street, nearly parallel to the river; and has a handsome parish church, a R. Cath. chapel, 2 Methodist chapels, an Independent meeting-house, a court-house, a bridewell, barracks, and infirmary, with commodious baths, a public reading-room, library, &c. On its W. side are the ruins of its old castle, the property of the lord of the manor. There are here two schools, one attended by about 200 boys, and the other by about 130 girls, both under the control of the Board of Education. The town is surrounded by thriving plantations, and is situated in a peculiarly rich and well cultivated part of the country. "Though the river be not navigable, and that Mallow has no manufactures, it is yet considered one of the best country towns of its sort in Ireland. It is resorted to in summer on account of the mineral waters that it possesses, the properties of which are much the same as those of Clifton, and in the neighbourhood there is a very unusual number of country gentlemen's houses, occupied by families of the first respectability." (*Parl. Boundary Report*, &c.) Several flour mills have been established on the Blackwater, and there is a brewery in the town, and a salt work and some quarries in its immediate vicinity; but the great dependence of the inhabs. is on its extensive retail trade, and on the resort of visitors to its Spa. Branches of the provincial and agricultural banks were opened here in 1835. Post office revenue in 1830, 700*l.*; in 1836, 830*l.* Mallow was incorporated by charter of James I. in 1612, which vested the right of sending 2 mems. to the Irish H. of C. in the provost and 12 burgesses. But this charter fell, in no very long time, into disuse; for above a century since the corporate body was extinct, and the right of electing the mems. for the bor. vested in the *freeholders of the manor*, which comprised 1,120 acres, and had, in 1831, a pop. of 7,598. Since the union, Mallow has returned 1 mem. to the Imperial H. of C.; and the Boundary Act altered the limits of the parl. bor., as already stated, by including in it the suburb of Ballydaheen, and excluding the country part of the manor. Registered electors, in 1839, 40, 631. The bor. has a court held twice a year, and a court for debts under 2*l.* every third Wednesday. General sessions are held in April, and petty sessions every Tuesday. Markets on Tuesdays and Fridays; fairs on 1st Jan. (on pigs), Shrove Monday, 11th May, 25th July, and 28th Oct.

**MALMEDY**, a town of Rhenish Prussia, gov. Aix-la-Chapelle, cap. cir. on the Warge, close to the Belgian frontier, and 50 m. S. Aix-la-Chapelle. Pop. in 1838, 4,212. It has a noble church, formerly belonging to a rich Benedictine abbey, a fine private cabinet of medals, antiques, &c., and is the seat of the council for the circle, a police court, and board of taxation. It has some mineral springs, similar to those at Spa, and manufactures of fine woollen cloth, glue, and soap; but it is chiefly noted for its manufacture of leather for boot soles, with which it supplies a considerable portion of Germany. There are said to be 50 tanneries in active employment; hides are imported principally from S. America, and bark from the forest of Ardennes. (*Berghaus; Schreiber, Guide du Rhin*, &c.)

**MALMESBURY**, a parl. bor. & market-town, and par. of England, co. Wilts, hund. of same name, on the Avon, 17½ m. N.N.W. Bath, and 86 m. W. London. Pop. of parl. bor. (which includes, with the old bor., two out-parishes, and the several pars. of Brokenborough, Charlton, Garsdon Lea, Great and Little Somerford, Foxley, and Greshillham), in 1831, 6,185. The town, formerly fortified and more extensive, is pleasantly situated on a hill close to the Avon, by which it is nearly encircled, and which is here crossed by six bridges. It consists of three principal streets, two of which running parallel are intersected by the third. In an open space near the centre of the town is the market-cross, an octagonal turreted structure, with flying buttresses, and highly carved, supposed to have been erected in the reign of Henry VIII. There appear to have been formerly se-

veral churches in Malmesbury; but it now contains only one, the living being a vicarage in the gift of the lord chancellor. The Wesleyan Methodists, Baptists, Unitarians, and Moravians, have likewise their respective places of worship, and there are three Sunday schools.

Two free-schools, one of which is conducted on the national system, and well attended, furnish instruction to poor children of both sexes, and there are two sets of almshouses. "Malmesbury is not a place of any trade, nor is it even a considerable thoroughfare. No new buildings are rising in the suburbs, and it contains few houses appearing to be occupied by persons in independent circumstances: indeed, it has altogether the air of a place on the decline, and must now be considered as entirely an agricultural town." (*Parl. Board. Rep.*)

The bor., which is of high antiquity, received its governing charter from William III.; and it was considered too insignificant to be included in the provisions of the Municipal Reform Act. It has sent 2 mems. to the H. of C. from the 23 Edward I.; the franchise, previously to the Reform Act, being in the high steward, alderman, and 12 chief burgesses. The Boundary Act enlarged its limits, by including with it the two outparishes, as above considered. Registered electors, in 1839-40, 257. Markets on Saturday, and a cattle market on the last Tuesday of each month, except March, April, and June. Horse and cattle fairs, March 28, April 28, and June 5.

A nunnery was founded here at the close of the 6th century. Other monasteries were formed here in the two following centuries; and it was a place of considerable and rising consequence as the resort of religious recluses, including, among other establishments, an abbey, which afterwards attained to high celebrity. The Danes destroyed the town at the close of the 9th century; but monastic wealth and the beneficence of princes soon restored its prosperity, which it enjoyed almost without interruption till the Reformation. The chief monument of Malmesbury's departed greatness is its abbey, the entire buildings of which, with the church, covered about 45 acres. Little beyond mere foundation walls, is now left except the church, which appears to have been a very magnificent structure, and presents some fine specimens of different eras of architecture, but chiefly of the early English. It was cruciform, with a tower rising at the intersection of the transepts; and another at the W. end, the front of which was exquisitely finished and adorned with sculpture, having also a very fine window filled with painted glass. During the civil wars, however, when Malmesbury was repeatedly besieged, both by the royalists and parliamentarians, the church, already partly dismantled, suffered great injury; both its towers were battered down, its cloisters demolished, and now only a fourth part of the building is standing; but the ruins are highly interesting, and the S. porch is one of the finest specimens of its kind in England. In the town are several other remains of ancient monastic and ecclesiastical buildings; and about 1 m. from it is a field called Cans-hills, in which are evident vestiges of a Roman encampment.

Malmesbury claims the honour of having given birth to Aldhelm and Johannes Scotus, William of Malmesbury, second only to the Venerable Bede among our early historians; and Hobbes, so eminent by his metaphysical and political speculations, was a native of Malmesbury, where he first saw the light in 1588. (*Parl. Rep.; Britton's Arch. Antiq. of G. Britain*, vol. 1.)

MALMO, a strongly fortified sea-port town of Sweden, cap. the lan. Malmöhus, on the Sound, nearly opposite Copenhagen, and 110 m. S.W. Christianstadt. Pop. (1836) 8,769. It is irregularly built, but has wide streets and a fine market place. It has a citadel, two churches, two hospitals, manufactures of woollen cloth, stockings, prepared skins, carpets, hats, gloves, tobacco, starch, soap, looking-glasses, &c., and a brisk trade in the products of these establishments, and in corn; its port, however, admits only small vessels.

MALO (ST.), a fortified sea-port town of France, dcp. Ille-et-Vilaine, cap. arrond., on the British Channel, 40 m. N.N.W. Rennes, and 200 m. W. by S. Paris. Lat. 48° 30' 3" N., long. 2° 0' 51" W. Pop. (1836) 9,409. The town is built at the mouth of the Rance, on the peninsula of Aron, connected with the mainland by a causeway. It is defended by strong walls with four bastions constructed by Vauban, and a castle built by Anne Duchess of Brittany. On its N. side it is inaccessible; but, from the want of outworks, it could not hold out against a regular siege. The town is in many parts well built, and has some excellent houses. Its chief public edifices are a cathedral, bishop's palace, town-hall, theatre, hospital, founding asylum, communal college, and exchange. The port, on the S. side of the town, is commodious and secure, but is rather difficult of entrance, and dries at low water; though at high water springs it has a depth of above 40 ft. In 1836, however, the French Chamber passed a resolution for the construction here of a floating dock or basin. It has a

good roadstead N.W. of the town, and opposite the mouth of the Rance, which is defended by various forts; the principal, La Conchée, being constructed on an all but inaccessible rock, a considerable distance off shore. St. Malo is the seat of tribunals of primary jurisdiction and commerce, a board of artillery, &c., and is the residence of various foreign consuls. It has a hydrographical school of the first class, a chamber of manufactures, a royal tobacco factory, naval rope-walks, and dry docks for the building of vessels of various sizes. It has also manufactures of fishing-nets and hooks, pulleys, and other marine fittings, soap, &c.; a considerable trade in provisions with the French colonies, a brisk coasting trade, and numerous vessels employed in the mackerel, cod, and whale fisheries. St. Malo has given birth to several distinguished persons; among whom may be mentioned the brave admiral Duguay de Trouin, Jacques Cartier, Maupertuis, La Bourdonnaye, &c. (*Hugo, art. Ille-et-Vilaine*, &c.)

MALPAS, a market-town and par. of England, co. Chester, hund. Broxtun, 13 m. N.N.W. Chester, and 153 m. N.W. London. Area of par., 25,140 acres: ditto of township, 2,110 acres. Pop. of township in 1831, 1,004. The town, which stands on an eminence near the N. extremity of Cheshire, and on the E. side of the valley of the Dee, comprises 3 tolerably built and well-paved streets. The living is divided into 2 rectories, in the patronage of the Egerton and Drake families. The church (formerly the chapel to a Chinese monastery), a structure of unburnt stone, consists of a nave and chancel, without either aisle or steeple; it is highly ornamented, and some of its decorations are supposed to belong to the Saxon era. There are also 2 chapels of ease within the par.; and several denominations of dissenters have their respective places of worship. A grammar school was founded here in the 17th century; but the free instruction is limited to 6 boys, appointed by Lord Cholmondeley. The master's salary from the endowment is £57, with a good house, &c.; and he is also permitted to receive pay scholars, of whom there were 15 in 1836. Alport's school, founded in 1719, has property yielding an income of 119*l.*, and furnishes good plain instruction to boys, girls, and recently also, to infants, with clothing for 14 boys. In 1836, there were in attendance 49 infants, 87 boys, and about 50 girls. The other charities comprise an almshouse for 6 poor women, with an allowance of bread and money; and large sums have been left, at different times, for the relief of the poor. (*Char. Comm., 31st Rep.*) Malpas is an agricultural town, and derives its chief importance from its large market for cheese, and its position in the centre of a great dairy-farm district. Markets on Monday: cattle and cheese fairs, April 5, July 25, and Dec. 8.

MALPLAQUET, a small village of France, dcp. du Nord, 16 m. N.N.W. Arras. This place is celebrated as the scene of one of the bloodiest and most obstinate conflicts of modern times. On the 11th of September, 1709, the allied army, under the Duke of Marlborough and Prince Eugene, attacked the French army under Marshal Villars in their entrenched camp near Malplaquet. The combat was maintained on both sides with undaunted courage and resolution; but in the end the allies succeeded in forcing the entrenchments. The victory, however, was purchased by the sacrifice of above 20,000 men, killed and wounded. Though vanquished, the loss of the French did not exceed half that number, and they effected their retreat in good order. According to Voltaire (*Siècle de Louis XIV.*, cap. 21.), who derived his information from Marshal Villars, the army of the allies amounted to 80,000, and that of the French to 70,000, though other accounts represent each army as about 100,000 strong; but, whichever be the more correct statement, there are certainly very few, if any, instances of so great a carnage in an engagement where the defeated army effected an orderly retreat.

MALTA (an. *Melita*), an island of the Mediterranean Sea belonging to Great Britain, 62 m. S.S.W. Cape Passaro, in Sicily, and 198 m. N. Tripoli, in Africa, Valetta its port and cap. being in lat. 35° 54' 6" N., long. 14° 31' 10" E. Extreme length, 17 m.; do. breadth, 9 m.; area, 98 sq. m. Estimated pop. in 1838 (exclusive of Gozzo), 163,000: pop. of Gozzo, 16,534; the number of British in both islands being estimated at 4,550, and that of the other foreigners at 3,116. It is of an irregular oval shape, rising precipitously from the water's edge on the S. and S.W. The surface presents the appearance of an inclined plane, sloping gradually from its highest elevation (about 1,200 ft. in the S.W.) to the more level land on the N.E. side, where it dips into the ocean. The substratum consists of soft calcareous sandstone only scantily covered with soil, great part of which has been carried thither from other countries, or artificially created by breaking the surface of the soft rock into small fragments, which crumble by exposure to the air, and in the course of two or three years become good soil. It has neither lake nor river; and from its geological formation

and the absorbent nature of the soil, has no marshy or swampy ground, except, indeed, two spots of very limited extent at the head of the Great Harbour and St. Paul's Bay, where the sea has receded and left an accumulation of moist soil, from which noxious exhalations have been supposed to emanate. There is no exuberant vegetation, brushwood, or forest; the verdure is scanty, and the greater part of the surface is an arid rock. The climate of Malta, from its being exposed to the winds blowing from the African and Syrian deserts, is unusually hot, especially during summer, when the heat almost equals that experienced in tropical regions. This heat not only lasts during the day, but, owing to the radiation of the caloric absorbed while the sun is up, it continues, with little abatement, throughout the night; so that, by an excess of heat for months together, a feeling is induced among the inhabitants of extreme lassitude and oppression. The medium temperature of the three coolest months (Dec., Jan., and Feb.) is 57° Fahr., the maximum 61°; and the minimum 53°; while the medium of the four hot months (June, July, Aug., and Sept.) is 78°, the maximum 82°, and the minimum 73°. Frequent showers occur in Sept., increasing in frequency during Oct. and Nov.; but from Dec. to Feb. the rain falls with nearly the same violence as in the tropics, and the atmosphere continues surcharged with moisture till March, when the weather begins to clear; and during the five following months scarcely a drop falls, the sky being generally without a cloud. The most prevalent winds in Malta are from the S.E., S., and N.W.; the first of which, well known as the *scirocco*, is at once the most prevalent (especially in autumn) and the most disagreeable in its effects on the human frame; neither are there any regular land and sea breezes, as in some southern countries, to modify the temperature. With respect to the salubrity of Malta, the most favourable opinions have been entertained by some writers; but it appears from the following facts, deduced from medical observations and records during sixteen years, that the average deaths between 1819 and 1834, inclusive, amounted to 2,552 a year, being about 1 in 39, or nearly 2.5 per cent. for all ages; whereas in England the mortality, at an average of the same years, was only 1 in 47, or 2.2 per cent.; so that, even as regards the indigenous inhabitants of both countries, Malta would appear to be less healthy than Britain, and seems only to enjoy the average salubrity of the S. of Europe, in which the mortality varies from 1 in 35 to 1 in 40 of the pop. annually.\* The mortality, moreover, is sometimes increased by the prevalence of epidemics, and on two late occasions by plague and cholera, the former of which, in 1813, cut off 4,500 of the inhabitants, being 80 per cent. of those attacked. For further particulars as to the climate of Malta, we beg to refer the reader to Major Tulloch's elaborate *Report on the Sickness, Mortality, &c., of Troops in the Mediterranean*.

Cultivation in Malta is pursued with equal diligence and success. In former times the entire surface was but one mass of barren rock; but continued industry has not only rendered a large part of it capable of tillage, but given it fertility. The rock having first been levelled in terraces, the small particles were pulverised and mixed with soil, while the larger masses were employed in erecting walls to sustain these artificial beds. Soil was, also, at first, brought from Gozzo, and even Sicily; but after a time this was found unnecessary. Owing to this laborious perseverance, Malta is now, on the whole, a fertile island, the cultivated parts yielding annual and often double crops without a fallow, and frequently 80 or 90 fold." (*Sir R. C. Hoare's Tour*, ii. 286.) Cotton is the principal product both of Malta and the neighbouring island of Gozzo, the annual crops of which average about 4,000,000 lbs. It is sown in May, and gathered before sunrise in Oct., the chief vent for it being in the ports of Trieste, Leghorn, Genoa, and Marseilles. The corn crops suffice for the supply of the inhab. with bread during four or five months a year; the remainder is imported from Sicily and the Black Sea, the duties on its importation making it rather high-priced. The grass of the island, called *sulla*, is similar to sainfoin, and some, though small crops, are raised of cummin and aniseed. The vine has been cultivated with some care; but its produce is very inferior, and wine as well as oil, is imported from Sicily. Figs and oranges are very abundant, and of superb flavour. Brydone says, that "the Maltese oranges are deservedly considered the finest in the world. The season continues upwards of seven months, from Nov. till the middle of June, during which time the trees are covered with an abundance of delicious fruit. Many of them are of the red kind, and these are certainly the best. They are produced from the common orange bud engrafted on the pomegranate stock, and the juice of the fruit is red as blood." (*Brydone's Tour*, p. 181.) Some good springs

\* This is the statement given by Major Tulloch; but to make the comparison between England and Malta quite accurate, allowance should be made for the rapid increase of pop. in the former, which makes the mortality appear less than it really is.

of fresh water are made available for the purposes of tillage; and numerous large cisterns and aqueducts are constructed for the purposes of irrigation. Still, however, Malta imports the principal necessities of life. Sicily and Odessa supply her with corn, oil comes from the ports of Italy, and wine from Naples and Sicily; from which latter, also, snow and ice are brought, no trifling luxuries in an arid climate like that of Malta. Horses and oxen come chiefly from Barbary, but also from Greece and Albania.

**Port and Trade.**—The central position, excellent port, and great strength of Malta, make it an admirable naval station for the repair and accommodation of the men-of-war and merchant ships frequenting the Mediterranean, and render its possession of material importance to Great Britain. It is also of considerable consequence, particularly during war, as a commercial *dépôt*, where goods may be safely warehoused, and from which they may be sent, when opportunity offers, to any of the ports belonging to the surrounding countries. Malta likewise presents unusual facilities for becoming the entrepôt of the com-trade of the Mediterranean and Black Seas. Her *caricatori* for corn are like those of Sicily and Barbary, excavated in the rock, and are, perhaps, the best fitted of any in Europe for the safe keeping of grain. The harbour of Valetta, which lies on the N.E. side of the island, is divided into two sections by a promontory or tongue of land on which stands the cap, defended by the castle of St. Elmo. The S.E. side, called the Grand Port, is the most frequented, having an entrance about 250 fathoms in width, with an average depth of 10 or 12 fathoms; it runs inwards about 1½ m., has deep water and excellent anchorage throughout, the largest men-of-war coming close up to the quays. N.W. Port St. Elmo is Port Marsamseet, which is also a noble harbour, used exclusively by ships performing quarantine; near its centre is an island on which are built a castle and lazaretto. The Custom-house and storehouses are in the Grand Port, and furnish every facility for landing and warehousing goods. An excellent dock-yard, victualling office, naval hospital, &c., have been constructed for the use of the navy. As a trading port and entrepôt, Valetta rose to high distinction during the war with France; but at the general peace, when commerce reverted to its natural channels, the other ports of the Mediterranean took from Malta a large portion of its trade, which was also depressed by the imposition of various oppressive discriminating duties. In 1819 this vexatious system was partially obliterated; but it continued to exercise a very pernicious influence till 1827, when, in consequence of a commission of inquiry, the then existing tariffs of customs-duties and port charges were wholly abolished, and a new tariff was substituted, imposing moderate duties, for the sake of revenue only, on a few articles in general demand, without regard to the country whence they came, at the same time that it equalised the tonnage duties, and reduced the warehouse rent on articles in bond to the lowest level. Every thing has since then been done that was possible to second the natural advantages enjoyed by Malta for becoming the grand entrepôt of the Mediterranean, and there can be little doubt that they will powerfully contribute to bring about the most favourable results.

The following is an official statement of the ships which arrived at and left Malta in 1834, distinguishing those belonging to Great Britain, the British colonies, and the United States.

Places.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
Great Britain	113	16,139	58	10,545
British Colonies	11	1,614	13	1,948
United States	1	248	2	948
Foreign	1,825	178,329	2,007	204,491
Total	1,963	199,500	2,083	216,267

There belonged to Malta, in 1838, 171 vessels, of the aggregate burden of 17,500 tons, and since Malta-built ships were admitted into the ports of the United Kingdom on the same terms as British-built, the trade of ship-building has materially increased. The vessels, which rank among the best in the Mediterranean, are built with oak timber from Dalmatia; the Maltese are diligent expert shipwrights; and their wages being moderate, Valetta is a favourable place for careening. Owing, however, to the want of a dry dock, all ships, above the size of a sloop-of-war, requiring to have their bottoms examined, are obliged to come to England for that purpose. The articles of export comprise British and foreign manufactures, with colonial produce, chiefly to the ports of the Mediterranean, cotton, both raw and manufactured of island growth, wool, cigars, grain, and pulse, wine, spirits, &c. the value of between 300,000*l.* and 400,000*l.* a year; the imports comprise manufactured goods (chiefly from Great Britain),

colonial produce, wheat from Sicily and Odessa, wine and spirits, tobacco, and salt-fish, with numerous minor articles of the average value of about 700,000*l.* a year. At an average of the six years, ending with 1838, the value of the exports of the produce and manufactures of the United Kingdom to Malta, amounted to 161,632*l.* a year. Latterly, however, the exports have begun to increase, though they are still comparatively trifling. Malta has, within the last few years, become the centre of a very extensive steam-packet system, the steamers from and to England, the Ionian Islands, Alexandria, &c. touching here. The French steamers, between Marseilles, Alexandria, and other parts of the Levant, usually perform quarantine at Malta. The industry of the island comprises the manufacture of cotton fabrics, the annual value of which may amount to from 70,000*l.* to 80,000*l.* Cabinet work is made for exportation to Greece and the Ionian Islands; soap, leather, macaroni, iron bedsteads, &c. are made on a smaller scale; and the Maltese goldsmiths are remarkable for the elegance of their gold filigree-work, neck chains, &c., the exports of which are valued at about 7,000*l.* a year. The currency of Malta consists partly of British silver and copper, introduced in 1825, but partly also of Maltese scudi of the value of 1*s.* 8*d.* English, of Spanish dollars valued at 4*s.* 3*d.* and of Sicilian dollars at 1*s.* 2*d.* each. The weights most in use are the *rottole* or pound = 12,216 English grains, and the *cantaro*, comprising 100 *rottole* or 117½ lbs. avoird. Corn is measured by the *salma* = 8·221 Winchester bushels, and oil is sold by the *cafiso*, which contains 54 English gallons. Bills on London are usually drawn at 30 and 60 days' sight; and the deputy commissary-general must, at all times, grant bills on the treasury of Great Britain for British silver tendered to him, at the rate of the 100*l.* bill for every 101*l.* 10*s.* silver, receiving the silver of other countries at a fluctuating rate of exchange. There are two joint-stock banks in Malta, the united capital of which may amount to 20,000*l.*; they discount good bills, of short date, at 6 per cent., keep cash without charge, and issue notes payable at sight, which pass current through the island, except in transactions with the government. Any person may establish himself as a merchant, and numerous Englishmen, Frenchmen, and Sicilians carry on an extensive commerce; while among the native traders, perhaps the wealthiest of all are those who speculate in articles of consumption for the island, buying a great variety of goods, in small quantities, for ready money, and realising large returns by retail as well as wholesale trade. (For further particulars as to the trade, port regulations, and tariff, see *Commercial Dictionary*, art. MALTA.)

**Government and Garrison.**—Malta is a crown colony, the local government of which is conducted by a governor, immediately responsible to the secretary of state for the colonies. In legislative matters, however, he is assisted by a council of seven persons, appointed by the crown, and at present consisting of the Rom. Cath. bishop of the island, the military officer second in command, the chief justice, and chief secretary, with three unofficial members, appointed by the governor. All orders in council have the force of laws. The principal administrative departments are the chief secretary's office, quarantine department, custom-house, land-revenue department, and audit office. There are numerous courts of justice, in all of which the procedure is both intricate and expensive; besides which, the laws themselves are frequently contradictory, and generally require revision. The public revenues amounted in 1837 to about 100,000*l.* a year, of which about 23,000*l.* were derived from the rents of government property, 70,000*l.* from customs and quarantine dues, and about 8,000*l.* from internal taxes; but it is believed that some reduction in the public burdens has recently taken place, in consequence of the recommendations of the late commission of inquiry. The above revenues not only defrayed the salaries of the various government officers, but the expenses attending the maintenance of the public roads, as well as liberal contributions for the support of schools and public charities. The military force of Malta consists almost entirely of British troops, varying between 2,000 and 2,500 men. There is also an engineer and artillery corps, the entire maintenance of which, as well as of the army generally, falls on England. There is likewise a native regiment, comprising about 500 men, called the Malta fencibles; but their duties being exclusively local, and rather of a civil than military nature, the maintenance of this body (costing about 11,000*l.* a year) is defrayed out of the revenues of the island.

**Religion and Education.**—The national religion of the Maltese (secured by the English government) is Rom. Catholic, to which the people are strongly attached, scrupulously observing its rites, and celebrating its festivals; but, notwithstanding their sincere adherence to the church of Rome, they entertain little or no jealousy of the Protestants: both parties observe the greatest moderation and deference

for the religious opinions of each other. There are in all no fewer than 1,000 Rom. Cath. clergymen, the church property producing about one fourth part the rental of the island. The Protestant places of worship comprise the governor's chapel, naval chapel, Church missionary chapel, and Wesleyan mission chapel; besides which, a church has recently been erected at Valetta, for the exclusive use of the English garrison. The total number of Protestants does not, however, exceed 1,500. Education till recently has been much neglected; but within the last 15 years several new schools have been established, the principal being the Normal free schools at Valetta, Senglea, Notabile, in Malta, and Rabato in Gozto, giving instruction in 1836 to about 1,500 children. Other primary schools are scattered through the villages, and there are about 80 private schools. The university of Valetta, founded in 1771 by the grand master, Pinto, and now occupying the convent of the suppressed Jesuits, is supported by the government, at an expense of between 1,000*l.* and 1,200*l.* a year, and had (including the lyceum) 375 students in 1836. The bishop has an ecclesiastical seminary at Notabile, giving religious instruction to about 50 boys. Instruction is commonly conveyed in these schools in the Italian language, the mother-tongue of the Maltese (a *patois* of Arabic, mixed with a little Italian), being wholly unwritten, and never applied to the purposes of literature. English is spoken by many of the higher classes, and is making considerable progress even among the lower orders in the cities. In the rural districts, however, Maltese is spoken almost without exception.

**Manners of the People.**—The Maltese are as dark as the natives of Barbary, but without the Arab features, the men being of middle height but erect stature, robust and active; while the women, though small, and of dark complexion, are elegant, and slender, and sometimes handsome *à la Grecque*. The working classes are described as laborious and frugal, living on very slender fare, the great bulk of them being employed either in agricultural labour, or quarrying and cutting stone for exportation to Constantinople and Alexandria. The Maltese are celebrated all over the Mediterranean for their good and intrepid seamanship. The dress of the higher orders is similar to that of other Europeans; but among the inferior or working classes the dress of the men is a short loose waistcoat, covering a cotton shirt; short loose trousers leave the leg bare from the knee, and on the feet are worn *korchas*, a kind of sandals, nearly resembling those of the ancient Romans. The women wear short cotton shifts, blue striped petticoats, corsets with sleeves, and a loose jacket covering the whole. A black veil, called the *faldetta*, is the out-of-doors head-dress of the women; whereas the men wear woollen caps in winter, and straw hats during summer. (*Sir R. C. Hoare's Tour*, ii. 288.) The morals of all classes are much higher than in most parts of S. Europe; and if there be less refinement of manners in the Maltese than among their continental neighbours, there is less vindictiveness and intrigue, while drunkenness and gambling are almost unknown. A few of the aristocratic families, ennobled by the knights of Malta, yet remain, but they form a very small portion of the pop., and few of them possess large property.

**Cities and Towns.**—The principal towns are Valetta, built in 1566, by the famous grand master, John de Valetta, as being more conveniently situated for a cap. than the old island city called Citta Vecchia, the former cap. of the island, and identical with the ancient Melita. Valetta, on the N.E. coast, in the centre of a fine double harbour, in lat. 35° 51' 6" N., long. 14° 31' 10" E., has a pop. incl. the garrison, and its suburb, Vittoriosa (on the S.E. side of the great harbour), of about 40,000. It is very strongly fortified, and from its position on a hill, as well as the almost impregnable works and trenches that surround it, has a most imposing appearance; nor is the visitor less struck with its internal beauty. The streets, though generally steep, are wide and well paved with lava, while the public squares and quays along the harbour, are of noble proportions, indicative of the former wealth of the knights of Malta. The governor's palace and gardens, lying outside the walls, were formerly occupied by the grand-master: a public library (once belonging to the Order) contains upwards of 40,000 vols.; and the general hospital is not only used for the reception of sick troops, but has ample room for stores, and other purposes: the Floriana hospital is also a large building, occupying two sides of a quadrangle; and in the suburb of Vittoriosa is a third military hospital. Other hospitals are open for the relief of the native sick, and among the other public buildings may be mentioned the barracks, prison, theatre, university, collegiate church of St. John, and 19 other churches, including those in the suburbs. Valetta has a bustling animated appearance, from its being the great centre of the industry and commerce of Malta. Citta Vecchia stands on very high ground, overlooking nearly the whole island, about 7 m. W. of Valetta. The rock on which it is built is excavated into

large catacombs, "some of which are said to extend 15 m. under ground!" (*Byrdone*, p. 188.) This old and decayed city is strongly fortified, and the cathedral is an extremely large and lofty structure, underneath is a grotto in which, as the monks inform us, St. Paul concealed himself for some time after his shipwreck. They have equally authentic legends respecting other localities close to the city. The towns are mere villages, besides which there are about 40 hamlets, chiefly remarkable for their picturesque and well-built churches. The roads, generally speaking, are good, many of them having been recently much improved; but the inland transport is, notwithstanding, chiefly by horses, mules, and asses, nor do the few carts lately introduced meet with much favour from the natives.

**Neighbouring Islands.**—About 4½ m. W. of Malta is the small island of Gozzo. It produces considerable quantities of cotton, the cultivation of which constitutes the chief occupation of the islanders, who differ in no essential respect from the Maltese. An English garrison is stationed at Chambray, a strong fort elevated about 500 ft. above the sea, and there are other military works well adapted for the defence of the island. Between Gozzo and Malta is another, though very small island, called Cunnio, which belongs to a single proprietor, who derives from it the title of a prince palatine.

**History.**—Malta was probably first discovered by the Phœnicians, who communicated to the Greeks its oldest known appellation of *Μελίτη*. \* From the Phœnicians it passed to the Carthaginians, from whom it was taken by the Romans in the first Punic war, and made a prefecture subject to the prætor of Sicily. St. Paul, during his voyage from Palestine to Rome, was wrecked here; and being kindly received by the people, performed some miraculous cures, which made him be "honoured with many honours, and, when he departed, laden with such things as were necessary." (*Acts*, xxvii. 39–44; and xxviii. 1–10.) On the decline of the Roman empire, Malta fell under the dominion of the Goths, and afterwards of the Saracens. It was subject to the crown of Sicily from 1196 till 1525, when the emperor Charles V. conferred it on the knights hospitallers of St. John of Jerusalem, who had a short while previously been expelled from Rhodes, giving them power to levy taxes, import duties, &c. for the maintenance of the Order, on condition that they should wage perpetual war against the Turks and Corsairs. It was besieged by a powerful Turkish armament for 4 months, in 1555, but without success; the knights, under their heroic grand master, John de Valette, foisted off the city called by his name, having succeeded in repelling all their attacks, and compelling them in the end to retreat with vast loss. During more than 150 years, the island maintained itself against the Ottoman power; but the Order was never sufficiently wealthy to attempt foreign conquests, or equip numerous fleets. At length, however, the inexpediency of the continuance of the practical contests, in which the knights had been so long engaged, became obvious; and, in 1724, they concluded a truce with the Turks, which secured for the Maltese in Turkey the same privileges as the French. The subsequent history of Malta till its surrender to the French has little worthy of notice. In 1798, a French fleet of 18 ships of the line, with 18 frigates, and 400 transports, arrived off Valetta, having Napoleon on board; and the treachery of the French knights, who desired to be the subjects of France rather than Russia, rendered the capture of the island, with its cap., no very tedious or difficult task; and accordingly, after some fighting, the island capitulated 12th July, 1798, one month after the arrival of the fleet, when the Order of Malta was virtually extinguished. In consequence of the irregular practices and oppressions of the French, the Maltese rose *en masse* to expel them; and compelled them to take refuge in the towns, where they were closely blockaded for upwards of two years. At length, the French, being reduced to extremities, surrendered on the 5th September, 1800. The English immediately took military possession of Valetta, and have since retained it; the treaty of Paris, in 1814, having definitively annexed it to the crown of Great Britain. (*Reports of Commissioners of Inquiry; Byrdone, Sir C. Hoare, and other Travellers; and Private Information.*)

**MALTON (NEW)**, a par. bor., market-town, and par. of England, N. riding co. York, wap. Hyedale, on the Derwent, 16 m. N.E. York, and 181 m. N. by W. London. Area of par. bor., which comprises the pars. of St. Leonard and St. Michael in New Malton, with the pars. of Old Malton and Norton, 6,640 acres. Pop. in 1831, 5,802. The town, which occupies an eminence on the W. bank of the river, is very irregularly laid out; but the buildings,

chiefly of stone, are decidedly improving in quality; on the opposite side of the Derwent, crossed here by an ancient bridge, shaped somewhat like an inverted Y, is the suburb of Norton in the E. riding, a thriving and increasing place; and about 1 m. N.E. of the town is the village of Old Malton, formerly of some consequence, but now exhibiting all the symptoms of decay. (*Part. Bound. Rep.*) The public rooms, theatre, and workhouse, are handsome modern buildings; and near the bridge stand the remains of a castle, built by the Vesci family, and destroyed by Henry II. There are two churches, one of which is surmounted by a tall unfinished spire; the livings are curacies, dependent on Old Malton, and in the gift of Earl Fitzwilliam. The Wesleyan Methodists, Presbyterians, and the Society of Friends have their respective places of worship; and there are 3 well-attended Sunday schools. New Malton has 2 subscription schools for children of both sexes; but the grammar-school, founded by Archbishop Holgate, is at Old Malton. The Derwent being navigable up to New Malton bridge, is made available for the shipment of large quantities of corn, hams, bacon, and other farm produce. Malting and tanning are carried on to a considerable extent, and there are two large porter breweries; but the chief and most important trade is on its retail trade with the opulent gentry of the neighbourhood. New Malton is a bor. by prescription, governed by a bailiff. It has returned 2 mems. to the H. of C. since the 23d Edward I. Previously to the Reform Act, the franchise was vested in the burgage holders and inhabs. rated to church and poor. The limits of the bor. were enlarged by the Boundary Act so as to include the entire pars. of New Malton, and the pars. of Old Malton and Norton. Registered electors, 1839–40, 603. New Malton is also one of the polling-places at elections for the N. riding; and the petty sessions are held here for the E. div. of wap. Hyedale. Markets on Tuesday and Saturday, but chiefly on the latter for horses and cattle, corn, hams, and farming implements. Very large cattle fairs, Monday before Easter-day before Whitsunday, and Oct. 11. **MALVERN, GREAT**, a town, par., and celebrated watering-place of England, co. Worcester, hund. Pershore, 7½ m. S.S.W. Worcester, and 104 m. W.N.W. London. Area of par., 4,340 acres. Pop. in 1831, 2,010. This town, which for many years has been a place of fashionable resort, in consequence of its delightful situation in

"The vale of Severn, Nature's garden wide,  
By the blue steep of distant Malvern wall'd,  
Solitarily vast —"  
Byron's *Forest*.

stands on the E. declivity of the well-known hills bearing its name, and is neat and well built, comprising, besides good houses for the tradespeople, several hotels and substantial private residences for visitors. The church, a fine cruciform structure of Anglo-Norman and pointed architecture (lately renovated in excellent taste), is 171 ft. in length, with an embattled and pinnacled tower rising 124 ft. above the intersection of the nave and transepts. It formerly belonged to a Benedictine monastery, founded here in 1083, and long one of the wealthiest and most important religious establishments in England. At the dissolution of the monastery, when the rest of the property was sold, the church was bought by the inhabitants and made parochial. Malvern has long been noted for two medicinal springs, the chief of which (St. Anne's well) is bituminous, and enjoys a good reputation for the cure of nervous and cutaneous diseases; the other is a simple chalybeate, and little frequented.

About 3 m. S. is the village of Little Malvern, the road to which skirts the Malvern Hills, an extensive range composed of greenstone and quartz covered in parts with blue limestone, and running from N. to S. about 10 m., with an average breadth of 3 m. The activities in many parts are very gentle; but the summit of the ridge, which attains a height of 1,444 ft., commands magnificent views over Wales and the cos. of Hereford, Worcester, and Gloucester.

**MALWAH**, a prov. of Hindostan, chiefly between lat. 22° and 26° N., and long. 74° and 80° E., having N. Rajpootana and Agra, W. Gujrat, E. Allahabad, and S. Guudwanah and Candahar, from which it is separated by the Nerbuddah. The central part of this prov. is a table-land, extending from the Vindhyas mountains on the S. to the Chittore and Mokundra ranges on the N., and E. and W. from Bhopal to Dohud; but which seldom rises to more than 2,000 ft. above the sea. It declines gently towards the N., in which direction flow most of the principal rivers, as the Chumbul, and its chief affluents, the Kali-Sind and Betwah, tributaries of the Jumna, and the Mhye, which falls into the Gulph of Cambay. The climate is usually mild and salubrious, except for about two months after the rains, when fevers are very prevalent. The total fall of rain from June to September has been estimated at 50 inches. The soil consists either of a loose black loam, or a more compact ferruginous mould, both noted for their fertility. Wheat, grain, peas, jawaree,

\* There are, however, no good grounds for believing that the island was known to the Greeks in the time of Homer, and we regard the notion that either Malta or Gozzo was the island of Cyprus, referred to in Homer's *Odyssey*, as unworthy credit. Several German critics on the *Odyssey* have written learned essays on this subject, but a glance at the island, which of course was below their notice, would have sufficed to show the futility of their elaborate railing.

barley, mung, and maize, are among the chief grains cultivated; the first two furnishing the largest export. Rice is raised only in small quantities sufficient for home consumption; but opium, sugar, tobacco, cotton, lilies, garlic, turmeric, and ginger, are grown to a considerable extent. A little indigo, and the root of the *Morinda citrifolia*, which supplies a red dye, are also raised, and fruits, including grapes, flourish in great abundance.

Opium is by far the most valuable product of Malwah, the soil and climate of which appears singularly well adapted for the cultivation of the poppy. The Malwah opium is considered by the Chinese, for whose consumption it is chiefly grown, superior in strength, in the proportion of 7 to 5, to that of Bahar and Benares, though inferior in flavour. Since the pacification of central India, the quantity of opium produced in Malwah has increased very rapidly, so much so, that while the total exports of Malwah opium to China, in 1821, did not amount to 3,000 chests, they amounted to about 21,000 chests in 1839, worth above 2,000,000*l.* (*Documents relating to the Opium Trade*, p. 79.) In Malwah the culture of opium is freely carried on; the cultivator paying a proportionally heavy land-tax for the land occupied in its culture. Previously to 1830, the Bombay government endeavoured to obtain a monopoly of the sale of opium exported from the ports under that presidency, but with little success; for 2-3*l.* of the Malwah produce were carried to the Portuguese settlement of Damam and elsewhere, to be exported. But at the above period, the attempted monopoly was abandoned, and a permit, or transit-duty, similar to that imposed in other states through which the opium passes, was laid on in its stead. Since then 9-10ths of the Malwah opium have been shipped at Bombay; and in 1832, the trade yielded to the British government an annual revenue of 200,000*l.* (see *Reports on E. I. Affairs*, 1830-32), which has since been materially augmented. The tobacco of the prov., especially that of the Bilah district, is also, beyond all comparison, the best in Hindostan.

Malwah is the chief seat of the Bheel race, as it was of the Pindarry and Maharratta powers. It is almost wholly divided among the dominions of native princes, the chief of whom are Scindia, Holkar, and the rajahs of Bhopal, Kotah, Dewass, &c. Except the Maharajah of the Punjab, Scindia is the only prince in Hindostan who can be called independent of British authority; but his independence has more of semblance than reality, for the power of his dynasty has been completely broken by a succession of reverses: his dominions are surrounded by the territory of the British, or their allies, who are bound to negotiate with foreign states only through the intervention of the British. A stationary British camp is kept up in his neighbourhood; and he is obliged to receive an English resident at his court, and to furnish a contingent of 15,000 men to the Anglo-Indian army. The dominions of Scindia are estimated to comprise 32,940 sq. m., with a pop. of nearly 4,000,000; and to yield a gross annual revenue of 2,398,000 rupees, out of which the chief derives a net subsidy of 1,561,000 rup. yearly. The chief cities belonging to Scindia are, Gwalior, his modern, and Oudjeh, his ancient cap. The states of the other chief native princes of Malwah have been briefly noticed under ISSAR, BERRAT, KOTAH, &c. (*Parl. Reports*, *Hamilton's E. I. Gaz.*)

MAMERS, a town of France, dép. Sarthe, cap. arrond., 21 m. N.N.E. Le Mans. Pop. (1836) 5,565. It is indifferently built, but has of late been greatly improved. It is a town of great antiquity, and was surrounded with entrenchments by the Normans, some remains of which are called the "fossés du Robert le Diable." It has a handsome Gothic parish church, a college, a prison, some public baths, a theatre, manufactures of hempen, cotton, and woollen fabrics, pearl buttons, &c. and several tanneries and breweries. (*Guide du Voyageur*.)

MAN, ISLE OF (an. *Monia*, *Monapia*, or *Moneda*), an island belonging to the United Kingdom, in the Irish Sea, between lat. 54° 4' and 54° 27' N., and long. 4° 17' and 4° 34' W.; its N.E. extremity (the Point of Ayre), being 17 m. from Burrow-head, in Wigtownshire, its E. coast 34 m. from St. Bee's head, in Cumberland, and the town of Peel, on its W. side, 30 m. from Ballyquintin Point, in Ireland: greatest length, 35 m.; greatest breadth, about 13 m. Area, 280 sq. m., exclusive of the Calf-of-Man, a small disjointed fragment of the island, at its S. extremity. Pop., in 1831, 41,000. Its general aspect, as viewed from the sea, is bold and precipitous; a ridge of mountains runs through its whole length, and three of the highest points reach an elevation of more than 1,600 ft. above the sea; Snafell, the loftiest, being 2,064 ft. high. Several rills and streams flow from the high ground in different directions; but there are no rivers nor lakes of any considerable size. The prevailing feature in the geology of the island is clay-slate, interpersed with mica-slate; and covered, near the coast, with grauwack and old red sandstone. Limestone also is found on the S. side, near Castleton, intersected in some parts by veins of trap. The clay-slate is quarried

at a place called Spanish-head, near Castleton; and stones are raised in blocks averaging about 7 ft. in length, by 1 ft. in breadth, and 6 inches in thickness. Drawing and roofing slates are quarried on the W. side of the island, not far from Peel. Close to Castleton, on the shore, are limestone and marble quarries, which have been worked for many years, and furnished a part of the stone for St. Paul's Cathedral, London. The island also produces lead, zinc, and copper, raised in considerable quantities by the Chester mining company, and by private parties. But mining and quarrying are in a very depressed state; the tools employed are of the rudest description; and not even a common crane is to be seen in the quarries. (*Head's Home Tour*, vol. iii. p. 19.)

The climate of Man is considered milder during winter than that of the adjacent parts of Great Britain and Ireland. Frost and snow are rare; and when they do occur, they are seldom of long continuance. Owing, however, to the frequency of fogs and dews, as well as to the prevalence of E. winds, during many weeks of spring, the summers are deficient in heat, and the harvest is generally rather late. The climate however is, on the whole, favourable to health: cases of longevity are frequent, epidemics rare, and agues unknown. The soil is extremely various. Clay and marl, covered with white sand, predominate in the N. and N.W. extremity of the island, which is covered with scanty herbage, affording sheep pasture; but, proceeding S. and E., the quality of the soil improves, and in the valleys especially, are some tracts, partly sand and loam, and partly stiff clay. No part of Man is, however, very productive; nor are any great pains taken to improve its natural resources. The mountains, commons, and other waste lands, include about 54,000 acres, leaving above 100,000 acres for tillage. Agriculture has considerably improved since the diminution of the herring fishery has made the men turn their attention to farming, which used to be exclusively the occupation of women: wheat, barley, and potatoes are raised in sufficient quantities for exportation, and within the last few years, the turnip husbandry has been introduced with some success by the English and Scotch settlers. The implements, however, are very rude; and the division of land into small farms has combined with the herring fisheries and smuggling to retard improvement. The extent of land under white crops, and the average produce of each in 1835, were estimated as follows:—

Wheat	8,000 acres, at 24 qrs. per acre	21,250 qrs.
Barley	5,000	4
Oats	13,000	3
		20,000
		39,000

This was supposed to leave a surplus of about 5,000 qrs. of wheat, and 3,000 of barley, over the consumption. Peas are cultivated in the N. parts, clover is a favourite crop, and flax is raised by almost all the farmers for domestic use. The cattle of Man, which at present consist of a mixture of Irish and British breeds, are small and short-horned, running to fat, and not yielding milk till they are six years old. Ayrshire cows have, however, been recently introduced with much advantage. The native sheep, which are small, hardy, and usually of a white or grey colour, are slow feeders, long in coming to maturity, and very coarse-wooled; they are now, however, confined to the hills; the lowlands being mostly stocked with improved breeds. The island yields a race of hardy ponies, capable of much labour, and requiring little food; but for draught and farming purposes other breeds, chiefly Irish, have been imported of larger size and strength. Man had formerly a peculiar breed of hogs, now totally extinct, the animals at the present day being of various kinds, some of which resemble the Chinese variety. Red deer formerly ranged in the mountains but the game at present consists of hares, rabbits, partridges, snipes, and woodcocks. Foxes and polecats are not found, neither are there any poisonous animals on the island; but weasels and rats are very numerous, and detrimental to the farmers. The Manks tenures are remarkable: the different pars. (of which there are 21), are divided into *troens*, each comprising 4 quarterlands, varying in size from 60 to 190 acres, and rising in yearly value from 1*l.* to 12*l.*; there are 700 quarterlands, and they are esteemed by the Islanders as property of the highest nature, in fact strictly entailed estates. Other lands, called *intacks* and cottages, are devisable by will, and on the whole considered to be of a far inferior nature. The yeomen are very proud of these little freeholds, which range from 10 to 200 acres, and usually comprise portions of pasture as well as arable land; "but there can be no doubt," says Lord Teignmouth, "that the system is practically vicious, diminishing the wealth both of the farmers themselves, and of the public at large, containing indolent idlers: itself the seeds of its own dissolution." (*Sketches of Scotland and the Isle of Man*, vol. ii. p. 202.) Most of the yeomen have large and expensive families, which the law of Man compels them not only to rear and educate, but to provide for; and hence their estates soon become encumbered, and they are effectually prevented from pursuing any hu-

proved system of management, even if they felt inclined to its adoption, which is seldom the case; there being no more obstinate adherents to routine, and ancient practices, than the Manx husbandmen. Many of them thus become involved in debt, and mortgage their property, the redemption of which being seldom in their power, they are dispossessed of it, and compelled to leave the island, or to resort to trade or prodigal labour.\* Hence the class of small proprietors is gradually disappearing: numbers of them having been swallowed up in the extending estates of the Scotch and English residents.

Man used to be one of the principal seats of the herring-fishery; but for several years past it has been comparatively deserted by the herring-shoals, and the fishery has, in consequence, become quite inconsiderable, though even now it is the frequent practice of the farmers to purchase a boat, and share in the excitement and profit of the season. This diminution, however, is not to be regretted, as the fishery was carried on from July to October, exactly when the services of the yammon and others engaged in it, were most necessary at home. Being also a kind of lottery, in which, by a few weeks' labour, large sums were occasionally realised, it attracted crowds of adventurers, without either capital or skill; while the irregular life led during these pursuits tended to encourage intemperance, and was a main cause of the indolence for which the Manx have been long notorious. There has, in fact, been a material improvement in the habits and industry of the people since the decline of the fishery; and there are, perhaps, few things less to be desired for the island than its revival. The herrings appear off the coast of Man in June, remaining till September, when they seek the E. coast of Ireland to deposit their spawn. The fishing vessels now built are much larger than formerly; they are half-decked, with very short keels, and are good sea-boats, though apt to pitch to a dangerous extent in rough weather: they vary from 18 to 30 tons burden, and are manned by 8 or 10, and sometimes 12 men. Cornish, Welsh, and Irish fishers also visit Man; and, according to Sir J. Romie's estimate, it appears that out of 250 boats, and 2,000 men employed in 1835, only 110 boats with their crews belonged to the island, 100 being Cornish or Welsh, and about 50 Irish. The cod-fishery has been neglected, owing to the want of adequate capital for the supply of proper vessels and lines.

The manufactures are chiefly domestic, and carried on by women, most of whom, when not in the field or farmyard, are employed at their looms or spinning-wheels, producing woollen, linen, and cotton cloths, both for the home and foreign supply, as well as nets for the use of the fisheries. Bleaching is conducted on a large scale in Laxey Glen, stuffs being sent thither from all parts of the island. A paper-mill and brewery are also established in the same neighbourhood. A woollen manufactory is established at Douglas; and hats, made of coarse wool, which cost about 2s., are said to wear extremely well. The exports consist principally of corn, potatoes, eggs, lime, and limestone, lead and copper ore, herrings, linen, sail-cloth, and paper. Owing to the Isle of Man having been formerly independent, a discrepancy has, for a lengthened period, existed between the duties on commodities in it and in Great Britain, the former being considerably lower than the latter. This distinction which still subsists, has occasioned, at different times, a great deal of smuggling, particularly on those articles on which high duties have been imposed in this country. This, however, is now materially reduced, by adopting the plan of allowing only certain quantities of those goods on which the Manx duties are lower than those of England, to be imported into the island (viz. wine, 110 tons; spirits, except British, 80,000 gallons; tea, 75,000 lbs.; coffee, 8,000 lbs.; sugar, 10,800 cwt.; and tobacco, 60,000 lbs.); and by maintaining an extra number of customs officers and revenue cruisers for the suppression of smuggling. Nothing, however, can be more impolitic than the continuance of such a system. The public has, at a very heavy expense, purchased all the feudal rights of the Atholl family; and that being the case, it is high time that an end should be put to the anomalous absurdity of having a considerable island lying, as it were, in the very centre of the empire, and in the direct line between some of the principal trading towns, with discriminating duties on many important articles. In making any change, it would, of course, be necessary to make the inhabitants some compensation for the temporary inconvenience that it would occasion; but this might be done with advantage to the natives, and without expense to the public, by modifying and improving the internal regulations and legislative policy of the island, which would eventually lose nothing by the change. In 1836 there belonged to the

island 242 vessels of the burden of 7,229 tons, being a considerable increase on previous years; and as it lies in the line of the steamers plying between Liverpool and Glasgow, most of which touch at Douglas, it has begun to be largely frequented by visitors from these cities and other parts of the empire, whose influx has materially contributed to the improvement of its principal towns. To this cause, indeed, the present improved state of Man may be chiefly ascribed. It is also the residence of numerous half-pay officers, and others, who are induced to live here in consequence of the lower duties on many articles of domestic consumption.

The condition of the labouring pop. is moderately prosperous. Ordinary labourers receive about 1s. a day; and skilled labourers, if we may so call their clumsy tradesmen, get about 3s. a day, which, considering the low price of provisions, is certainly ample. There is no legal provision for the poor, who have to depend wholly on voluntary charity. Generally speaking, the cottages are of a very inferior description: they are frequently built of earth or sod, and thatched with straw, having a funnel of sail-cloth, as a substitute for a chimney. There are, however, a few improved cottages, and their number will, no doubt, increase with the spread of improvement.

The feudal sovereignty of Man, which was a *kingdom* prior to 1504, was held by the Stanleys, afterwards Earls of Derby, and their successors, the Dukes of Atholl, from 1426 to 1765, when parliament, conscious of the injury which the revenue and the public generally received from the contiguity of an island only feudally subject to the crown, and hence affording refuge to debtors, outlaws, and smugglers, purchased from the Duke of Atholl for 70,000*l.*, his civil and military rights and patronage, but with certain reservations as to fiscal matters and titular dignity. A further arrangement was made in 1826, and Great Britain now enjoys all the rights and privileges of sovereign of the island. The constitution, however, was left untouched; and for many years, at least, the legislative power has been vested in the House of Keys, a body comprising 24 members, now self-elected, but formerly chosen by the statesmen or owners of entailed estates. Their acts are binding in all cases, and the laws are so few and brief as to admit of being included in a small volume. Attorneys occasionally plead in the courts; but the suitors quite as frequently defend their causes in person: law is cheap, and, as was to be expected, litigation is very common. There are two supreme judges in the island called *deemsters*, or "awards of the law," officers of high antiquity, and exercising jurisdiction over all civil and criminal cases; being the presidents (under the crown and governor) of the two courts of chancery and exchequer, each of which is held eight times a year. The former of these has little more to do than to confirm or annul the decisions of the deemsters, who hold a primary court of judicature; and the exclusive business of the latter is to punish offences against the revenue laws. The common-law courts are held at different places for the different *shendings* into which the island is divided, and may be considered as courts of "common pleas," in which all actions, personal or real, may be tried, as in the deemsters' court, by a jury of 6 in real, or of 4 in personal actions. The appeals from this court are first to the House of Keys, afterwards to the governor, and finally to the Queen's Privy Council. A half-yearly gaol-delivery is made compulsory, and bailiffs act in the five chief towns to hear and determine cases of debt under 40*l.* (*Feltham's Tour*, pp. 35-44; *Lord Teignmouth*, ii. 227-231.)

The established religion is that of the Church of England; all sects, however, enjoy full toleration. The clergy are under the bishop of Sodor and Man, suffragan to the archbishop of York, but holding no English barony, and hence having no voice in the legislature, though privileged to sit in the House of Lords. This see has been held by several highly celebrated divines; and among others, by Barrow, Wilson, and Ward. An ecclesiastical court is held twice a year, either by the bishop or his vicars-general, and an archdeacon regulates the fabrics and minor concerns of the 17 parishes. These courts are commonly well attended to by respectable clergymen; but their stipends do not average 90*l.* a year; and the churches, though externally pretty, are miserably deficient in accommodation. The dissenters have made considerable progress in the present century; but the Methodists comprise even now only one tenth of the pop., and the other bodies of dissenters are unimportant. Bishop Wilson and other prelates have done much to promote education, not only by establishing schools, but also by translating the Scriptures and other books into the Manx language. Each parish has its school more or less richly endowed; and while elementary instruction is given in the Manx, every endeavour is made to instruct the natives in the English language. Indeed there can be no doubt, that, at no distant period, the pop. will be familiarly acquainted with our language; and this will be the surest method to disabuse them of the prejudices

\* The mortgages on land, held chiefly by the English, amounted, it is said, in 1835, to 800,000*l.*, which at 5 per cent. would amount to 40,000*l.* a year.

which so many entertain against a union with England. A collegiate school was established a few years ago, through the exertions of the late Bishop Ward; and though the funds were far too small for the expected outlay, the establishment, being well conducted, attracted numerous students, and has, on the whole, been successful.

The Manx, like the Welsh, and Scotch Highlanders, belong to the great Celtic family, which probably occupied the whole United Kingdom previously to the immigration of the Belgæ. Their Celtic origin is clearly evinced by their language, which is a mere dialect of the Irish, Erse, or Gaelic. They have a swarthy complexion, stout, with an air of melancholy pervading their countenances. Indolence, and a love of litigation, are distinguishing characteristics of the male part of the pop. Even, at present, workmen rest for two hours in the middle of the day, when they may be seen stretched under hedge-rows by the road-sides. The women, however, are extremely industrious; and on them devolve not only the production of domestic manufactures, but also a large share of the labours of agriculture. They are hospitable, superstitiously attached to existing institutions and religious forms, and treat bishops and clergymen as beings of an exalted nature; but they are, notwithstanding, unclean, indolent, dirty, and addicted to pilfering. Their old habits and prejudices are now, however, gradually giving way; the increasing influx of visitors, during the summer season, having, in this respect, effected an important and beneficial change. The *élite* of society is composed of the government officers and the large landholders, with a few church dignitaries; the other clergy, the attorneys, and medical men being too poor to mingle with the first circle.

The rocky islet, or Calf of Man, already alluded to, at the S. extremity of the island, was formerly the resort of vast numbers of puffins (*Procellaria Puffinus* Lath.). At present, however, the bird is there entirely unknown. It was supposed to have been driven from this favourite haunt by the too great destruction of its young. These were held in considerable estimation; and Pennant mentions that, in his day, great numbers of them were taken every year by the person who farmed the islet. It appears, however, that rats that had escaped from a vessel wrecked on the coast, were the real exterminators of the birds. (*Quayle's Survey*, p. 8.)

The early history of Man is obscure. It was the Mona of Cæsar, and the Monapia of Pliny; but we know little more of it beyond mere traditions of its being held by the Druids, and subsequently by Norwegian monarchs, till, in 1264, it was purchased by Alexander III. of Scotland, who appointed a viceroy, and made it tributary. The Scotch were soon afterwards expelled by the English, but the power of the latter was not established till the reign of Henry IV., who granted it to the Percys, from whom it fell by attainder, and thence passed by gift of the same monarch to the Stanley family, by whose heirs it was sold to the British crown.

The chief towns of Man are: 1. Castletown, in which is the college above mentioned, the seat of legislature, and the residence of the governor (pop. in 1831, 2,077); 2. Douglas (which see), the chief trading town, with upwards of 7,000 inhab.; 3. Peel, formerly celebrated both as the residence of the earls of Derby and the cap. of the kingdom, but now decayed, and having only a pop. of 1,729 persons, which is about the same as that of Ramsey, one of the steam-packet stations between Liverpool and Glasgow, on the N.E. side of the island. (*Quayle's Survey*, and *Feltham's Tour*; *Lord Teignmouth's Scotland* and *J. of Man*, li. 181–202, and appendix, &c.; *Head's Home Tour*, li. 1–30.)

MANAAR (GULPH OF), an inlet of the Indian Ocean, dividing Ceylon from the S. extremity of Hindostan; extending between lat. 7° 30' and 9° N., and long. 75° and 80° E. It is in general too shallow to be navigated by vessels above the size of sloops; and is separated by the islands Ramissiram and Manaar, and the chain of rocky islands and sandbanks called Adam's Bridge, from another inlet of the sea called Palk's Strait, also between Ceylon and the continent. The island of Manaar is 18 m. in length, by 2½ m. broad; but has little importance of any kind. For further particulars, see Ceylon (I. 576).

MANCHA (LA), a prov. of Spain in the S. part of New Castile, bounded S. by Granada, E. by Cuenca and Murcia, and W. by Estremadura. Area about 7,500 sq. m. Pop. 250,000. This district consists chiefly of lofty and barren plains, upwards of 2,000 ft. above the sea, and is, without exception, the least picturesque and productive in the whole peninsula. But it produces corn, wine, olives, and saffron; the Val-de-Peñas, a light red wine, is highly esteemed all over Spain. The mules of this prov., also, are the largest and strongest in the peninsula. La Mancha, however, derives its chief celebrity from the inhabitable work of Cervantes; and many of the customs he has depicted are still prevalent in the province. The cap. of La Mancha is Ciudad Real, once a flourishing city, but now decayed, and having at present a pop. of only 8,000 persons.

MANCHA (REAL), a town of Spain, in Andalusia, prov. Jaen, 8 m. E. the city of Jaen. Pop., according to Mifano, 4,939. It is situated in a spacious plain, and comprises some regular built streets and handsome squares; its chief buildings being a par. church, Carmelite convent, and hospital. Woollen and linen cloths, bed-ticks, and sackings, are made here, with bricks and tiles in large quantities, for the supply of the prov. The neighbourhood is both picturesque and fertile, producing, with little tillage, abundant crops of olives, with smaller quantities of wine and grain.

MANCHE (LA), a marit. dep. and peninsula of France, formerly included in the prov. Normandy, between lat. 48° 40' and 49° 40' N., and long. 0° 40' and 2° W., enclosed on the W. and N. sides, and partly on the E., by the English Channel (Manche), whence its name; and elsewhere bounded, on the E. by the depts. Calvados and Orne, and S. by Mayenne and Ille-et-Vilaine. Length N. to S. about 85 m.; greatest breadth nearly 40 m. Area, 553,776 hectares. Pop. (1836) 594,382. Surface is generally undulating. A chain of hills, of no great elevation, runs through the dep. in a N.W. direction, dividing it into two nearly equal parts. Near its N.E. and S.W. extremities are some marshy tracts. The chief rivers are the Vire and the Ouve. The coast is mostly about sea rocky, especially in the S., but it has several good roadsteads and commodious harbours, of which Cherbourg is the finest. In 1835, about 380,400 hectares were estimated to be arable, 94,000 in pasture, 24,000 in woods, 20,200 in orchards, and 46,250 in heaths, wastes, &c. Agriculture is better conducted than in many other depts. The produce of corn, which is chiefly wheat and barley, exceeds the home consumption; potatoes are an important substitute for grain; and, in 1835, the crop amounted to nearly 607,400 hectolitres. Beans, peas, and a good deal of hemp and flax, are raised. The dep. is beyond the limits of the vine-culture; but about 1,000,000 hectolitres of superior cider are annually produced, and someerry. In 1830 there were about 189,000 black cattle in the dep., and sheep and butter are among its principal products. It had also, in the same year, about 201,000 sheep, estimated to yield annually 411,500 kilogr. of wool, though chiefly of inferior quality. There is a considerable traffic in horses and mules. Poultry are reared in great abundance; large quantities of eggs being exported from Cherbourg and Valognes to England and the Channel Islands. In 1835, of 192,038 properties subject to the *contribution foncière*, 62,792 were assessed at less than 5 fr., and 36,550 at from 5 to 10 fr. The oyster and other fisheries on the coast are important; but, according to Hugo, fish are less plentiful than formerly. Among the mineral products are iron, lead, coal, marble, slate, and granite; which last is found of excellent quality in the Chansey Isles, a group of small islands off the coast of this dep. Salt-works are established at several places on the coast. Manufacturing industry is employed on iron, copper, zinc, woolen, linen, cotton, and various other materials. Cutlery, glass, paper, hair fabrics, lace, &c. are produced; and in some cantons, baskets, panniers, willow sieves, &c., are made, and sent into other parts of Normandy, and into Brittany. But its principal trade is in agricultural produce and fish, fresh or salted. Manche is divided into six arrondissements; chief towns, St. Lô, the cap., Cherbourg, Coutances, Avranches, Valognes, and Mortain. It sends 8 mems. to the Ch. of Dep. Number of electors (1838–39), 3,568. Total public revenue (1831), 15,145,926 fr. This dep. is rich in Celtic and Roman antiquities. (*Hugo*, art. *Manche*; *Official Tables*, &c.)

MANCHESTER, a mun. and parl. bor. and par. of England, the great centre of the cotton manufacture of Great Britain, and the principal manufacturing town in the world, co. Lancaster, hund. Salford, on the Irwell, an affluent of the Mersey, 31 m. E. Liverpool, 35 m. S.W. Leeds, 70 m. N. Birmingham, and 163 m. N.N.W. London; lat. 53° 28' 50" N., long. 2° 13' W. The entire par. of Manchester includes an area of 31,260 acres, comprising 30 townships, and had, in 1841, a total pop. of 353,390 persons. The following table exhibits the area, pop., and rate of increase in the contiguous parl. bors. of Manchester and Salford, the limits of which pretty correctly define the extent of the town and its suburbs:— [See top of next page.]

From the above table it appears, that the rate of increase in the two boroughs, during the 40 years ending with 1841, was 224.8 per cent.; and in the bor. of Salford, 259.6 per cent., a rate exceeded only by Preston, and one or two other towns. In 1773, the pop. of the township of Manchester was estimated by Dr. Percival at 22,481; and that of Salford at 4,765, making together 27,246;

Township.	Pop. in 1801.	Pop. in 1831.	Pop. in 1811.
<i>Dist. of Manchester.</i>			
Manchester Town	70,409	142,026	165,856
Ardsick	1,762	5,524	9,006
Beswick	6	218	345
Bradford	91	306	911
Cheetham	752	4,025	6,082
Chorlton Row	675	20,509	25,756
Harpurhey	318	363	138
Hulme	1,677	9,624	26,082
Newton	1,235	4,777	6,127
Total (Manchester)	76,788	187,022	211,085
<i>Dist. of Salford.</i>			
Salford town	13,611	40,786	55,200
Piccadilly	5,611	8,155	11,052
Other districts included in the borough	1,503	3,145	2,392
Total (Salford)	18,525	52,066	68,644
Manchester and Salford	95,313	239,088	280,697

that is, about *one-eighth* part of the pop. in 1841. The present (1845) pop. of the par. bors. of Manchester and Salford is certainly not under 360,000.

Manchester and Salford, which, being separated only by the small river Irwell, form a single large town, covering 3,000 acres, with a dense mass of buildings, stand in a large plain, encompassed by hills on every side except the W., and dotted with towns and villages, the inhab. of which are all industriously engaged in the production of woven fabrics. The Irk and the Medlock join the Irwell close to the town, and all three are made extensively useful in moving machinery, and for other purposes. Six bridges connect Salford with Manchester; the handsomest being Victoria Bridge, having a single arch of 100 ft. span, opened in 1839. The streets are irregularly laid out, and many are narrow and inconvenient, especially in the more central parts. Great improvements, however, have been made within the last 30 years: narrow lanes have been pulled down to make way for broad avenues; noble public buildings, which would be ornamental to any capital in the world, have been erected in the chief thoroughfares; factories and warehouses of gigantic proportions have arisen in every direction; confined and mean-looking shops have been replaced by superior establishments, some of which will bear to be compared with the best in London; the paving of the streets, though still in parts very defective, has been much improved; and flagging has been generally introduced, with macadamising, in the principal streets. The whole town is lighted with gas; but in the poorer districts the lamps are but thinly dispersed, and are extinguished at too early an hour. It is well supplied with water, sufficiently drained (except in some poor districts) by an underground sewerage, and well watched by a day as well as night police. There are three main lines of street, which run in a curve S.E., nearly parallel to each other. The central line, which is the principal thoroughfare of the town, comprises Market Street (formerly a narrow lane, but now vastly improved, having some of the finest shops in town), Piccadilly, and the London Road; more to the N., joined to the last mentioned line by Oldham Street, is Great Ancoat Street, with its continuations; and S. is the avenue known in different parts as Quay Street, Peter Street, and the Oxford Road, connected with Piccadilly by a handsome line called Mosley Street, and a long narrow street called Deansgate.

The public buildings of Manchester are too numerous to admit of individual description; but the following are the largest, best built, and most important. The Exchange, which stands in the market-place, at the lower end of Market Street, is a large but somewhat low semicircular stone building, fronted with Doric pillars. In the lower floor are the commercial room, a magnificent hall, having an area of 6,750 sq. ft., and a spacious news-room (added in 1839 from a space previously occupied by the post-office, in the rear of the building); there are upper rooms on a corresponding scale, used for public meetings, dinners, &c.: the establishment is supported by subscription, and had, in 1840, about 2,000 members. The chief business day is Tuesday, on which, about noon, all the principal manufacturers of Lancashire may be seen in or near this building. The Town Hall, in King Street, which has been recently widened, is of Ionic architecture, and extremely elegant, being formed on the model of the Temple of Erechtheus at Athens, with a central octagonal cupola, resembling Andronicus's Tower of the Winds. It cost upwards of 40,000*l.*; and comprises, besides rooms for the police business, gas-offices, &c., a spacious and well proportioned public room (ranking amongst the finest in Europe), 131 ft. long, and 34 ft. broad. The fresco paintings, however, with which the walls are covered, are said to display little taste, elegance of design, or correctness of execution. Smaller town

halls are situated in Salford and Chorlton, the former of which townships has its separate police establishment, &c. The Corn Exchange, in Hanging Ditch, is a handsome building, erected from a design adapted to it from the Temple of Ceres at Athens. Six Ionic columns support the central pediment; and on each side are wings, very slightly projecting, and ornamented with pilasters; between which are the entrances to a square hall, inclosing an area of about 6,000 sq. ft., and affording standing room for 2,000 persons. Of the buildings devoted to charitable purposes, to literature, or to public amusement, the following deserve notice, from their architectural beauty. 1. The Royal Infirmary and Lunatic Asylum, finely situated in Piccadilly, recently faced with stone, and now constituting one of the chief ornaments of Manchester. 2. The Athenæum in Bond Street, a peculiarly elegant structure, designed by Barry, in the Italian style, and completed at an expense of about 13,000*l.* 3. The Royal Institution in Mosley Street, built at a cost of 30,000*l.*, from Barry's designs, having a noble front, with a portico in the Ionic style, and comprising, besides other apartments, a handsome gallery for the exhibition of pictures, and a theatre for lectures capable of accommodating 800 persons. 4. The Portico News-room, in the same street as the Institution, having an Ionic portico. 5. The Union Club House, also in Mosley Street, a fine modern stone building, with internal reconstructions equal to those found in the best London establishments of the same description. 6. The Natural History Society's Hall in Peter Street, a large square building, having in the principal front a portico supporting a pediment and comprising a fine hall, lighted from a cupola, and different apartments stored with numerous specimens of birds, insects, fossils, shells, &c., and a few quadrupeds. 7. The Concert Hall, near the last-mentioned building. 8. The Assembly Room, below which is a billiard and news-room; and, 9. The Asylum for the Blind, and the School for the Deaf and Dumb, at Old Trafford, designed by Mr. Richard Lane, in the Elizabethan style, having a fine frontage of stone, consisting of two wings and a projecting centre formed by the chapel of the two institutions. There are three theatres, one of which has a royal patent; but neither is much patronised.

Among the sacred edifices of Manchester, the collegiate church far surpasses the others, both in size and architectural beauty. It stands close to the Irwell, near Victoria Bridge; and was erected in the 13th century, in the ornamental Gothic style, having been frequently since repaired and in part rebuilt. The interior is about 180 ft. long and 60 ft. broad; but only a portion of the building is fitted up with stalls and pews for choral service, the remainder consisting of private chapels, which cover a large area, and render the form of the edifice exceedingly irregular. The choir is one of the finest in England, and the tabernacle-work is unrivalled: the monuments are numerous, and full of interest: the carved figures, with which the church is liberally adorned, are as quaint and grotesque as an antiquary could desire; and there are several beautiful stained-glass windows, with inscriptions and paintings. The college was founded in the reign of Henry VI., dissolved by Edward VI., and again chartered, in 1578, by Q. Elizabeth, who directed that the establishment should comprise a warden, 4 priests, 2 chaplains, and 8 choristers. This charter was, for the most part, confirmed by Charles I. In the charter dated Sept. 30, 1635, it is ordered that there shall be a warden (appointed by the crown), and 4 fellows (elected by the warden and fellows), who shall be a body corporate and politic of themselves for ever. The charter further directs that there shall be 2 chaplains or vicars, and 2 clerks (one to be in holy orders), 4 singing men (whether clerks or laymen), and 4 boys skilled in music. [There are now 6 singing men and 6 boys.] It is also ordained that there shall be a scholar continually in the college, a treasurer, a collector (all of the number of the fellows), a reader, a master of the choir, an instructor, an organist, and a bursar. Whenever either of the sees of Bangor or St. Asaph becomes vacant, they will be united, and Manchester will be raised into a bishopric. Preparatory to this change, the title of warden and fellows has already been changed for that of dean and canons; and this, in due course, will be followed by the appointment of an archdeacon of Manchester to superintend the clergy of the diocese. A chapel of ease was erected in Salford in 1634: this, St. Anne's, erected in 1712, and St. Mary's, erected in 1753, being the only places of worship in the town till 1760, between which and 1800 eight additional churches were built. Nine other churches, two of which (St. Luke's, Cheetham, and St. George's, Hulme), are very elegant, and cost 14,000*l.* each, have been erected in the present century; so that, on the whole, there are 23 episcopal places of worship in the borough, served by 46 clergymen, and accommodating 20,400 individuals. The Rom. Caths. raised their first chapel in 1746, but one belonging to the Presbyterians was opened at an earlier period. The Independents opened a chapel in 1762, and the Wesleyan Methodists in 1780. The dissenting

meeting-houses now open comprise, 1 for seceders from the Scotch kirk, 5 belonging to Rom. Catholics, 11 belonging to Wesleyan Methodists, 16 occupied by various seceders from Methodism, 9 belonging to Independents, 6 to Baptists, 4 to Unitarians, and 6 others to Swedenborgians, &c. the whole being calculated to accommodate about 140,000 persons. Three cemeteries have been laid out in Chorlton, Ardwick, and Harpurhey; and the noxious practice of interring bodies within the town is slowly but gradually going out of use. The two boroughs of Manchester and Salford have above 120 Sunday schools.

The means existing in Manchester, in 1834, for the diffusion of elementary instruction, may be learned from the following summary, drawn up from the report of the Manchester Statistical Society:—

Description of Schools.	Manchester.			Salford.		
	Schools.	Scholars.	Per cent. to Pop.	Schools.	Scholars.	Per cent. to Pop.
I. Sunday schools:						
Established Church	25	10,284	5.14	9	2,741	4.98
R. Cath. " "	1	38	0.02	2	615	1.41
Dissenters	52	19,052	9.52	20	6,100	11.61
Total Sun. schools	78	33,196	16.60	31	9,751	17.75
II. Children returned as day scholars	-	-	-	-	3,410	6.20
Sund. scholars only	-	25,185	11.59	-	6,341	11.53
III. Free or subscription day schools	26	4,177	2.05	16	1,776	3.23
IV. Evening schools	86	1,158	.73	28	526	.96
V. Schools supplied by the children's payment						
Primary	400	11,621	5.81	107	3,357	6.11
Higher	114	2,954	1.47	29	882	1.60
Total	721	43,578	21.65	211	12,885	23.45

It would appear from this statement that, in 1834, about 26,000 children were receiving daily instruction in Manchester and Salford, and that 30,000 more were taught on Sundays. But doubts have been entertained as to the accuracy of these returns; and of the day scholars, nearly 19,000 were reported to be educated in private schools and dames' schools, in two thirds of which the instruction is extremely defective. Within the last half dozen years considerable additions have been made to the better class of schools supported by the church and the manufacturers; still, however, there can be no doubt that the education of the working classes is defective, and that it admits of being very materially improved. From the report of the Inspector of the Chester Diocesan Board of Education, read at a meeting of that body on the 11th of March, 1841, we derive the following particulars relative to the church schools in the town of Manchester:—

	On the Books.	Average Attendance.
21 Day schools	2,750	2,200
11 Infant schools	1,900	1,565
10 Evening schools	-	530
50 Sunday schools	15,156	11,540
Total	19,806	15,835

Among the schools deserving particular notice, the first place is due to the grammar school, founded in 1520, by Hugh Oldham, Bishop of Exeter. Its revenue amount to upwards of 4,500*l.* a year; and in consequence of a decree of Chancery, in 1833, its usefulness was increased by the opening of a lower school, and a general augmentation of the establishment. The decree of 1833, however, was *ex parte*, and as it did not effect all the alterations that were necessary, a suit was instituted to obtain further reforms, in which a judgment was given by the lord chancellor on 10th Nov. 1840, from which it appears that "the income in 1833 was 4,550*l.*, and the salary awarded to the head master was 600*l.* per annum; and the salaries of all the masters together was 2,050*l.*, whilst the number of scholars, including boarders, was only 198." The lord chancellor concluded his judgment as follows:—"I propose, therefore, to declare, that in all future appointments of teachers and trustees regard should be had to the qualification required by the statutes; that all children of an age capable of instruction are entitled to be admitted into the school; that no part of the funds of the charity are hereafter to be applied towards paying premiums for exhibitions to boys who are or have been boarders in the houses of any of the masters, except in continuing to pay exhibitions already granted; and that such boarders are not in future to derive any benefit from the funds of the charity in any manner by which the expenditure of such funds may be increased; and with these declarations, I shall refer it to the master to approve of such alterations

in the scheme contained in the report of 1833 as may be necessary to carry the same into effect, and as the master shall find to be proper for the purpose of more effectually carrying into effect the objects of the charity." We understand, however, that the whole case is in a train for being again brought before the court in another shape. Few establishments in England confer so many university advantages on their *alumni*. It has 16 exhibitions of 60*l.* a year, tenable for 4 years; 16 Somerset scholarships at Brasenose College, Oxford, averaging 20*l.* a year; and several others of less value both at Oxford and Cambridge; besides which it derives great though not exclusive advantages from the valuable Hulme's exhibitions, connected with Bras. Coll., and tenable for three years after the degree of B.A. The instruction is efficient; and should it be placed on the footing directed by the lord chancellor, it will no doubt rank amongst the best grammar schools in the kingdom. The College, founded by Humphrey Chetwode, in 1665, is likewise a wealthy scholastic establishment, comprising, besides lodgings and school-rooms for boys, a valuable library of 25,000 vols.; but it is said that the modern part of this library is deficient, and that it is better suited for the scholar and the antiquary than for men of business: this college has also a museum of curiosities of little real value, but much visited by strangers and holiday people. The number of scholars is restricted to 80, 40 of whom must belong to Manchester and Salford, the rest belonging to Droylsden, Crumpsall, Bolton and Turton. A plain education is furnished, and the scholars are afterwards apprenticed and fitted out in trade. Seven other endowed charities for instructing children are amalgamated with national and other schools, very liberally supported, and conducted in the most efficient manner; and, besides these, the town has an asylum for the blind, erected by public subscription, and supported by an endowment bequeathed by Thomas Henshaw, Esq., of Oldham, and a deaf and dumb school, established in 1823, and remodelled in 1831; there are 80 scholars on the establishment, which is in every respect well conducted. A chapel is connected with the school, to which the public are admitted.

A college (removed) by the Unitarians, (from York), on the plan of King's College, London, under the denomination of the Manchester New College, was opened for the reception of students on the 5th Oct. 1840. Instruction is given by distinguished professors in every department of literature, science, and theology. The erection of another college, to be called the Lancashire Independent College for the Education of Dissenters, is also in active progress, and will be soon completed.

The charitable institutions of Manchester, for the relief of the sick, disabled, and destitute, comprise an infirmary and dispensary, relieving 18,000 patients yearly, a fever hospital, or "house of recovery," a lying-in hospital, an eye institution, a lock hospital, a night asylum for the destitute poor, a female penitentiary, a provident society, a dispensary for children, a dispensary for diseases of the skin, and four other dispensaries, relieving altogether about 30,000 patients annually, and supported by funds, from bequests and subscriptions, amounting to 14,000*l.* a year; besides which, there are various minor charities belonging to Manchester and Salford, the aggregate income of which exceeds 4,000*l.* a year: so that upwards of 18,000*l.* are annually expended in the relief of the poor, over and above the expenses of parish support, which in 1838 amounted to 40,000*l.*

The literary and philosophical establishments of Manchester are very numerous, consisting of a philosophical society, instituted in 1781, and numbering among its past and present members Dr. Percival, the three Henrys (father and sons), Dalton, and other eminent men, whose science and discoveries have been of material advantage, not only to the town, but to the world generally; indeed, few provincial societies of the kind have earned so high a reputation; its memoirs (in 16 vols.) have been translated into both the German and French languages; a geological and mining society, founded in 1838, has already upwards of 200 members; a statistical society is actively engaged in collecting local information respecting education, morals, &c.; a botanical and horticultural society, established in 1831, possesses gardens that cover 16 acres; a zoological society has spacious gardens on the Barry road, tastefully laid out, and containing a good and increasing collection of animals; a society of natural history has a good museum, and is supported by about 600 subscribers. The Royal Institution was founded in 1823, for the promotion of literature, science, and the fine arts. We have already noticed its fine building, the principal hall of which has a statue of Dalton, from the chisel of Chantrey. Connected with this institution is a school of design, likely to be of material service to pattern-draughtsmen, machine-makers, and others. The Athenæum, established in the view of affording to the middle classes a suitable resort for reading, study, and conversation, is supported by

about 1,000 members, and has a library of 4,000 vols. : two schools of medicine and surgery are superintended by able teachers, and provided with extensive museums, lecture-rooms, &c. There are two mechanics' institutes, and another establishment for similar purposes called the Christian Institute: these institutions are all well provided with libraries, museums, apparatus, &c., and are well attended. There are three lycæums, specially intended for the improvement and recreation of the working classes by furnishing them with books, magazines, newspapers, lectures, and opportunities for friendly intercourse; and there can be no doubt that they have been of very material advantage. The Royal Victoria Gallery has an exhibition of objects in mechanics and science, and courses of lectures. A temperance society, formed in 1835, was the first to inculcate total abstinence from all intoxicating beverages; it has at present 12 branch associations, holding weekly meetings, and about 8,000 members.

The banking establishments of Manchester, which are numerous, and conducted on a scale corresponding with the commercial importance of the place, comprise, besides five private banking-houses, mostly of great wealth and respectability, a branch of the Bank of England, and five joint-stocks: viz., the Bank of Manchester, founded 1829; the Manchester and Liverpool District Banking Company (1829); and the Union Bank of Manchester (1836); the Manchester and Salford Banking Company (1836); the S. Lancashire Bank (1836); and the Alliance. A savings' bank was opened in 1848; and, from the report of 1859, it appears that it had then deposits to the amount of 337,880*l.*, received from 11,862 depositors. Five newspapers are published in Manchester: three of which, the *Guardian*, *Times*, and *Advertiser*, advocate whig and radical politics, the *Courier* and *Chronicle* being conservative. The *Guardian*, which has the largest circulation, and *Chronicle*, are published on Wednesdays and Saturdays; the others appear on Saturdays only.

Manchester possesses several large establishments connected with its internal economy. The workhouse, which occupies an embayment N. of the town, is a very extensive and well conducted establishment, accommodating at an average 780 in-door paupers, whose weekly cost is about 2*s.* 4*d.* each for food, and 5*d.* for clothing. The house expenditure, in 1859, amounted to about 8,750*l.*, and 13,000*l.* were distributed among the out-door poor; the total expenditure of the overseers being 11,000*l.* The Salford workhouse in Greengate has accommodation for about 300 inmates, whose average cost per head is about 3*s.* 4*d.*; the expenditure of the establishment was about 2,000*l.*, 8,000*l.* more being distributed among out-door paupers. The New Bailey prison in Salford, close to the New Bailey Bridge, commenced by Howard in 1787, has been since greatly enlarged: it has accommodation for about 800 prisoners, and is well conducted; but, owing to the great increase of population and crime, it is inadequate to the wants of the bor., and is frequently overcrowded, that three persons have to sleep in one cell. A police-office court is held daily within the precincts of the prison, by a stipendiary magistrate, appointed by the chair of the bor. of Manchester, with a salary of 1,000*l.* *per* *ann.* The police of the bor. is regulated by a recent temporary act (2 and 3 Vict. c. 87.), which provides for the establishment of a police-office, under a chief commissioner, who is to be a justice, and to have an annual salary not exceeding 800*l.*; and authorises the appointment of a sufficient number of fit and able men, to act under the commissioner as a day and night police, not only within the bor., but throughout the co. of Lancaster. The force consists at present of 296 sergeants and constables, and 24 superior officers, costing in all about 21,700*l.* a year. The police fire-engine establishment is perhaps the most effective in the kingdom, and that of the metropolis: it comprises 7 engines, completely furnished with every necessary implement, fire-wagon, and water-pumps, and a body of 10 firemen, commanded by a superintendent. The Manchester gas-works are the property of the town, and the profits are applied towards its improvement: the works were established in 1817, but the streets were not generally lighted with gas till 1824. The main pipes extend, in various directions, upwards of 80 m. in length; and the quantity of gas made in 1838 exceeded 160 millions of cubic feet. The Salford gas-works are on a much smaller scale, having only come into operation in 1835. The board of directors of the Manchester establishment paid over to the Improvement committee, between 1830 and 1835, 34,000*l.* The Manchester and Salford Water-works Company was originally established in 1808, but assumed its present shape only in 1823, when it received additional powers from parliament. There are two reservoirs, one at Boswell, 110 ft. above the level of the town, and the other at Gorton, 140 ft. above that level: the iron mains extend upwards of 70 m., and the daily consumption of water is estimated at 1½ millions of gallons; besides which, 30,000 gallons are daily supplied to the railway companies. The markets of Manchester

are not such as a town of great wealth and magnitude might be expected to possess; and this circumstance is most probably owing to the fact, that the tolls are not the property of the town, but belong to the lord of the manor. There are no general markets, like those of Liverpool, Birmingham, and Newcastle; but several are scattered in different parts of the town. In Victoria Street, Swan Street (Smithfield), Camp Field, and Deansgate, are markets for butchers' meat and vegetables; and a fish-market was erected near the exchange in 1828. The cattle-market is held every Wednesday, in Cross Lane, Salford; a large area on its sides is fitted up with stalls, filled with various articles both of farming and manufactured produce.

The following table, drawn up from the *Reports of the Manchester Statistical Society*, shows the consumption of butchers' meat in Manchester and its environs (estimated pop. 343,500) in 1836:—

Description of Meat.	Average weight of Carcasses.	Number of Carcasses.	Quantity to each Person.
Cattle	160 lbs.	40,820	66 lbs. 8 oz.
Sheep	68	105,040	71
Lamb	37	96,508	7
Calfes	90	11,791	5
Total (edible)		254,519	101
Total		36,097,160	105

The market-days are Tuesday, Thursday, and Saturday, the first named being the manufacturers' day, and the last the chief market for agricultural produce and provisions. The fairs are held in Easter and Whitsun week, the first week in Oct., and on Nov. 17. The first of these, called Knott-fair, is a mere popular festival, and the rest are cattle fairs.

*Manufactures.*—Manchester, though situated close to an almost inexhaustible coal-field, and deriving great advantages from the vicinity of three streams, available for machinery, would never, in all probability, have attained to her present magnitude and importance, as the first manufacturing town of the world, but for the invention of the steam engine, and the wonderful improvements made since 1760 in the manufacture of cotton-textiles and fabrics, through the genius and discoveries of Arkwright, Crompton, Cartwright, Horrocks, and others. How astonishing their solution effected by the ingenuity and enterprise of a few obscure individuals! Before the spinning frame, which was invented in 1767, came into operation, the imports of cotton wool did not amount to 4,000,000 lbs. a year, and the value of the exports hardly exceeded 200,000*l.* Arkwright's patent was set aside in 1785, and since then the progress of the cotton manufacture of Great Britain, and especially of Manchester, has been rapid beyond all precedent. Previously to 1785, the imports of cotton wool had not reached 12,000,000 lbs. in any single year; but in 1787 they amounted to 23,250,263 lbs. 1. The progress of the manufacture was not impeded by the late war, to the successful termination of which it contributed more, perhaps, than any thing else; and what is not less extraordinary, it has more than quadrupled since the peace! The imports of cotton wool, in 1840, amounted to the prodigious sum of about 543,500,000 lbs., of which no fewer than 459,000,000 lbs. were manufactured! In 1843, the value of the exports of cotton goods equalled those of woollen, the long-established and staple manufacture of the country; and they now amount to about 25,000,000*l.* a year, while the exports of woollens do not exceed 6,000,000*l.* Indeed, the cotton manufacture now forms, next to agriculture, the principal business carried on in the country, affording an advantageous field for the accumulation and employment of millions upon millions of capital, and of thousands upon thousands of workmen! About 1½ millions of people are supported by spinning and weaving cotton, and the different supplementary employments of the trade; and fabrics of great beauty and excellent quality, which a few years ago were out of the reach of all except the wealthy, have been so much reduced in price as to be within the command of all but absolute beggars. (For further details, see *ENGLAND AND WALES*, Vol. I. p. 772.) Of this gigantic manufacture Manchester is the grand centre, absorbing, with its neighbourhood 10 m. round, fully four fifths of the trade, and comprising, besides spinning mills, most extensive power-loom factories, and large dyeing and printing establishments. The manufacture of silk goods, also, which was introduced in 1816, has been in a most flourishing state since the removal in 1826, of the oppressive import duties on raw silk; and this branch of industry in Manchester now exceeds that of Birmingham. In the infancy of the trade, silk handkerchiefs and mixed goods were principally made; in 1822, gros-de-Naples and figured saracens were introduced; and at present (1840) nearly every kind of silk, from the rich brocade to the flimsy Persian, is man-

manufactured, consuming upwards of 1,000,000 lbs. of raw silk, and employing 4,000 hand-loomers, besides 2,000 persons in throwing-mills, and 500 in dyeing and printing-houses. Mixed goods of silk and cotton, silk and woolen, and cotton and woolen, occupy several hands; and many hundred persons are engaged in making machinery, and in various branches of handicraft nearly or more remotely connected with the principal object of industry. The following statement respecting the factories within the bor. of Manchester is extracted from the *Parl. Return* of 1839:—

Description of Mill.	Number.	Engines.	Power.	Hands employed.
Cotton mills	165	201	6,659	51,059
Worsted	2	2	66	220
Woolen	2	1	16	58
Silk	19	19	339	4,152
Total	186	227	7,140	58,149

There are also several flax-mills, and this branch of spinning is extending. In some of these factories the process of spinning only is carried forward; but in many others the whole process is carried on, from the first carding to the ultimate dressing of the woven and bleached fabric. Many of them are buildings of extraordinary size, comprising 7 or 8 stories, erected at a heavy expense, and filled with machinery costing 50,000*l.* or 40,000*l.* The rooms are kept in the most perfect state of cleanliness, and the strictest order, regularity, and silence prevail throughout the establishments. Several thousands of spindles are at work in each of the principal factories; and in many of them upwards of 600 power-looms are in action, each producing from 15 to 20 pieces of fabric, of 24 yards each, per week. Besides the pop. connected with the factories, which almost absorb the plain-goods' trade, including jacobines, twilled cloths, and fustians, upwards of 9,000 hand-loom weavers are employed in Manchester and the neighbourhood in weaving cotton, silk, and mixed goods. "The cotton fabrics are quiltings, figured waistcoatings, twilled shawls and handkerchiefs, checked and striped gingham, tape-stripes, dimities, apron-checks, checked handkerchiefs, buff-checks and bulks, coarse shirtings and sheetings. The silk fabrics comprise velvets, figured sarrements, figured plain levantines, plain satins, plain serges, sarrements, and gros-de-naples, checked sarrements, string-persians, dressy handkerchiefs, such checked cravats, Brussels handkerchiefs, black bandannas, Welsh shawls, romuls, turbans, Barcelona handkerchiefs, and grey bandannas. The mixed are chiefly for waistcoatings, handkerchiefs, cravats, shawls, &c. The weaving of each of these fabrics, with a variety of others, may be regarded as a separate branch of the weaving trade; and the earnings of the weavers employed on each are as various as the fabrics." (*Hand-loom Weavers' Rep.*)

We subjoin a statement drawn up by the Manchester Statistical Society of the amount of steam power employed in the various branches of manufacture within the parli. bor. of Manchester and Salford in 1838:—

Branch of Manufacture.	Horse Power.		
	Man- chester.	Salf- ord.	Both Bors.
Cotton-spinning and weaving	5,272	704	6,036
Wool-spinning, dressing, printing, &c.	759	521	1,277
Machine-making, foundries, &c.	508	226	754
Silk-drawing and weaving	2574	161	3111
Silk throwing and small wares	270	36	306
Cotton thread and small wares	106	100	206
Collieries	141	11	155
Saw mills	75	6	81
Engraving for calico-printing, &c.	46	34	80
Fustian shearing	16	62	78
Breweries	55	11	66
Flax-spinning	26	22	48
Chemical works	408	28	456
Woolen	13	1	14
Various, all of minor importance	7,924	1,998	9,924
Total	7,924	1,998	9,924

The manufacture of machinery is conducted on a most extensive scale, employing many hundred hands. Steam-engines are made of different powers, varying from 8 to 400 horse power; and the castings are often of gigantic size, weighing from 30 to 50 tons. The iron-planing and riveting machines are curious specimens of mechanical ingenuity, and have greatly tended to facilitate the manufacture. Many of the workmen receive from 2*l.* to 3*l.*, and few less than 30*s.* weekly wages. The business of locomotive engine and tool making, also, is most extensively carried on, the largest establishments of this kind being at Patricroft; and at Sharp and Robert's; Peel, Williams, and Peel's; Fairbairn's; and Whitworth and Co.'s, in Manchester; at each of which several hundred men are employed, and the arrangements in every way are most complete and systematic.

The speedy and cheap communication established with the port of Liverpool, and other places, has

been at once a cause and a consequence of the increase of manufactures in Manchester. It had become, at the close of the last century, a great centre of internal navigation. Bridley constructed the Duke of Bridgewater's canal, uniting with the Mersey at Runcorn, in 1761; the Bury and Bolton canal was projected in 1791; that to Ashton and Oldham in 1792; and that to Rochdale in 1794; and these communicate with other canals, in such a manner as to establish an easy communication with the eastern, central, and southern counties, including the ports of Hull, London, and Bristol, as well as that of Liverpool, which is, *par excellence*, the port of Manchester. Large sums were sunk in excavating these canals; but the returns far exceeded expectation, and the profits to the shareholders were in some cases immense.

The Mersey and Irwell Navigation Company have recently commenced operations in the river Irwell, which will have a most important influence over the navigation and commerce between the two towns. The river at Manchester is being deepened between the New Bailey and Victoria Bridges, in which portion it is not at present navigable; and a report, survey, and plans have been drawn up by Mr. Palmer, (president of the Society of Civil Engineers, London,) in compliance with which it is proposed to open the navigation to vessels of 300 tons burden the whole distance from Manchester to Runcorn. The inhab. of Manchester have for some time been earnestly soliciting to be allowed the privilege of bonding goods; and bills to that effect have been introduced into the H. of C. Hitherto, however, the opposition of interested parties has prevented the project being carried into effect; but should the Mersey and Irwell Navigation Company carry their designs into execution, Manchester will be entitled to claim the privilege of bonding from its being a *port*.

Notwithstanding the rivalry of railways, the tonnage on the canals continues to be very heavy. It was proved before the House of Lords, in 1836, that the water-carriage between Manchester, Birmingham, the Potteries, Shrewsbury, &c., amounted annually to 364,100 tons; and if the trade with London, and other southern traffic, be added, it seems probable that the entire canal carriage of Manchester exceeds 700,000 tons a year. But the rapidity and ease of communication have been still more prodigiously increased by the construction of railways, which have brought Manchester within an hour's distance of its great warehouse for the raw material, within four hours of Birmingham, and nine hours of the metropolis! The Liverpool and Manchester railway, opened in 1830, cost 876,000*l.*, and the expense of maintenance amounts to 160,000*l.* a year. The annual profit being about 100,000*l.* at an average of four years. The passenger traffic on the railway have averaged for some years 450,000 a year; and the receipts from goods, computed with those from passengers, bear the proportion of 110 to 5 nearly. The Grand Junction Railway, connecting Manchester and Liverpool with Birmingham, is 82½ m. in length (15 m. of which are on the Liverpool and Manchester line), the original cost amounted to 1,860,000*l.*; the receipts, in 1838, were 178,000*l.*, the expenses averaging 53 per cent. on the returns. The Manchester and Leeds Railway was opened the whole distance on the 1st of March, 1841, and in connection with the North Midland and the Midland Counties, furnishes another route from Manchester to London. The Sheffield and Manchester railway, and that between Manchester and Birmingham, have been recently commenced, and will probably be completed by the end of 1841.

Manchester has recently received a charter of incorporation; and the mun. bor. is divided into 15 wards, the government being vested in a recorder, mayor, 15 aldermen, and 48 councillors. Quarter sessions are held by the recorder; and there is a court for the recovery of debts under 20*l.* Notwithstanding its vast importance, Manchester did not enjoy the privilege of sending representatives to parliament till the Reform Act gave to the manufacturing interests of the country that influence in the legislature to which they had been long entitled. Manchester was then erected into a parli. bor., with power to send 2 mems. to the H. of C.; its boundaries including, besides Manchester, the eight other townships enumerated at the commencement of this article. Reg. electors, in 1839-40, 12,150. The same act conferred on Salford the privilege of sending 1 mem. to the H. of C.; its limits comprise two other entire townships, and part of a third. Reg. electors, in 1839-40, 2,519. Manchester has also been formed into a Union under the Poor Law Amendment Act, which came into operation in January, 1841. The union comprises the townships of Blakeley, Crumpsall, Cheetham, Moston, Harpurhey, Bradford, Newton, Fallowfield, Great Heaton, Little Heaton, Prestwich, and Manchester.

*Condition of the People of Manchester.*—The increase of wealth in Manchester, during the

last half century, has been quite unprecedented, and it has at present, in proportion to its size, a greater number of opulent capitalists than any other town of the empire. The capital vested in mills, machinery, and stocks of goods, is immense; and, in addition to the vast sums that are thus employed in their peculiar business, the capitalists of Manchester, and the adjoining districts, have been the great promoters of railways in all parts of the empire, and hold a very large proportion of the stock embarked in these undertakings. To achieve such great results, a combination of all those qualities that go to form accomplished men of business has been required; and no where do we find the persevering attention to details, added to the sagacity to distinguish between the doubtful and the certain, and the enterprise to embark in remote and apparently hazardous, though really safe schemes, that characterise the highest class of commercial men, so generally diffused as in Manchester. It is, in fact, the grand arena of industry and enterprise. Every one is striving to raise himself to distinction, and to outstrip his neighbour in the accumulation of wealth. But there are no mean jealousies, or unfair jostlings: there is more than room enough for every one; and every one knows that his success is wholly dependent on his own efforts.

The shopkeepers and middle classes of Manchester are more attached to old habits than those of most other towns. In proof of this we may mention, that by far the greater number of them continue to dine at the primitive and unfashionable hour of one. At no very distant period, indeed, they were accustomed to shut their shops from one till two; and though that be no longer the case, the banks will not, at present, with one or two exceptions, cash cheques sent to them at such a time, or allow their clerks to be interrupted when at dinner!

But it is not so easy to arrive at any very definite conclusions with respect to the condition of the lower classes in this great workshop. On the whole, however, we are inclined to consider it as tolerably satisfactory. No doubt, the condition of the English part of the population has been most injuriously affected by the prodigious influx of Irish immigrants, of whom there are probably not fewer than 65,000 in the town, where they, for the most part, occupy an inferior quarter, called "Little Ireland." The Irish, it is but fair to say, are neither peculiarly disorderly nor peculiarly dishonest; but their competition has depressed wages, or hindered them from rising, and their example has been most pernicious, by accustoming the English to a lower standard of food and comfort. But despite the influence of this fruitful source of degradation, the work-people of Manchester seem, when employed, with the exception of the hand-loom weavers, to be really well off. Unluckily, however, a number of individuals, partly belonging to the town, but mostly new comers from Ireland and other parts of England, are usually without employment, and in a state bordering on destitution. It is unfortunate, too, that so many of the workmen's wives should be employed in factories, as this takes them away from their families, and prevents them from bestowing sufficient pains on the training of their children, and their household affairs. It is singular, indeed, how ignorant workmen's wives, engaged in factories, and brought up as factory girls, are of most matters connected with domestic economy; and how much more comfortable their families might be were they familiar with such details, even though their earnings were

less. It is not true, however, that the condition of the work-people has been deteriorated, and, in point of fact, it has, on the contrary, been very materially improved. Most descriptions of labourers receive good wages; and such skilled labourers as are temperate and industrious are, speaking generally, in decidedly comfortable circumstances.

It appears, from a statement published by the Manchester Statistical Society in 1838, which may be regarded as nearly accurate, that 71,799 individuals, comprising nearly all below the rank of shopkeepers, were employed as follows:—

	Individuals.
In cotton factories in Manchester and Salford	18,553
Other factories in ditto	1,453
Hand-loom weavers	3,192
Persons employed in warehouses	7,007
— in manufactures	7,067
— in building trades	4,545
— in building trades	6,280
Occupations not classed	25,952
	71,799

The following table, drawn up by the Manchester Chamber of Commerce, exhibits the average rates of wages paid to the different classes of labourers in and out of factories in Manchester in 1832, since which period no material alteration has taken place:—

	L. s. d.	L. s. d.
Spinners, men	1 0 0	1 5 0
— women	0 10 0	0 15 0

Spaltemen	—	0 10 0 - 0 15 0

The lower classes of Manchester live principally in houses above ground, consisting for the most part of cottages, of which many lengthened streets have been built of late years; but, in addition to these, great numbers inhabit cellars or underground floors, sometimes below the cottages, and sometimes below other houses. According to a statement published by the Statistical Society, the bulk of the population, in 1835, were lodged as follows:— [See top of next page.]

Of the 169,223 persons classified above, 84,333 were adults, 53,699 were children under 12 years of age, and 30,691 were children above 12 years of age, and mostly employed.

It is greatly to be regretted that effectual provision had not long since been made in Manchester and other large towns for their proper

drainage and pavement, and for laying down rules as to the erection of houses. The authorities in Manchester have done all in their power, under the existing laws, to improve the streets; but there is no general building act for the town, and except in certain districts where the commissioners of police are entitled to interfere, each proprietor builds as he pleases. Hence cottages may be seen springing up row behind row, without the streets or alleys between them being of sufficient width, or drained or paved; in some places, indeed, the streets are full of pits filled with stagnant water, the receptacles of all sorts of filth. (*Report on Health of Towns*, p. 10.) Such a state of things is discreditable alike to the local authorities and the government; and we do not know that any measure is more imperatively necessary, seeing the vast and rapid increase of towns, than the enactment of such regulations as may be required to provide for the proper construction of the streets and houses, and consequently for the health and comfort of the population.

Cellars, however damp and unhealthy, are preferred by a large proportion of the lower classes both here and in Liverpool, not so much from their cheapness, as because they afford facilities for dealing in various sorts of articles, and because their inmates either are or believe themselves to be more independent than if they resided as lodgers in houses rented by other parties.

It is unhappily true, as seen from the previous statements, that many of the dwellings of the lower classes, especially those of the Irish, exhibit a great want of furniture, of cleanliness, and of comfort. This, however, is not owing, as many have supposed, to the growth of the factory system, but partly to the poverty, and still more to the perverse habits of the occupiers. In a tract written in Manchester, and published by authority in 1755, long before the factory system had any existence, the houses of the poor are said to be "most wretched," "filthy and nasty" in the extreme, and "noisome and infectious." (*See extract from tract in Manchester as it is*, p. 36.) There is really, therefore, no room or ground for saying, that any portion of the poor are worse lodged now than formerly; while, on the other hand, of 37,724 dwellings of the labouring classes, examined by the agents of the Statistical Society, no fewer than 27,281 were decidedly "comfortable;" and as respects the clothing and other accommodations of the poor, they are infinitely superior at present to what they have ever previously been. Their prosperity is evinced by the great average consumption of butcher's meat.

A good deal of fever necessarily prevails at most periods of the year, in the poorer districts of Manchester, especially in those where the streets are in the disgraceful state already no-

ticed. But, on the whole, Manchester is less unhealthy than Glasgow, or than the old town of Edinburgh, which has no manufactures.

The idle and absurd stories that were so industriously propagated with respect to the influence of factory labour on health and morals, are now pretty well exploded. \* Latterly, indeed, there would appear to be a considerable increase of crime; but this increase is apparent only, and is mainly a consequence of the improved state of the police, and of trivial offences that formerly escaped notice being (whether wisely or not we shall not stop to inquire) now visited with fine or imprisonment. The truth is that, in respect of morality, the labouring population of Manchester has but little to fear from a comparison with that of any large town in the empire. An unexceptionable witness, the Rev. R. Parkinson, canon of the collegiate church, Manchester, in a speech at a public meeting in Feb. 1839, said, "I am aware that an able and well-known poet has said (and the saying has almost passed into a proverb) —

'God made the country, but man made the town:'

meaning, of course, that the country was the most proper place for man to dwell in, and that the occupations of town-life were unnatural. I think, on the contrary, that instead of an agricultural pop., the people of this country were meant to be one of a very different character. I have no natural predilections for my present opinions. My birth and early education put me in a very different position from that which I now hold; but being at present an inhabitant of this town, having enjoyed ample opportunities of observing and judging, and being in a position which gives me no motive for a partial judgment, I maintain that, taking an average of all classes of our pop. and that of other districts, we shall find the morality of this district not below that of the most primitive agricultural pop. I have the best authority for saying, that the streets of Manchester, at ten o'clock at night, are as retired as those of most rural districts. When we look at the extent of this par., containing at least 300,000 souls, being more than the pop. of half our counties, can we be surprised that there is a great amount of immorality? But a great proportion of that immorality is committed by persons who have been already nursed in crime in districts supposed to be more innocent than our own, and who swell our police reports, not so much because we hold out greater facilities for rearing them, as that they are apprehended through the superior vigilance of our police." This is pretty conclusive; and we may add, that the regard paid by females to decency, both of language and deportment, is stated by intelligent witnesses before the Factory Commissioners of 1833-34 to be greater in Manchester than in most rural districts. It is a fact, too, that the proportion of illegitimate to legitimate children in the county is only 1 in 13, a very low ratio for so dense and varied a pop., and not greater than in the purely agricultural cos. of Hereford and Salop.

We believe that the doctrines of chartism and ultra-radicalism have made less progress in Manchester than in most other great towns, the metropolis excepted, certainly less than in Glasgow. Stagnations of trade, by occasioning a want of employment and reducing wages, necessarily, also, occasion discontent and dissatisfaction; and in such periods demagogues are not wanting to recommend political nostrums of all sorts as infallible remedies for the grievances under which they labour. But the great bulk

According to Whittaker, the historian of Manchester, "the Roman invaders of this country fixed a military station in a place since called Castlefield, to which they gave the name *Mancunium*," whence Manchester has been derived. In the time of the Saxons the old town was deserted, and about 627 another was built on its site. In 920, according to Dr. Aikin, the Saxon king, Edward the Elder, ordered Manchester to be fortified. In *Domesday Book* the town is called a manor, and is described as having two churches. In the 14th and 15th centuries it received great additions and improvements, so that, in Edward's time, it was reckoned "the fairest, best builded, quickest, and most populous town of Lancashire." Camden also mentions it as being famed in his time for the manufacture of woollen cloths, then called "Manchester cottons," that is, coatings. The first authentic mention of the cotton manufacture in England is made by Lewis Roberts, in his *Treasure of Traffic*, published in 1641, where it is stated, "The town of Manchester in Lancashire must be also herein remembered, and worthily, for their encouragement, commanded, who buy the yarn of the Irish in great quantity, and, weaving it, return the same again into Ireland to sell. Neither doth their industry rest here; for they buy cotton wool in London that comes first from Cyprus and Smyrna, and at home work the same, and perfect it into fustians, velvets, linings, and other such stuffs; and then return it to London, where the same is vended and sold, and not seldom sent into foreign parts, who have means, at far easier terms, to provide themselves of the said first materials." (*Orig. ed.* p. 32.) In 1650, the inhabs. of Manchester were reckoned the most industrious in the N. of England. The town was stated to be a mile long, with open and clean streets, and good buildings; and, in 1720, it is described as "the largest, most rich, populous, and busy village in England, having about 21,000 individuals within the parish." Fustians were the earliest article of manufacture, and other fabrics were made soon afterwards; but the great increase of pop. and commercial prosperity did not take place till 1770, when machinery was first introduced into the town. From that year down to the present time Manchester has been a scene of rapidly increasing industry, and has been distinguished by the invention and enterprise of its citizens; its working pop. supplies every quarter of the world with clothing; and wealth, the reward of successful labour, flows in from all sides in a large, rapid, and uninterrupted current. (*Baines's Hist. of Lancashire* (4th ed.), ii. 149-392; *Wheeler's Manchester; Manchester as it is; Parl. Rep.*; but principally *Priv. Inform.*)

MANCHOOHRIA (Chin. *Kirin-oolu*), an extensive region of N.E. Asia, belonging to China, and the original seat of the present ruling dynasty (Ta-tsing) of the Chinese empire, extending between lat. 41° and 52° N., and between long. 127° and 140° E., bounded N. by the Russian gov. of Yakutsk, E. by the Gulf of Tartary and Sea of Japan, S. by China Proper, and W. by the Russian gov. of Irkutsk and Mongolia, from which latter it is separated by a wooden palisade, connected with the great wall of China, and by a line running down the Songari and other rivers to the Daurian range, on the S. of Siberia. Estimated area, 700,000 sq. m. Pop. unknown. The S. provinces are the only parts of the country that have been visited by Europeans; our knowledge of the remainder being derived only from the doubtful statements of a Chinese geographer. It is, therefore, more than probable, that, should any events lead to the admission of competent travellers into the country, it will be found necessary to make considerable alterations in our maps and descriptions of what is now little better than a *terra incognita*. Manchooiria lies chiefly in the great valley formed by the Amur and Songari, with their numerous tributaries, and is bounded by three principal mountain chains, 1. one on the E., running from the peninsula of Corea along the whole line of coast to the N. boundary, and having a probable elevation of 5,000 ft.; 2. the Daurian mountains (called, by the Chinese, the outer Hing-an-ling), which form the entire N. boundary of Manchooiria, but also send out minor offsets into the centre of the country; 3. the inner Hing-an-ling, or Sialkoi chain, which appears to be a continuation of the Shan-see mountains, and to extend, with little interruption, over a great part of Mongolia. Besides the above principal ranges, there are, to the N. of Corea, some chains of inferior importance, bearing several different names; but this part of the country, near the coast, though nominally a part of Manchooiria, is inhabited, almost exclusively, by Amos, a people similar to those inhabiting Jesso and Farakal, in the empire of Japan. The chief river of Manchooiria is the Amur, Sagalien, or Kwantung (for it is thus variously called), which, measured along its windings, is about 2,200 m. in length, and, with its tributaries, drains a territory of about 900,000 sq. m. Several of these streams afford pearls; but the principal pearl-fishery is on the E. coast, in the channel of Tartary. It is a government monopoly, and is carried on by Man-

choo soldiers, who are required, annually, to deliver into the Imperial coffers, a fixed quantity of pearls. The chief lakes are the Hinkal-nor, a large sheet of water near the source of the Ononuri, in the prov. of Kirin, and the Hoorun and Pir, which give their names to the most W. district of the prov. Taitshir: there are a few others in different parts of the country, but only of small size.

The nature of the Manchoo soil, and its mineral productions generally, are little known. The people in the N. being chiefly nomads, subsisting by the produce of the chase, pay little attention to tillage; but agriculture is common in the S. districts, and the *cerealia*, as well as hemp and cotton, are extensively cultivated. The staple productions, however, are ginseng and rhubarb, the former being an exclusive government monopoly. The province of Shing-king, on the gulph of Pechlee, produces corn, millet, and peas, large quantities of which, with ginseng, are sent by sea to the S. provinces of China. The forests, which clothe the sides of most of the mountains, comprise oaks, pines, firs, and birches; lime-trees, maples, oleanders, acacias, &c. being found on the plains towards the S. The domestic animals of Central Europe are common in the more cultivated districts; but the cattle are small, and the breed of sheep peculiar to this country, called *argali*, is small, and coarse-woolled. Near the Yablonoi range, rein-deer are kept, and camels are to be seen in many parts of the S. provinces. The wild animals comprise the ermine, sable, fox, and bear, hunted for their furs, which are a considerable article of trade with the Russians. Fish, especially salmon, and remarkably fine sturgeons, are abundant in the rivers, and held in high estimation by those living near the banks.

The Manchoo territory is divided into three provinces, 1. Shing-king, (comprising the anc. Leaou-tung), near the borders of China; 2. Kirin, occupying the country E. of the Songari; and, 3. Taitshir, comprising the whole country W. and N.W. that river. The government of the first of these provinces is conducted by civil officers, on the same plan as in China; but the other provs. are under a government more strictly military than any other portion of the Chinese empire. The governors and magistrates are all military men; and the law makes all males, above 16 years of age, liable to serve under the standards to which they belong by birth, of which there are 8, each being distinguished by its peculiar flag. Kirinoolu is the metropolis of the country, and the residence of the supreme governor. Ningoota, on the Hooke, a tributary of the Songari, is also held in high esteem, in consequence of its having been the residence in former times of the reigning family of China. With respect to trade, however, both are inferior to Fung-hwang-ching, on the borders of Corea. The sea-ports frequented by the Chinese junks are Kin-tchou, at the N. end of the gulph of Leautung, and Kaichou, on the same gulph. E. of that last mentioned. The other cities of Manchooiria, except Moukden, the old cap., and still denominated "the affluent metropolis," have no claim to rank higher than villages, though most of them are surrounded by walls, and garrisoned by small bodies of soldiery.

The general history of the Manchoes, or Eastern Tartars, with an account of their physical conformation, has already been given at some length in the article ASIA, in this work (i. 192-194.), to which the reader is referred for further particulars. (See, also, MONGOLIA, *Ritter's Asien*, i. 85-153., ii. 210-320.; *Klaproth's Magasin Asiaticque*, and *Asia Polyglotta, Appendix; Chinese Repository*, vol. i. p. 113-118.; and also vols. v. and vi.)

MANDARIEE, a town and sea-port of Hindostan, being the largest, populous town, and principal emporium of Cutch, on the S. coast of which it stands, 35 m. S.S.W. of Bombay; lat. 22° 50' N., long. 69° 31' E. Pop. probably 50,000; of whom, upwards of 15,000 are Bhattias, 10,000 Banyans, 5,000 Brahmins, and the rest Lohannas, Mohammedans, and Hindoos of low caste. "The town is within gun-shot of the beach, and is surrounded with fortifications in the Asiatic style. Its environs are laid out in gardens well stocked with cocoa-nut and other trees. The bed of a river nearly dry, except in the rains, covers the E. face, and joins the sea, forming the only harbour which Mandavee has. Small boats, laden, can cross the bar at high tides; larger vessels unlade in the roadstead. A brisk trade is kept up with Arabia, Bomlay, and the Malabar coast, in which upwards of 800 boats, of from 40 to 500 canties tonnage, are employed. The exports are chiefly cotton, mussoo of silk and cotton thread, piece goods of a coarse kind, alum, and glue. The imports are, bullion from Mocha; ivory, rhinoceros' horns, and hides, from Powahil; dates, cocoa-nuts, grain, and timber, from Malabar and Dammam. There is a considerable inland trade, by means of charons and other carriers with Marwar and Malwah." (*Bombay Transactions*, ii. 217.; *Geog. Journal; Hamilton's E. I. Gaz.*)

MANDURIA, a town of the Neapolitan dom., prov. T 2

Otranto, cap. cant., in an arid plain, 22 m. E.S.E. Taranto. Pop. about 5,000. It is a straggling but well built town, with wide unpaved streets, many handsome churches, several convents, an orphan asylum, and a large palace, formerly belonging to the Francavilla family. The town during the middle ages, and until 1750, was called Casalmuro; but at the latter epoch it re-assumed, by royal privileges, the name of the ancient city, on the site of a part of which it is built. When Swinburne visited it, it was noted for nothing except the taste of its inhabitants for dog flesh, the skins of the slaughtered dogs being, at the same time, tanned into an imitation of Turkey leather for the supply of the neighbourhood. It had no other trade or manufacture. The remains of Manfredia, destroyed by Fabius Maximus in the second Punic war, consist of its walls, standing several feet above ground, and double, except on the S. side, where the fortifications appear to have been left incomplete. The outer wall, and its ditch, measure 8 yards in breadth; behind this bulwark is a broad space, and then an inner wall, which together measure 14 yards. According to Craven, the walls are no where more than 6 ft. in height, having probably been lowered to furnish materials for the construction of the modern town. In the vicinity is a well, mentioned by Pliny, as constantly preserving the same level, whatever quantity of water be added to or taken from it; *lucus ad mirificas plenas, neque exhaustis aqua minuitur, neque minus augetur.* (Hist. Nat. lib. ii.) This singular well still exists, and was visited by Swinburne and Craven. (Craven's Tour, &c., pp. 165—169; and Swinburne's Trav. i. 223, 224.)

MANFREDONIA, a sea-port town of the kingdom of Naples, prov. Capitanata, on a bay of the Adriatic, about 19 m. S.W. the promontory (Testa di) of Gargano, and 20 m. N.E. Foggia; lat.  $41^{\circ} 36' 53''$ , long.  $15^{\circ} 35' 40''$ . Pop. 6,000. "A la point of symmetry, it may vie with any town in Europe, having been constructed on a regular plan, which never underwent any alteration; and which, notwithstanding the unfinished state of some of the edifices, and the dilapidated bases of others, gives it an air of grandeur and uniformity very remarkable. It is walled towards both land and sea: from the last a narrow ledge of rocks, almost always under water, divides its bulwarks. One long and wide street runs throughout the city, from one gate to the other; for there are but two gates on the land-side, though two others open to the port, which is protected from the effects of the N. wind by a small mole, and commanded by a strong castle, defended by a ditch and drawbridge. The walls are fortified with large round bastions. The harbour is reckoned safe; but its want of depth renders it fit for small vessels only." (Craven's Tour, 68, 69.) Four streets run parallel with the principal thoroughfare, and are intersected at right angles by smaller ones. Though narrow, the streets are well kept; and the inhab. are both cleanly and industrious, in a degree not at all usual in S. Italy.

Vegetables and fish are good, plentiful, and cheap at Manfredonia, but water and wine are indifferent, as are oranges, which form an important article of commerce throughout Apulia. It exports considerable quantities of salt, obtained from the salt lagoons which border the coast of the bay to the S. of the town. It has also a considerable trade in corn, quantities of which are shipped from its port.

About a mile S.W. of the town stood the ancient Sipontum, once a considerable city of *Magna Græcia*, and traditionally said to have been founded or colonised by Diomed. Its site is now principally occupied by a low marsh, abounding with wild fowl, and productive of the malaria which infects Manfredonia. The only remains of the ancient city are its cathedral, and two columns of cipolino marble, both in a dilapidated condition. The former is a small Gothic edifice, with a handsome portico, but little adorned within. It is still the seat of an archiepiscopal see, founded in 1061. Sipontum, which was colonised by the Romans A.C. c. 58, had fallen into such irreparable decay in the 13th century, that Manfred, king of the Two Sicilies, having founded, in 1266, the town which bears his name, but which he called *Nova Sipontum*, removed thither the few inhab. of Sipontum, bestowing on them many valuable privileges and exemptions. But, though it has always enjoyed some commerce, Manfredonia never attained to the prosperity or celebrity of its ancient predecessor, and has long been stationary. (Swinburne's Travels in the Two Sicilies, i. 149—151; Craven's Tour in the S. Provs. of Naples, 67, 70; Craven's Ancient Italy.)

MANGALORE, or COREAL BUNDER, a sea-port town of Hindoostan, prov. Canara, of which it is the cap., on a sandy promontory between a salt lake and the Indian Ocean, 47 m. S.S.E. Bombay; lat.  $12^{\circ} 53' N.$ , long.  $74^{\circ} 57' E.$  Early in the present century it had 30,000 inhab. The town is well built, and has a fort, now dismantled, which opposed a gallant and successful resistance to Tippon, in 1783. The port does not admit vessels drawing more than 10 ft. water, except at

spring tides; but there is good anchorage in the roadstead, in from 5 to 7 fathoms. The exports are chiefly rice, to Muscat, Goa, Bombay, and Malabar; betel nut, black pepper, sandal wood, cassia, and turmeric. Raw silk and sugar are imported from China and Bengal, and oil and ghee from Surat. Mangalore was at an early period much resorted to by Arabian traders; and most of its present inhab. are of Arabian descent. The vessels employed in its trade belong chiefly to other ports. Salt is made at Mangalore, but it is of bad quality. (Hamilton's E. I. Gaz.; Port. Report.)

MANILLA (Sp. *Manila*), a fortified sea-port city of the Philippine Islands, and the cap. of the Spanish settlements in the East, on the E. side of the Bay of Manilla, island of Luzon, and on the river Passig, about  $\frac{1}{2}$  m. from its mouth; lat.  $14^{\circ} 36' 8'' N.$ , long.  $120^{\circ} 53' 30'' E.$  The pop. of the city and its suburbs was said to amount, in 1818, to from 70,000 to 80,000; and is at present variously estimated at from 100,000 to 150,000, including, besides Tagalogs, or natives, from 4,000 to 5,000 Spaniards and other Europeans, with Chinese, Neges, the descendants of the foregoing races, and foreigners from all parts of the world. The bay and city of Manilla have a very picturesque and imposing aspect from the sea. The former is surrounded by mountains covered with verdure, which, on the E., decline gradually towards the shore. At their feet, on this side, is a small plain, on which the city stands; its buildings consisting almost entirely of the volcanic tufa, of which the plain and its vicinity are geologically constituted. Manilla comprises the city-proper and ten suburbs. The former is on the left or S. bank of the Passig, across which it communicates, by a handsome stone bridge of 10 arches, with its important suburb of Bidondo, and those of Tondo, Santa Cruz, &c. This bridge, which is about 149 Castilian *varas* (or yards) in length, by 8 in breadth, was founded in 1630; but it has been rebuilt since 1814, when it was for the most part destroyed by an earthquake\*. The city-proper, little more than 2 m. in circ., is surrounded with strong walls, and a broad ditch, and has not more than 10,000 or 12,000 inhab. At the mouth of the river is a small battery, and the town is further protected by the citadel of Santiago, near its N.W. extremity; but Manilla could not make any effectual resistance to a European force. The city, which is entered by six gates, is regularly laid out; and, according to Meyn, by whom it was visited, in 1831, it is superior in point of appearance to either Lima or Santiago. (*Reise um die Erde*, ii. 207.) The streets have carriage-ways, composed of a mixture of loam and quartz, and are provided with footpaths, and lighted at night. The houses in the city are solidly constructed, though, on account of earthquakes, they are seldom more than one story above the ground-floor. The houses in the suburbs, however, are not so substantial. In Bidondo, for example, they are almost wholly composed of bamboo, and are raised from the ground, to the height of 8 or 10 ft. on thick poles, as is customary among African nations. Most of the houses are furnished with balconies and verandahs; the place of glass in the windows is supplied by thin semi-transparent pieces of shell, which, though more opaque, repel heat better. Bidondo is the most interesting portion of Manilla, and that in which its trade mostly centres. It is principally inhabited by Chinese and Tagalogs, and looks very like a Chinese town.

The public edifices are mostly within the walled city. The new *aduan*, or custom-house, is a large fine building, constructed at a great expense; but, like the Dublin custom-house, its size is out of all proportion to the business to be transacted in it. The residence of the Captain-General, and the principal government offices, are also in a large edifice, occupying one of the sides of the *Plaza Mayor*, or principal square. This square measures about 100 yds. by 50, and has, in its centre, a bronze statue of Charles IV. on a marble pedestal, presented to the city by Ferdinand VII. in 1824. There are, in Manilla, a vast number of churches and ecclesiastical establishments; and the number of clergymen is said to exceed that of the garrison, which is estimated at about 7,000 men! We need not, therefore, be surprised to learn that religious observances are here scrupulously complied with, while real piety and sound morality are at the lowest ebb. The city was erected into an archbishopric in 1568; and the cathedral and archbishop's palace are among its most conspicuous structures. The Augustine, Franciscan, Dominican, and Jesuit convents, the arsenal and cannon foundry in the citadel, the university (founded in 1645), the missionary college, the various schools for natives and Europeans, the hospitals, orphan asylums, and other charities, and the royal cigar manufactory, in which 850 males and 2,000 females are said to be employed, include the other principal public buildings

\* Meyn, *Relat.* &c., ii. 210. The Dict. Géog. says that the bridge was destroyed in 1814, mais en grande partie renversé par le tremblement de terre de 1821.

and establishments. The promenades round the city are frequented in the evening by the more opulent classes, on horseback, or in their carriages. The neighbourhood is interspersed with orange, areca, tamarind, and mango groves; gardens; coffee, cocoa, and cotton plantations; rice grounds, &c.

The Passig is navigable for vessels of 600 tons in ballast, or for laden vessels of from 250 to 300 tons, as far as the bridge; and for large shallow boats, drawing from 2 to 3 ft. water, as far as the lake in which it rises, about 9 m. inland. There are 13 ft. water, at low ebb, in the channel through the bar at the entrance of the river; for the further deepening of which a steam dredging-boat has been employed since 1837. The rise and fall of the tide in the river is from 2 to 3 ft. A lighthouse, at the end of the pier, marks the entrance of the Passig on the left-hand side. Ships of all sizes anchor in Manilla roads, at from 1 to 2 m. off shore, except during July, Aug., and Sept., when the S.W. monsoon throws in a heavy sea, which extends quite to the entrance of the river. At this season,

therefore, small vessels load and unload in the river, and large vessels at Cavite, in an anchorage sheltered by a neck of land to the S.W., and about 6 or 7 m. by water from the mouth of the river; their cargoes being conveyed to and from Manilla, in secure decked boats, of from 50 to 70 tons burden.

Manilla is the only port in the Spanish Philippines with which Spanish vessels to or from Europe, or foreign vessels from any quarter, are allowed to trade. Spanish vessels trading to China, Singapore, &c. are, however, allowed to proceed to various outports, and there take on board their outward cargo. The principal articles of export are sugar, which is by far the most important; hemp, and stuffs made of hemp; rice, of which large quantities are sent to China, Indigo, sapao and other woods, tobacco, cigars, coffee, cotton, tortoise-shell, hides, ebony, &c. The tobacco of the Philippine Islands is excellent, and might be produced in any quantity; but its growth is comparatively limited by its being made a government monopoly. (See PHILIPPINE ISLANDS.)

The following is an Account of the Quantities and Values of the Principal Articles exported from Manilla in 1837.

Articles.	By Foreign Vessels.	By Spanish Vessels.	Total.	Price.	Gross Amount.

Subjoined is a statement of the import trade of Manilla in 1838, which we have procured direct from that city; but it is right to bear in mind that the official accounts from which it has been drawn up are so defective, that the amounts specified can only be considered as rough approximations; and are, no doubt, under the mark.

Account of the Quantities and Values of the principal Articles exported from Manilla in 1838.

Articles.	Quantities.	Value.
		Dollars.
Iron	piculs	21,874
Cottons, grey	yds.	4,613,775
Do. white	-	1,158,352
Grainbags	-	232,199
Stripes	-	595,170
Hankkerchiefs	doz.	67,594
Shirts	yds.	136,213
Woolenies and worsted	-	175,592
Muslins	-	551,015
Umbrellas	No.	22,308
Glass and earthenware	packs	776
Sundries	-	91,903
Total value in Sp. dollars	-	1,665,265

Of the above, goods to the value of 1,145,000 dollars were imported, in Spanish vessels, from China, Singapore, and elsewhere. About 130 ships entered the port of Manilla in 1838; of which, 46 were Spanish, 36 British, 28 American, and 11 Chinese.

The port charges on foreign vessels consist of a tonnage-duty of 2 reals, or a quarter-dollar, per register ton; and fees, varying from 15 to 20 dollars, according to the size of the vessel, for port-captain's and health officers' visits, passport, &c. The tariff is bottomed on a custom-house valuation, fixed every 5 years. Most foreign commodities, imported in foreign vessels, pay an import duty of 14 per cent. *ad valorem*, except wines and spirits, which mostly pay a duty of from 30 to 60 per cent., unless the produce of Spain. Cotton-twist of certain colours, cutlery, ready-made clothes, European fruits, confectionery, and vinegar, pay 40 per cent. if imported in Spanish vessels, and 50 per cent. if in any other. British and other foreign cotton and silk manu-

tures made in imitation of native cloth, Madras and Senegal cottons, &c., pay 15 per cent. if imported in Spanish, and 25 per cent. if in other ships. Machinery of all sorts for the promotion of industry, cotton-twist of certain colours, gold and silver, plants and seeds, are imported duty free; but tropical products, the same as those of the Philippines, gunpowder, swords, and other warlike stores, &c., are prohibited, unless landed in hand for re-exportation. Exports of nearly all descriptions, by Spanish vessels, pay only from 13 to 2 per cent. *ad valorem*, and by foreign vessels double this duty; but manufactured tobacco, rope from Manilla, hemp, and gold and silver, coined or uncoined, if exported to Spain, go duty free. The principal currency of Manilla consists of Spanish dollars, of 8 reals and 96 grains; but S. American dollars are also current. The weights in use are the Spanish lb., which is nearly 2 per cent. heavier than the English; the arroba = 27 1/2 lb. nearly; the quintal = 102 lbs.; and the picul of 5 arrobas, or 14 cwt. Eng. The covan is a measure for rice, &c., varying from 96 to 135 lbs. According to a recent list, there are in Manilla 47 Spanish merchants and 11 foreign firms. The Spanish merchants have a chamber of commerce and a joint-stock insurance society. The U. States, France, and Belgium have consuls, and each of the Canton marine insurance companies has an agent here. There are, however, neither fire nor life offices nor agencies; nor is any newspaper, price-current, or other periodical publication issued in Manilla.

Manilla existed as a native town prior to the Spanish invasion; it was taken by the Spaniards, and made the cap. of their E. dominions, in 1571. It has frequently suffered very much from earthquakes, especially in 1646 and 1762, and 1824. In 1762, it was taken by the English; butransomed by Spain for 1,000,000 sterling. (*Meyen, Reise um die Erde*, ii. 203-213.; *Hamilton's E. L. Gazetteer*; and *valuable Private Information*.)

MANNHEIM, or MANHEIM, a town of W. Germany, grand duchy of Baden, lower circ. of the Rhine (*Unter-Rhein*), of which it is the cap., on the Rhine, where the Rh. is joined by the Neckar, 32 m. N. Karlsruhe, and 37 m. S.S.E. Mayence; lat. 49° 29' 15" N., long. 8° 28' 7" E. Pop. in 1838, 20,600. It was once strongly

fortified, and has at different times suffered severely from sieges and bombardments; but towards the end of last century its defences were levelled by the French, and their site is now laid out in gardens and public walks. Mannheim is a regularly-constructed, handsome town; though it is, notwithstanding, monotonous and tiresome. It consists of 11 streets, crossed at right angles by 10 others, all perfectly straight, broad, well paved, and equidistant; and its houses being uniform, it is difficult for any one, not resident, to distinguish one part of the town from another. It has several handsome public squares, which, though the town is deficient in good water, have mostly fountains. The spacious *Paradeplatz* and the *Plancken*, or principal thoroughfare, both planted with trees, afford pleasant promenades. The principal public edifice is the palace, a huge structure of red sandstone, built by the elector palatine when he made Mannheim his cap., in 1720, but more remarkable for size than elegance. A part of it is inhabited by the dowager grand duchess Stephanie, the adopted daughter of Napoleon and Josephine; and in one wing are museums of antiquities and natural history, the picture-gallery, with some fine Dutch and Flemish paintings, collections of plaster casts and engravings, and a library, said to consist of 70,000 vols. (*Hess. Anzeiger v. Stein*); but the other wing, comprising the old theatre, was mostly laid in ruins during the bombardment of Mannheim in 1795, in which state it remains. The new theatre, a handsome fabric, is neatly fitted up, and is rich in scenic decorations; it is said to have one of the best theatrical companies and orchestras of Germany; and is celebrated as being the place at which Schiller's tragedy of the Robbers was originally produced. Opposite the theatre is the house in which Kotzebue was assassinated. Mannheim has about an equal number of Lutheran and Rom. Cath. churches, of which that formerly belonging to the Jesuits is the finest. It has also a synagogue, an observatory, with a tower 115 ft. high, and a good collection of instruments, an arsenal and cannon foundry, an exchange, surrounded by arcades, several hospitals, a savings' bank, a lyceum, with schools of drawing, painting, sculpture, surgery, &c. The Rhine is bordered by a fine terrace in the spacious grounds belonging to the palace, whence an extensive view of the surrounding country is obtained; and, like the Neckar, is crossed by a bridge of boats. Mannheim has some public baths, and a club called "The Harmony," with a reading-room, &c. The cheapness of living has attracted a good many English residents.

This town is the seat of the supreme court of justice for the grand duchy, and of one of the four subordinate courts of appeal in Baden. It was formerly an important town of some importance; and, among other articles, trade, &c., of a compound called Mannheim-gold, were made in large quantities, but this branch of industry is nearly extinct. It still, however, produces carpets, linen and silk goods, tobacco, liquors, starch, glue, pasteboard, and sealing-wax; and has several coach-building establishments, tanneries, breweries, and bleaching-grounds. Its neighbourhood produces hops and garden stuff in large quantities; and, besides its traffic in cattle and agricultural products, it has a considerable transit trade by the Rhine and the Neckar. Previously to 1696, when it was fortified by the Elector Frederick IV., Mannheim was a mere village. It soon after received numerous Flemish and other immigrants. In 1777, it was ceded to Bavaria; but, since 1802, has been again united to Baden. (*Schreiber, Guide du Rhin*, 65, 66; *Berghaus*; *Allg. Lnder, &c.*, iv. 313; *Stein*; *Germany and the Germans*, &c.)

MANRESA (*Minorca*), a town of Spain, prov. Catalonia, 34 m. N.W. Barcelona. Pop. 13,000. It stands on a rocky height, in the midst of a country irrigated by the Llobregat and its tributaries; is walled and strongly fortified; has good streets, and comprises among its public buildings and establishments a collegiate church, with a chapter, 4 parish churches, 5 oratories, a well-endowed asylum for female orphans, infantry barracks, free school, and hospital. The inhab. rank among the most industrious in Catalonia, and are pretty equally divided between agriculture and manufacturing pursuits. Cotton and silk fabrics, cotton thread, fine broad-cloths, tapes and ribands, paper, brandy, and gunpowder, are made in considerable quantities for exportation to Cuba and the W. Indies. The neighbouring district, one of the best cultivated in Spain, produces corn, hemp, oil, and wine, which, with the goods above mentioned, find a ready sale at the weekly markets, and the two fairs held here Sept. 1. and Nov. 30.

MANSFIELD, a market-town and par. of England, co. Nottingham, in the N. div. of wap. Broxtow, 13 m. N.N.W. Nottingham, and 118 m. N. by W. London. Area of par., 9,070 acres. Pop., in 1831, 9,426. It is situated in the forest of Sherwood, near the small river Mann, from which it takes its name; and, though old-fashioned, and irregularly laid out, it contains many good modern houses, and is paved and lighted with gas. The chief buildings are the moot-hall, a structure well

adapted for county meetings; a theatre, and the church, a commodious Gothic edifice, containing some curious monuments, and fine specimens of painted glass. The Presbyterians, Wesleyan and Calvinist Methodists, and the Society of Friends, have their respective places of worship; to which, as well as the church, are attached well supported Sunday schools. A grammar-school was established here in 1567, by Queen Elizabeth, who endowed it with  $\frac{1}{2}$  part of the church-land of the par., and founded for it 2 scholarships, of 10l. each, at Jesus College, Cambridge; but the management appears to have been unsatisfactory, and it had, in 1833, only 27 scholars, including the master's boarders. (*Char. Comm.*, 25th Rep.) There are two other charity-schools; one of which was founded in 1723, for teaching and clothing 20 boys and 20 girls, and for paying apprentice fees with the former. Besides the above, there are several other charities and money-bequests. The inhabs. are chiefly engaged in the hosiery and lace trade, and in cotton spinning; it had, in 1839, 5 cotton-mills, which employed above 400 hands. There are some large iron foundries, for light castings; and the town has also a considerable trade in corn and malt, as well as in the valuable building-stone, quarried in its vicinity. A railway connects it with the Puxton canal; and, from its proximity to the N. Midland railway, it seems probable that it will, at no distant period, be united with that line. Petty sessions of the huns are held here; and it is the election-town for the N. division of the co. Markets on Thursday; large cattle fairs, 5th April, 10th July, and the 2d Thursday in Oct.

About 11 m. from Mansfield is the village and township of Mansfield-Woodhouse (pop., in 1831, 1,859), near which are some curious and pretty perfect remains of 2 Roman villas. Within a few miles are Worksop Manor, formerly belonging to the Duke of Norfolk, but now the property of the Duke of Newcastle, who has decided on pulling it down; Clumber, the seat of the latter; Thoresby, of Lord Newark; and Welbeck, of the Duke of Portland. Hence, in popular language, this part of the co. is called the dukery.

MANS (LE) (an. *Satinianum* and *Cynomania*), a town of France, dep. Sarthe, of which it is the cap., on the Sarthe, here crossed by three bridges, 50 m. N.E. by N. Angers, and 120 m. S.W. Paris. Pop. in 1836, ex. com., 19,103. It stands partly on the declivity of a hill, and partly beside the river. The latter portion is very ill-built, and has narrow crooked streets, impassable for carriages; but the upper town, though irregular, is open, and tolerably well built, its houses being of stone, roofed with slate. A handsome new quarter has been laid out, having a large square in its centre; and there are two good public promenades, one along the bank of the Sarthe. The Romans surrounded the ancient city with walls, a portion of which, on the S.N.E. side, remains nearly perfect; but the modern town is of no strength. Le Mans has several remarkable ecclesiastical structures. Its cathedral, begun in the 9th, but not finished till the 16th century, is a fine Gothic edifice, 416 ft. in length, with a large square tower, 212 ft. in height, the supports of which in the interior are ornamented with numerous statues. The choir is inferior in elegance only to that of Beauvais; and the stained glass window in the S. arm of the cross is much admired for its richness. The church of St. Julian is an interesting edifice of the 11th century. Another church, built in the 13th century, presents a combination of the Gothic and antique style. The new prefecture, the town-hall, and the theatre, are handsome buildings. Le Mans has two hospitals, a seminary, with a library of 15,000 vols., a public library, with 45,000 printed vols. and 500 MSS., in excellent preservation; several other libraries, museums of natural history, antiquities, and painting, the latter having several works by Guido, A. Durer, Teniers, Vandyck, &c.; a royal society of arts, a communal college, schools of drawing, midwifery, &c. It has manufactures of linen and coarse woollen stuffs, wax candles, &c.; and a considerable trade in these, and in rags, iron, salt, wine, brandy, and agricultural produce. Mans has suffered much from the ravages of war at different periods; and, in 1793, it was the scene of the last struggle between the Republican and Vendean forces. (*Itoge*, art. *Sarthe*; *Guide du Voyageur*, &c.)

MANTINEIA, a celebrated city of ancient Greece, in Arcadia, the ruins of which, close to the wretched hamlet of *Palaioptoli*, in a marshy plain watered by the Ophis, and enclosed S.E. by the rugged heights of Parthenion and Aræmision, are about 7 m. N. Tripolizza, and 17 m. W. by S. Argos. The walls, probably built soon after the battle of Leuctra (n. c. 371), are similar to those of Messene, and enclose an oval space in which the city stood; they have square towers, and the whole exhibits an interesting specimen of Grecian fortification. A ditch, or fosse, round the walls is supplied by the Ophis; which, at certain seasons, would inundate the plain were it not absorbed by a chasm (*καράβαθρον*), through which its waters find a subterranean vent. Mantinea had eight

temples, besides a theatre, stadium, hippodrome, and several other monuments enumerated by Pausanias. (*Arcadia*, ch. 8-11.) Some imperfect remains of the theatre are still visible, but no other ancient building can be identified; and every thing, except the enclosing walls, is in a state of total dilapidation. (*Dodwell*, ii. 422.)

But Mantinea is wholly indebted for its long-continued celebrity to the great battle fought in its vicinity, anno 362 B. C., between the forces of Sparta and Thebes, and their allies; in which Epaminondas, the leader of the Thebans, and the most illustrious, perhaps, of all the warriors of Greece, fell in the moment of victory. Xenophon is very brief in his account of the battle; but it may be collected from his statement that, on the whole, the plan of the Theban general succeeded in all its parts. The charge of the Theban and Thessalian cavalry, which commenced the attack, was completely successful and prepared for the deeper impression made by the column of Theban and Arcadian infantry. But, in the critical moment, when the phalanx of the Lacedæmonians had been broken, and a decisive victory appeared to be secured, Epaminondas received a mortal wound; and, being carried to a rising ground, whence he might view the scene of combat, would not allow the weapon to be extracted till assured that the victory had been won, when he almost immediately expired. But his fall, and the consternation thence arising, paralysed the successful army. They kept the ground they had gained, but did little or nothing more. Hence it was that the result of this great contest disappointed the expectations of those who had supposed that it would be decisive of the fate of Greece. "The Gods," says Xenophon, "decided otherwise. Each party claimed the victory, and neither gained any advantage; territory, town, and dominion was acquired by neither; but inclination, trouble, and confusion, more than ever before prevailed throughout Greece." (*Xen. Hæc.* i. vii. c. 5. *ut finem*.) This, however, is the statement of a partisan of Sparta, and is not quite fair. The Theban confederacy was, on the whole, decidedly successful. They effectually broke the power and humbled the pride of Sparta; and, by re-establishing the independence of the Messenians, the old and inveterate enemies of the Lacedæmonians, they obtained a new guarantee against any dangerous increase of their power in future. (See *Milford's Greece*, sect. viii. cap. 28.)

Mantineia was taken and sacked by Antigonus during the wars of the Archæan league; and its name was changed, in honour of the conqueror, to Antigonia, which it retained till the time of Adrian, who restored its original appellation.

MANTUA (Ital. *Mantova*), a fortified town of Austrian Italy, prov. Lombardy, cap. deleg. Mantua, on both sides the Mincio, 21 m. S.S.W. Verona, and 37 m. E. by N. Cremona; lat. 45° 9' 10" N.; long. 109° 48' 10" E. Pop., in 1857, 26,865. Its situation is peculiar, being in fact nearly surrounded by lakes, partly natural, and partly formed by damming up the waters of the river. The mounds, or dams constructed for this purpose, are sometimes called bridges, from their being perforated with arches, to allow the superfluous water to escape; and by these the town is connected with the *Borgo di Forcella*, or strong citadel of Porto on the N.; and with the *Borgo di San Giorgio*. The latter, as well as the town itself, is surrounded by strong walls; to the S.E. is the outwork of Pradelpa, and to the S. the fortified island of Cereso, or T., from its alleged resemblance to that letter. The fortifications, though not imposing in their appearance, are very strong, and kept in excellent order; and their strength and the position of the place render it one of the bulwarks of Italy. Mantua has some good streets and squares, but, on the whole, it is ill-built and dirty. Many of the inhab. live in cellars, its pop. has declined, and it has a decayed appearance. Its best part is the Piazza Virgilliana, a large square, surrounded with trees, and open to the lake. The climate is subject to great extremes, and in summer the exhalations from the surrounding swamps make it very unhealthy; though, of late years, the Austrian government has exerted itself, by draining part of the marshes, and opening a passage for the turbulent waters, to lessen its insalubrity. Several of the public edifices in Mantua were designed or finished by Giulio Romano. But the cathedral, planned by that great artist, is said by Woods to be, as a bad imitation of the church of Santa Maria Maggiore, at Rome; it has double ranges of side isles, and the columns stand very wide apart. The church of St. Andrea, begun in 1470, but not completed till 1782, was designed by Alberti, and is said by Woods to be very superior to the cathedral, and to be, indeed, one of the handsomest churches in Italy; it has fine statues of Faith and Hope, by Canova. The old ducal palace (*Palazzo Vecchio*) is a large imposing building; and, were it perfect, would be one of the finest palaces in Europe. It is beautifully floored with porcelain, and was formerly splendidly adorned with Flemish and Mantuan tapestry and rich

furniture; and, though repeatedly despoiled, it has still to boast of a room painted in fresco, by G. Romano. But the most celebrated fresco of Romano, "the Fall of the Giants," is in the palace of the T. At the extremity of one of the bridges is a handsome gateway, attributed to Romano, who also erected the open arcade on the bridge over the Mincio, in the heart of the city. Romano inhabited a house opposite the church of St. Barnabas, in which is his tomb. There are numerous convents, a Jews' synagogue, a civil hospital, two orphan asylums, a *monte-di-pietà*, a workhouse, an asylum for 50 poor Jews, an arsenal, cavalry barracks, a large prison, a new and a summer theatre, an imperial academy of arts and sciences, a lyceum, a gymnasium, a public library with 80,000 vols. and many MSS., attached to which are a museum and a fine gallery of sculpture, which has a celebrated bust of Virgil, a botanic garden, and various other scientific and literary institutions. Mantua is a bishop's see, the residence of an Austrian delegate, and the seat of the council, and civil, criminal, and commercial tribunals for the delegation. In the days of her prosperity, and when governed by her own dukes, Mantua is said to have had a pop. of 50,000, and extensive manufactures; and, though the latter he greatly fallen off, she still produces limited quantities of silk, woollen, and linen fabrics, with leather, parchment, paper, cordage, &c., and carriages and boats for the navigation of the Po. Mantua is very ancient, her foundation being probably antecedent to that of Rome. She derives her principal celebrity from her being the native country of Virgil, that great poet having been born in her immediate vicinity, anno 70 B. C.

Mantua Museum of Art, situated at Mantua

Mantua A. M. C. Sig. A. M. C. Sig. A. M. C. Sig.

Mantua A. M. C. Sig. A. M. C. Sig. A. M. C. Sig.

Mantua appears, from the contrast, in the first Eclogue, between her and Rome, not to have been a place of much importance in Virgil's time; and Martial applies to her the epithet of *parva*. (Ep. xiv. 193.) Her unhappy vicinity to Cremona made her territory be divided among the veterans of Augustus. (See art. CREMONA, in this work.)

After the conquest of N. Italy by Charlemagne, Mantua became a republic, and continued under that form of government till the 12th century, when the Gonzaga family acquired the supreme direction of its affairs. They were subsequently raised to the title of dukes, and held possession of Mantua till 1707, when it was taken by the Austrians. Under the French, it was the cap. of the dep. of the Mincio. (*Forsyth; Euclase; Woods; Oesterr. Nat. Enzycl.*, &c.)

MANZANARES, a town of Spain, prov. La Mancha, 24 m. E. by N. Ciudad Real, and 100 m. S. Madrid. Pop. 9,160. It stands in the loftiest and blindest part of the prov., on the high road between Madrid and Seville; being, according to Inglis, "a place of considerable size, and proportionate poverty." A par. church of Gothic architecture, a castle, hospital, and cavalry barracks are the only public buildings; the private houses are better built than in most towns of Spain. The inhab. are chiefly employed in the production of saffron, for which the neighbourhood is celebrated, and of the Val-de-Penas wine, highly esteemed all over Castile; the only other branches of industry being the manufacture of coarse woollens and linens for home supply. Not far from Manzanares are the ruined walls and tower of the ancient *Mares*; a city described, in Antiquity's *Itinerary*, as being on the road from *Laminium* (Alhambra) to *Tolntum* (Toledo).

MANZANARES, a small river of Spain, tributary to the Tagus, and flowing by MADRID, which see.

MARACAYBO, MARACAIBO, or NUEVA ZAMORA, a fortified city of Venezuela, cap. dep. Zulia, and prov. Maracaybo; on the W. shore of the strait connecting the lake of Maracaybo with the sea, 175 m. E.S.E. Santa Marta, and 320 m. W. by N. La Guayra. Lat. 10° 39' N., long. 71° 45' W. In 1841, its population, including a number of Spanish refugees from St. Domingo, was estimated at 21,000; and it may still, perhaps, amount to 20,000. It stands on an arid and sandy soil, partly on the shore of a small inlet of the strait, and partly on a tongue of land which projects into it. Several of its houses are built of a compound of lime and sand, without stone, but they are nearly all thatched with reeds, and, as the greater number consist wholly of reeds and straw, the town has a mean appearance, and is very subject to fires. A handsome par. church, a chapel, a Franciscan convent, and an hospital, are the only public buildings of which modern travellers make mention. The harbour of Maracaybo, within the bar at the entrance of the straits, has deep water; and is defended by the 3 castles of San Carlos, Zapara, and Bajo Seco, situated on the islands of the same names, among the shoals forming the bar. The *Bajo Seco*, or dry shoal, is in advance of the other islands, and the best channel to the harbour, on the N.W. side, has 13 ft. water. The climate of Maracaybo is oppressively hot; during a part of the year water is scarce;

and in the summer, when violent thunder-storms and earthquakes occur, the city often suffers greatly from very heavy rains. This port has superior facilities for ship-building, and its shipwrights have produced some fine schooners. A brisk traffic is carried on with the interior by the numerous vessels which navigate the lake. The inhabs. are said to be good sailors, and they have generally a taste for a sea-faring life. Many, however, devote themselves to the care of cattle, large herds of which are reared in the vicinity. (*Geog. & Account of Colombia*, i. 217—225; *Mod. Trav.* xvii.; *Encyc. Amer.*; *Encyc. of Geog.*, American ed.)

MARACAYBO (LAKE or LAGOON OF), a large lake, or inlet of the sea, in the N. part of S. America, repub. Venezuela, dep. Zulia, prov. Maracaybo. It extends between lat. 9° 5' and 10° 30' N., and long. 71° and 72° 20' W., and is of an oval, or rather "decanter-like" shape; communicating, at its N. extremity, with the Gulph of Maracaybo, by a strait nearly 20 m. in length, and varying in breadth from 5 to 10 m. Length of the lake, N. to S., nearly 100 m.; greatest breadth, about 70 m.; circ. probably about 250 m. Inside it has water enough to float the largest vessels; and, being easily navigated, serves for the conveyance to Maracaybo of the produce of the interior intended for consumption in, or exportation from, that city. But a shifting bar, at the mouth of its strait, where it unites with the sea, in lat. 11° 2', having only 14 ft. water, renders it inaccessible to large ships. It receives several considerable rivers, so that its waters are perfectly fresh, sweet, and fit for drinking, except in the spring, when strong N. winds impel inwards a swell from the gulph, which renders them brackish. The lake is not very subject to violent tempests. It abounds with fish and waterfowl; but tortoises, elsewhere so common in Colombia, are not met with in it. Its banks are in many parts sterile, and only cultivated on the W. side; and they are, in general, so unhealthy, that the Indians prefer mounting their huts on iron-wood posts in the water, to fixing them on the shore. It was from the Indian villages or towns, built in this way, that the whole country is said to have derived from the Spaniards the name of Venezuela, or Little Venice. Four of these towns are still standing on the E. part of the lake, at unequal distances from each other, the iron-wood on which they are founded having become a mass of stone, from the petrifying quality of the water. (*Geog. Account of Colombia*, i. 216, 217.)

Towards the N.E. border of the lake is a remarkable mine of asphaltum (*piz montana*); "the bituminous vapours of which are so easily inflamed that, during the night, phosphoric fires are continually seen, which, in their effect, resemble lightning. It is remarked that they are more frequent in great heat than in cool weather. They go by the name of the 'Lantern of Maracaybo,' because they serve for light-house and compass to the Spaniards and Indians, who, without the assistance of either, navigate the lake." (*Depons, Trav.* i. 70; *Mod. Trav.* xxvii. 269—271; *Geog. Account of Colombia*; *Blunt's American Coast Pilot*.)

MARAGA (an. *Ganagara?*), a city of Persia, prov. Azerbajan, 50 m. S. by W. Falezere, and 305 m. W.N.W. Teheran. Pop. about 15,000. It is a well-built walled town, in a low valley, at the extremity of a fertile plain, opening to the lake Urmia, which lies 10 m. W. Maraga. The chief buildings are a large and handsome bazaar, spacious public baths, and the tomb of Holaki, one of the most able princes of the dynasty of Jenghishkhan. Maraga is also celebrated for its beautiful and highly productive gardens and plantations, watered by canals drawn from a small river, over which are two bridges, erected in the 11th century. The town has a large manufactory of glass; but the inhabs. are chiefly employed in the cultivation of the fertile country round the town.

On the top of a mountain rising behind Maraga are the remains of an observatory, built by Holaki, for the use of Nazer-a-Deen, one of the most famous Oriental astronomers; and at the foot of the hill are several cave-temples, similar in form, though not equal either in size or beauty, to those of Hindostan. (*Kinnier's Persia*, p. 156, &c.)

MARANHAM, or SAN LUIS, a city and sea-port of N. Brazil, cap. of the prov. Maranhão, on the W. coast of the Island of the same name, in the Bay of Marcos, 200 m. E. by S. Para. Lat. 2° 31' 30" S., long. 44° 16' W. The inhabs. are variously estimated at from 12,000 to 30,000, of which a large proportion are negroes. The city is built on unequal ground, extending inwards about 14 m. from the water's edge. It is laid out in a straggling manner, with numerous squares and broad streets, the latter being only partially paved. There are many neat and good-looking houses; the better sort consist of a ground floor, and a story above; the lower part being usually employed as a shop, and lodging for servants, and the upper as the apartments of the family. These houses have mostly balconies, and are handsomely fitted

up. In the poorer and unpaved streets the houses consist of only a ground floor, and having thatched roofs and unglazed windows, their appearance is extremely mean and shabby. Adjoining the shore is an open space, one side of which is nearly taken up with the governor's palace, town-hall, and prison, which occupy a long, uniform, and handsome stone building, of one story in height; another of its sides is occupied by the cathedral. This, which was formerly the Jesuit's church, is said to be the finest of any in the maritime cities of Brazil, except that of Para. The Jesuits' college is now the episcopal palace. There are a great number of other churches and convents, a treasury, two hospitals, various public schools, and a custom-house, which, though small, was till recently quite large enough for the business of the place. Latterly, however, its commercial importance has been much increased; and it is the principal port of the empire for the shipment of cotton and rice; the other articles of export consist principally of hides and horns, catelhone, isinglass, sarsaparilla, cocoa, &c. We subjoin an

Account of the Number and Tonnage of the Ships which cleared out from the port of Maranhão in 1837 and 1838, specifying the Countries to which they belonged, and the Value of the Cargoes:—

We have no authentic information as to the importation of slaves into Maranhão; but there can be no doubt it is very considerable, and may, perhaps, be estimated at above 3,000 a year.

The harbour of Maranhão is rather difficult of access. It is usual for vessels arriving on the coast to make the light-house on the Island of St. Anna, about 40 m. N.E. Maranhão. The harbour of the latter consists of a narrow creek, defended by some indifferent forts. It is so beset with shoals and islets, as to render a pilot almost necessary, but with such there is no real danger. It has about 18 ft. water at low ebb; but it is said to be filling up, and that the probability is that the port will, at no very distant period, be transferred to Alcantara, on the opposite side of the bay. The latter, indeed, is in all respects a preferable port, being more easily accessible, having deeper water, and greater facilities for getting to sea. The Island of Maranhão is fertile, and densely peopled; having a number of villages, which uniformly consist of four large timber huts, from 300 to 500 paces in length, and about 20 or 30 ft. in depth, each capable of accommodating from 200 to 300 inhabs. This city was founded by the French in the early part of the 17th century. (See BRAZIL, in this Dict.; *Mod. Trav.*, xxx. 278, 281; *Encyc. Americana*; *Blunt's American Pilot*, &c., p. 515.)

MARAZION, or MARKET-JEW, a decayed bor., sea-port, market-town, and township of England, St. Hilary par., co. Cornwall, E. div. of hund. Penwith, 42 m. S.S.W. Bodmin, and 252 m. W. by S. London. Pop. 1,383. It is situated on the shore of St. Mount's Bay, on the side of a hill, which shelters it from the cold N. winds. The par. church is 2 m. distant; but it has a chapel of ease, and places of worship for Wesleyan-Methodists and other dissenters. An endowed school is held in the guildhall; a national school and three Sunday schools furnish instruction to the children of the poor; and there are a few charities. Its principal trade consists in the importation of timber, coals, and iron, for the supply of the town and neighbouring mines. The market, held on Saturday, is well supplied, especially with ready-made shoes; and 2 large cattle fairs are held 3d. Thursday in Lent and Sept. 29.

Though a bor. by subscription, this town was chartered by Queen Elizabeth; the corporate officers being a mayor and 8 aldermen, with 12 cap. burgesses, whose privileges were not interfered with by the late Mm. Reform Act. It is supposed to have sent mems. to the H. of C. at a former period, but certainly not subsequently to 1658. Its name, Market-Jew, has been supposed to be derived from its having been, in the period of its prosperity, a great trading place for the Jews, but the presumption is unsupported by history; and it appears more rational to conclude that it is a corruption of its ancient name Marghasyon, or Marghaslewe.

**MARBELLA** (an. *Salduba*), a sea-port town of Spain, in Andalusia, prov. Malaga, 30 m. S.W. Malaga, and 38 m. N.E. Gibraltar. Pop., acc. to Mifano, 4,282. "It stands slightly elevated above the sea; and its turreted walls and narrow streets declare it to be thoroughly Moorish. The town is particularly clean, and respectably inhabited; the fishing portion of the pop. being located more conveniently for their occupation, in a large suburb on its E. side." A church, two hospitals, and an old Moorish castle, are its principal public buildings. The trade of Marbella is only trifling; its valuable mines of lead and iron, which formerly secured for it a certain degree of prosperity, have been for many years totally abandoned, its sugar-refinery and tan-yards have disappeared, and fishing now forms the chief occupation of the inhabs. "There is no harbour; but vessels find excellent holding-ground, in deep water, near the shore. The landing also is good, on a fine hard sand; and a small pier has lately been constructed. (*Scott's Ronda and Granada*, ii. 378.)

**MARBURG**, a town of Hesse Cassel, cap. circ. Upper Hesse, on the Lahn, a tributary of the Rhine, 50 m. S. W. Cassel, and 64 m. E. Coblenz. Lat. 50° 44' 12" N., long. 8° 46' 12" E. Pop., incl. the suburb of Weidenhausen, on the opposite bank of the Lahn, 7,700. It is built on the slope of a hill, crowned by a ruined castle; and has narrow and dirty streets, and indifferent houses. Its only building worth notice is the church of St. Elizabeth, an elegant edifice, and one of the earliest existing specimens of the pointed Gothic style, having been commenced in 1235, and finished within the succeeding 48 years. The town of St. Elizabeth, in this church, has been long resorted to by pilgrims, and was formerly adorned with numerous gems and articles of value, mostly carried off by the French in 1810. In the transept are several curious monuments of the Landgraves of Hesse. The university of Marburg, founded in 1527, has 40 professors, and a good library of 70,000 vols. In 1833, it was attended by 422 students, but, in 1840, the number of pupils had declined to 285. Marburg has also the Wilhelm's Institute, a school of surgery; and a philological seminary, teachers' seminary, botanic garden, school of veterinary medicine, Lutheran and Catholic orphan asylums, a workhouse, a free-school of industry, &c. The inhabs. derive their principal support from the university, and from the manufacture of linen fabrics, stockings, hats, tobacco, and tobacco-pipes, &c. It is the seat of the chief judicial and other state establishments for Upper Hesse. (*Berg-haus*; *Stein*.)

**MARBURG**, a town of the Austrian empire, being next to Grätz, the principal in the prov. of Styria, cap. circ. on the Drave, and on the road from Grätz to Laybach, 36 m. S.E. the former city. Pop., in 1837, 4,578. Mr. Turnbull says, it is "a good town, and surrounded by a beautiful country, richly planted with vines. The climate here is far more congenial to their growth than on the N. side of the hills, and excellent wine is produced." (*Trav.* i. 279.) Near it, the Archduke John has a vineyard and villa. Marburg has three suburbs, an old castle, a church, in which are several good pictures, an hospital, theatre, gymnasium, military school, swimming school, &c. It is the seat of the council for the circ., furnishes leather and rosoglio, and has some trade in corn, wine, and iron; but its inhabs. derive their chief subsistence from the active transit trade between Hungary and Croatia and Illyria. (*Turnbull's Austria*; *Berghaus*; *Oester. Nat. Encycl.*)

**MARCHE**, a market-town, township, and par. of England, belonging to Doddington par. Isle of Ely, hund. Wicheford, on the Old Nen, 13 m. N.W. Ply. and 74 m. N. London. Area of township, 20,140 a. Pop., in 1831, 5,117. Excepting the church, which is large and handsome, the town contains nothing worthy of remark; the streets being generally narrow, and the houses, for the most part, low and meanly built. Its situation on the Nen, which is navigable, makes it the centre of a considerable trade; corn, hemp, flax, cheese, &c., being shipped here; and coal, timber, and London goods imported. Markets on Friday; fairs, Monday before Whitsuntide, Whit-Monday, and 3d Tuesday in Oct., chiefly for horses, cattle, and cheese.

**MARENGO**, a village of N. Italy, Sardinian States, near the Bormida, in an extensive plain, 3½ m. E. by S. Alexandria. This village will be ever memorable for the great battle fought here, on the 14th of June, 1800, between the French under Napoleon, and the Austrians under Melas. Napoleon, believing that the Austrians had withdrawn from the neighbourhood of Marengo, had, on the day previously to the battle, despatched Dessaux with a strong corps to Rivolta. By this means, his army was reduced, when attacked by the Austrians, on the following morning, to little more than 20,000 men, whereas the Austrians had nearly 40,000 troops in the field. The contest was most obstinate and bloody; but, despite a desperate resistance, the Austrians carried the village of Marengo, broke the left wing of the French,

and compelled them to retreat. But, at this critical moment, when the fate of the day appeared all but decided, Dessaux, who had returned by a forced march, came upon the field. This gave the French new strength, and inspired them with new courage. The Austrians, exhausted by their previous efforts, were immediately attacked at all points, forced back, and completely defeated, with the loss of all their cannon and baggage, and of a vast number of men left dead on the field and taken prisoners. Dessaux, whose opportune arrival turned the fortune of the day, was killed, charging at the head of his division.

**MARGARITA**, an island off the N. coast of S. America, belonging to the repub. of Venezuela, and attached to the dep. Cumana. It lies in lat. 11° N., and long. 64° W., separated from the continent by a channel, 20 m. in width, through which all ships coming from Europe, or windward of Cumana, Barcelona, or La Guayra, must pass in going to those ports. Length of the island, E. to W., 37½ m.; breadth varying from 5 to 20 m. Pop. estimated at 15,000. Viewed at a short distance from the N. it appears like an island, there being a tract of low swampy land in its centre, and the two parts not more than from 10 to 12 ft. above the level of the sea; but other parts of the island rise to a considerable elevation; and Maranao, near its W. extremity, a mountain of micaceous schist, is upwards of 2,000 ft. in height. The coast-lands are arid and barren; but the interior is comparatively fertile, producing maize, bananas, and various fruits, with sugar, coffee, cocoa, and other W. Indian products, though not in sufficient quantities for the demands of the inhabs. A good deal of poultry, and other live stock, is reared, and exported to the continent; and Margarita has an active fishery, and some salt-works. It was formerly much celebrated for its pearl-fishery; but this has greatly declined, and the pearls now found are said to be of inferior size and quality. The pearl-fishery was principally conducted at the rocky island of Coche, between Margarita and the main land. The inhabs. have some manufactures of cotton stockings and hammocks, of very good quality. Assumption, the cap., and residence of the governor, in the centre of the island, is pretty well built. There are three sea-port towns or villages; one of which, Pamptar, on the S.E. coast, has a pretty good harbour, with anchorage in 7 or 8 fathoms water. (*Blund's American Coast Pilot*, p. 410.) This island, which is of little value in any other point of view, might, were it occupied by a European power, be of considerable service as a depot for the supply of the adjacent continent. It is better situated for such a purpose than Trinidad. It was discovered by Columbus, in 1498. (*Geog. Account of Colombia*; *Humboldt's Personal Narrative*, &c.)

**MARGATE**, a sea-port town and much-frequented watering-place of England, co. Kent, in the Isle of Thanet, lathe St. Augustine, 16 m. E. N.E. Canterbury, and 65 m. E. London. Area of par., 3,810 acres. Pop., in 1831, 10,339. The town is finely situated, partly along the shore, and partly on the declivities of two hills, one of which presents a bold cliff towards the sea. The older streets are narrow and irregular, lined with inferior-looking houses; but in the upper parts and outskirts of the town are several handsome streets and squares formed by houses which for size and regularity of construction would not disgrace the metropolis. The whole is well paved, lighted with gas, and plentifully supplied with good water. The town-hall and market-house is a plain but substantial building of recent erection, supported on cast-iron pillars, and fronted by a Tuscan portico. The assembly-rooms in Cecil Square have long ranked among the largest and most elegant in England, and a neat theatre stands on the E. side of Hawley Square, where also is a large public library. Numerous bathing-houses line one side of High Street, and near the Parade E. of the town, is a very complete establishment formed in the cliff, and furnishing hot and cold baths of a very superior description. There are two churches; one an old heavy-looking building, with a low square tower; the other at the opposite side of the town being a very handsome modern Gothic structure, with a light octagonal tower, built at an expense of 26,000*l.* The R. Catholics, Independents, Baptists, and Society of Friends have also their respective places of worship, to which are attached well-attended Sunday-schools. A national school furnishes instruction to about 250 boys and 180 girls, and there are 2 other large day-schools. Drapers' almshouses, founded in 1709, a dispensary, and lying-in charity, are the principal charitable institutions; and in the immediate vicinity, close to the beach, is a large sea-bathing infirmary, founded in 1792, and since so much enlarged as to furnish accommodation for about 120 patients. The harbour dries at low water. To obviate this defect a stone pier, projecting 900 ft. into the sea, was erected from the designs of the late John Rennie; still, however, the water is insufficient for the purpose, there not being more than from 4 to 5 ft. water at the pier head at low ebb. Since 1824, however, a wooden jetty, cou-

netted with the pier, has been constructed, which projects into deep water, and may be approached by steamers or other vessels at any time of the tide, except when it blows a gale from the N. or N.N.E. The pier is a favourite promenade for the town's folk and visitors.

Margate enjoys a considerable coasting trade, and has some commerce with Holland and Germany; but neither these nor its fishery are of any importance compared with the advantages that accrue to it from the thousands of visitors who annually resort thither from the metropolis. The town, indeed, like many others, owes its present importance to the invention of steam; for though prior to 1817 it was a respectable and well-frequented watering-place, the means of access to London were so difficult and tedious, that none but those who could afford a week or two of uninterrupted leisure were ever induced to visit it. But within the last fifteen years the water-communication with London has been so greatly facilitated, that Margate may now be considered as within five or six hours of the metropolis. Several handsome steamers ply regularly between London bridge and Margate; and for some years past the number of persons landed from these steamers at Margate is supposed to have averaged above 90,000 a year. The fares being extremely reasonable, Margate is frequented chiefly by the families of tradesmen and others belonging to the middle classes, for whose amusement there are numerous bazars, libraries, &c., with the Tivoli Gardens, in the suburbs, very similar to the well-known, but now extinct, Vauxhall of London. Great numbers of persons engaged in business during the week join their families here late on the Saturday, returning to London early on the Monday morning; and it is from the flying visitors that the steam-packet companies derive their chief revenues.

Margate is within the jurisdiction of Dover, by the lord-warden of which the constable of the town is appointed; and as a port, it is subordinate to Ramsgate. It is the chief place of a poor-law union, comprising all the parishes in the Isle of Thanet.

**MARIA-THERESIANOPEL**, or **THERESIEN-STADT** (Hungar. *Székesváros*), a royal free town of Hungary, co. Bacs, in the great plain between the Danube and Theiss, 25 m. S.W. Segedin, and 100 m. S.S.E. Pesth. Pop. said to be about 35,000, chiefly Hungarians and Servians. Its territory, or commune, comprising an area of 300 sq. m., is larger than that of any other town of the Austrian dominions. (*Berghaus*.) The "National Encyclopedia" says, it is well built, and has numerous handsome public edifices; including several churches, a gymnasium, large barracks, a town-hall, &c. It has manufactures of linen cloth, leather, and tobacco, and a large trade in horses, cattle, sheep, raw hides, and wool.

**MARIANNA**, an episcopal city of Brazil, prov. Minas Geraes, of which it is the cap., on the Carmo, a tributary of the Doce, 5 m. E.N.E. Villa Rica. Its pop., in 1822, was estimated at from 6,000 to 7,000. (*Mauve's Brazil*, 238.) It stands principally in a small plain, bounded by rocky hills, the small knolls, and projections of which are crowned by its churches. The city itself is nearly square, and consists principally of two well-paved streets, regularly laid out, and conducting to a kind of square. The houses are whitened, and have a neat appearance. The supply of water is ample, and is of material importance in the cultivation of several extensive gardens; but, being surrounded by lofty eminences, the air is close and hot, and the town unhealthy. There are several churches and a large cathedral. The Carmelite and Franciscan convents, the episcopal college, which has sundry privileges, the bishop's palace, surrounded with fine gardens, and the town-hall, are among the other chief public buildings. It has very little trade, and depends chiefly on the mines and farms in its vicinity. (*Mauve's Brazil*; *Diet. Gög.*)

**MARIAZELL**, or **MARIANZELL**, a village of the Austrian empire, prov. Styria, in a mountainous district, about 55 m. S.W. Vienna. Pop. about 1,000. It would be unworthy notice in a work of this kind, but for its celebrated shrine of the Virgin, which renders it the "Loretto" of the Austrian empire, and a principal place of Christian pilgrimage. The town, which stands at an elevation of about 2,200 ft. above the sea, is small and mean-looking; and consists principally of huts and ale-houses for the accommodation of the visitors, the influx of which only ceases when the roads are impassable by snow. The only building of note is the church, rebuilt, since 1827, on the site of one erected in 1363, by Louis I., king of Hungary, over the chapel, in which the image of the Virgin is placed. The church, as it now stands, is of Roman architecture, except the porch, which is Gothic. It is a spacious edifice, 286 English ft. by 99 inside, and is surmounted by a spire, 275 ft. in height. Some of the side altars and chapels are handsomely decorated; but its principal object of curiosity and devotion is the small stone chapel, erected by a margrave of Moravia, in 1202, instead of the wooden hut in which the

*Gnaden Statue*, 'Statue of Grace,' had stood from about 1150, when it was luckily brought thither by a Benedictine monk. This image, like that of Loretto, is ascribed to St. Luke; and, like it, also, is but an indifferent specimen of the apostle's skill in statuary. It is a rudely-carved wooden figure, only 18 in. in height, representing the Virgin, with the Saviour on her knee. Both are as splendid as brocade, gold, gems, and bad taste can make them; their faces are of a negro hue; the effect, perhaps, in part, of the smoke of the solitary lamp kept constantly burning in the dark and gloomy recess in which they are encoined. The altar and other decorations of the shrine are said to be of solid silver, and the chapel is surrounded by a costly fence of the same metal. A thousand acres of land were assigned for the support of the church; and its treasury was very rich previously to the reign of Joseph II., having received many valuable donations from preceding sovereigns, princes, and private individuals. But Joseph, though he succeeded to the dominions of his mother, inherited none of her superstition: unawed by the sanctity of the place, he did not hesitate to strip the shrine of the greater portion of its wealth; and profanely threw the silver angels that guarded the high altar, and even the figures of his father and mother, into the melting-pot. The present emperor and empress have, however, made a propitiatory visit to the cell; and have endeavoured, by their pious liberality, to atone, in some measure, for the sacrilegious depredations of their less scrupulous predecessor.

The ecclesiastical establishment of Mariazell consists of about 20 resident priests, deputed from the Abbey of St. Lambrecht, who here form a kind of subsidiary Benedictine college, under a pro-rector. During half the year all find abundant employment among the penitents, who arrive here from all parts of the empire. Shortly after the erection of the church, the popes granted the same indulgences to the shrine of Mariazell, as were attached to St. Peter's at Rome; and thenceforward it became crowded with pilgrims. Previously to the reign of Joseph, the pilgrims are stated to have amounted to about 100,000 annually; and it is alleged that, at the celebration of the 16th jubilee of the miraculous image, in 1757, no fewer than 350,000 individuals did homage to the sable Maria! We confess, however, that we do not attach implicit credit to this statement; but it is, at all events, certain that the number was very great. The *Austrian Encyclopedia* says that the shrine is, at present, annually visited by 100,000 pilgrims; and, according to Mr. Turnbull, the number is fully 80,000. (*Austria*, i. 196.) It is customary for the pilgrims from different places to set out together; and formerly, it was no unusual circumstance for a band of pilgrims from one province or city to have a contest for precedence with those from another; so that disturbances, which frequently ended in bloodshed, were perpetually recurring. The government has however put an end to these unseemly brawls, by ordering that the pilgrimages from different places should take place at different times. Accordingly, most of the towns of any importance in Upper and Lower Austria, Styria, Bohemia, and Moravia, and some in the W. parts of Hungary, have their stated days on which the devotees assemble, and form their processions of piety and pleasure after the manner described by Chaucer in his *Canterbury Tales*. In all, about 80 processions take place annually from different parts of the empire. Vienna furnishes 4 distinct parties, 3 in June or July, and one in August; the last, which is also the largest, generally consists of about 3,000 persons of both sexes, and all ages, travelling chiefly on foot, and performing the journey in 4 days. In their progress they are jumbled together, without any regularity, until they come within about a mile of the shrine. Here they halt; and some hours are generally occupied in marshalling the confused assemblage into regular devotional order. Banners are unfurled; sacred emblems exposed to view; the maidens and youths are placed in the van of the procession, after whom follow the elder pilgrims, male and female, in distinct parties; and thus they advance to the church, by slow and measured steps, stopping at certain appointed stations on the way, and chanting in their native tongue, whatever it may be, some one of the litanies, in general chorus. Arriving by thousands in a day, they fill to suffocation every inn and house of accommodation within the town; but the larger portion are, notwithstanding, obliged to bivouac in the fields around; where they spend the night in jollity, drinking and singing songs, which are frequently of a kind not especially suited for virgin ears. (*Turnbull*, i. 197-199; *Russell*.) It is needless to add, that by far the largest proportion of those who join these processions are but little influenced by religious motives. The enlightened portion of the community despise them as miserable mummeries; and the motley crowd principally consists of the ignorant, the idle, the frolicsome, and the profligate. They are, in fact, an outrage upon religion and morality.

The holy image has been but an indifferent protectress of the village of Marlanzell. Six times has it been destroyed by fire, and its pop. temporarily reduced to ruin. The last conflagration occurred in 1827; when the roof and towers of the church were destroyed, and, out of 111 houses, only 20 escaped. The inhabitants are generally poor. They depend principally on the supply of necessities, and of rosaries, tapers, relics, and such like articles, to the pilgrims.

The iron-foundries, 2 or 3 m. distant from Marlanzell, are the most important of the Austrian empire. Every species of casting is executed in them, from the largest cannon and steam-engines, down to trinkets, which are said to rival those of Berlin. Marlanzell has also some copper and sulphur works: a great deal of timber is sent from its neighbourhood to Vienna and the Black Sea. (*Oesterr. Nat. Encyc.*; *Turnbull's Austria*, i. 185, 199; *Germany and the Germans*, ii. 291—295; *Hirschmann's Silesia*, &c.; *Russell*, p. 348—351.)

MARIE-GALANTE, one of the French W. India Islands. (See GUADELOUPE.)

MARIENBURG, a town of the Prussian dom., prov. W. Prussia, cap. circ. Marienburg, on the Nogat, an arm of the Vistula, here crossed by a bridge of boats, 27 m. S.E. Dantzig. Pop. (1837) 5,708. This little town is chiefly interesting in having been the seat of the grand masters of the Teutonic Order for nearly two centuries. "To the N.E. of the town, and on the summit of a small hill, 50 ft. above the level of the Nogat, and an equal number of feet from the bank of the river, stand the ruins of the Teutonic Castle, so often mentioned in the history of chivalrous times. The whole mass is at once imposing and picturesque, bespeaking the grandeur of its former occupants, and the purposes to which it was destined." Most probably this castle had been commenced towards the end of the 12th, or the beginning of the 13th, century. In 1281 it was greatly enlarged, by the addition of that part which was afterwards known as the Old Castle; and, about the same time, the residence of the grand master was transferred to Marienburg from Venice. Successive grand masters built the middle and lower castle (see text, according to Zedlitz, chiefly between 1300 and 1360), and the church of Notre-Dame, in the immediate vicinity, which is still in existence, and forms a very prominent feature in the landscape of these ruins. In 1611, the Old Castle was burnt to the ground; but the rest of the building escaped; and, after undergoing many vicissitudes, was put in complete repair by the present king of Prussia, when crown prince. It comprises a chapel, in which are numerous monuments of the grand masters, cells of the knight-monks, with their halls, dormitories, refectory, subterranean caverns, chapter-house, &c., in tolerable preservation. The chapter-house, by far the most interesting part of the edifice, is a large square apartment, with 20 windows, displaying the arms of the successive grand masters in stained glass. (*Granville's Tour to Petersburg*, i. 341, 342.) An antiquated tower, called the *Buttermilchthurm*, and some singular water-mills in the neighbourhood, are among the other curiosities of the town. It has a Rom. Cath. and a Calvinist church, a teachers' seminary, a deaf and dumb school, and numerous other schools; a workhouse, hospital, &c. It is the seat of the council for the circ.; and has manufactures of woollen and cotton cloths, stockings, and hats; various breweries, distilleries, and tanneries, and some trade in corn and timber. Marienburg fell into the hands of the Poles by their conquest of the Teutonic knights, in 1457, and was ceded to Prussia at the treaty of Thorn, in 1666. (*Zedlitz, Der Preuss. Staat*; *Bergknecht*.)

MARIENWERDER (SLAV. *Kienzdin*), a town of the Prussian dom., prov. W. Prussia, cap. of the gov. and circ. of Marienwerder, on the Little Nogat, a tributary of the Vistula, 44 m. S.E. Dantzig, and 5½ m. N.E. Thorn. Pop., in 1837, 5,520. It stands on elevated ground, is well-built, and has 4 suburbs. Its cathedral, erected in the 13th century, has a steeple 170 ft. in height; and in its interior are the tombs of many church dignitaries and grand masters of the Teutonic order, and some curious mosaics. What remains of the old castle is now appropriated to the judicial courts for the circle and town, and a school of arts. Marienwerder is the seat of the head court of justice for the province of Prussia, and of the provincial council, and agricultural union for W. Prussia. It has a gymnasium, a royal school of agriculture, a school for the improvement of neglected children, an hospital for blind soldiers, to which is attached the *Louisien*, an institution for the blind widows of soldiers, a large printing establishment, &c. It has, however, few manufactures, and little trade, except in retail; the inhabs. being principally employed in the supply of necessities to the various public establishments. (*Zedlitz; Der Preussische Staat*, ii. 483, 484.)

MARIGLIANO, a town of the Neapolitan dom., prov. Napoletano, cap. cant., 12 m. N.E. Naples. Pop. estimated at 5,000. It has some ruins, which have been supposed to have formed part of an ancient palace of the Mariti.

MARINO (SAN), a town and republie of Italy, under the protection of the Pope; being about the smallest, as well as the most ancient, state in Europe. The territory of the republic, enclosed on all sides by the legation of Urbino, in the Papal States, consists of a craggy mountain, about 2,200 ft. high, and some adjacent hills, with 1 town and 4 villages; comprising an area of about 22 sq. m., and a pop. of 7,600. The town stands on the side of the mountain above mentioned, about 15 m. S.W. Rimini, and 26 m. N.N.W. Urbino. Lat. 43° 56' 21", long. 12° 27' 59". Pop., 5,500. It is accessible by only one road, and is irregularly built. It has a principal square, in which is the town-hall; 5 churches, in one of which are the tomb and statue of St. Marino, the founder of the town; 4 convents, and 3 castles. Its inhabs. are chiefly occupied in agriculture and cattle-breeding, or in the manufacture of silk. Most of the wealthy inhabs. of the republic reside in the village of Borgo, at the foot of the hill on which the town is situated.

The legislative powers of the government are vested in a senate, or council, of 60 members, elected for life; 20 from among the nobles, 20 from the citizens, and 20 from the rural pop.; and in a lesser council, or tribunal of appeal, composed of 12 senators. The executive powers belong to 2 *capitani regenti*, chosen, every 6 months, by the inhabs. at 1000 below 25 years of age; the *capitani* preside in the council of 60; and justice is administered by a *commissario*, who must not be a foreigner. Every family is obliged to furnish an individual capable of bearing arms to the military force of the republic, amounting, in all, to between 800 and 900 men; but only about 40 men are ordinarily kept on duty. The state supports an hospital, and 4 superior and 2 elementary schools. Public revenue about 6,000 *scudi* or crowns a-year, which is sufficient to meet the expenditure. The town grew up round a hermitage formed here by an individual of the name of Marinos, or Marino, belonging to Dabunia, afterwards enrolled in the calendar of saints, in the 5th century; and the insignificance and unworthy character of its territory appear, by making it unworthy of attention, to have enabled it to preserve its independence during the disturbed periods of the dark and middle ages. It was occupied by Cesar Borgia, but for a short period only; and was taken, in 1739, by Cardinal Alberoni; but the pope disavowed the proceeding, and restored San Marino to its privileges. In 1796, Napoleon offered to increase the territory of the republic; but, this being wisely declined, he presented it with 4 pieces of cannon. (*Scrittoria, Stat. d'Italia*; *Addison's Tour in Italy*, &c.)

MARKET-BOSWORTH. See BOSWORTH (MARKET).

MARKET-DRAYTON, a market-town and par. of England, partly in N. Bradford hund., co. Salop, and partly in N. Pirehill hund. co. Stafford, on the Tern, a trib. of the Severn, 18 m. N.E. Shrewsbury, and 135 m. N.W. London. Area of par., 13,000 acres. Pop., in 1831, 4,619. The town, which stands on the W. side of the river, and in the co. Salop, having been recently much improved, is now clean and well built, with tolerably wide streets. The church, originally erected in the reign of Stephen, was all but rebuilt in 1787. There are also places of worship for R. Catholics, Wesleyan Methodists, and Independents, with attached Sunday-schools. The charitable institutions comprise a free school, founded in the reign of Queen Mary, a national school, and a set of almshouses and dispensary, with a few small money bequests. Drayton was formerly a place of more consequence than at present; its market having been among the largest in England, till the formation of the Liverpool and Birmingham Junction Canal gave superior advantages to Stone, in Staffordshire. There are two paper-mills and two horse-hair manufactories close to the town; but most of the inhabitants are engaged either in retail trade or farming pursuits.

Drayton is a bor. by prescription, governed by a mayor and two constables, chosen at a court-leet by the lord of the manor; and petty sessions are held here for the Drayton div. of Salop. Markets on Wednesdays, chiefly for corn; fairs, for horses and farming-stock, Wednesday before Palm-Sunday, Sept. 29, and Oct. 21.

About 1 m. from Drayton, on Bone-heath, a battle was fought between the partisans of the houses of York and Lancaster, on the 23d of Sept. 1459. Lord Audley, the Lancastrian general, was slain in the engagement; the spot where he fell being marked by a stone, close to the Newcastle road.

MARKET-HARBOROUGH. See HARBOROUGH (MARKET).

MARKET-JEW. See MARAZON.

MARKET-RASIN, a small market-town and par. of England, Lindsey div., co. Lincoln, wap. Walscroft, on the river of its own name, a trib. of the Ancholme, 134 m. N.E. Lincoln, and 130 m. N. London. Area of par., 1,220 acres. Pop. in 1831, 1,428. This town deserves notice, chiefly on account of its large cattle and sheep fairs, which are attended by persons from almost all parts of

the co. The church, an ancient structure, with an embattled tower, has peculiar windows, resembling those of the church at Louth. The living is a vicarage in the gift of the Lord Chancellor. The R. Catholics and Wesleyan Methodists have also their respective places of worship; and its only charities are a free school (now incorporated with the national school, and a set of almshouses. Markets on Tuesdays; and fairs on alternate Tuesdays, between Palm Sunday and Sept. 25. About 1½ m. W. Market Rasen is the village of Middle Rasen, remarkable for a small church presenting a most beautiful specimen of early Norman architecture.

MARLBOROUGH, a parl. and mun. bor., and market-town of England, co. Wilts, hund. Selkley, on the Kennet, 27 m. E. Bath, and 70 m. W. London. Area of parl. bor. (which includes with the old bor., the par. of Presbute), 4,389 acres. Pop., in 1831, 4,186. The town consists of one broad main street, crossed by others of inferior dimensions. The houses are irregularly built, and apparently of great antiquity, having high and curiously carved gables; a portion of the High Street also has a kind of colonnade projecting from the houses. The guildhall is supported on pillars, the lower part being open for the accommodation of the people frequenting the market; above are the council-chamber, sessions-hall, and assembly-rooms. There is also a handsome market-house, the upper part of which is used as a national school. The prison, which serves as a bridewell and house of correction, was built in 1787; but it is too small to admit either of separate confinement or proper classification, and there is no provision for hard labour. There is also a very large hotel, partly built with the materials of the old castle, which once stood at the S. end of High Street. The old church of St. Mary the Virgin, near the guildhall, is of early Norman architecture, with a low square tower: the living is a vicarage, in the gift of the Dean of Salisbury. The other church, which stands at the W. end of High Street, is of more modern construction, and distinguished by its light pinnacled tower: the living is a rectory, in the patronage of the Bishop of Salisbury. The Independents, Wesleyan and Calvinist Methodists have likewise their respective places of worship, with attached Sunday-schools. The national school furnishes gratuitous instruction to 100 boys and the same number of girls; besides which, there are two church Sunday-schools. It has also a free grammar-school, founded by Edward VI., and endowed with estates producing about 70*l.* a year; the instruction is almost exclusively classical; and the school has the privilege of sending an exhibitor, on the Somerset foundation, to Brasenose College, Oxford.

Marlborough has little trade, and derives its chief importance from being on the great road between London and Bath; but it will soon lose this advantage, as the Great Western Railway runs through a fine country considerably N. of the town. Malting and rope-making are extensively pursued. Large quantities of corn and cheese are sent to London and Bristol, their carriage being greatly facilitated by the Kennet and Avon Canal, which commences at Newbury, and joins the Avon near Bath, having an entire length of 57 m. "The town has likewise several excellent inns and shops, possesses a large market for the agricultural district, and may be considered in a prosperous state, and highly respectable." (*Mun. Bound. Rep. p. 2, Marlboro'.*)

The bor., which received its first charter from King John, in 1205, and a subsequent one, in 1577, from Elizabeth, is governed, under the Mun. Reform Act, by a mayor, 3 other aldermen, and 12 councillors; but it has no separate commission of the peace. Corp. revenue, in 1839, 322*l.* (ex. of 352*l.*, according from the sale of property). Marlborough has sent 2 mems. to the H. of C. since 24 Edw. I.; the right of election, down to the Reform Act, being vested in the mayor and burgesses; but it was, in fact, a mere nomination bor., belonging to the Marquis of Aylesbury. Registered electors, in 1839-40, 280. Markets on Saturday; large fairs, 10 July, 1 Aug., and 23 Nov. (*Mun. Corp. Rep.; Parl. B. Reps.*, part vi.; *Oxford Calendar*; *Priv. Inform.*)

MARLOW (GREAT), a parl. bor., market-town, and par. of England, co. Bucks, hund. Desborough, on the N. bank of the Thames (here crossed by a handsome suspension-bridge), 29 m. W. London. Area of parl. bor., which includes the several pars. of Great Marlow, Little Marlow, Medmenham, and Bishan (the last being in Berks), 14,910 acres. Pop., in 1831, 6,175. The town, formed by several streets, meeting in a large open market-place, is irregularly built; but is well paved and lighted, and contains many substantial houses, and a good town-hall. The par. church, opened in 1835, is a handsome structure, surmounted by a spire. The living is a vicarage, in the gift of the dean and chapter of Gloucester. There are also places of worship for Wesleyan-Methodists and Baptists, with attached Sunday-schools. A charity-school, for 24 boys and 12 girls, a national school, for children of both sexes, and a set of almshouses, are the principal benevolent foundations.

Great Marlow has little trade, except what results from its position, in the midst of a rich and productive country, inhabited by wealthy land-owners. On the Loddon, however, are several paper-mills; and, "on the whole, the town is slowly recovering from a state of great depression, consequent to the removal, some years ago, of the military college." (*Parl. Bound. Rep.*) The bor. has returned 2 mems. to the H. of C., with some interruptions, since 28 Edw. I.; the right of election being vested, down to the Reform Act, in householders, paying scot and lot. The Boundary Act extended the limits of the parl. bor., by including with the old bor. 3 out-parishes. Registered electors, in 1839-40, 387. Market, well attended, on Saturday; fairs, for cattle and farming produce, May 1-3 and Oct. 20. (*Parl. Papers*, &c.)

MARMANDE, a town of France, dép. Lot-et-Garonne, cap. arrond., on the Garonne, here crossed by a bridge of one arch, 30 m. N.W. Agen. Pop. (1836), ex. com., 4,880. It is regularly laid out, well built, and clean; has several good public edifices, and is nearly surrounded by an esplanade, planted with trees. It has a small port, suitable for steam-boats, which ascend the Garonne as high as Marmande. It is the seat of courts of original Jurisdiction and commerce; and has manufactures of woollen and linen fabrics, cordage and sail-cloth, and several brandy distilleries. (*Hugo*, art. *Lot-et-Garonne*, &c.)

MARNE, a dep. of France, reg. N.E., formerly included in the prov. of Champagne, chiefly between lat. 48° 30' and 49° 20' N., and long. 3° 30' and 5° E., baying N. Ardennes and Aisne, W. the latter dep. and Seine-et-Marne, S. Aube, and E. Haute Marne and Meuse. Length, E. to W., about 70 m.; greatest breadth, nearly as much. Area, 817,037 hectares. Pop. (1836) 345,215. The hills in this dep. do not rise to more than 1,300 ft. above the sea; its general slope is from S.E. to N.W., in which direction nearly all its rivers flow. It derives its name from the Marne, which divides it into 2 nearly equal parts. This river rises in the dep. of Haute-Marne, about 3 m. S. Langres; it flows, at first S.W., and afterwards generally W., through the dep. of Haute-Marne, Marne, Aisne, Seine-et-Marne, Seine-et-Oise, and Seine; and falls into the Seine at Charenton, about 1 m. S.E. Paris, after a course of about 300 m., for 215 of which it is navigable. It has some considerable affluents; and Vitry, Châlons, Château-Thierry, and Meaux are on its banks. About 2-3ds of this dep., including all its central portion, has an arid barren soil, composed principally of chalk, covered with a thin layer of vegetable mould. But on the borders of this sterile tract are the vineyards which produce the celebrated champagne wine; and surrounding it is a country with a deep and rich alluvial soil. In 1831, the cultivated land was estimated at 614,825 hectares, pastures at 38,454 ditto, vineyards 18,495 ditto, woods 78,501 ditto, and heaths, wastes, &c., 16,951 ditto. Considerable more corn is grown than is required for home-consumption. Its average annual amount has been estimated at 3,000,000 hectol.; but, according to the official tables, 4,570,000 hectol. were harvested in 1835, chiefly wheat, oats, and rye. The culture of the vine is, however, by far the most important branch of industry. The dep. is supposed to furnish annually from 650,000 to 700,000 hectol. Of this quantity, however, the finest growths, produced in the arronds. of Epernay and Rheims, make but a small portion. The red wines "*se distinguent par beaucoup de finesse, de délicatesse, et d'agrément; ils occupent un rang distingué parmi les meilleurs vins fins du royaume.*" (*Jullien*, 21.) But the white wines, which include the finest varieties of champagne, are by far the most celebrated. They are of three sorts, *still, mousseux, and grand mousseux*. The  *vrais gourmets* prefer the first, or still wines, of which *Sillery* (which see) is the best; but the greater number of amateurs prefer the *mousseux*, being that variety of the sparkling wine which merely creeps on the surface: the *grand mousseux*, or full frothing wines, are less esteemed. The wine of Ay, the best of the *mousseux* variety, is an exquisite liquor, worthy, according to the President De Thon, of being called *Vinum Dei*! The best of the red wines are those of Verzy, Verzenay, Mailly, Bouzy, St. Basle, Clos-Thierry, &c. The vineyards round Epernay are valued at from 4,000 to 10,000, and even 20,000 fr. the arpent; and about 5,400 *pieces* of wines of the finest growths are produced annually in its arrond. and that of Rheims, about a half of which is exported to foreign countries. Rheims, Epernay, and Avize are the chief seats of the wine trade. Epernay has extensive vaults, excavated in tufa, and admirably fitted for the preservation of wines. (See *EPERNAY*.)

Agriculture, according to Hugo, is in a tolerably advanced state. Near St. Mencheville orchards are numerous. More cattle are reared than in any of the adjacent dep.s, the number, in 1830, being about 120,000. In the same year the dep. was estimated to have 506,000 sheep, the breeds of which have been much improved by crossing with Merinos and English varieties. In 1835, of

179,318 propriétés subject to the *contribution foncière*, 98,523 were assessed at less than 5 fr., and 24,897 at from 5 to 10 fr.; 134 were assessed at 1,000 fr. and upwards. *Il y a de l'aïsance dans le pays, mais il n'y a pas de grandes fortunes. On n'y voit point le contraste affligeant de l'extrême opulence et de la misère; la mendicité n'y règne point. (Hugo.)* Marne has but one iron mine; but it furnishes excellent mill-stones, potter's clay, &c. Manufactures of various kinds of woollen fabrics, woollen yarn, &c. are established at Rheims; and hats, silk goods, paper, glass, earthenware, cordage, leather, candles, and soap are made in different places. Marne is divided into five arronds; 4 chief towns, Châlons-sur-Marne the cap., Epervy, Rheims, St. Menchould, and Vitry-le-François. It sends 4 mems. to the Ch. of Dep. Number of electors (1838-39), 2,308. Total public revenue (1831), 13,229,636 fr.; expenditure, 8,598,985 fr. (*Hugo, art. Marne; Official Tables; Julien, Topographie de Vignobles; Henderson on Win.*, p. 153. &c.)

MARNE (HAUTE), a dep. of France, reg. N.E., between lat. 47° 35' and 48° 40', and long. 4° 40' and 6° E., having N. the deps. of Marne and Meuse, E. Vosges and Haute Saône, S. the latter and Cote d'Or, and W. Cote d'Or and Aube. Length, N.N.W. to S.S.E., 80 m.; average breadth, about 30 m. Area, 625,013 hectares. Pop. (1836), 249,827. The *plateau* of Langres and the *Faillies* mountains traverse the S. and E. parts of this dep., covering the greater part of its surface with their ramifications. They, however, no where rise to any great elevation; Mont-aigu, the highest point in Haute Marne, being only 1,630 ft. above the sea. The chief rivers, are the Marne, which intersects the dep. lengthwise; its affluents the Ormain, Blaise, Meuse, and Aube, rise in this dep., and have, more or less, a N. course. Surface mostly stony or calcareous; there not being more than 11,000 hectares of rich soil. In 1834, however, the arable land was supposed to comprise 335,611 hectares; pasture land, 35,528 do.; vineyards, 13,136 do.; woods, 174,275 do.; and heaths, wastes, &c., 27,969 do. The farmers devote their attention to the growing of corn, the culture of the vine, and the rearing of live stock. The produce of corn exceeds the demand for home consumption: the annual supply is estimated at nearly 1,800,000 hectolitres, chiefly wheat and oats. The produce of wine amounts to between 400,000 and 500,000 hectols. a year; but the quality is very inferior to that of the wines of Marne. Cherries and walnuts are grown in considerable quantities. The pasture lands are excellent; and, in 1830, there were 84,000 head of cattle, and 221,000 sheep in the dep.; the annual produce of wool is estimated at 160,000 kilograms. In some cantons of the arrond. Vassy, a good many turkeys are reared. Bees are numerous, and wax and honey are valuable products. This is one of the best wooded deps. in France, and St. Dizier has a considerable trade in timber, sent in large quantities to Paris by the Marne. Iron is the only metal found in the dep., but the working of the iron mines, and the manufacture of their produce, hold a high rank among the occupations of the people. The dep. has upwards of 50 smelting furnaces (*hauts-fourneaux*), and 100 ordinary forges. Iron plates, rasps, files, and hardware of all kinds are manufactured; and the cutlery of Langres has long enjoyed a high reputation. Chaumont has manufactures of gloves and haberdashery. Linen and cotton thread, wax, candles, leather, brandy, and vinegar are the other chief articles made in the dep. In 1835, of 124,714 properties, subject to the *contribution foncière*, 72,624 were assessed at less than 5 fr., and 16,700 at from 5 to 10 fr. Haute Marne is divided into three arronds; 4 chief towns, Chaumont the cap., Langres, and Vassy. It sends 4 mems. to the Chamber of Deputies. Number of electors (1838-9), 1,064. Total public revenue (1831), 6,788,563 fr. (*Hugo, art. Haute Marne; Official Tables, &c.*)

MAROS-VASÁRHELY, or SZEKELY-VARSÁRHELY (Germ. *Neumarkt*, Wallach. *Oschorj*), a royal free town of Transylvania, the cap. of the Szekler-land, and of the *szék*, or presidency, of Maros; on the Maros, 53 m. N.N.E. Hermannstadt. Pop. 7,000. "Although there is nothing very imposing in the wide streets and small houses, of which Maros-Vásárhely is mostly composed, it is rather an important place; and, in winter, many of the gentry in the neighbourhood take up their residence within it. Moreover, both Protestants and Catholics have colleges here; the Protestant has 800, and the Catholic 300, scholars; and these institutions give something of a literary air to its society. Maros-Vásárhely is also the seat of the highest legal tribunal in Transylvania, the Royal Table; and it is, consequently, the great law-school of the country. Almost all the young nobles who desire to take any part in public business, as well as all the lawyers, after having finished their regular course of study, think it necessary, under the name of *foratlen*, to pass a year or two here in reading law, and attending the court.

"The great pride of the town is the fine library of

the Teleki, founded by the Chancellor Teleki, and left to his family, on the condition of its being always open to the public. It contains about 80,000 vols., which are placed in a very handsome building, and kept in excellent order. It is most rich in choice editions of the Latin and Greek classics." (*Paget's Hungary and Transylv.*, ii. 303, 394.) The town has a Rom. Cath. gymnasium and seminary, a reformed college, with a library and printing office, two convents, a flourishing *casino*, or literary club, and considerable trade in agricultural produce, artificial ivory tobacco, which is grown in large quantities to its vicinity. (*Paget; Berghaus; Oesterr.; Nat. Encyc.*)

MARSAALA (an. *Lilybæum*), a city and sea-port of Sicily, at its W. extremity, adjacent to Cape Boeo (the *Promontorium Lilybæum*), in the intend. of Trapani, 16 m. S.S.W. Trapani; lat. 37° 48' 10" N.; long. 22° 25' 10" E. Pop., in 1831, 23,388. It is of a square form, and is surrounded by an old wall, flanked at the angles with bastions, but destitute of a glacis. It might be easily rendered a strong military post; but, at present, it is without ordnance, quarters, or bomb-proof stores. The town, which is pretty well built, is bisected by a broad and regular street, called the *Cassaro*, on one side of which is the cathedral, a large edifice, ornamented with 16 fine marble columns of the Corinthian order. It has 16 churches, numerous convents, a *retiro*, or place of retirement under monastic regulation, 3 abbeys, a gymnasium, a seminary, an hospital, with 70 beds, a *monie-dipietà*, barracks for cavalry, an old castle, &c. Among its curiosities is a bell-tower, which vibrates perceptibly when the bell is rung.

Lilybæum was famous for its port; but, though secure, and well adapted for the use of the galleys of the ancients, it would not have accommodated the larger ships of modern times. Captain Smyth says, that where deepest, the ancient port could not have had more than 14 ft. water. The Romans, in their struggles with the Carthaginians, attempted over and over again to fill up the port, but uniformly without success. This, however, was effected, in 1570, by Don John of Austria, who, to prevent the Barbary corsairs from taking refuge here, filled up the port with rubbish. The modern is not, therefore, identical with the ancient harbour, but is about 1 m. S. from the town. It has a mole, constructed by Mr. Woodhouse, for the convenience of the shipment of his wine; large ships anchor S.W. from the city, about 2 m. off shore, in from 8 to 11 fathoms water. The entrance to the port is a good deal encumbered with rocks and reefs; the knowledge of which is as indispensable to the modern, as it was to the ancient, mariners. (*Smyth's Sicily*, p. 233.)

Marsala is indebted for its importance in modern times to its wine trade; which has grown up, within the last half century, through the skill and intelligence of the Messrs. Woodhouse, Englishmen, who began business here in 1780. The wine, however, did not begin to come into much repute till 1802, when it was supplied, by order of Lord Nelson, to the Mediterranean fleet. It is a dry wine, the best qualities closely resembling the lighter sorts of Madeira; but the extensive demand for it in this country is, no doubt, ascribable more to its cheapness than its quality. It is, however, in all respects, superior to Cape Madeira, with which it principally comes into competition. The success of the Messrs. Woodhouse has led others to embark in the business; and Mr. Ingham and Mr. George Wood have, also, very large establishments at Marsala. The entire produce of the district is estimated at about 30,000 pipes, of which from 18,000 to 20,000 are exported, partly to the U. States and the W. Indies, as well as to England. In 1823, the entries of Marsala for home consumption in the United Kingdom amounted to 79,686 galls.; whereas, in 1839, they amounted to 369,417 galls.; but, for some years past, the consumption has been pretty stationary.

Besides wine, Marsala exports corn, cattle, oil, salt, and soda; but in no great quantities. In 1839, 37 British and 9 American ships, of the aggregate burden of 6,548 tons, cleared out from Marsala. (*Margregor's Report on the Commercial Statistics of the Two Sicilies*, passing *Commercial Dict.; Official Accounts, &c.*)

Lilybæum, from its proximity to Carthage, and the excellence of its port, was, for a lengthened period, the capital of the Carthaginian possessions in Sicily. It was a place of great strength; being fortified by strong walls and a deep ditch, into which the sea appears to have flowed (*Polihymn*, lib. i. cap. 42.); indeed, a portion of the ancient ditches still exist in tolerable preservation. (*Hoare's Classical Tour*, ii. 73.) The size of the city may be inferred from the fact of its requiring a garrison of 10,000 men, exclusive of the citizens, for its defence. The successful resistance it opposed to Pyrrhus, by whom it was attacked with great fury, and its defence against the Romans, sufficiently evince its strength and importance. After having ineffectually attempted to carry it by assault, the Romans converted the siege into a blockade; and the city only surrendered at

the end of five years, when the defeat of Hannu made farther resistance unavailing. (*Ancient Universal History*, xvii. 531, &c., &c., 8vo.) Under the Romans it was the residence of a quaestor; and is called by Cicero, *ciuitas splendidissima*. (In Verren, v. cap. 5.) Very few remains now exist of its ancient grandeur; vases, coins, &c., are, however, occasionally dug up; and in the town-hall is a group of two lions destroying a bull, said to be worthy the best period of Grecian art.

MARSEILLES (Fr. *Marseille*, an. *Massilia*), a large commercial city and sea-port of France, dep. Bouches-du-Rhône, of which it is the cap., on the E. side of a bay of the Gulf of Lyons, 30 m. W.N.W. Toulon, about 170 m. S.S.E. Lyons, and 120 m. S.E. Paris; lat. 43° 17' 49" N., long. 5° 22' 13" E. Pop. of the city, ex. suburbs, in 1836, 120,555; and, inc. suburbs, 146,239; but this official statement is said to be under the mark, and it is alleged that, including strangers, the pop. is now (1849) at least 170,000. (*Conducteur dans Marseille*.)

"The situation of Marseilles," says Mr. MacLaren, "is one of the most beautiful I ever saw. It occupies the centre of a basin about 6 m. or 7 m. broad, bounded by lofty precipitous hills. The whole space from the city back to the hills, is adorned with villas and hamlets; for every merchant or respectable shopkeeper here has his *maison de campagne*. These buildings are showy, sometimes large and splendid. They are called *bastides*, and I learn that their number is not less than 5,000." (*Notes on France and Italy*, p. 39.) The country around is, however, extremely arid; and the wind called the *mistral* is blighting and noxious in the extreme. The city is somewhat of a horse-shoe shape, and built round its port. It is divided into two parts:—The first, or old town, occupying the site of the ancient Greek city, on rising ground, on the N. side the harbour, is confined, ill-built, with narrow dark streets, or rather lanes, not half ventilated, and inconceivably filthy. The second, or new town, constructed in the modern style, with regular streets, and handsome squares and houses, stands on the S. and E. sides of the port, being separated from the old town by a magnificent quay, which extends in a right line from the Porte d'Aix to the Porte de Rome, traversing the city in its entire length N. to S. The middle part of this street, called the *Cours*, is sheltered by trees; the houses on either side are good, it has some handsome fountains, and is one of the chief places of public resort; but the favourite public promenade is the *Rue Cannetiere*; a fine broad street, running at a right angle from the fore- quay to the inner extremity of the harbour, and completing the line of demarcation between the old and new town. Marseilles has been fortified at different periods; but its walls were finally destroyed in 1800; and their place is occupied by boulevards, planted with trees, beyond which the city is rapidly extending, particularly towards the E. and S. It still, no doubt, is defended by the fort of *Notre Dame de la Garde*, on a steep eminence to the S.; but it is more remarkable for the beauty of its situation than for its strength: the harbour (*see post*) is protected by a fort on either side its entrance by the *Clapier* and *de l'île* on the island of its name, and by some additional works on the islands of Ratoneau, Pomegue, &c., nearly opposite its mouth.

Marseilles has numerous public edifices, but none merit any detailed notice. The cathedral occupies the site of an ancient temple of Diana; it is extensive, but heavy-looking. Its interior is a mixture of various orders; and its ornaments, which are mostly of the 11th and 12th centuries, are in bad taste. In fact, none of the churches within the city have any considerable claims to notice. The church of St. Madeleine (formerly *des Chartrons*), in the suburbs, an edifice constructed in the 17th century, is far superior to any one else: it has a handsome facade, and 2 steeples (*campaniles*), remarkable for their light appearance. There are in all about 20 Rom. Cath. churches, several chapels, 2 Greek churches, a Protestant church, and a synagogue. The *Profecture* is the finest of the public buildings. The town-hall, on the N. quay, is a lofty edifice, composed of two separate piles of building, connected by a light and elegant arch on the first story. Its ground floor is appropriated to the exchange. There are numerous hospitals, and other charitable institutions. The *Hôtel Dieu*, one of the first established hospitals in France, was founded in 1188; it has usually from 500 to 600, and is capable of accommodating 750 patients. The *Hôpital de la Charité*, founded in 1640, an asylum for aged persons, and for orphans, foundlings, &c., has usually from 800 to 850 inmates. The *Lazarett*, one of the largest and most perfect establishments of the kind in Europe, is situated to the N. of the city, and is surrounded by a triple wall. Ships may clear from it while in quarantine. Marseilles has also a lying-in hospital, a *bureau de bienfaisance*, asylums for poor children, a *mont-de-piété*, and a savings' bank. One of the largest public edifices, formerly a Bernardine convent, accommodates the Royal College, which has between 300 and 400 students; the Royal Society of Science, Literature, and Art; the public library

of 50,000 printed vols., and 1,300 MSS., with cabinets of natural history, medals, and antiquities, &c. and a gallery of paintings, comprising works by Carracci, Salvator Rosa, Rubens, Vandyck, Jordæns, and other artists of the Italian and Flemish schools. The observatory, on the highest point of the old town, has apartments appropriated to schools of navigation, geometry, &c. The Grand Theatre, built after the plan of the Odéon in Paris, is spacious and handsome. It has 6 tiers of boxes; but is in general ill-attended. The *Théâtre Français*, a small building, open on Sundays for vaudevilles, and on other days for occasional concerts, is more frequented. The other chief public buildings and establishments are the hall of justice, the new prison, the custom-house, arsenal, barracks, mint, bishop's palace, various public halls, the fish market, &c. Marseilles has a botanic garden, and some excellent public baths. It is well supplied with water from fountains and public wells, but it is not introduced into the houses. At the extremity of the Rue d'Aix is an unfinished triumphal arch, of the Corinthian order, originally erected in honour of the Duc d'Angoulême, after his invasion of Spain in 1823; but it is now intended to commemorate the Revolution of 1830, one of the effects of which was to expel the Duc d'Angoulême from the kingdom! Marseilles has but few remains of antiquity. Except a fountain, with an inscription in Greek, an obelisk, and the remains of an aqueduct, none is worthy of mention. It is doubtful, indeed, whether Marseilles possessed any grand or remarkable edifices in antiquity; and if she did, the corroding influence of the sea air, which proves so detrimental to the modern buildings, has been a powerful agent in their destruction. But the Marseillais, for a lengthened period, took little interest in the preservation of the relics of past ages; and, says Hugo, "lorsque l'esprit de conversation entra dans les mœurs, il n'y avait plus rien à conserver."

Marseilles is the see of a bishop, suffragan under Aix; the seat of tribunals of primary jurisdiction and commerce; a chamber of commerce; the residence of a commissary-general and a treasury of marine; and the headquarters of the 8th military division of the kingdom. Consuls from all the principal states of Europe and America are resident in it. Besides the public institutions before noticed, it has a diocesan seminary, a royal society of medicine, societies of agriculture and *belles lettres*, a statistical society, an *athénæum*, and several commercial and other clubs. 3 newspapers (2 of them daily), and several literary journals are published in the city; the principal of the former are the *Semaphore de Marseille* and the *Gazette du Midi*.

The port, to which Marseilles is wholly indebted for her early and long-continued prosperity, is a fine basin, stretching from W. to E. about 1,000 yards, into the very centre of the city. It has from 16 to 18 ft. water at its entrance, and from 12 to 21 ft. within; so that it is extremely well fitted for moderate-sized merchantmen, of which it will accommodate from 1,000 to 1,200. The ships come close to the quays, by which it is surrounded on all sides, except at its entrance; which is defended on its N. side by the tower of St. John, a work of the 15th century, and on its S. side by Fort St. Nicholas, constructed by Louis XIV. The careening basin, on the right side of the harbour, occupies the site of the ancient necropolis.

Unluckily, this fine basin becomes, from its position, the common sewer, as it were, or receptacle for all the filth of the city; and, as it is not agitated by tides, which are here hardly perceptible, nor by storms, from which it is screened on all sides, nor swept by any current, the water is completely stagnant; and, unless the mud were removed by dredging-machines, it would in no very long time be entirely filled up. But in hot weather, the stench arising from this torpid reservoir, and from the detestably filthy streets of the old town, is absolutely insupportable, at least to those not habituated to it; and has doubtless been the cause of Marseilles having suffered so dreadfully on various occasions from the plague, and, more recently, from the cholera. Such a state of things is a disgrace to a civilized country. And we agree with Mr. MacLaren in thinking that, next to the enforcing of proper sanitary regulations in the old town, the best thing that could be done to improve the city would be to cut a canal from the *Anse de Juliette*, on the coast, to the harbour, which would at once create a current, and freshen and agitate the water in the latter. In its present state, Marseilles has been truly described as a "vast cloaca." We doubt, indeed, whether there be a single water-closet in the city.

There is excellent anchorage ground for men of war and other large ships, about 2 m. W.S.W., between the isles of Ratoneau and Pomegues, which have been connected by a mound. Ships from the Levant pass from quarantine at Pomegues; and on Ratoneau Island is a hospital for those whose health is dubious. A lighthouse, with a revolving light, 131 ft. in height, is erected on the *Ile de Planier*, about 10 m. from the city, and there is an-

other in Fort St. Jean. Ships having got within  $\frac{1}{2}$  or  $\frac{3}{4}$  m. of the Isle d'I, usually heave to for a pilot. The charge for pilotage is 4 sous per ton in, and 2 sous per do. out, for French vessels and vessels belonging to powers having reciprocity treaties with France. With the exception of the above pilotage charges, and the charges on vessels performing quarantine, there are no port charges on ships entering or clearing out from Marseilles.

The trade of Marseilles is very extensive, and is rapidly increasing. She is the grand emporium of the S. of France, and the centre of 9-10ths of her commerce with the countries bordering on the Mediterranean. The exports consist principally of silk stuffs, wines, brandies, and liqueurs; woollens and linens; madder, oil, soap, refined sugar, perfumery, stationery, verdigris, gloves, and all sorts of colonial products. Among the principal imports are sugar, coffee, and other colonial products; dye-stuffs; corn, from the Black Sea and the N. coast of Africa; cotton, from Egypt and America; coal, linen thread, and various descriptions of manufactured goods, from England; hides, wool, tallow, tinner, &c. &c. Marseilles engrosses almost the whole trade between France and Algiers. She is now also the principal station for the intercourse carried on by steamers with Malta, Alexandria, and Constantinople; and, besides the steamers employed by the government as packets, she had, in 1839, 12 steam packets belonging to private companies. Mr. Maclaren says that most of the private steamers have English-made engines, and English engineers; and that they burn English coal, sold here for about 30s. a ton.

The following details set the importance of the trade of Marseilles in a still more striking point of view:—

	Ships.	Tons.
In 1837, there entered the port—		
French ships from foreign ports	1,158	116,190
—considered from French ports	121	30,225
—considered from the Atlantic to the Mediterranean	401	57,987
—considered in the Mediterranean trade	5,185	171,508
—coal and other fisheries	61	11,512
Total of French ships	5,272	421,222
Foreign ships from foreign ports	1,692	251,285
Total entries of ships of all sorts	6,851	672,507

We subjoin an Account of the Ships arrived at Marseilles from the Levant, during the Four Years ending with 1837; specifying the Ships, and their Tonnage from each Country.

	1834.		1835.		1836.		1837.

• Total	250	56,160	268	42,009	229	43,979	322	61,541

In this account, the ships from Syria and Candia are included under Egypt. The total value of the imports into Marseilles may be estimated at about 200,000,000 fr., or 8,000,000*l.*; and that of the exports at about as much.

The customs revenue of Marseilles is greater than that of Havre, or any other French port; it amounted in 1836 to 29,808,316*fr.*, and in 1837 to 30,234,013*fr.*. A joint stock bank, established here in 1835, is said to have been eminently successful.

Though principally distinguished by its commerce, Marseilles has several important manufacturing establishments. Its soap-works, which are numerous and extensive, employ about 760 workpeople, and consume large quantities of olive oil; but, though soap be exported, by far the greater portion of that produced here is destined for home consumption. The artists of Marseilles prepare and fashion coral into a great variety of articles. Among its other manufactures are woollen stockings and caps *à la façon de Tunis*; hats, of which from 30,000 to 50,000 are, and from 10,000 to 15,000 coarse, are annually exported; Morocco and other leather (but the tanneries have fallen off), and sail-cloth. Marseilles has likewise refineries for sugar, sulphur, wax, and borax, with breweries, oil-works, glass-works, brick and tile works, &c., and furnishes large quantities of vinegar and *liqueurs*. Another branch of industry is the salting and curing of meat, and the pickling and preparing of capers, olives, and other fruits, and of anchovies and other fish. It has, also, a great variety of trades connected with the building and fitting out of ships, steamers, &c.; and is, in fact, a very prosperous and rapidly increasing town.

There are but few great capitalists in Marseilles.—

“Here, as in Paris,” says Mr. Maclaren, “it is the custom to retire altogether from business as soon as a trader has realized a competency. I was told that there are not a hundred men in Marseilles worth 20,000*fr.* each; but there are a great many worth half that sum. The people generally seem staid and well-to-do. I went into the Place Royal when it was filled with 400 or 500 of the middle classes, meeting for business. I thought them the tallest, stoutest men I had ever seen. The sailors, porters, and carters, are more tanned than at Paris; but the shopkeepers are not sensibly darker than in the capital. Black eyes, however, are more common; a change invariably observed as we approach the equator. The houses and mode of living resemble those of Paris; but in the new streets, houses with front-doors like our own are common; while in Paris they adhere to the old plan of vast tenements, with a grand gate and open court in the centre.”

Marseilles is very ancient, having, according to the best authorities, been founded by colonists from Thiva, a city of Ionia, about 600 years *b.c.*. The Massilians, as the inhab. were then called, speedily distinguished themselves by their skill as seamen, and the extent of their commerce; and were celebrated for the wisdom of their political institutions, and their civilisation. They became, at an early period, allies of Rome; but having espoused the party of Pompey, their city was besieged, and, after an obstinate resistance, taken by Cæsar. But though Marseilles lost her liberty, she preserved her commerce and superior civilisation under the Romans; and was highly distinguished as a school of *Belles Lettres* and philosophy. She is spoken of by Cicero in the highest terms of eulogy. (*Oratio pro L. Flacco*, cap. 26.) At a later period, Agricola was sent thither to be educated; and Tacitus calls her *sedes ac magistra studiorum*. (*Pl. Agricola*, cap. 4.) After the fall of the Roman empire, she underwent many vicissitudes. In the 10th century she was taken and sacked by the Saracens. She was afterwards governed by dukes and counts, and sometimes by her own magistrates, and more recently by the counts of Provence. She was finally united to the crown of France in 1482. During the middle ages she rivalled Venice and Genoa in her trade with the Levant. In 1720 she suffered dreadfully from the plague, which is said to have cost her about 10,000 persons of the inhab. She also suffered considerably from the revolutionary phrenzy and the anti-commercial policy of Napoleon; but, as already seen, she has risen superior to all these disasters, and is now more populous and flourishing than ever.

Marseilles has given birth to many very distinguished individuals, among whom may be specified Pytheas, one of the most illustrious navigators and astronomers of antiquity, who flourished in the 4th century *b.c.*; and Icturius Arbitrator, *Auctor pyrrhæicæ imposturæ*. Among its modern citizens have been Dumarsais, the grammarian, Maclaren, the celebrated preacher, Pissomond, the author of a treatise on the commerce of the Black Sea, and of several other works on the Levant, and Puget, celebrated as a sculptor, painter, and architect.

The famous revolutionary song and air, called the Marseillaise, did not originate in Marseilles, as might be inferred from the name: this was derived from the time having been played by a body of troops from Marseilles, on their entry into Paris, in 1791. (Besides the authorities already referred to, we have consulted *Hugo*, art. *Bonches du Rhone*; *Jubany*, *Essai sur le Commerce de Marseille*; *Dictionnaire du Commerce*; and *Private Information*.)

MARTABAN, a town of the Birman empire, cap. of the prov. Martaban, on the Than-Iswing (Salween) river, near its mouth, 10 m. N.W. Maulmain; and 92 m. E.S.E. Rangoon; lat. 16° 28' N., long. 95° 30' E. Pop. uncertain: in 1826, it was estimated at 5,000; but many of the inhab. were then preparing to emigrate into the British territories, and Mr. Crawford (*Embassy to Siam*, ii. 232.) estimates the ordinary pop. at only 1,500. It stands on the E. declivity of a high hill, is more than a mile in length, consisting of two long streets, and is surrounded by a stockade, which separates it from some suburbs. The houses are of wood; it has several conspicuous temples, one of which is upwards of 150 ft. in height. Martaban has an imposing appearance from the water, facing which is a battery on a rocky mound, and a deep wall of masonry with embrasures for cannon, &c., behind the stockade. It was formerly a place of considerable trade; but, early in the sinking of the last century, its navigation was injured by the course of vessels in the river by the Birman in their wars with Pegu; and Maulmain (which see) is at present the emporium of all the adjacent provs. Martaban was taken by the British in 1824. (*Crawford's Embassy*; *Hamilton's E. I. Gaz.*; *Mod. Trav.*, xi. 179—181.)

MARTHA, or MARTA (SANTA), a sea-port town of Columbia, N.W. Granada, dep. Magdalena, cap. prov. Santa Martha, N.W. the Caribbean Sea, 105 m. N.E. Cartagena, and 175 m. W.N.W. Maracaibo. Lat. 11° 19'

N., long.  $74^{\circ} 18' W.$  Pop. estimated at 6,000. It has some good houses, a cathedral, which is a conspicuous object in approaching it, both by land and sea, some convents, &c.; but it suffered much from the attacks of the Indians during the revolutionary war, and does not appear to have regained its previous importance. Its harbour, which is one of the best on this coast, having sufficient depth of water and good holding-ground, is defended by several batteries, and by a castle on an insulated rock, commanding both the town and the harbour. Santa Marta was founded in 1528, and made an episcopal city four years afterwards. Before the revolution it had risen to considerable importance as a commercial city, and was the port into which manufactured goods for Bogota were almost exclusively imported. (*Cochrane, in Mod. Trav.* xvii. 297, 298; *Blond's American Coast Pilot*.)

MARTIGUES (LES), a marit. town of France, dep. Bouches-du-Rhône, on an island in the channel between the lagoon of Berre and the Mediterranean, on either bank of which channel are its suburbs of Ferrières and Jonquieres, 18 m. W. N. W. Marseilles. Pop. (1836), including its suburbs, 7,220. Its situation, amid pools and canals, has made it be called the Venice of Provence. It is well built, and has several good streets and quays, and handsome buildings; but it is ill supplied with water. Its port is much resorted to by fishing-boats. Merchant vessels are built here; and it has an active trade in olive oil, fish, wine, and salt. (*Hugo, art. Bouches du Rhône, &c.*)

MARTIN (ST.), one of the Virgin Islands, in the W. Indies, belonging partly to the French and partly to the Dutch; about lat.  $18^{\circ} 4' N.$ , and long.  $63^{\circ} 35' W.$ ; between Antigua and St. Bartholomew, 12 m. N. W. the latter, and 75 m. N. N. W. Barbados. Area estimated at 30 sq. m. Though hilly, it has no eminence 2,000 ft. in height. It is watered by numerous rivulets; and in the S. are numerous lagoons, from which great quantities of salt are obtained by the Dutch. The coasts, which are deeply indented, afford several good roadsteads, of which Philipsburg and Marigot are the best. The soil is light, strong, and frequently arid; but it is tolerably healthy. The northern, and larger portion of the island belongs to France, forming a commune of the colony of Guadeloupe; and having an area of 5,371 hectares, of which, 1,811 are cultivated, 241 in pasture, 674 in woods, and 2,616 unproductive. The annual produce of sugar averages about 900,000 kilogs., syrup about 11,000 kilogs., and rum about 50,000 gallons; a good many cattle are also reared. Pop. of the French division about 3,600, five sixths of whom are slaves. The southern, or Dutch, division of the island is less fertile and richly wooded than the French, but more profitable, on account of the salt it produces, which is sent to the neighbouring island, and to N. America; it also estimates to export annually about 25,000 cut. of sugar, and 130,000 gallons of rum. (*Stevins's Handbook*, iii. 828.) The Dutch portion is said to be about as populous as the French. Nearly all the white pop. of St. Martin are of English descent. The Spaniards first colonised this island, but abandoned it in 1650; after which it became a subject of contention between the French and Dutch, who subsequently divided it between them. It has been frequently taken by the English. (*Hugo*, iii. 369; *Notices Statist. sur les Colonies Françaises*; *Stevins, &c.*)

MARTINIQUE, one of the Windward Islands, in the W. Indies, belonging to France; between lat.  $14^{\circ} 23' 43''$  and  $14^{\circ} 52' 47'' N.$ , and long.  $66^{\circ} 46'$  and  $62^{\circ} 15' W.$ , about 25 m. S. E. Dominica, and 20 m. N. St. Lucia; length, N. W. to S. E., 34 m.; average breadth, about 10 m. Area estimated at 98,782 hectares. Pop., in 1836, 117,562, of whom 40,000 were white, or free coloured, and 77,560 slaves. The surface gradually rises on proceeding inland, and mountains occupy the centre of the country. Their loftiest summits are the *Montagne Pelée*, towards the S. extremity of the island, and the *Piton du Carbet*; the former rises to 4,422 ft., the latter to 3,960 ft., above the sea. These, and other mountains, are evidently extinct volcanoes; having their characteristic conical form, and abounding with lava, and other volcanic products. The flanks of the mountains are mostly covered with a dense and luxuriant forest vegetation, and are in many parts under culture to an elevation of 1,300 ft. About a third part of the island consists of pretty level land. It is watered by numerous rivulets; but of these only three or four, which disembogue on the W. coast, are navigable in any part of their extent. At the S. extremity of the island is a small salt-lake. The coasts present many bays and inlets, but the harbours on its E. side are difficult of access, being obstructed by numerous islets, and extensive banks of madrepore. On the S. side is the bay of Marin; and on the W. is that of Fort Royal, forming one of the best harbours in the Antilles. In the N. W. is the roadstead of St. Pierre, where ships ride safely, except during W. winds. The mean annual temp. in the plains is about  $81^{\circ}$ , the maximum in the shade being  $95^{\circ}$ , and the minimum  $69^{\circ}$  Fah.; but the heat is tempered by sea-breezes

during the day, and land-breezes at night. The moisture of the atmosphere is excessive; and it is estimated that at the level of the sea 85 inches of rain fall annually. Most of this rain descends from July to Oct., a period of the year termed the *hivernage*; when the hurricanes, from which the island has often suffered severely, are most frequent. The weather for the remaining 9 months is generally fine; but Martinique, like the neighbouring island of St. Lucia, is very unhealthy. Mineral springs are abundant, of a chalybeate, saline, or siliceous nature; and useful in catarrhes and liver complaints. The surface consists chiefly of disintegrated pumice-stone, intermixed with vegetable mould, forming a light and very fertile soil. In 1835, it was estimated that 38,320 hectares were under culture; that savannahs and pasture lands occupied 21,772 do.; woods and forests, 23,387 do.; and unproductive lands, 15,303 do. The following official account has been given of the distribution of the cultivated lands, their produce, &c., in 1836:—

Articles.	Hectares cultivated.	Slaves employed in culture.	Produce.
Sugar-cane	23,777	34,240	Raw sugar - kth. 33,900,800 Do. - " - 198,780 Syrup & molas. ltr. 6,250,150 Rum - " - 1,660,920
Coffee	2,917	8,897	Do. - kth. 692,867
Cotton	219	-	Do. - " - 18,760
Cocoa	464	-	Do. - " - 125,510
Corn, &c.	12,706	8,677	Do. - value, fr. 2,886,831
Mulberry	4	-	-
Various	-	5,607	-
Total	40,117	55,421	-

Of late years, agriculture has made considerable progress in Martinique. The plough has come more into use, and manuring is more extensively practised; and the culture of the sugar-cane, to which the colonists have turned their chief attention since 1820, has been greatly improved. The cane is of two kinds: the Otahaitian variety, and the yellow cane of Batavia. It was first naturalised about 1630. The coffee plant was introduced in 1723; but its culture, like that of most other products, is diminishing in favour of sugar. A few cloves, and some other spices, are grown; and the government has attempted, though hitherto with little success, to introduce the culture of indigo. Martinique formerly produced a pretty large supply of tobacco, but it is now quite insignificant. Manioc, bananas, sweet potatoes, maize, &c., are the principal farinaceous vegetables. The island has about 40,000 head of live stock, of all sorts; about 18,000 being black cattle and 9,000 sheep. In 1836, there were three earthenware and tile factories, and 10 lime-kilns, employing 352 slaves; these are, however, the only manuf. establs. in Martinique. Carpenters, masons, and such-like workmen are pretty numerous; but there are few of any other description. Most part of the skilled workmen belong to the free coloured class, and only work when they have expended their wages, and are in want of necessaries. A number of hands, both free and slaves, are employed in fishing; and between 400 and 500 are occupied in navigation and the coasting trade. Subjoined is an

ACCOUNT OF THE QUANTITIES AND VALUES OF THE PRINCIPAL ARTICLES EXPORTED FROM MARTINIQUE IN 1835.

Articles.	Quantities.	Value.
Raw sugar	22,994,754 kilogr.	13,796,862

Coin, gold and silver	-	415,180
Other articles	-	252,289
Total	-	16,123,428

The imports consist chiefly of salted meat, butter, and fish, corn, flour, pulse, oils, timber; cotton, linen, and other manufactured goods; wines, soap, candles, hardware, jewellery, apparel, &c.; chiefly from France and the French colonies. In 1836, the value of the imports amounted to 19,480,598 fr. In the same year, 358 French vessels, of the aggregate burden of 48,861 tons, entered, and 353 left, the ports of the island; in addition to which, 495 foreign vessels entered, and 487 cleared out.

The government is vested in a governor, assisted by a privy council, composed of the military commandant, the 3 principal civil officers of the colony, and 3 privy councillors nominated by the king; and in a colonial council of 30 members elected for 5 years. Every individual of French descent, 25 years of age, born or having resided two years in the colony, and paying taxes to the extent of 300 fr. a year, or having property worth 30,000 fr., may be an elector; and inhab. paying taxes, or pos-

assessing property of double the above amount, are eligible to the colonial council. In 1836, there were 819 electors, and 507 individuals eligible to the council. Martinique is divided into the arronds, of Fort Royal and St. Pierre, 4 cantons, and 26 communes. Justice is administered by a royal court at Fort Royal, courts of assize and primary jurisdiction in each arrond., a justice of the peace in each canton, and a functionary, uniting both the civil and military jurisdiction, in most of the communes. The military force amounts to 2,020 men, besides which there is a militia of 4,103 men. There are 3 schools of mutual instruction, 2 in the cap., and one in St. Pierre; and primary schools in almost every commune. At St. Pierre is a superior female seminary. There are orphan asylums, and various other charities, in the two principal towns; and 2 newspapers are published, both at St. Pierre. The total expenditure of the colony, in 1837, was estimated at 4,387,866 fr., the local receipts to meet which amounted to only 2,287,711 fr.

Martinique has only three towns worthy of mention. Fort Royal, the cap. and seat of government, on the N. shore of the bay of same name, in the S.W. part of the island. Pop., inc. com., about 11,500. It is well built, its chief public edifices being the par. church, government offices, naval storehouses, arsenal, barracks, hospital, two prisons, and the residence of the *prefet apostolique*, the superior ecclesiastic of the island. It is defended on the N. by Fort Bourbon, and on the S. by Fort Louis, on a small peninsula, by which it is shut off from its port; but it communicates with the harbour, by a canal, cut within a few years. Near Fort Royal are numerous pleasant country residences. St. Pierre (which see) on the W. coast, is the largest town in the French W. Indies. La Trinite, on the bay of same name, on the E. side of the island, has a pop. of about 4,600, large warehouses, a prison, some barracks, an hospital, and a handsome church. Its roadstead and harbour are secure; the latter has good holding-ground, but it is difficult of access. Its entrance was formerly protected by a fort, now in ruins.

This island was discovered by the Spaniards in 1493. In 1635 it was settled by the French. In 1762 the English took it from the latter, but restored it in the succeeding year. In 1794 it was again taken by the English, who gave it back in 1802; it came a third time into our possession in 1809, and was finally restored to France in 1815. The Viscount Beaucharnais, and his wife Josephine, subsequently espoused by Napoleon, were natives of Martinique. (*Notices sur les Colonies Françaises*, l. 27—134; *Official Tables*; *Hugo, art. Martinique*.)

MARWAR, a native state of Hindostan. See JOURNAL.

MARYBOROUGH, an inland town of Ireland, Queen's Co., of which it is the cap.; prov. Leinster, on a branch of the Barrow, 46 m. S.W. Dublin. Pop., in 1821, 2,677; in 1831, 3,220. "It is a town of very little importance or wealth, possessing a very inconsiderable market, compared to Mount Mellick and other towns in the co.; but within the last few years the quantities of grain brought to market have increased." (*Mun. Bound. Report*.) It is straggling and meanly built. The new co. prison has 75 cells and 36 other prisoners' rooms. The district lunatic asylum has accommodation for 104 patients. It has 3 schools, one for boys, another for girls, and one for both, partly supported by and connected with the Education Board, which, in 1839, were attended by 743 children. When the territory of Leix was made shire-ground, at the close of the reign of Philip and Mary, this place, previously a border fortress, was fixed on as the assize town, and named from the reigning queen. It changed masters several times during the war of 1641. It has several good public buildings, among which are the par. church, a Rom. Cath. chapel, a convent, Presbyterian and Methodist meeting-houses, the infirmary for the co., the district lunatic asylum lately erected for King's and Queen's Cos., Westmeath, and Longford, the new co. court-house and prison, with barracks, schools, &c. It is a constabulary station. The corporation, under a charter of Elizabeth, in 1570, consists of a burgomaster, two halliffs, and an indefinite number of burgesses and freemen. It returned 2 mems. to the Irish H. of C. till the Union, when it was disfranchised. The assizes for the co. are held here; and general sessions in April and October, and petty sessions weekly. Markets on Thursdays; fairs, Jan. 1, Feb. 24, March 25, May 12, July 5, Sept. 4, Oct. 26, and Dec. 12. Post-office revenue, in 1830, 364*l.*; in 1836, 437*l.* Rathleague, the seat of Sir Henry Parnell, and Ballyfin, the seat of Sir Charles Coote, are in the immediate vicinity of the town.

MARYLAND, one of the U. States of N. America, on both sides Chesapeake Bay, between lat. 38° and 39° 40' N., and long. 75° and 79° 20' W., having N. Pennsylvania, W. and S.W. Virginia, E. Delaware, and S.E. the Atlantic. Area estimated at about 10,800 sq. m. (*Philad.*) Pop., in 1830, 447,040, of whom 102,294 were slaves. The two portions into which Chesapeake Bay

divides the state are called the E. and W. shores; the former being low, undulating, and alluvial, while that on the W. side, though at first of the same character, gradually rises on proceeding westward; and the N.W. part of the state is traversed by some offsets of the Alleghenies, which have an elevation of about 3,000 ft. The Potomac, which divides the state from Virginia, and the Susquehanna, which falls into the innermost extremity of Chesapeake Bay, are the only considerable rivers. The climate of the hill country is healthy and agreeable; but along the coast the heats in summer are sometimes oppressive, and destructive fevers frequently prevail. The mean annual temp. at Baltimore is about 53° Fah. The soil is particularly fertile in the valleys between the mountain ranges of the W.; but elsewhere it is of very various qualities, and towards the coast is often sterile. Large quantities of excellent wheat, of a variety supposed to be peculiar to this state, is raised, especially on the E. shore; the crop, however, is rather precarious; and Indian corn is probably the principal produce. (*Encyc. of Geog.*, Amer. edit., fil. 513.) Tobacco is the other great staple, and is grown almost exclusively on the W. shore. (For an account of the quantities of these staples inspected in Maryland, see BALTIMORE, in this Dict., l. 285.) Most part of the products of the more N., and some common to the more S. states, are cultivated. Fruits and sweet potatoes are grown in abundance; a little cotton is raised for domestic purposes; and hemp and flax are grown in the W. The forests abound with trees, producing *mast*, which feeds great numbers of hogs. Beef and mutton are also plentiful; and large quantities of provisions are shipped from Baltimore. The fisheries are extensively carried on in the bay and along the coast; and, in 1835, upwards of 40,000 barrels of herrings, 5,500 do. shad, and 16,000 do. mackerel, were inspected at Baltimore. Coal of good quality is found in the W. part of the state, in two principal fields, one of which extends over an area of 400 sq. m. Iron is every where abundant; and the bog-ore wrought on the E. shore yields at an average from 40 to 50 per cent. of metal. Sulphur of copper, chrome and alum earths, green vitriol, and various fine marbles, are among the other mineral products. The manufactures consist principally of coarse cotton fabrics, and of hardware, salts, earthenware, &c. The principal articles of export are flour and tobacco, and, next to these, lumber, iron, Indian corn, pork, flax seed, and beans. Exclusive of her very extensive trade with other parts of the Union, the total value of the exports from Maryland to foreign countries, during the year ending Sept. 1839, amounted to 4,576,561 dolls., and that of the imports, during the same year, to 6,695,285 dollars.

The canals and railways of Maryland are on a large scale. The Chesapeake and Ohio Canal, intended to unite Georgetown, in the district of Columbia, with Pittsburgh on the Ohio, was commenced in 1828, and, in 1839, 136 m. had been completed. It is generally from 60 to 70 ft. wide; though in parts it is contracted to 50 and expanded to 150 ft.; its depth is 6 ft. The rise to William's Port, 105 m. from Georgetown, is 353 ft., which is "overcome by 44 locks 100 ft. long by 16 ft. wide. There are in this distance 119 culverts, and 6 aqueducts, one of which is 1,714 ft. long; the culverts, aqueducts, and locks, are all built of solid stone masonry; the cost of the work, thus far, is estimated at about 4,100,000 dolls. The legislature of the state has also appropriated 1,000,000 dolls. for the construction of branch canals to Baltimore and Annapolis." (*Bradford*.) The aggregate length of the railroads in Maryland, in 1840, was between 260 and 270 m.; and the Baltimore and Ohio railway is the most stupendous national work undertaken in America. Its length, when finished, will be at least 300 m., within which a rise of 885 ft. must be overcome. In 1835, 804 m. of the work had been completed. In 1839, there were in the state 22 banks and 2 branch banks, with an aggregate capital estimated at 11,420,000 dolls. The legislative government is vested in a senate and a house of delegates, together styled the General Assembly of Maryland. The H. of Delegates is chosen annually by the voters who have free white male citizens above 21 years of age, who have resided a year in the state, and 6 months in the county for which votes are tendered. The senate is composed of 15 mems., 9 from the W., and 6 from the E. shore, and is elected every 5th year. The governor and executive council are elected annually by the General Assembly, and appoint all subordinate officers of state.

Annapolis is the seat of the state government; but Baltimore is the commercial capital, and, in pop. and importance, the third city of the Union. (See BALTIMORE.) Maryland is divided into 20 counties, Frederick, Hagersburg, and William's Port, are the other principal towns, and 6 judicial districts, each comprising 2, 3, or 4 counties. Each of these districts has a chief judge and 2 associates; the 6 chief judges constituting the court of appeal for the state. Judges hold office during good behaviour. The militia, in 1838, consisted of an aggregate of 46,854 men. Maryland has a fund for the

support of free schools, which, in 1831, amounted to 142,063 dolls., and possesses several large and important colleges, including Maryland University and St. Mary's College, with a library of 12,000 vols., at Baltimore; St. John's College, at Annapolis; Mount St. Mary's, at Emmitsburg, &c. In 1839, the state had 48 periodical publications, 20 of which issued from the Baltimore press. The inhab. are mostly Rom. Catholics or Methodists.

Maryland was first colonised by Lord Baltimore, and about 200 Rom. Catholic emigrants, in 1634. It remained a proprietary government until the revolution of 1688, when it became a royal prov.; but in 1716 it was restored to the descendants of its original possessor, and retained by them till the independence of America. Its constitution was formed in 1776, and dates next in order to that of Virginia; it has, however, received several important alterations and amendments at different periods. (*Darby's Views of the U. States; American Almanack, 1834-41; Knapp, of Geog., American ed.*)

MARYPORT, a sea-port town of England, co. Cumberland, par. of Cross Canobay, Allerdale Ward, on the Solway Frith, close to the mouth of the Elen, 25 m. S.W. Carlisle. Pop., in 1831, 3,477. It is neat and well-built, and, from its salubrity, is much frequented by summer visitors. A modern-built townshapel, chapel of ease, and 5 places of worship for dissenters, are its chief public edifices. A national school furnishes instruction for about 150 children, of both sexes, and there is a school of industry for 20 girls. The present importance of Maryport, which, in 1750, was a mere hamlet, is attributable to the rise of an extensive coal-trade with Ireland and Scotland. It has also three ship-building yards; and sail-cloth, ropes, blocks, &c., are made on a pretty extensive scale. A pier has recently been erected, and there are commodious quays and staiths; but the harbour dries at low water, and has only 12 ft. at high water springs, and 8 at neaps.

MASCALE, a town of Sicily, intend. Catania, cap. canton, at the E. base of Mount Etna, on a small river about 2 m. from the sea, and 10 m. S.W. Taormina. Pop., in 1831, 3,983. Its district is exceedingly fertile, and the town was formerly flourishing, but it is now rapidly decaying, while several of its dependent villages are proportionally thriving and increasing, particularly Giarre and Riposto.

MASSA-CARRARA (DUCHEY OF). See MODENA.

MASSACHUSETTS, one of the U. States of N. America, in the N. part of the Union, in the distr. known by the name of New England; and which, though comparatively small, is one of the most important and flourishing states belonging to the Confederacy. It extends between lat. 41° 13' and 42° 52' N., and long. 69° 50' and 73° 30' W.; having N. Vermont and New Hampshire, W. New York, S. Connecticut and Rhode Island, and E. the Atlantic, the islands of Martha's Vineyard and Nantucket (in that ocean being comprised in this state, Greatest length, W.N.W. and E.S.E., 130 m.; ordinary breadth, between 40 and 30 m.; area, 7,800 sq. m. Pop., in 1830, 610,108; in 1840, 718,302, or 1/2 to the sq. m., being the most densely peopled state of the Union. Generally speaking, the country ascends according to the distance inland, the general slope being from W. to E. The coast presents a capacious, deep, and admirable bay, between Cape Ann and Cape Cod; from which the state has derived its name. A sandy, and in some parts marshy plain extends several miles into the interior: this is abruptly succeeded by a hilly country, which occupies all the central parts of the state, abounding with valleys of various extent, numerous rivers, and extensive blue plains. The valley of the Connecticut river separates this region from the third, or mountainous, or most westerly division of the state. It is well watered, but no large river rises within it. Next to the Connecticut, the chief is the Merrimack, which runs through its N.E. parts, and falls into the sea near Boston. There are no large lakes, but numerous ponds. The climate varies according to elevation; but is generally dry and healthy, and the atmosphere serene. The thermometer, in the south, in the plains, during summer, often exceeds 77° Fahr., and sometimes rises to 100°. In some of the central and W. districts the soil is strong and rich; but in general it is poor rather than otherwise; though the active perseverance of its inhab. and good cultivation have rendered it highly productive. In no part of the U. S. has greater advances been made in agriculture: maize, rye, wheat, oats, barley, peas, beans, buckwheat, potatoes, hops, flax, and hemp are the chief agricultural products. Great quantities of cider also are made, and fruits and garden vegetables extensively grown. But notwithstanding its superior agriculture, Massachusetts is indebted to the southern states, especially to N. York, Maryland, and Pennsylvania, for by far the largest portion of her supplies of flour and corn; and to these and the other states she is indebted for cotton (about 100,000 bales), staves, coal, &c.) Beef, po. k., butter, and cheese, are of excellent quality, and so abundant as to form a

## MASSACHUSETTS.

considerable article of export; the W. part of the state is especially distinguished for its extensive dairies. Mr. Stuart speaks in high terms of the cheerful appearance and flourishing condition of the rural districts of Massachusetts. "The whole of the villages, from Northampton to Boston, Belchertown, Ware, and Worcester, are handsomely laid out, and comfortable places; and every thing about them is so neat, and so much in order, that it is delightful to see them. About Northampton there is more appearance of real comfort and beautiful village scenery than I have seen any where else." (1. 294.) Agriculture is here, however, of inferior importance to manufactures and commerce, in which Massachusetts ranks second perhaps to no state in the Union, unless it be New York. Nearly 40 millions of dollars are said to be invested in manufacturing stock; of which a large proportion is employed in Lowell, which, next to Pittsburgh, is the chief manufacturing town in the U. States, and may be styled the Manchester of America. (See LOWELL.) Next to cotton goods, boots and shoes are the chief manufactured articles; from 3 to 4 million pairs are annually made at Lynn and other places in this state, principally for export to the southern states and the W. Indies. Spirits, leather, cordage, wrought and cast iron, nails, woollens, paper, straw bonnets, lints, oil, and muskets, are the other principal manufactures. There is a large national establishment for the manufacture of arms at Springfield. There are numerous iron mines, and some also of lead. Excellent marble and granite, slate, limestone, &c. are obtained. The whale, cod, and other fisheries of the U. States centre principally in Massachusetts, and are at once a principal employment and a most productive source of wealth. The chief exports of this state, exclusive of its manufactures and the produce of its fisheries, are beef, pork, lumber, spirits, flax seed, &c. During the year ending the 30th of September, 1839, the value of the foreign produce imported into Massachusetts amounted to 19,385,223 doll., while the value of her exports to foreign countries amounted to only 9,276,085 doll.; the excess of the value of the former above that of the latter being defrayed by bills on New York, Philadelphia, and other states, which are always largely indebted to Massachusetts. The aggregate burden of the ships belonging to Massachusetts in the same year amounted to 325,364 tons, being more than 1-4th part of the tonnage of the Union, and more than that of any other single state. (For further details as to the trade of Massachusetts, see BOSTON.) The internal communications are very extensive and important. In 1840 it had 12 railways of the aggregate length of 337 m.; the revenue from which, in 1839, amounted to 11,741,432 doll. Of these, Quincy railway, the first work of the kind finished in the U. S., was completed in 1827; but the principal are those from Boston to Providence, Worcester, and Lowell, that from Worcester to Springfield, and the Eastern railway, now nearly completed from Boston to Portsmouth (New Hampshire). There are also several canals of considerable length: that connecting Boston harbour with the Merrimack (completed in 1828) was the first canal of any size undertaken in the Union. Massachusetts had, in 1839, 110 banks, with a united capital of 31,630,000 doll.; and in 1837, 27 savings' banks, the aggregate deposits in which amounted to 3,921,370 doll.

Till lately the legislature of Massachusetts had a greater number of members than that of any other state of the Union; but the amended constitution of 1840 reduced the senate to 40 members; and the number of representatives to 356, elected by towns of more than 1,200 inhab. Of the Representatives, Boston, the cap., sends 35; Lowell, 9; Salem, 6; and Charlestown and New Bedford, 5 each, &c. The right of election is in every male citizen 21 years of age who has resided within the state for a year, and within the town or district for which he desires to vote for 6 months preceding the election. Elections take place annually for senators, representatives, the governor, lieutenant-governor, and a council of 9 members, intended to assist the executive, and chosen from among the people at large by a joint vote of the senators and representatives. The salary of the governor is 3,666 dollars a year. The supreme court of justice sits at Boston; it consists of a chief justice, 3 assistant judges, and 7 other officers. There is a court of common pleas, and other courts are established in each co.; the different judges of all the courts are appointed by the governor and council, and hold office during "good behaviour." Every able-bodied white male citizen between 18 and 45 (with certain exceptions) is required to enrol himself in the militia; but the active militia consists of only 10,000 men, called out at different times. Education is very widely diffused. In 1838-39, there were 3,014 public schools, the number of scholars attending which in winter was about 148,600. There are 73 corporate and 1,100 unincorporated academies and superior private schools. In 1838-39, the sum of 447,810 doll. was raised by taxes for the support of schools. The principal educational establishments are—Harvard university, near Boston; Phillips, Dunster, Leicester and Derby academies; Williams' and Amherst colleges;

several theological seminaries, and other special schools. Learned societies, mechanics' institutes, lyceums, reading societies, and public libraries, are numerous. The number of churches as compared with the pop. is greater in this than in any other state of the union; and the inhabs. are distinguished by their industry, sobriety, and good morals. The public debt at the close of 1839 amounted to 5,000,000 dol.

This state was first permanently settled by a party of emigrants from England, who landed at Plymouth in 1620. Another settlement was formed at Salem in 1628, and both were united by charter under the same government with Maine in 1693. The first engagement with the forces of the mother country occurred at Lexington in this state, 19th April, 1775. Massachusetts sends 12 mems. to congress. (*Mitchell's United States; Darby; American Almanack*, 1834-41.)

MASSA-DUCALE, or DI-CARRARA, a town of N. Italy, belonging to the Modenese dom., cap. duchy of same name, on the road between Genoa and Leghorn, 3 m. from the Mediterranean, and 24 m. N.W. Lucca. Pop. estimated by Rimpoldi at 7,000. It is distinguished by the beauty and salubrity of its situation, and is clean and well built, but has few remarkable edifices. Its ancient cathedral was destroyed by Eliza Baci, a ciocchli, sister of Napoleon, when queen of Etruria, on account of its being too near the royal palace. It has an academy of sculpture and architecture, a seminary, college, hospital, public library, and an old castle now used as a prison. It is the see of a bishop; and has manufactures of silk stuffs, and some trade in soap, oil, and other agricultural products, and in the fine marble of its vicinity, as to which see CARRARA in this Dict. (Vol. I. p. 546.)

MASSAFRA, a town of the Neapolitan dom., prov. Otranto, cap. canton, on the road from Bari to Taranto, 10 m. N.W. the last-named city. Pop. about 7,000. "Massafra is prettily situated on the slope of a hill interspersed with tufts of trees and shrubs; but when near it, it assumes a most singular appearance. The rock on which it stands is perforated and worked into a thousand fantastic shapes. The houses stand on the brink of a narrow valley, or rather chasm, worked through the rock by the action of running water." (*Burgess's Greece*, §c. 1. 22.) The town is walled, and is conjectured by some authors to occupy the site of the *Messapia*, of antiquity; but others contend that *Messagna*, between Oria and Brindisi, is the modern representative of that ancient city.

MASSAT, a town of France, dépt. Arlège, cap. cant. in a fertile valley, 14 m. W.S.W. Foix. Pop. in 1836, 7,180. There are in its vicinity numerous iron mines, the working of which employs a considerable portion of the people.

MASUAH, the principal sea-port of Abyssinia, on the Red Sea, on an island separated from the continent by the narrow but deep channel of Adowa, 250 m. N. Gondar, and 420 m. S. by E. Djidda: lat. 15° 36' 45" N., long. 39° 24' E. Pop. 2,000. ? The island in which Masuah stands is only about ½ m. in length, and ¼ m. in breadth, one third of its extent being occupied by houses. The town has several stone houses, two stories high; but most of them are in ruins. The other dwellings are mere huts, built, as in Arabia, with poles and bent grass. The only public buildings are four mosques, of small size and rude architecture. Owing to the total absence of springs, water is very scarce, and is collected in large public tanks, that occupy nearly a third part of the island. The harbour, though having a narrow entrance, can accommodate about 50 vessels; and is safe, deep, and easily accessible. The trade carried on between Masuah and the ports of Arabia is of considerable importance. From Djidda are brought many articles of European manufacture, embroidered velvets, arms, glass-ware, silks, and satins; while Mocha furnishes Indian

fabrics of every quality, from the finest muslins to the coarse Surat cloths, used as articles of dress in a great part of Africa. The exports comprise a considerable number of slaves, gold-dust, ivory, rhinoceros' horns, and corn, brought from the interior by a large caravan, which arrives in Feb. The Naybe demands 10 per cent., *ad valorem*, on all exports and imports, and the same amount of duty is levied by the Imâm. (*Valentia's Travels*, li. 46.—68.)

MASULIPATAM. See CIRCARS (NORTHERN). MASULIPATAM, a fortress and town of British India, presid. Madras, cap. of the above district, on the Coromandel coast, 230 m. N. N.E. Madras; lat. 16° 15' N., long. 81° 14' E. The fort is of an oblong figure, 800 yds. by 600, in the midst of a salt morass, and close to a canal communicating with the Krishna. By means of this canal the surrounding country may be entirely inundated, a circumstance constituting the chief strength of the place. The *pettah*, or native town, is about ½ m. to the N.W.; it is very extensive, and, for a Hindoo town, tolerably well built. Masulipatam stands on the only part of the Coromandel coast which is not beat with a heavy surf. Its port receives vessels of 300 tons; and it was for a lengthened period a place of considerable trade with Bengal, China, Birmah, Persia, and Arabia. Its commerce is now greatly fallen off, and scarcely extends beyond Calcutta on one side, and Bussorah on the other. Its chief exports are piece-goods and tobacco. The chintzes of Masulipatam, though not equal to those of Europe, have been long, and deservedly, celebrated, and are very generally worn in some parts, especially in Persia. This town is the residence of the district collector and judge. It was conquered by the Bhamane sovereigns of the Decca, in 1480, ceded to the French in 1751, and taken by the British in 1759.

MATANZAS, a sea-port town of Cuba, ranking next to the Havannah, in commercial importance, on the N. coast of the island, at the bottom of a deep bay, 52 m. E. Havannah; lat. 23° 2' 28" N., long. 81° 37' 44" W. Pop. in 1827 (incl. garrison and strangers, estimated at 3,000), 14,341: of the resident pop., 6,353 were whites, 1,141 free people of colour, and 3,067 slaves; but, at present (1841), the pop. is probably not under 20,000. It is pretty well built, has some good streets, and about one third part of its houses are of stone. It has a large hospital, a good par. church, barracks, theatre, 2 market-places, 2 printing-offices, a bathing establishment, &c.; and in the neighbourhood is a considerable sugar-refinery, belonging to an English firm. The bay of Matanzas, defended by the castle of San Severino, is extensive, and is exposed only to the N.E. wind. The harbour, in front of the city, is protected by a ledge of rock, 4 ft. below the surface, which serves as a natural breakwater, to defend the vessels at anchor within it from the swell. There are two channels by which to enter, the one by the N., the other by the S. end of the ledge; but the S. channel is fit only for coasting vessels. There are two rivers, one on each side of the town, which deposit so much mud at their mouths as greatly to diminish the extent of the anchorage-ground, and render it necessary to load and discharge the shipping by lighters and launches. (*Turnbull's Cuba*, 217—219; *Comm. Dict.* &c., *passim*.)

Matanzas, though situated in one of the most fertile districts of this noble island, was an inconsiderable place till within the last 30 years. Under the old colonial government, it was merely a subsidiary port to the Havannah, and was not allowed to carry on any direct intercourse with foreign countries; but this impolitic restriction being removed in 1809, Matanzas immediately became the centre of a considerable trade; and the town and its commerce have since continued to increase, with the rapidly increasing cultivation of sugar and coffee, and other colonial staples in the adjoining districts. The great importance of the trade of Matanzas will be seen from the subjoined

ACCOUNT of the Sugar and Coffee exported from the Havannah and Matanzas, in 1838 and 1839.

**MATARO** (an. *Iluro*), a sea-port town of Spain, in Catalonia, 20 m. N.E. Barcelona. Lat.  $41^{\circ} 33' N.$ , long.  $2^{\circ} 30' E.$  Pop., according to Miñano, 12,949. The more ancient or Moorish portion of the town stands on a slight eminence, at a short distance from the shore, and is surrounded by walls: its streets are narrow and crooked, with the exception of the Riera, which is wide and straight, lined with rows of trees, and forming an agreeable promenade. The new town, which stretches eastward along the sea-shore, is much larger and more regularly built, with wide streets, and respectable houses. A parish church and a general hospital, with 2 or 3 large buildings, formerly used as monasteries, are the only public edifices. The town is celebrated for the excellence of its red wine and brandy, much of which is exported to the U. States. Its cloth fabrics, which were favourably noticed by Townsend (l. 102.), have much declined; and, since the emancipation of the colonies, its exports of cotton-prints, ribands and lace, have become quite considerable. The port has a ship-building yard, and there is good anchorage for merchant-ships close in shore. "The neighbourhood is very picturesque, and the country-houses and cottages have an air of greater neatness and comfort; the windows are glazed, and the insides of the dwellings display a good stock of furniture. No beggars and fewer ragged people are seen; industry is evidently active; the ground is better cleared, fences (made of the American aloë) are more general and more neatly constructed; nobody is seen hawking in the sun. In short, there is altogether a new order of things, quite different from that seen in any other part of Spain." (*Inglis*, ii. 304.)

**MATHURA**, or **MUTTRA**, a celebrated town and place of pilgrimage in Hindostan, prov. Agra, on the Jumna, 30 m. N.W. Agra; lat.  $27^{\circ} 34' N.$ , long.  $77^{\circ} 33' E.$  It is highly venerated by the Hindoos, from its being the birthplace of their deity Krishna, and consists chiefly of one continued street of temples and ghauts, which, though they do not exhibit the architectural magnificence of similar structures in S. India, have, nevertheless, considerable elegance and richness. Mathura was taken in 1019 by Mahmood of Ghiznee, who despoiled it of an immense quantity of gold, silver, and gems, threw down many of its temples, and desecrated others by converting them into mosques. Under Aebur and his successors, however, the Hindoos were permitted to rebuild and improve the city; and a temple, erected about that period, is said to have cost 60 lacs of rupes. But this splendid edifice was destroyed by Aurungzebe, who built on the spot a mosque with the materials. Another large mosque, built by a Mohammedan governor, is now in a state of decay. Some extensive cantonments are separated from the town by an interval of broken ground covered with ruins. Mathura has a fort, in which is an observatory, founded by the rajah Jye-Singh of Jeypoor. At the end of the last century it was the head-quarters of the commander of Scindia's infantry: it was, however, taken, without opposition, by the British in 1803. (*Hamilton's E. I. Gaz.*)

**MATLOCK**, a village and par. of England, celebrated for its mineral waters, hound. Wirksworth, co. Derby, on the Derwent, 14 m. N. by W. Derby, and 125 m. N.N.W. London. Area of par., 3,960 acres. Pop., in 1831, 3,262. The town is beautifully situated, partly in a valley and partly on the slope of a hill rising E. from the Derwent, here crossed by a neat stone bridge: the houses are chiefly of stone. The church, picturesquely situated on the brow of a rock, rising perpendicularly above the river, and embosomed in trees, is a small edifice, in the perpendicular English style, with a square tower at its W. end: the living is a rectory (ann. val. 320*l.*), in the gift of the Dean of Lincoln. There are also four places of worship for Wesleyan Methodists, Independents, and other dissenters, with attached Sunday-schools, providing religious instruction for between 400 and 500 children of both sexes. There is also an endowed school, for clothing and educating 30 boys. In 1839, a cotton-mill employed about 300 hands; it has, also, a large paper-mill; and the lead mines in the neighbouring hills employ about 150 hands. A museum of mineralogy, established here a few years ago, contains a great many valuable specimens of ore, &c., peculiar to this district. Visitors purchase considerable quantities of Derbyshire spar. But the chief dependence of the inhab. is on the supply of those

who come here during summer, to use the mineral waters; which are considered beneficial in cases of glandular affections, scrofula, bilious disorders, pulmonary complaints, and diabetes. The springs, which first attracted notice, for their medicinal qualities, in 1698, when the first, or old bath, was built, are about  $\frac{1}{2}$  m. S. of Matlock, on the W. bank of the river; and here are the hotels, libraries, and lodging-houses, to which the visitors chiefly resort. Other two springs have been discovered, each of which is now enclosed, with a handsome edifice, conveniently fitted up with baths and pump-rooms. The waters have a temperature of about  $66^{\circ}$  or  $68^{\circ}$  Fahr., and hold in solution only a small quantity of carbonate of lime, their specific gravity being less than that of ordinary water: it would hence appear, though having a lower temperature, greatly to resemble the Buxton and Bristol waters.

The scenery of Matlock-dale is peculiarly picturesque and romantic, diversified with rugged beetling crags, strongly contrasted with the fine verdure of the valley; the most prominent objects being the High Tor and Masson Hill. The former rises almost perpendicularly about 300 ft., the upper half of which is a broad mass of naked brown rock, from which fragments often fall into the river which flows immediately below, obstructing the channel, and greatly increasing the impetuosity of the stream after heavy rains. Opposite the High Tor, but of a less bold, though loftier, character, is Masson Hill; on the summit of which are the heights of Abraham, rising about 750 ft. above the river, and not only overlooking the whole dale, but commanding an extensive prospect over a considerable part of Derbyshire. Willesley Castle, the seat of Mr. Arkwright, son of the great founder of the cotton manufacture, stands on a commanding eminence E. of the Derwent. (*Parl. Rep.; Prin. Inform.*)

**MAUCHLINE**, a neat village of Scotland, co. Ayr, on an eminence  $\frac{1}{2}$  m. N. from the river Ayr, 27 m. S. by W. Glasgow. Pop., in 1831, 1364. The only public buildings are the par. church, and a chapel belonging to the Associate Synod. It has a woollen mill, which employs about 25 hands; and hand-loom weaving and tambooring for the Glasgow manufactures employ about 200 hands. It has also a manufacture of beautifully jointed and varnished wooden snuff-boxes, similar to those made at Cumnock and Laurence Kirk. There are 4 schools in the town, of which 3 are endowed: 2 subscription libraries, and a savings' bank. The village of Catrine (l. 563.), is 3 m. S.E. from the town.

This place, trifling as it is, has been "married to immortal verse." Burns lived for nearly 9 years at the farm of Mossiel,  $\frac{1}{2}$  m. N. of the village; and Mauchline was the birth-place of "bonnie Jean" and the scene of two of his inimitable poems, "The Jolly Beggars," and "The Holy Fair."

**MAULMAIN**, or **MOULMEIN**, a sea-port town of India beyond the Ganges, cap. British prov. Martaban, at the mouth of the great river Than-lieng, having N. the Birme town of Martaban, on the opposite side of the river, and W. the island of Balu, which serves as a natural breakwater to defend the port from the heavy seas that would otherwise be thrown in from the W., 100 m. S.S.E. Rangoon, 27 m. N.N.E. Amherst; lat.  $16^{\circ} 30' N.$ , long.  $97^{\circ} 38' E.$  It was founded so late as 1825, when the site was selected by Sir A. Campbell, as eligible as well for a commercial as a military station. It is about 200 ft. above the level of the river, and extensive and fertile plains stretch eastwards from it towards the mountains. Its port is good, and, from its extensive command of internal navigation, it promises to become a considerable emporium. The principal articles of export are teak, timber, and rice; but there is also a considerable export of tobacco, stic-lac, betel-nut, ivory, cutch, cocoa-nut, &c. The imports consist principally of European cotton goods, and marine stores. The principal trade of the place has hitherto been carried on with Calcutta, Madras, Rangoon, and Pinang; but, in 1837, a direct trade was commenced with London. Ship-building is carried on to a considerable extent. We have no recent accounts of the pop.; but, probably, it is not under 8,000 or 10,000. An English newspaper (the *Maulmain Chronicle*), from which we borrow the following details, is published once a week:—

	Imports.		
	1836.	1837.	Increase.
	<i>Reals.</i>	<i>Reals.</i>	<i>Reals.</i>
Calcutta	5,56,419	9,58,891	3,82,672
Madras	77,802	1,39,476	61,674
Straita	51,922	91,137	39,515
Rangoon	1,94,874	1,37,532	55,658
Tenasserim coast	45,730	52,174	8,444
Other ports	34,510	41,455	6,945
Total	8,65,357	14,60,666	5,95,308

	Exports.		
	1836.	1837.	Increase.
	<i>Reals.</i>	<i>Reals.</i>	<i>Reals.</i>
Calcutta	94,244	2,08,011	1,13,767
Madras	26,900	1,23,935	97,035
Straita	49,390	86,908	37,518
Marittima	-	84,305	84,305
Rangoon	2,04,457	1,48,081	-
Tenasserim coast	32,614	18,471	-
Other ports	18,790	48,609	10,519
Total	4,24,995	6,68,410	2,43,415

"In order to exhibit, at one view, the decided increase of our trade in 1837 over the preceding year, we place the totals to and from each port in juxtaposition.

"From this it will appear, that the imports have increased nearly six lacs of rupees, and the exports two lacs and a half. Among the imports, the increase is found chiefly under the head of marine stores, spirituous liquors, and articles of European and Birnese manufacture. Among the exports, it is found in the staple productions of the country, rice and timber. Under the head of imports, we may notice that five lacs of rupees were received during the year into the government treasury; to which may be added, what does not appear in our statement, about half a lac of rupees, perhaps, from the Mauritius, for the purchase of cargoes of rice and timber. Under the head of exports, also, it would not, we think, be improper to include the estimated value of the vessels built and launched during the year at the several dock-yards. The following is a very rough estimate:—

	No.	Tonnage.	Estimated Value.
Vessels launched	-	-	-
Ditto fitted for sea	-	-	-
Total	9	2,500	Reals. 250,000 125,000 375,000

"We are not aware that the mode in which our statements are drawn up requires any particular explanation. The word 'Sundries' may be, perhaps, thought too comprehensive; but we have divided it among articles of European, Indian, Chinese, and Birnese produce or manufacture.

"The following is a statement of the imports into Maufmain from the neighbouring Shan states during 1837:—

	No.	Value.
Elephants	68	15,600
Pories	116	17,520
Buffaloes	99	900
Cows and bullocks	3,180	45,000
Sundries	-	4,500
Total	-	81,610

"Of the exports to those states, we can procure no detailed statement. Little else, however, is taken to them from hence but piece goods, either European or native, the value of which may, perhaps, be estimated at about 60,000 rupees.

"Taking, then, into consideration the various items above alluded to, and which are not brought into our statements, we shall have the following as the amount of imports and exports for the year 1837:—Imports, 20,92,275 reals; exports, 11,03,410 reals."

MAURA (SANTA) (an. *Leucas*), one of the Ionian Islands, off the W. coast of Greece, and separated from it only by a channel about 100 yards broad, and so shallow, as in some places to be fordable; 48 m. S.E. Corfu, and 7 m. N. Cephalonia, its cap. Amaxichi being in lat. 33° 56' 30" N., long. 20° 43' E. Length, 23 m.; average breadth, 8 m. Area, about 180 sq. m. Pop., including troops in 1836, 17,385. It is intersected by a chain of mountains, running N. and S. through its whole extent, and rising in some places to the height of 3,000 ft., whence secondary ridges branch off in various directions, forming a few small valleys admitting cultivation; but most of the produce is raised on a narrow strip of land, stretching about 20 m. along the N.W. side of the island, and comprising the residences of the greater part of the pop. The soil is generally very scanty; and many parts of the surface exhibit nothing but bare rock, interspersed with small patches of verdure: indeed, only about 1-8th part of the surface is capable of cultivation. In the valleys, the soil is either alluvial, or a red loamy earth, tenacious of moisture. There are no rivers; and, though numerous torrents flow from the mountains during the winter months, their channels are quite dry in the summer. There is a winter lake, if we may so call it, about 6 m. S. of Amaxichi, in the bottom of a valley, surrounded by lofty mountains, which dries in summer, and produces rich crops. At the S. end of the island, is a shallow lagoon called the Venetian harbour, now rapidly filling up by the accumulation of sand and mud, the banks of which are said to be exceedingly unhealthy. The temperature of Santa Maura, like that of the other Islands, is extremely variable; the thermometer in autumn often rising or falling 20° in 24 hours. In the valleys it seldom falls to the freezing point; but occasionally there is snow on the hills. The quantity of rain, and the seasons in which it falls, are much the same as in the adjacent islands. The low grounds are very unhealthy; and fever usually prevails at Amaxichi during summer, attended with a mortality in some years of 1 in 19 of the pop.: indeed, most of the natives, except those

living on the mountains, present a very sickly appearance. (*Major Tulloch's Reports.*) The quantity of corn raised in the island is barely sufficient for half the consumption of its inhab.; but wine, olive oil, and several varieties of fruit, are produced in great abundance. The sides of the hills afford excellent pasture, and are grazed by large numbers of sheep and goats. Game is plentiful, and bees form an object of rural economy. The salt-pans near Amaxichi produce annually from 5,000 to 6,000 tons of basalt, which, as well as wine, oil, and cotton, are the chief articles of export. The inhab. are of Greek origin, and belong to the Greek church. Many of them are employed as fishermen and sailors; while others, especially at harvest-season, cross to the neighbouring continent in quest of agricultural employment.

It has several good ports, and some towns; but none is of any importance, except the cap. AMAXICHI (which see).

The ancient Leucas once formed a part of the continent; for Homer expressly terms it *Ἀχαιῶν Ἡρώεα*, in opposition to Ithaca and Cephalonia. So late as the time of Thucydides, the Peloponnesian fleet was more than once conveyed across the isthmus; and Livy informs us, that it had its peninsular shape even in the Macedonian war. *Leucadia, nunc insula et vadoso freta quod perfossam manu est, ab Acarnania divisa, tum peninsula erat occidentis regione artius faucibus cohærens Acarnanie.* *Quingentos ferme passus longa fœces erant; late haud amplius centum et viginti.* In his *angustis Leucas posita est, colli apicula verso in orientem et Acarnaniam.* (*Iliad*, lib. xxxiii. 17.) The cut here mentioned, called Dioryctus, was 3 stadia in length, and, in Strabo's time, was crossed by a bridge. The famous Leucadian promontory (now *Cape Ducato*) is a long ridge of white marble rocks, projecting S. about 2 m., terminating in a precipice 200 ft. high. It was surmounted by a temple of Apollo, and Virgil represents it as an object of dread to mariners:—

*Mox et Leucææ nimboea cacumina montis,  
Et formidatus nautis aperitur Apollo.* *Æn.* iii. 274.

but it is wholly indebted for its immortality of renown to its being

The Lover's refuge, and the Lesbian's grave,

—the spot whence Sappho precipitated herself into the ocean, resolved either to recover the affections of Phaon, or to die in the attempt. (See *Ovidii Epist. Sappho Phaoni*, lin. 165, &c.)

Not far from the promontory stood the very ancient town of Nerium, mentioned by Homer as *Νηριεύων πόλις*, "a well-built city," and of which there are still some small vestiges. The position of the ancient Leucas is fixed by Livy in the above passage close to the narrow strait which divides the island from Acarnania; and Dr. Holland mentions the ruins of an ancient town about 2 m. S. of Amaxichi, exhibiting the remains of massive old Greek walls, ascending a narrow ridge near the sea, and of numerous sepulchres, which appear among the vineyards covering its declivity. (*Travels in Greece*, p. 63.) The modern history of Santa Maura is closely connected with that of the Ionian Islands generally; and to that article the reader is referred. (*Holland*, ii. 34.; see also *Dudwell's Greece*, i. 62, &c.)

MAURITIUS (THE), or ISLE OF FRANCE, an island in the Indian Ocean, belonging to Great Britain, situated between 19° 58' and 20° 32' S. lat., and 57° 17' and 57° 46' E. long., from 70 to 80 m. N.E. the Isle de Bourbon, and 500 m. E. Madagascar. It is an irregular oval; length, N.E. to S.W., about 36 m.; breadth varying from 10 to 27 m. Area estimated at nearly 500,000 acres. Pop., in 1836, 92,147, of whom 29,612 were whites and free people of colour, 61,045 apprenticed labourers (blacks), now also free, and 1,490 strangers. "From whatever quarter it is approached, the aspect is singularly abrupt and picturesque. The land rises rapidly from the coast to the interior, where it forms three chains of mountains, from 1,800 to 2,000 ft. in height, intersecting the country in different directions. Except towards the summit, these are generally covered with wood, and in many parts cleft into deep ravines, through which numerous rivulets find their way to the low grounds, and terminate in about 20 small rivers, by which the whole line of coast is well watered, from the foot of the mountains to the sea. Though, from its mountainous and rugged character, a great part of the interior is not available for any useful purpose, yet extensive plains, several leagues in circumference, are to be found in the high lands; and in the valleys, as well as along the coast, most of the ground is well adapted either for the ordinary purposes of agriculture, or for raising any description of tropical produce. Extensive forests still cover a considerable portion of the districts of Mahébourg, the Savanna, and Flacq, and in the centre of the island are several small lakes. The soil, in many parts, is exceedingly rich, consisting either of a black vegetable mould, or a bed of stiff clay of considerable depth; occasionally the clay is found mixed with iron ore

and the *débris* of volcanic rock. In the neighbourhood of Port Louis, and generally in the immediate vicinity of the sea, there is but a scanty covering of light friable soil over a rocky surface of coralline formation. The whole coast is surrounded by reefs of coral, with the exception of a few openings, through which vessels can approach the shore; and at these points the different military posts for the defence of the Island have been established. There is a marked difference in the climate of this island in different situations; the windward (or S.E.) side enjoying a lower temperature by several degrees than the leeward (N.W.), owing to the cooling influence of the S.E. breeze, which prevails during most part of the year.

In so far as regards temperature, rain, physical aspect, and diversity of climate, this island exhibits a very striking resemblance to Jamaica; though, being S. of the line, the seasons are reversed; summer extending from Oct. to April, and winter during the rest of the year. The principal rainy season is from the end of December to the beginning of April, but showers are frequent at all times. Hurricanes are of frequent occurrence, and create great devastation, with much loss of life; they principally occur in January, February, and March. "So far as can be ascertained from the statistical returns of the island, the climate does not exert any prejudicial influence on the health of the white resident pop., though it is by no means favourable to the negro race." (*Tut- loch's Report on the Sickness, &c., of the Troops in W. Africa, &c.*, p. 3, 4, c.)

Previously to 1825, the sugar and other articles imported from the Mauritius into Great Britain were charged with the same duties that were laid on such articles when imported from India. But, at the epoch now alluded to, the produce of the Mauritius was admitted into our markets at the same duties as W. Indian produce, which were then materially lower than those imposed on the produce of our Eastern possessions. This alteration of the duties gave a great stimulus to cultivation in the Mauritius, particularly to that of sugar, which has since been raised, to the almost total exclusion of coffee, cotton, and indigo, that were previously produced in considerable quantities, the coffee especially being of excellent quality. Wheat and maize are raised in small quantities, with yams, manioc (introduced by the French), potatoes, bananas, and other vegetables. But the island is almost wholly indebted for its supplies of provisions to Hindostan, the Cape of Good Hope, Madagascar, the Isle de Bourbon, &c. Next to sugar, blackwood, or ebony, of which there is an immense supply, and tortoise-shell, are the principal articles of export.

The exports of sugar from the Mauritius amounted, in 1812, to less than one million lbs. In 1814 they amounted to 1,034,224 lbs.; and, in 1818, to 7,509,380 lbs. Since then, and especially since the modification of the duties in 1825, there has been a most extraordinary increase in the export of sugar from the island. It amounted in

	lbs.		lbs.
1820 to	15,524,755	1835 to	64,544,515
1825 -	21,739,766	1836 -	63,557,317
1826 -	42,189,416	1837 -	68,478,874
1830 -	67,946,692		

But the exports of other things are comparatively trifling; having amounted, in 1836, to only 15,819 galls. rum, 23,358 lbs. cloves, and 664,369 lbs. ebony.

In 1837, the total value of the imports amounted to 1,035,783*l.*, of which cotton manufactures and other articles from Great Britain made 345,714*l.* The total value of the exports (including 77,792*l.* for imports re-exported) during the same year, amounted to 831,050*l.*, of which, sugar produced no less than 739,972*l.*; of the total export of sugar that year, amounting to 68,478,874 lbs., 57,150,444 lbs. were shipped for Great Britain, 7,585,197 lbs. for New South Wales, 3,226,703 lbs. for the Cape of Good Hope, and some small quantities for other places. Among the imports were 54,685,000 lbs. of rice, and nearly 5,000,000 lbs. of wheat, from India; with considerable, though far less extensive, supplies from the Cape and Madagascar. During the same year, 433 British ships, of the aggregate burden of 95,831 tons, and 65 foreign ships, of the burden of 16,492 tons, entered the ports of the island.

Nine tenths of the sugar produced in the island, comes to England. We have seen above the distribution of the shipments in 1837; and it appears, from the customs' returns, that we imported, in 1838, 67,874,128 lbs.; and, in 1839, 69,294,460 lbs., from the Mauritius. We believe, however, that the culture of sugar in the Mauritius has attained to a maximum. Indeed, the fair presumption seems to be that, in future, it will decline rather than increase. We found this opinion partly and principally on the greater natural facilities enjoyed by India for the culture of the cane, and partly, also, on the influence of the abolition of slavery, in lessening the supply of labour in the island.

The emancipation of the slaves in the Mauritius does  
\* These are French lbs., and are about 9 per cent. heavier than English lbs.

not appear to have been so prejudicial to agriculture as in the W. Indies. By way of supplying the demand for labour, a considerable number of hill-coolies have been brought from Hindostan; but it has been contended, and we believe truly, that, despite the regulations under which the coolies were introduced, they would be, in fact, little else than slaves; and their introduction has, in consequence, been stopped. Chinese settlers have also been introduced, but not in any considerable numbers.

The government is vested in a governor, with a salary of 7,000*l.* a year, and a colonial legislative council, subordinate to the orders of the sovereign in council. The governor is aided in his duties by an executive council, composed of the military officer second in command, the colonial secretary, and the advocate-general. The legislative council is composed of 15 members, 7 of whom hold no official situation. Justice is administered in a supreme civil and criminal court, with three judges, a petty court from which there is no appeal, and such other minor courts as the governor may see fit. Several provisions of the old French law continue in force. The troops employed in this command have consisted either of two complete, or the service-companies of three, regiments of the line, with one company of sappers and miners, and half a company of artillery. The service-companies of two corps, with the head-quarters of the artillery and sappers and miners, are generally at Port Louis; those of the other corps are distributed between the different stations on the windward side of the island, having their head quarters at Mahébourg. The public revenue, in 1835, amounted to 187,780*l.*, and the internal colonial expenditure to 177,740*l.*, leaving a surplus of about 10,000*l.*, which was to be paid over in aid of the expenditure incurred in Great Britain, in the same year, on account of the colony, amounting to 78,284*l.* (*Port. Paper*, No. 632, Sess. 1840.) The greater portion of the revenue is derived from the customs' duties received at Port Louis.

Port Louis, or N.W. port, the cap, and seat of government, is on the N.W. side of the island, in lat. 20° 9' 6" S., long. 57° 28' 41" E. Pop. 26,000. It is situated at the bottom of a triangular bay, the entrance to which is rather difficult. Every vessel approaching the harbour must hoist her flag and fire 2 guns; if in the night, a light must be shown, when a pilot comes on board, and steers the ship to the entrance of the port. It is a very convenient port for careening and repairing, but provisions of all sorts are dear. In the hurricane months, the anchorage of Port Louis is not good, and it can then only accommodate a few vessels. The streets are tolerably regular; but the houses are low, and are principally built of wood. It has extensively, but generally very filthy suburbs. It suffered severely from fire in 1816, and from the cholera in 1819. The town and harbour are pretty strongly fortified. At the W. extremity of the town are some extensive and commodious barracks; and about ½ m. distant is the hospital, on a peninsula of coral rock, jutting into the sea. Mahébourg, in a healthy situation on the S.E. coast, with an excellent harbour, was opened to ships from distant countries in 1836.

The Mauritius has numerous small dependencies between lat. 30° and 20° S., and long. 50° and 70° E. The chief of these are the Seychelles islands, between lat. 4° and 8°; about 930 m. N. from the Mauritius; one of which, Mahé, is 16 m. long, by from 3 to 4 m. broad; fertile, well-watered, very healthy, and having a pop. of about 7,000. Mahé, its chief town, has on its N.E. side about 100 wooden houses, and a garrison of 300 men.

The Mauritius was discovered, in 1505, by the Portuguese. The Dutch took possession of it in 1598, and named it Mauritius, in honour of Prince Maurice. They made a settlement in it in 1634, which, however, they abandoned early in the next century. The French having, in 1673, occupied Bourbon, sent occasional settlers to the Mauritius, and, on its evacuation by the Dutch, they established a regular colony in the island in 1715, of which, however, they did not take formal possession till 1721. But the real founder of this important settlement was the justly celebrated M. de la Bourdonnaye, appointed governor in 1734. The Isle de France had hitherto been neglected for that of Bourbon, and was, at the arrival of the new governor, in the most impoverished and disordered state imaginable. But M. de la Bourdonnaye immediately perceived the importance of the island, which its two excellent harbours rendered of the greatest consequence to any European power having, or wishing to have, possessions in India; and he set about its improvement with a zeal, sagacity, and success that have rarely been equalled, and never surpassed. Besides extending the culture of the sugar cane, coffee, cotton, and indigo, he introduced the manioc from S. America, and cinnamon, cloves, pepper, &c., from the Dutch islands; though the latter, with the exception of cloves, have not answered his expectations. He fixed the seat of government at Port Louis,

which he may be said to have created as well as fortified; and constructed numerous roads, aqueducts, and other useful public works. His administration continued only for 11 years; and in that short space he contrived to change the whole aspect of the country, and rendered it a most prosperous and valuable colony.\* Even after the possessions of France in India had all fallen into our hands, the Mauritius continued to be of importance to her, and proved how justly M. de la Bourdonnaye had appreciated its capabilities as a naval station. It was estimated that, during the first 10 years of last war, the value of the British ships captured by privateers and other cruisers from the Mauritius amounted to 2,500,000*l*. At length, a formidable armament being sent against it in 1810, it surrendered to our arms, and was definitively ceded to us in 1815.

Every body knows that this island is the scene of St. Pierre's inimitable tale of Paul and Virginia. The wreck of the *St. Geran*, so striking and affecting an incident in the story, is a real event, which took place on the 18th of August, 1744. (See *Almanac de l'Isle Maurice pour 1837*; and *Part. Papers*.)

MAYBOLE, a bor. of barony and market-town of Scotland, co. Ayr, distr. Carrick, of which it is the cap., on the slope of a hill with a S. exposure, 8 m. S. Ayr, and 38 m. S. by W. Glasgow. Pop. in 1837, 4,000. The town consists mainly of an antique well-built street, interspersed with numerous modern buildings. The superiority of the old houses is owing to Maybole having been, in ancient times, the town residence of the aristocracy of Carrick; and the remains of no fewer than 28 baronial mansions are still more or less entire. Of these the most imposing is "the Castle," once occupied by the Earl of Cassillis, the principal part of which is still standing. The only modern building is the parish church, erected in 1808. There is also a dissenting chapel. Hand-loom weaving, in connection with the Glasgow cotton manufactures, is extensively carried on, employing from 600 to 800 hands. The weavers are mostly Irish; boys and females also engage in the work, and perpetuate the poverty inseparable from the business. A weekly market is held in the town; and it has a bank, and a savings' bank. The parish school and the other schools bear a good character. There are 2 subscription and 2 circulating libraries. Poor-rates have not been introduced; but, when occasion requires, the inhab. and landowners submit to a voluntary contribution to meet the case.

Maybole, being the cap. of the bailiery of Carrick, was the seat of the courts of the district previously to this abolition of hereditary jurisdictions in 1747. The remains of Crossraguel Abbey are situated close to the town, on the W. A celebrated disputation, which lasted three days, between Quintin Kennedy, one of its abbots, and John Knox, took place, in 1561, in a house in Maybole, now "the Red Lion Inn;" it is needless to add, that it ended, as is universally the case with such disputes, in a drawn battle, each party claiming the victory, and conceiving that he had demolished his antagonist. (*McCr's John Knox*, p. 241, ed. 1839; *New Statistical Account of Scotland and Ayrshire*, p. 348.)

MAYENNE, a dep. of France, reg. N. W., formerly comprised in the prov. of Maine; between lat. 47° 45' and 48° 34' N., and long. 0° 5' and 1° 20' W., having N. Manche and Orne, E. Sarthe, S. Maine-et-Loire, and W. Ille-et-Vilaine. Length, N. to S., 55 m.; average breadth about 30 m. Area, 514,968 hectares. Pop. (1836) 352,586. A mountain chain, though of no great height, bounds Mayenne to the N., from which two ranges strike off to the S., one forming the E., and the other a part of the W. boundary of the dep. It slopes generally from N. to S., in which direction it is intersected near its centre by its principal river the Mayenne. The latter rises in the dep. of Orne, about 12 m. W. Alençon, running at first S. W., and afterwards generally S., through the depts. of Mayenne and Maine-et-Loire; in the last of which, after receiving the Sarthe and Loire, it assumes the name of the Maine, and falls into the Loire, after an entire course of nearly 130 m. (See also MAINE-ET-LOIRE.) Mayenne, Laval, Château-Gontier and Angers are on its banks. There are numerous small lakes in this dep. In 1834 it was supposed to comprise 354,298 hectares of arable land; 69,338 do. pasture; 26,379 do. woods; and 24,429 do. heaths, wastes, &c. More corn is grown than is required for home consumption. In 1835, the total produce was reckoned at upwards of 3,000,000 hectol., chiefly wheat, oats, and rye. The annual produce of cider is said by Hugo to be about 600,000 hect. Some inferior wine is produced, but in small quantities only. Flax, hemp, chesnuts, and some other fruits,

are the other principal products. Property is very much subdivided; and many of the farms, or rather patches called *closeries*, are so very small that they do not admit of the use of the plough, and are cultivated by the spade only. In 1835, of 86,503 properties subject to the *contribution foncière*, 27,337 were assessed at less than 5 fr., 13,009 at from 5 to 10 fr., and 13,231 at from 10 to 20 fr., and only 17 were assessed at 1,000 fr. or upwards. We need not, therefore, be surprised to learn that the occupiers are generally destitute of either capital or enterprise, and strongly attached to routine practices. In 1830, there were about 214,000 head of cattle and 144,000 sheep in the dep.; the produce of wool being estimated at 175,000 kilogr. a year. The woods yield excellent timber, a good deal of which is appropriated to ship-building. Some extensive manufactures of linen stuffs and yarn were formerly established at Laval and Château-Gontier. But though these have fallen off, the linen and cotton fabrics, including printed handkerchiefs, &c., of the dep., still enjoy a high reputation. The iron trade of Mayenne is of considerable importance; and it also furnishes superior paper. It is divided into 3 arronds; chief towns, Laval the cap., Mayenne, and Château-Gontier. It sends 5 mems. to the Ch. of Dep.; number of electors (1839), 1,716. Total public revenue (1831), 6,666,211 fr.; and expenditure, in the same year, 3,791,530 fr. (*Hugo*, art. *Mayenne*; *Official Tables*.)

MAYENNE, a town of France, in the above dep., cap. arrond., on both sides the Mayenne, 18 m. N.N.E. Laval. Pop. (1836) 8,790. Five w.-p. roads radiate on the right, or W., bank of the river; the portion on the opposite bank, though comprising a third of the entire pop., being only a suburb. They are connected by a bridge. This is an ill-built town; its streets are steep, irregular, and inconvenient, and its houses old and odd-looking.

Mayenne has a ruined castle, two par. churches, two hospitals, a good town-hall, &c.; and manufactures of linen and cotton fabrics; the former of which has, however, greatly declined of late years, while the latter has increased. (*Hugo*, art. *Mayenne*; *Guide du Voyageur*.)

MAYN, or MAIN, a river of Central Germany, which has its source in Bavaria. It is formed by the union, about 24 m. N.W. Bayreuth, of the White and Red Main; the former rising in the Fichtelberg, and the latter in the Frankenjura, about 8 m. S.E. Bayreuth. The resulting river flows, with a gentle current, generally W., but with a very tortuous course; first traversing the circles of Upper and Lower Franconia, in Bavaria, then dividing Hesse-Cassel and Nassau, on the N., from Hesse-Darmstadt, on the S., and intersecting the territory of Frankfurt; till it ultimately falls into the Rhine, nearly opposite Meitz, after an entire course of about 230 m. Though shallow, it is of equal depth, and is navigable throughout 7-8ths of its extent, as far as the confluence of the Regnitz, near Bamberg. The Main is of considerable importance as a means of traffic; and Frankfurt, especially, owes all its consequence, as a commercial city, to this river. But few rivers, at least in civilised countries, presenting such facilities for improvement, have been more neglected; and, in addition to other inconveniences, the number and amount of the tolls levied on the Main oppose serious obstacles to its navigation. A vessel, in passing from the Rhine to Wertheim, in Baden, has to pay tolls amounting to 23 kreutzers per cwt., or 14*s*. a ton, besides fees, &c. A commission has, however, been recently appointed, for examining the state of the river, and introducing some improvements. The Main will, probably, at no distant period, form a part of the line connecting the Rhine and the Danube; a canal having been already commenced, which is to run from Dietrichshaus, on the Altmühl, to Bamberg, on the Regnitz. Besides the Regnitz, the Tauber, Mümling, and Gersprenz are its chief tributaries from the S., and the Rodach, Spalt, Kitzgr., and Nidda from the N.; Bayreuth, Bamberg, Würzburg, Aschaffenburg, Hanau, Offenbach, and Frankfurt are either on, or immediately adjacent to, the banks of the Main. (*Dict. Glog.*; *Berghaus*; *Private Inform.*.)

MAYNOOTH, an inland town of Ireland, prov. Leinster, co. Kildare, on the Liffey Water, an affluent of the Liffey, 14 m. W. Dublin. Pop. in 1841, 2129. It is without trade, and depends principally for its support on the contiguous college. It has a par. church, a Rom. Cath. chapel, and the ruins of a large castle, once occupied by the family of Kildare.

The Royal College of St. Patrick, Maynooth, was founded in 1795, for the education of persons designed for the Roman Catholic ministry in Ireland. It is vested in a board of trustees, of whom the Roman Catholic archbishops are members *ex officio*; the remainder being selected from the Catholic hierarchy and nobility, in the proportion of 7 of the former to 6 of the latter. The government of the college is administered by a board of visitors, partly chosen by election, and

\* The signal services rendered by M. de la Bourdonnaye here and in India met with a most ungrateful return. On his return to France, in 1748, he was thrown into the Bastille, where he was imprisoned for more than three years, without, as it turned out, there being the smallest foundation for any one of the charges made against him! He died, the victim of this disgraceful treatment, in 1755. (See *Biographie Universelle*, art. *Made de la Bourdonnaye*.)

partly nominated by the Crown, under the provisions of the late act; but the powers of the visitors in general do not relate to or interfere with any matter having reference to the tenets, discipline, or authority of the Romish church. These important matters are entrusted to the care of the elected visitors, who must be members (and usually dignitaries) of the Roman Catholic church. The chief functionaries of the establishment are the president, vice-president, and 3 deans; besides whom, there are 3 professors of Divinity, and 7 others, giving instruction in various branches of literature and science. The number of students, on the first opening of the classes, in 1798, amounted only to 50; but it has since progressively increased to 450, to which it was limited, by the inadequacy of its funds to admit of further augmentation. But under the new regulations provision is to be made for 520 students. These are to be comprised, 250 in four junior classes, and 250 in three senior do., with a class of 20 superior students, who each derive, exclusive of other allowances, an income of 55*l.* a year from a fund left by a Lord Dunboyne for that purpose. The funds for defraying the expense of the establishment have hitherto been derived from an annual parliamentary grant (usually of 8,924*l.*), and from bequests and fees. These, however, have been quite insufficient for the proper support of an institution having to provide for the education of the Catholic clergy of Ireland. The salaries of the professors and the accommodations of the students were alike inadequate and paltry; while, despite this miserable economy, the institution was getting into debt, and the number of pupils was unequal to the wants of the priesthood. It is needless to say that the consequences of such a state of things were most prejudicial to the public interests; and to obviate these, and to place the institution on a footing more suitable to its important object, the annual parliamentary grant (of 8,924*l.*) has been changed in the course of the present year (1845) to a permanent grant of 26,360*l.* a year, a sum of 10,000*l.* being, at the same time, voted for the repair and enlargement of the buildings and library. The trustees of the college have been also authorised to hold such land and other fixed property as may be left for its behoof, up to the value of 3,000*l.* a year.

In consequence of this liberal addition to its funds, the emoluments of the professors, and the education and accommodation of the pupils, will be materially improved; so that the most beneficial effects may be expected to result from the measure,—directly, by the greater allurements it will hold out to professors of superior merit and attainments to enter the college; and indirectly, by the grateful sense which they and the pupils cannot but feel, of the liberality and munificence of the government. Hitherto the students have belonged, with but few exceptions, to the middle and lower classes of R. Catholic farmers and occupiers. Public examinations are held twice a year. The site of the establishment is a tract of 54 acres, adjoining the town; and the buildings, which form three sides of a quadrangle, comprise a chapel, refectory, library, lecture-rooms, dormitories, and professors' residences. The library contains about 10,000 vols., chiefly on theological subjects.

There certainly has been much to object to in the course of education hitherto followed at Maynooth; and the priests which it has sent forth have, for the most part, contrasted very unfavourably with those educated at foreign seminaries. We, however, are inclined to think that this untoward state of things has been principally ascribable to the poverty and destitution in which the college has hitherto languished. Its professorships could be no object to men of ability; and the teachers and students must have been equally disgusted when they compared the pittance allowed them by the state, with the vast sums lavished on the established church, though supplying only the wants of a small minority of the population. But a great change for the better may be now fairly anticipated. The new endowment will make chairs in Maynooth be sought after by men of superior attainments; while the better education, and the greater comfort in which the students will be supported, will make it be resorted to by a higher order of pupils, and will tend to soften prejudices and asperities, and to make the priests less indisposed to the English connexion.

Considering that Maynooth had received an annual grant of nearly 9,000*l.* a year since its foundation in 1795, the intolerant opposition made to the late wise and liberal measure could hardly have been anticipated. Happily, however, it has not been allowed to thwart its success, which is important not on its own account merely, but also as being (as we trust is the case) the first step towards that endowment of the Catholic clergy of Ireland, which is, in all respects, so indispensable to the well-being of the country.

MAYO, a marit. co. of Ireland, prov. Connaught; of which it occupies the N.W. portion; having N. and W. the Atlantic, E. Sligo and Roscomrion, and S. Galway. Area, 1,355,048 acres; of which 425,124 are unimproved

mountain and bog, and 57,940 water, consisting principally of Loughs Mask, Conn, Carra, &c. The coastline is extremely irregular, from its being more deeply indented with bays and arms of the sea than any other part of Ireland. On the W. it is fenced with numerous islands, and it has several fine harbours, of which, however, very little use is made. It has every variety of surface, rising, in parts, into high mountains and rugged wastes; but comprising, also, a large extent of comparatively flat and fertile land. The substratum is generally limestone; and, from the thinness of the soil and the humidity and mildness of the climate, it is better suited for grazing than for tillage. Property in a few hands. There were formerly some very extensive grazing farms in this co., but their number and size have been very greatly diminished within the last half century. Land being here indispensable to existence, the competition for small patches is quite intense; and it is said that any amount of rent that may be asked is sure to be promised! It was formerly usual to let land on the village, or partnership, system; but of late years this practice has luckily been getting into disuse. Unfortunately, however, the *con-acre* system seems to be rapidly extending; and this is, if possible, worse than the other. (See *ante*, p. 40.) Hence, notwithstanding the increase of cultivation, the condition of the great bulk of the occupiers of land has deteriorated, and is, at present, as bad as possible. Average rent of land, 8*s.* 6*d.* per imp. acre; but the best grazing lands fetch above 40*s.* per Irish acre. Iron used to be made in this co.; the works have, however, been long abandoned, on account of the want of fuel. It has, also, some valuable slate quarries; but its mineral riches have been but very imperfectly explored. The linen manufacture, which had been pretty widely diffused, has materially declined, and its place has not been occupied by any other department of industry. Principal rivers, Moy, Guhaden, Deol, Owenmore, and Robe. Principal towns, Castlebar, Ballina, and Westport. Mayo is divided into 9 baronies and 68 parishes. It sends 2 mems. to the H. of C., both for the co. Registered electors, in 1839-40, 2,185. In 1831, Mayo had 62,367 inhabited houses, 65,207 families, and 366,328 inhab., of whom, 179,595 were males, and 186,733 females.

MAZMET, a town of France, dép. Tarn, cap. cnt. on the Arnette, a tributary of the Tarn, 32 m. S. S. E. Albi. Pop. 1836, 4,438. Its pop. and prosperity are increasing; it has some manufactures of woollen cloth; several dyeing establishments and paper-mills, and considerable annual fairs for cattle, wool, &c.

MAZANDERAN, a prov. in the N. of Persia (an. a part of *Hyrcania*, separated from Irak-Adjemi by the lofty ridge of Elburg, and bounded N. by the Caspian Sea, E. by Khorassan, and W. by Ghilan. Length from W. to E., 200 m.; average breadth, 50 m.; area 10,000 sq. m. Pop. 150,000 (exclusive of the nomad tribes of Kadjars, Kodjajends, and Modanlis). The S. parts of the prov. are mountainous, abounding with oak-timber, and full of swamps; but the valleys are fertile, producing the finest rice in vast quantities. Besides many smaller streams, the Mazanderan has two principal rivers, both having their sources in the Elburg mountains, and falling into the Caspian Sea. With respect to temperature, the prov. may be divided into a warm and cold climate, the former being that of the flat country near the sea, and the latter that of the mountain-region: in all parts, however, the climate is extremely variable with respect both to temperature and moisture. (Fraser's *Caspian Sea*, p. 49.) Winter and spring are the healthiest seasons; for during the summer and autumnal heats, such exhalations arise from the fens and marshes overspreading this part of Persia, as to render the air most insalubrious. Agues and dropsies, rheumatism and eye-diseases, are the prevalent disorders, and the natives have generally a sallow and bloated appearance. Heavy rains fall in Oct., Nov., and Dec.: snow also falls, but never lies long on the ground; and in spring the rivers almost invariably overflow. The cultivation of rice is the most important branch of agriculture. Cotton and sugar, also, are raised; but the canes are small, and the produce is dark, moist, and of very inferior quality. Tobacco does not succeed, nor is opium much cultivated, though the poppy grows abundantly. Barley is sown occasionally in spring as a green crop for horses and cattle; it is cut about the middle of May, after which the ground is ploughed, and planted with rice. Wheat is little cultivated, and is of bad quality; but excellent flour is imported from Astrakhan. Unhusked rice is used as dry food for horses and mules. Silk was formerly raised only in small quantities, but it appears that since the government monopoly ceased some few years ago, more attention has been paid to it, and its price has fallen. The trade of the prov. is chiefly with Russia in rice, silk, and cotton, which it exchanges for silk, cotton, and woollen fabrics, corn, tobacco, cutlery, &c.

The inhabs. are described as "vain, ignorant, and arrogant, considering themselves as persons of mighty in-

portance, superior to all strangers. Their ignorance of every thing beyond their own prov. is profound to a degree hardly credible. Their bigotry in religious matters is excessive, though chiefly confined to forms; for there are few who do not transgress every article of inhibition; all of them drink strong liquors and eat opium. In their appearance and dress they greatly resemble other Persians; but swarthy and almost black men are of more frequent occurrence than elsewhere. The natives are regarded as the most warlike of the Persians; and, in the time of Timour Bee, they defended their retreats and castles with so much courage and ability, as to secure their independence. This prov. is also said to have been the grand seat of the war between the Sefeed Deevee (or White Demon) and Rustom, prince of Zablestan; and the relief of his sovereign, who had been besieged in the city of Mazanderan, is one of the most glorious exploits recorded in the life of the Persian hero. The chief cities are Sari, Balfrosh, Ferahad, and Amul. Most of the towns and villages are open, well built, and delightfully situated either on verdant hills or in fertile and well-watered valleys. Among the numerous public works of Shah Abbas the Great, is a magnificent causeway of great length, running nearly parallel to the Caspian. The pavement, even now, is perfect in many places, though it has hardly ever been repaired. In some places it is above 20 yards wide, with ditches on each side; and on it are many bridges, under which the water is conveyed to the rice-fields. (*Fraser's Trav. on the Shores of the Caspian*; *Kinnear*, &c.)

MAZZARA (an. *Emporium*, or *Massara*), a sea-port town of Sicily, on its W. coast, intend. Trapani, cap. distr. on the Salami (Mazara), at its mouth, 11 m. S.E. Marsala, lat. 37° 33' 56" N.; long. 12° 28' E. Pop., in 1831, 8,365. It is surrounded by an old wall of Saracenic construction, flanked by small square towers, and has an old ruinous castle at its S.W. angle. The domes of its churches give Mazzara an imposing aspect from the sea; but the contrast, on entering the town, is no less striking. The streets are narrow, unpaved, filthy, and swarm with pigs: the public buildings, for civil purposes, are large, heavy, and mean; and those for ecclesiastical purposes, being very numerous, we need not wonder that it should have become a common saying, "that every house in Mazzara has a priest and a pig;" the latter being by far the more useful animal of the two. The principal square has a singular appearance, from the antiquated style of its architecture; probably of the 11th century, from its having an equestrian statue of Count Roger destroying a Saracen, over the cathedral gate. Besides the cathedral, an edifice, remarkable for its fine cupola, the principal buildings in this square are the bishop's palace, the senate-house, and the residence of Count Gazzi. "In the cathedral porch are preserved three sarcophagi; the finest of them bears a bas-relief, representing the battle of the Amazons; the second, the rape of Proserpine; the third, and most inferior, the Caledon hunt. At the convent of St. Michael is a Roman tomb, and some marble inscriptions; these, with a small collection of Punic, Saracenic, and Roman coins, are nearly the sum of the antique remains. Nor are there any modern specimens of the fine arts." (*Smyth's Sicily*, 225.) Mazzara has an hospital, a college, and a theatre. Its port, which now, as in antiquity, is formed by the mouth of the river Salami, is convenient enough for boats and small craft, but larger vessels are obliged to anchor in an exposed roadstead, in from 8 to 10 fathoms water. The entrance of the port is ornamented by a statue of St. Vitus, the tutelary saint of the town, in whose honour a festival is held here in August. Notwithstanding the badness of its port, Mazzara enjoys a considerable trade. It has a *carri-cattori*, for the warehousing of corn, of which it exports considerable quantities; and it also exports pulse, wine, fruit, fish, barilla, madder, oil, and soap. (*Smyth's Sicily*, 221-228, &c.)

Mazzara, or Emporium, was taken by storm by Hannibal, previously to his commencing the siege of Selinus; but it does not appear to have been a place of much importance in antiquity. There can, however, be no doubt, were Sicily subject to a vigorous and enlightened government, capable of developing its gigantic resources, that Mazzara would rise to very considerable distinction as a shipping port. It was here that the Saracens landed when they invaded and conquered Sicily. (*Smyth's ubi supra*; *Ancient Universal History*, xvii. 360. &c. ed. *Hoare's Classical Tour*, &c., i. 75-77.)

An extraordinary phenomenon, called the *Marobeca*, being a violent agitation of the sea, is witnessed on this part of the Sicilian coast. "Its approach is announced by a stillness in the atmosphere, and a lurid sky; when suddenly the water rises nearly 2 ft. above its usual level, and rushes into the creeks with amazing rapidity; but, in a few minutes, recedes again with equal velocity, distributing the mud, and occasioning a noxious effluvia; during its continuance, the fish float quite helpless on the turbid

surface, and are easily taken. These rapid changes generally continue from half an hour to upwards of two hours, and are succeeded by a breeze from the S., which quickly increases to heavy gusts." Captain Smyth has some speculations as to the cause of this singular phenomenon, for which we beg to refer to his work. (*Smyth's Sicily*, pp. 224-228.)

MEATH, a mut. co. of Ireland, on its E. coast, prov. Leinster, having N. the cos. of Louth, Monaghan, and Cavan, W. Westmeath, S. King's Co. and Kildare, and E. Dublin and the Irish Sea. Area, 567,127 acres, of which only about 5,600 are said to be unimproved or waste. Surface mostly flat, or only slightly undulating; soil, clay or loam, on limestone or gravel, and generally very fertile. Grazing used formerly to be the principal occupation; but, since the close of the American war, tillage has been gradually extending, and is now spread over more than 4-5ths of the co. Notwithstanding the richness of the soil, and the favourable situation of Meath, the state of agriculture, and of the great bulk of the occupiers, are alike bad. A rotation of crops is only beginning to be introduced; corn frequently follows corn for a long series of years; when fallows do occur, they are in general wretchedly executed, so that the land is in general foul and in bad order. Latterly, however, a better system has begun to make its way into the co., and the stock and implements of husbandry have been a good deal ameliorated. Even the better sort of farmers are, for the most part, very badly lodged; and the cabins of the cottagers and labourers are in the last degree filthy and wretched. Potatoes constitute 4 of the food of the bulk of the people; oatmeal and churned milk are sometimes added, but they rarely taste butchers'-meat, the pig being usually sold to assist in paying the rent. There are some large estates; but property is better divided than in most Irish cos. Tillage farms vary from 5 to 50, and some few extend to 100 acres. Average rent of land, 18s. an acre, which is higher than that of any other Irish co., except Dublin. Minerals and manufactures of no importance. Irish language pretty generally spoken. Principal river, the Boyne. Principal towns, Navan and Kells. Meath is divided into 12 baronies and 147 par. In 1831, it had 29,796 inhab. houses, 31,632 families, and 176,826 inhab., of whom 88,993 were males, and 87,833 females.

MEAUX (an. *Jatinum*, afterwards *Meldū*), a town of France, dep. Seine-et-Marne, cap. arrond., on both sides the Marne, which is here crossed by an old stone bridge, 24 m. E.N.E. Paris. Pop. in 1836, 7,774. It is pleasantly situated, and is tolerably well built. Its ramparts have been laid out in public walks; and it has some good promenades along the river, and a spacious public square. The cathedral, one of the most remarkable Gothic edifices in France, was begun in 1282, but not finished till the 16th century; it is 328 ft. in length, 137 ft. in breadth; the height of its vault being 150 ft., and that of its tower 213 ft. Its choir and sanctuary are extremely elegant; but it derives its chief interest from its containing the remains and monument of Bossuet; who, having been raised to the bishopric of Meaux in 1681, continued in possession of the see till his death, in 1704. The controversial writings of this great glory of the Gallican church display extraordinary learning and acuteness; but it is to his *Discours sur l'Histoire Universelle*, and his *Oraisons Funèbres*, that he is mainly indebted for his imperishable renown. Exclusive of the cathedral, the public buildings comprise the episcopal palace, in which is the writing-table of Bossuet, a public library, with 14,000 vols., the college, town-hall, theatre, two asylums, a Protestant and two par. churches, and cavalry barracks. Meaux has manufactures of cotton stuffs, earthenware, and glue. Numerous flour-mills are constructed on the Marne, the produce of which is sent to Paris, and the town has a good deal of trade in this and other articles of farm produce; its traffic is greatly facilitated by the canals of Ourey and Corbion. Meaux is very ancient: it was made a bishopric in 375; was twice sacked by the Normans in the ninth century; and was annexed to the French crown by Philippe-le-Bel. The French Protestants first preached publicly in this town, and it was the first that abandoned the league, and submit to Henry IV. (*Hugot's Hist. Seine-et-Marne*, &c.)

MECCA, one of the most famous cities of the eastern world, the birth-place of Mohammed, and the great centre of attraction to all the pilgrims or *hajjis* of the Mohammedan faith, in Arabia, prov. El-Hedjaz, 51 m. E. from the port of Djidda (which see), on the Red Sea, and 270 m. S. by E. Medina; lat. 21° 28' 17" N., long. 40° 15' E. Pop. 28,000. This celebrated city, which, being forbidden ground to Christians, was known to Europeans only through indirect and suspicious information from Mohammedans or African renegades, was a few years ago visited, in disguise, by Burckhardt; who has given a very full though rather tedious description of the localities, climate, inhabitants, government, religious ceremonies, and pilgrim visitors, not only of this city, but also of Medina (which see). Mecca

(literally meaning "the place of assembly," but pompously entitled by the Arabs *Om-el-Kora*, "mother of towns," and *Beled-el-Amwy*, "region of the faithful") stands in a long, narrow, barren, sandy valley, running N. and S.; called in the Koran "the valley without seeds." It is a straggling town, nearly 2 m. in length, but nowhere more than about 600 paces in breadth; the streets, which are irregular, unpaved, and dusty, are generally wider than those of other eastern cities. The handsomest entrance is from Djidda, the S.W. quarters comprising some of the best houses; but on the other side of the great mosque, which is the nucleus of Mecca, there are 3 or 4 other good streets; the best of which, perhaps, is the *Mesaa*, the great resort of the Turkish pilgrims, and the noisiest, as well as most frequented, part of the town. "Indeed," says Burckhardt, "the *Mesaa* resembles a Constantinopolitan bazaar. Many shops are kept by Turks from Europe and Asia Minor, for the sale of swords, watches, copies of the Koran, and second-hand Turkish dresses; and there are numerous vendors of pices, sweetmeats, &c. Here, too, are numerous coffee-houses, crowded during the Hadj from 3 in the morning till 11 at night; butchers' shops, auction rooms, &c. W. of the *Mesaa* branches off a street called *Soueyga*, or the Little Market, which though narrow, is the neatest street in Mecca, being regularly cleaned and sprinkled with water. Here the rich India merchants offer for sale their piece-goods, Cashmere shawls, muslins, perfumes, Mecca balsam, aloewood, civet, &c., strings of coral, necklaces of carnelian, seal-rings, and various kinds of China ware, and Abyssinian slaves. In fact, the *Soueyga*, being the coolest spot in the town during mid-day, is on that account the most frequented; and here all the gentlemen-hadjis take their morning and evening lounge, smoke their pipes, and hear or tell the news." (*Burckhardt's Arabia*, i. 212-219.)

The quarter called *Shamye* is likewise well built, being chiefly inhabited by merchants or *olemas* (clergy) attached to the mosque, and frequented at the pilgrim-time by merchants from Damascus; in whose shops are found silks, cambrics, gold and silver thread, handkerchiefs, carpets, dried fruits, pistachios, &c. Near those last mentioned, also, is another respectably-built quarter, called *Garara*, inhabited by some of the wealthiest native merchants. These are certainly the best parts of the town, comprising lofty stone houses, often 3 stories high, surmounted by handsome terraces, and (what is unusual in eastern towns) having rows of windows fronting the streets. The town, however, is not lighted, is scantily supplied with water, and contains many quarters, which, in filth and closeness, might vie with the dirtiest parts of Constantinople. Though once walled on 3 sides, Mecca is at present entirely open; but the neighbouring mountains are sufficiently high to form a tolerably strong barrier against an enemy; and on the rising ground S. of the city stands the great castle, a massive square structure, with thick walls and solid towers, comprising a bomb-proof magazine, a reservoir for water, and accommodation for 1,000 men. With this exception, Mecca may be said to be almost destitute of public buildings; for the houses belonging to the sheriffs, though handsome, are merely private, and not large dwellings, and the *medreses*, or colleges, are now converted either into store-houses or lodgings for pilgrims. This circumstance is, no doubt, attributable to the veneration of the people for their holy house, and this feeling prevents them from erecting any structure which might seem to rival the great object of their affection.

The *Beitullah*, otherwise called *El Haram*, the chief glory of Mecca, and the resort of every pious Mussulman who regards the injunction of the Koran\*, is a building by no means remarkable either for size or beauty; standing on low ground, in an oblong enclosure about 350 ft. in length and 300 ft. in breadth, formed by colonnades, roofed with numerous small plastered cupolas, supported by 450 pillars, about 20 ft. in height, of marble, or Mecca stone. The temple has been so often ruined and repaired, that it has no traces of remote antiquity. The walls, arches, and minarets at the angles of the building are gaudily painted in stripes of yellow, red, and blue; but paintings of flowers in the usual Mussulman style are nowhere seen, and the colonnades are very clumsily paved. The

\* "They who shall disbelieve and obstruct the way of God, and hinder men from visiting the holy temple of Mecca, which we have appointed for a place of worship unto all men, - the inhabitant thereof and the stranger have an equal right to visit it, - and whosoever shall seek impiously to profane it, we will cause him to taste a grievous torment. Call to mind, when we gave the site of the house of the Kaaba for an abode unto Abraham, saying: 'Do not associate any thing with me; and cleanse my house for those who compass it, and who stand up and bow down to worship. And prelate unto the people a solemn pilgrimage, let them come unto thee on foot, and on every low camel, arriving from every distant road, that they may be witnesses of the advantages which accrue to them from the visiting, and may commend the name of God on the appointed days.' *Sura's Koran*, ch. 22.

Kaaba, or Holy House, which occupies the centre of the enclosure, and is the great attraction for all pilgrims, lays claim to a far more remote origin than that of Mohammedanism; and, though we may safely doubt the alleged fact of its having been built by Abraham and Ishmael, assisted by the angel Gabriel († there can be no question that its genuine antiquity ascends beyond the Christian era. In all probability, the Kaaba is alluded to by Diodorus Siculus, when speaking of a temple held in superior sanctity by all Arabians. In the second century Maximus Tyrius attributes to the Arabs the worship of a stone; and this, if not identical with, is, at any rate, analogous to the "black stone" of Mecca, which, as Gibbon justly remarks, is deeply tainted with the reproach of an idolatrous origin. (*Gibbon*, ix. 247.) The Kaaba, which was all but rebuilt in 1627, after having suffered great damage from fire, is an oblong massive structure, 18 paces in length, 14 do. in breadth, and from 35 to 40 ft. in height; its door being coated with silver, and embellished with gold ornaments. At the N.E. corner, near the door, is the "Black Stone" previously alluded to, obligingly brought by the angel Gabriel as his contribution to the building; it forms part of the sharp angle of the structure, and is 5 ft. above the ground; being oval-shaped, 7 inches in diameter, of a dark brown colour, somewhat resembling lava; and surrounded by a border of cement and silver, to prevent its being worn away by the kisses and touches of the pilgrims. Round the building is a broad marble pavement; and at the S.E. corner is another stone, much revered by all visitors, but of a less noble origin, and less holy than the other. The 4 sides of the kaaba are covered with a curtain of embroidered black silk stuff, called the *kisra*, annually brought from Cairo at the time of the Hadj, and renewed with some not very decorous ceremonies. The holy fountain of Zem-zem, (said to be so opportunely found by Hagar, when her son Ishmael was dying of thirst,) which supplies the town with water for *drinking or abluion* (its use for other purposes being forbidden), is enclosed in a substantial square building, having a handsome marble-faced entrance, with marble basins for abluion, and a room appropriated to the pilgrims, who come here in crowds to taste the miraculous fountain. From before dawn till near midnight, the well-room is constantly filled with visitors; all of whom, if not disposed to buy the services of the attendant, may themselves draw freely from the well. Various stories are about respecting the origin and virtues of this sacred spring, which, of course, are all believed by orthodox visitors, few of whom leave Mecca without carrying away some of the water in copper or tin bottles, to give away to their friends, and for their own use during illness, and their abluion after death. These are the chief buildings within the enclosure; but none of them can be considered as conserved, except during the hour of prayer; for at other times, barbers, and all kinds of retail vendors, porters, idlers, &c., are to be met with at every turn. (*Burckhardt*, vol. i. p. 278.) In several parts of the colonnade, public schools are held for the instruction of young children; while, in other parts, a few professors deliver theological lectures, which meet, however, with little patronage from the pilgrims, who, with all their anxiety to visit the holy house, are, like all Turks, too much attached to the *dolce far niente* to trouble themselves with the doctrines either of theologians or men of science. The exterior of the mosque is adorned with seven quadrangular minarets, from the summits of which a view is obtained of the busy scene around. There are 19 gates, distributed without any order or symmetry; and the outside walls are formed by the surrounding houses, which during the pilgrimage are let, at enormous rents, to the wealthiest hadjis, with whom it is a grand object to be as near as possible to the holy house. The windows of these houses overlook the inclosure; and hence their occupants are enabled to join in many of the mosque services without stirring from home. The service of the mosque occupies a vast number of people, as the Imams, Mullas, officers of the Zem-zem, Mueddins, Olemas, lamp-lighters, and menial servants, all of whom receive regular pay, besides sharing the presents made by the pilgrims. The revenues of the mosque were formerly very extensive; but its wealth has greatly declined, nor does it now possess any treasures except a few golden lamps, the establishment being kept up almost wholly at the expense of the sultan. The first officer of the mosque is the *Nayb el Haram*, or warden who keeps the keys of the Kaaba, receives the pilgrims' contributions, and directs the repairs of the building. Next to him is the Aga of the eunuchs, a body of about 40 negroes who perform the duty of police officers in the temple; preventing disorders, and washing and sweeping the pavement round the Kaaba. In the

† The curious reader is referred for a very full account of the traditional notions entertained by the Mohammedans respecting the origin, and antiquity of the Kaaba, to Burckhardt's *Travels in Arabia*, ch. 22, and works of well-known authority. (*Travels in Arabia*, i. 296-311.)

time of the Ramadan, or great festival, the mosque is particularly brilliant; not only from the number of pilgrims of every age, rank, and nation within the enclosure, but also from the thousands of lamps which illuminate the colonnades. On the termination of the Itad, however, the temple assumes a very different appearance. Disease and mortality, caused by fatigue, unhealthy lodgings, bad fare, and, in some cases, by absolute destitution, fill the mosque with the sick and dying; all of whom are anxious to have the satisfaction of expiring in view of the Kaaba, of receiving the Imam's prayers, and of being sprinkled with the sacred water of Zem-zem. Whoever enters Mecca, whether pilgrim or not, is enjoined by the law to visit the temple immediately, and not to attend to any worldly concern before he has discharged that solemn duty. Certain religious rites, such as walking seven times round the Kaaba, and reciting certain prayers, are performed in the interior of the mosque; then comes the ceremony of walking seven times between the hill of Szafa and Merona; and, lastly, the pilgrims must submit to have their heads shaved by the barbers of the mosque. All these ceremonies must be repeated by every Mussulman, who enters Mecca from a journey farther than two days' distance; and they must be again more particularly performed at the time of the pilgrimage to Arafat, a hill about 15 m. E. of Mecca, to which Mohammed used to retire to pray, and which, on this account, is esteemed particularly sacred by all Mohammedans.

The concourse of pilgrims to the holy mount is often immense. Burckhardt says he counted about 3,000 tents dispersed over the surrounding plain; but the greater number of the pilgrims were without tents: between 20,000 and 25,000 camels were to be seen scattered among the pilgrims, whose numbers, he concludes, must have exceeded 70,000. The camp was from 3 to 4 m. long, and between 1 and 2 m. in breadth. But we suspect that these returns are very decidedly beyond the mark; and the taste for pilgrimages is now rapidly declining throughout the Mohammedan world. A visit to Arafat is indispensable to the pilgrims; none by any chance omit it; nor can the title of Hadji be assumed except by those who have been present at the ceremony. Mecca, like Jerusalem, boasts of many places rendered sacred by tradition. The birth-place of Mohammed and his daughter Fatima, the tomb of his wife Hadja, and the cell where the prophet wrote the Koran, are shown to the pilgrims, who are expected to make contributions for their maintenance. But a visit to these places forms no item of religious duty; and but few depart in any way from the prescribed routine, as such acts would interfere with their profits either as merchants or beggars, and thus frustrate a very important, if not chief, object of the expedition.

The inhab. of Mecca are, with the exception of a few Hedjaz Bedouins, either foreigners or the offspring of foreigners. The ancient tribe of Koreysh, to which Mohammed belonged, is almost extinct; and there are now in Mecca only three or four Koreysh families, the head of one of which is the Naby, or keeper of the great mosque. The neighbourhood, however, of the great mart of Djidda, the annual arrival of immense caravans, and the holy house, attract thither vast multitudes of strangers; a portion of whom remain behind, and settle permanently in the city, adopting Arabian habits, and intermarrying with the native pop. The most numerous are the descendants of Arabs from Yemen and Hadramaut; next to them in numbers are those of Hindoo, Egyptian, Syrian, African, and Turkish origin; besides whom there are Persians, Afghans, Kurds, and people, in short, of almost every Mohammedan nation, all of whom are careful in preserving a traditional knowledge of their original country. The inhab., however, though differing so much, nationally considered, wear the same sort of dress, have the same customs, and care much less for national costume and manners than in any other part of the East. Their colour is a yellowish brown; and in features they closely resemble the Bedouins; the lower classes are generally stout, with muscular limbs, while the higher orders are distinguished by their meagre emaciated forms and black piercing eyes. All classes are fond of dress, and the earnings of the poor are mostly spent on clothes. The women wear Indian silk gowns, with large blue striped trousers reaching to the ankles, and a white kind of hood to cover the face. There are few families in moderate circumstances that do not keep slaves, most of whom are Nubians and Abyssinians, brought thither from the port of Suakin; many African females are kept as concubines; and, in case of their having issue, the masters usually legitimize the offspring by marrying them. The sale of concubines is confined to the middle and lower classes; the more wealthy regarding the practice as disgraceful. The inhab. of Mecca, as also of Djidda and Medina, are far more lively and communicative than either the Syrians or Egyptians, and in this respect they resemble the Bedouins. Indeed, vivacity of temper, acute intellect,

sagacity, and suavity of manner, are characteristics of almost all the native inhab.; while, at the same time, their proud, independent spirit, for which they are equally remarkable, is infinitely preferable to the cringing servility of the Turks of Anatolia and Syria. Religion exercises little control over them; and, though they are proud of aping the manners recorded of Mohammed, and thoroughly versed in the Koran, few Mussulmen are so inattentive to the moral duties inculcated by the Prophet. For the most part, indeed, they exhibit great profligacy of character. Drunkenness, gambling, cheating, false-swearing, and the grossest sensuality, are of every-day occurrence; and it is a common saying among the people, "Forbidden things abound in the city forbidden to infidels." Learning and science, which once flourished in Mecca, are now almost wholly neglected. The many *madresas*, or colleges, for which the city was formerly renowned, are turned either into corn-magazines or lodging-houses for pilgrims; its large libraries have disappeared; the great mosque is at present the only place where teachers of eastern learning are to be found; and the Meccaways themselves, who wish to improve in science, go to Damascus or Cairo.

The employments of the people are in trade and the service of the Beitullah; but there are few employed in the mosque who do not, clandestinely at least, engage in commercial affairs. There are but few artisans, and these much inferior in skill to the same class in Egypt; a few potteries and dye-works are the only manufactures, and the town is wholly dependent on other countries for its necessary supplies. Hence there is a large foreign trade; and the holy city is crowded, during the month of Dhalhaja (the latter end of June and beginning of July), not only with zealous devotees, but opulent merchants, who thus make use of the permission granted them by the prophet: "It shall be no crime in you, if ye seek an increase from your Lord by trading during the pilgrimage." (*Sa'd's Koran*, ch. ii.) During the whole twelve days that the pilgrims are allowed to remain, a fair or market is held in Mecca and its vicinity; and though the number of pilgrims has greatly declined of late years, it is still a crowded and bustling scene. "A few pilgrims," says Burckhardt, "except the mendicants (a very numerous class), arrive without bringing some productions of their respective countries for sale; and this remark is applicable as well to the merchants, with whom commercial pursuits are the main object, as to those who are actuated by religious zeal; for to the latter the profits derived from selling a few articles at Mecca diminish in some degree the heavy expenses of the journey. The Magrebins (pilgrims from Morocco and N. Africa) bring their red bonnets and woollen cloaks; the European Turks, shoes and slippers, hardware, embroidered stuffs, sweetmeats, amber, trinkets, &c.; the Turks of Anatolia bring carpets, silks, and Angora shawls; the Persians, Cashmere shawls and large silk handkerchiefs; the Afghans, tooth-brushes made of the spongy boughs of a tree growing in Bokhara, beads of yellow soap-stone, and plain coarse shawls manufactured in their own country; the Indians furnish the numerous productions of their rich and extensive region; the people of Yemen, snakes for Persian pipes, sandals, and various other works in leather; and the Africans bring various articles adapted to the slave trade. The pilgrims are, however, frequently disappointed in their expectation of gain, for want of money often obliges them to accept very low prices." The most respectable of the mendicant pilgrims are negroes (called here *Tchourrys*), and these apply themselves to labour immediately on their arrival at Mecca: some serve as porters, for the transport of goods and corn from the ships to the warehouses; some hire themselves to clean the court-yards, fetch wood, carry water, &c.; while others manufacture small baskets and mats of date leaves, or prepare the intoxicating drink called *honey*. The pilgrims are accommodated in lodgings, for which the inhab. charge a most exorbitant rent; and, in all, except those of the highest and lowest ranks, live together in a state of freedom and equality, keeping but few servants, and generally dividing among themselves the various duties of housekeeping. The two principal caravans which rendezvous at Mecca are those of Damascus and Cairo; both of which always arrive at fixed periods, generally a day or two before the departure of the Hadj for Arafat. The former of these is very large, and is, at the same time, very well regulated. The caravan of Cairo is much smaller, and its route, along the Red Sea, is more dangerous and fatiguing; but many of the Egyptian and African merchants now come by sea from Suez, Cosseir, and Suakin to Djidda, and thus avoid the weariness of a long land journey. The Persian caravan sets out from Bagdad, and crosses the desert; but it is now of little importance, as all but the poorest Persian pilgrims come round by sea from Bussorah, between which place and Djidda there is a large and steadily increasing trade.

The climate of Mecca is sultry and unwholesome; especially in August, Sept., and Oct., when a hot suffo-

ating wind prevails. The wet season is in Dec.; but the rains are not so continuous as in other tropical countries. Intermittent and inflammatory fevers, dysentery, elephantiasis, and stone, are common diseases; and, with respect to the general health of the town, Burckhardt says, "I seldom enjoyed perfect health while in Mecca: I was twice attacked by fever, attributable chiefly to bad water; and, even on those days when I was free from disease, I felt great lassitude, depression of spirits, and total want of appetite." (vol. i. p. 450.)

The territories of Mecca, Tayf, Goufade, and Yembo, were, previously to the Wahabee and Egyptian conquests, under the command of the Sherif of Mecca, who held his authority from the Grand Seignor; but when the Porte was no longer able to send large armies with the Hadj caravans to secure her power in the Hedjaz, the Sherifs became independent. The Wahabees (who are to the Mohammedan religion what the Protestants are to Christianity) took possession of Mecca in 1802, and retained it till 1813, when Mehemet Ali restored the holy cities to the nominal protection of the Porte, while at the same time he placed them effectually under his own control. (*Burckhardt's Arabia*, i. 171., *ad finem*, and ii. 1-86.)

MECHLIN (*Fr. Malines*), a city of Belgium, prov. Antwerp, cap. arrond., on the Dyle, a tributary of the Scheldt, and on the road between Antwerp and Brussels, 14 m. S.S.E. the former, and 14 m. N.N.E. the latter. Pop., in 1836, 22,896. The Dyle divides Mechlin into two parts. It is regularly laid out with broad, well-paved, and clean streets. Houses grotesque, antiquated, and frequently of a large size; but, being painted in front, they look clean and cheerful. The fortifications were demolished by the French, in 1804. The most remarkable public building is the cathedral, a Gothic edifice, commenced in the 12th century. The body of this building is by no means commensurate with the present altitude of the morisco tower attached to it, and still less with the height to which it was originally intended to be carried. This massive tower, with its truncated steeple, begun in 1452, is 370 ft. above ground, being the height of the cross of St. Paul's, London; and, had it been completed according to the original design, it would have been 640 ft. high. The Last Supper, the altar-piece, is by Rubens: the heads of the apostles and style of drapery are said to be in his best manner; but the Church is a failure, and the picture is milkwed. The church of the Récollets has the famous picture of the Crucifixion, by Vandike.\* "This," says Sir Joshua Reynolds, "is, perhaps, the most capital of all his works, in respect of the variety and extent of the design, and the judicious disposition of the whole. It may be considered as one of the first pictures in the world, and gives the highest idea of Vandike's powers." (*Reynolds's Works*, ii. 273. ed. 1819.) There are pictures by Rubens in the cathedral, and some of the other churches, of which the Adoration of the Mazi, in the church of St. John, is, probably, the best. After the churches, the bishop's palace, town-hall, arsenal and cannon foundry, the Franciscan convent, and the *Béguinage*, a large asylum for 800 widows, or aged women, are the principal public buildings. Mechlin is the see of an archbishop, who is primate of Belgium, and has a revenue of about 4,000*l.* a year. It is the seat of a tribunal of primary jurisdiction, and the residence of a military commandant. It has an ecclesiastical seminary, a college, an academy of painting, a society of the fine arts, and a *mont-de-piété*. It has been long celebrated for the manufacture of lace, of a coarser and stouter kind than that of Brussels; but this has latterly been, to a considerable extent, superseded by the Nottingham lace, and it is said that only eight houses are now engaged in the business. Among its other fabrics are those of cashmere shawls, and gilt leather chairs: the latter were at one time an article of export, and it is said that upwards of 400 workmen are still engaged in their manufacture.

Mechlin furnishes a peculiar species of beer, of a light body, which acquires, by keeping, a vinous flavour and quality. Another delicacy peculiar to this city is the *Dejûner de Malines*,\* a dish much admired by travellers as well as natives, into which pigs' feet and ears enter as important constituents.

Mechlin has an extensive trade in flax, corn, and oil. The tide ascends the Dyle to a league above the city, which is accessible for vessels of considerable burden from the Scheldt. Mechlin is connected with Louvain by a canal navigable by vessels of 160 tons: it would also, but for the absurd opposition of its magistrates, have been the central *dépôt* of the Belgian railways; but this has been fixed without its boundary, a circumstance which those by whom it was occasioned now deeply regret.

As early as the 6th century, Mechlin appears to have

been a place of importance, and the cap. of a lordship. It suffered severely from war, plague, and fire in the middle ages; and in modern times has been repeatedly taken by the Spaniards, Dutch, English, and French. (*De Cloet*; *Hewschling*; *Belgium*, by Emerson Tennent, Esq. M. P.; *Murray's Handbook for N. Germany*, &c., passim.)

MECKLENBURG, a territory in N. Germany, between lat. 53° and 54° 20' N., and long. 10° 35' and 13° 57' E.; having N. the Baltic, E. and S. the Prussian dom., and W. Hanover, Denmark, and Lubeck. Area, 5,343 sq. m. Pop. about 572,500. It is divided into

1. MECKLENBURG-SCHWERIN (GRAND DUCHY OF), a state of N. Germany, between lat. 53° 7' and 54° 20' N., and long. 10° 37' and 13° 15' E.; having E. Pomerania and Mecklenburg-Strelitz, S. Brandenburg, W. the Hanoverian and Danish provs. of Lüneburg and Lauenburg, the principality of Ratzeburg, belonging to M.-Strelitz, and the territory of Lubeck, and N. the Baltic. Length, E. to W., about 110 m.; average breadth nearly 45 m. Area, 4,833 sq. m. Pop., in 1840, 482,925. Mecklenburg belongs to the great plain of N. Germany; it is not, however, a dead level, but has an undulating surface, interspersed with some ranges of low hills, one of which, the Rühneburg, rises to nearly 600 ft. above the level of the Baltic. It has several rivers of some size, as the Recknitz, constituting its N.E. boundary, the Warnow, Stepenitz, &c., flowing to the Baltic, the Elde, a tributary of the Elbe, and others; and a great number of lakes, that of Müritz, which has an area of more than 50 sq. m., and is elevated 216 Rhinish ft. above the sea, being by far the largest lake in N. Germany; next to it is the lake of Schwerin, having the cap. of the duchy on its banks. Notwithstanding its high lat., this grand duchy has a milder climate than most parts of Germany. The mean temp. of Germany being taken at 51° Fahr., (8° 5' R.), that of Mecklenburg will be about 52° 5' F. (9° 3' R.) But the winter is severe, the average temp. of that season being little above the freezing-point; the atmosphere, also, is particularly humid, which, added to the moisture of the soil, renders catarrhs and consumptions frequent. The surface and soil are very various. On either border of the principal range of hills a poor sandy tract extends, covered with heath; and few parts of Germany are worse cultivated or more thinly inhabited than that between Schwerin and Güstrow, a distance of nearly 40 m. To the S. of this district the soil is somewhat better; and beyond Güstrow, towards what was formerly Swedish Pomerania, the sand gradually changes into a fertile loam, well adapted to the growth of rye and wheat. Near the Baltic the soil is, for the most part, a meagre sand, intermixed with stripes of loam. With the exception of the sandy heaths, the face of the country is cheerful and pleasing; the land is mostly enclosed; the woods, which are extensive, are scattered over the country, and on the borders of the lakes good meadow lands occasionally present themselves. Mecklenburg is essentially an agricultural country. It is generally divided into large estates. The demesnes of the sovereign comprise 4-10ths of the land, and those of the nobility, knights, &c., nearly 5-10ths; leaving about 1-10th in the possession of the municipalities and a few monastic institutions. Farms are generally very extensive; they vary from 300 to 1,000 or 1,200 acres. About one fourth part of the prov. is cultivated by proprietors resident on their own estates, and who are frequently very intelligent and well-informed; about a half is occupied by farmers, and a quarter by peasants or boors. The severity of the winter makes it necessary to have firm buildings sufficient to accommodate the live stock, in addition to the corn, hay, &c.; and hence a gentleman's house has near it, besides labourers' cottages, more than five times the extent of barns, stables, cow and sheep houses, &c., that would be required in England for the same extent of land. Farms, when let, are usually held by tenants on leases, varying from 7 to 21 years. The rent varies, of course, according to the quality of the soil, situation, &c. It is uniformly almost paid in money, and the rotation of crops prescribed in the lease must be strictly adhered to. The best farms brought, in 1827, according to Mr. Jacob, about 12*s.* an acre; the medium lands from 6*s.* 4*d.* up to 8*s.* 4*d.*; and the sandy districts in the S. from 2*s.* to 3*s.* 2*d.* an acre; but he thinks that the larger portion of land in the grand duchy did not then produce more than 3*s.* an acre. Taxes are lower than in most parts of the Continent. The various taxes and other out-goings borne by the proprietor may be estimated at about 1*d.* an acre. The stock on the larger farms usually belongs to the tenants; but that on the smaller farms, held by peasants, usually belongs to the landlords.

The cultivation of wheat (especially the red variety) has increased greatly of late years, and Mecklenburg is now one of the principal countries of Germany for the export of wheat. Rostock wheat is, however, inferior to either English or Danzig wheat; so much so, that while wheat is being shipped from Rostock at 18*s.* a quarter, it

\* This is Sir Joshua Reynolds's statement. Mr. Murray, on the contrary, says that this is the altar-piece of the cathedral! *Non notis*, &c.

will fetch 27s. or 28s. at Dantzic. Next to corn, peas, beans, potatoes, and turnips are principally grown. Hemp and flax are reared, but in no great quantities; and the culture of tobacco has very much diminished. Of late years horses, instead of oxen, have been employed in field labour. The system of cultivation corresponds with that of Holstein and Sleswick. After a year's fallow, three corn crops, usually rye, barley, and oats, are taken in succession, the land being sown down with grass seeds; along with the 3d corn crop, a crop of hay is taken in the 5th year, and the 6th and 7th years the fields are in pasture. (*Jacob's Report*.) The climate is too cold for the vine, though lately it has been raised to some extent at Greitz, and some bad wine has been produced. The horses and horned cattle, which are both numerous and excellent, find a ready sale in every part of Germany, and are a source of great profit to the landed proprietors. The breed of horses has been much improved, by means of the grand ducal stud at Redefin and several private studs. Sheep have been a good deal increased of late: the stock in the grand duchy is now estimated at about 1,300,000, and wool has become a principal article of export. Herds of hogs and flocks of geese are met with in every part of Mecklenburg. The former wanders, nearly wild, through the forests, feeding on acorns and roots, and the geese literally cover the banks of the lakes and rivers. The latter supply a considerable part of Europe with quills; and their breasts, smoked and cured like bacon, are much esteemed as a delicacy.

The pop. has increased very rapidly within the last 25 years, a consequence partly of the breaking up of the old feudal system, and partly of the introduction of the potato, &c. The number of inhab., in 1818, was 377,954, whereas, in 1837, it was 476,499, being an increase of 26 per cent. During the 10 years previous to 1838, the deaths amounted to 10,069, and the births to 16,070 a year. Mecklenburg is still, however, the least populous portion of Germany; there being only 99 inhab. to the English sq. m. Till within the last 20 years the peasants were in a state of mitigated slavery. They could acquire, enjoy, and transmit property, but they were *adscripti glebe*, and bound to the soil, so as to be sold or let with it. The government took measures, on the restoration of peace, to abolish this relic of the feudal ages; and, about 1820, all the peasants who still remained in the condition of serfs (for many of the proprietors had previously emancipated those on their estates) were declared free, though their actual manumission did not take place till about 1825. They are now, however, quite free, and may labour where and under whatever conditions they please to stipulate with their employers. Previously to the emancipation of the peasantry, a man was estimated to cost during harvest 1s. 4d., during hay-making 1s. 1d., and at other periods from 6d. to 1s. a day. Probably but few changes have yet taken place, either in the condition or appearance of the peasantry. The country, at a passing view, seems, from the magnitude of the farm-buildings and the number of enclosures and woods, to be more prosperous than, on a closer examination, is found to be the case. "On a nearer approach, it is scarcely possible to avoid feeling disgust at the miserable filthiness and apparent poverty of the peasants' dwellings and of their clothing; though a difference may be discerned on the several properties, according to the greater or less degrees of prudence and kindness of the various proprietors." (*Jacob's Rep. on Agric.*)

The condition of the peasants, of whom a large proportion are noble, appears, in fact, to be much depressed. The author of *Germany and the Germans*, in 1835-36, says, "The landsman, unlike his neighbour in Holstein, is poor. I sought in vain for the appearance of comfort and plenty which had delighted me in Holstein; and yet, like that latter, Mecklenburg is one of the most fertile provinces in the N. of Germany, and exports provisions in large quantities to Prussia and Hamburg, while the natives are obliged to content themselves with potatoes, horse-beans, and *sauer-kraut*. During my tour through the more remote villages, I found it impossible to procure a comfortable dinner. Fresh meat was entirely out of the question; the general bill of fare at the inns consisted of potatoes, bread, butter, and eggs, and those of a superior class added bacon and *sauer-kraut*. My drink was confined to wretched beer or schnapps; and, when I demanded wine, they looked at me as if my intellects were deranged. My bed was not unfrequently a straw pallasse, and the only covering a feather bed, enveloped in a gay-coloured cotton cover; the whole supported on a bedstead, 5 ft. long, composed of deal boards nailed together, in form not unlike a packing-box. These miserable arrangements are common to all the remote districts of Mecklenburg, Pomerania, and Prussia.

"As Germany supplies Europe with princes and princesses, it would appear as if Mecklenburg alone were sufficient to furnish it with nobles; for it is reckoned that the nobility include the half of the pop.,

the possessions of 6-8ths of these dignified persons being limited to their genealogical trees. During my progress through the country, I met with a *herr* (baron) who exercised the profession of relieving men's chins of what is sometimes considered an incumbrance; and at one of the inns I found a *herr graf* (count) for a landlord, a *frau gräfinn* (countess) for a landlady; the young *herren grafen* filled the places of ostler, waiter, and boots, while the fair young *fräulein gräfinnen* were the cooks and chambermaids. I was informed that, in one village, the whole of the inhab. were noble except four, and these were married to noble *fräuleins*." (*Germany, &c.*, i. 43, 44.)

In Mecklenburg the general principle is, that every place shall provide for its own poor, either separately or in common with others. All proprietors are bound to provide for the poor on their estates; and, in furtherance of that object, are entitled to levy a sum of about 8d. a year from the day-labourers, and 4d. from the maid-servants, &c., on the estate, though but few avail themselves of this privilege. When crown lands are let, there is always a clause in the contract, regulating what the farmer, the dairy farmer, the smith, and the shepherd are to pay for behoof of the poor. The higher classes, public officers, &c., should pay 1 per cent. of their income to the poor's funds. All poor persons have a legal claim to assistance, and such work must be found them as they can perform.

About 80,000 cwts. of salt are obtained annually; but, with the exception of lime, minerals are of little importance, and mining is quite neglected. Manufactures are not very considerable. The principal are those of woollen and linen fabrics; but the former employed, in 1834, only 1,128 hands, who produced goods of the value of about 271,000 doll., about 1-5th part of which was exported. Mecklenburg is famous, even in Germany, for the distillation of corn spirits. Every one may carry on the business of distiller, without tax or restriction of any kind; and this facility has, no doubt, tended to increase that taste for ardent spirits, which, unhappily, distinguishes the peasantry. A few cotton, paper, glass, tobacco, soap, and wax-light factories, with breweries and tanneries, complete the list of manufacturing establishments. The government is, however, devoting a good deal of attention to the improvement and diffusion of manufactures, and at least one school of arts and trades is now established in every town. Mecklenburg has an extensive trade in farm produce, which is facilitated by the proximity of the Elbe and the Baltic, especially the former, the principal part of the foreign commerce of the duchy being carried on through Hamburg. The value of the exports is estimated, at an average, at about 4,000,000 dolls. a year; of which, corn, pulse, &c., furnish 2,300,000, wool 800,000, butter and cheese 400,000, and cattle 250,000 dolls. The import trade is also considerable; but no accurate statement can be given, either of the exports or imports, from the want of custom-house accounts. The commercial policy of Mecklenburg is as liberal as can be desired: she has no duties on imports, except a trifling excise at her ports; nor any frontier duties beyond a trifle in the shape of a road-toll, which does not, however, appear to be strictly enforced. The only commercial towns and ports of any consequence are Rostock and Wismar. The other towns have merely a retail trade, a large part of which is in the hands of Jews. In the S. Prussian money and measures are current; but the Hanburg measures of length and the Luleek measures of capacity are in use, in most parts of the grand duchy. The Mecklenburg rod is larger than the Rhenish, in the proportion of 1 to .809; the *morgen* varies from 240 to 400 sq. rods. The pound is to that of Hamburg as 400 to 400; the centner = 8 Hespfund = 112 lb.; but in Rostock the Hesp, has 16 lb.

The government is intimately connected with that of Mecklenburg-Strelitz. Each grand duchy has its separate states, which, also, meet separately; but the states of both grand duchies assemble once a year, alternately at Sternberg and Malchin. The joint assembly has the right, in conjunction with the Grand Duke of Mecklenburg-Schwerin, to make laws for and impose taxes on the whole of Mecklenburg; it consists of the landed proprietors among the nobility, and of deputies from towns, &c., in all amounting to between 500 and 600 members. When the states are not assembled, a committee sits at Rostock. The executive power is entrusted to a *directorium*, consisting of 8 grand-ducal councillors, 3 heads of noble families (*Erb-Landmarschälle*), and a deputy from the town of Rostock, which is itself a sort of little republic, or *imperium in imperio*. The grand duchy is divided into 5 principal districts — the duchy of Schwerin, or circ. of Mecklenburg; the duchy of Gustrow, or circ. of Wenden; the district of Rostock; the principality of Schwerin, and the lordship of Wismar; besides which, there is a small extent of territory, which sends no representatives to the states, and over which 3 conventual establishments have jurisdiction.

Justice is administered in primary courts in the towns

and villages, in patrimonial courts on the estates of the nobility, with courts of secondary jurisdiction at Schwerin, Gustrow, and Rostock, and a high court of appeal at Parchim, which is the supreme legal tribunal for both grand duchies. With the exception of between 3,000 and 4,000 Jews, the inhabitants are nearly all Lutherans. There are upwards of 1,000 primary schools, about 40 superior public schools (*Bürger-schulen*), 5 gymnasia, and the University of Rostock, with several ecclesiastical and other special seminaries. Previously to 1826, there was but one book-selling establishment in the grand duchy; but, since that period, the diffusion of education and the cultivation of literature has led to the establishment of 11 others, besides 12 printing-offices. (*Borghaus*.)

The public revenues of the grand duchy amount to 4,600,000 fr. per annum, and the public debt to 18,000,000 fr. The dukes of Mecklenburg had formerly 5 votes in the College of Princes, in the Diet of the Empire. Since 1815, Mecklenburg-Schwerin has held, with Mecklenburg-Strelitz, the 14th rank in the Germanic Confederation. They have conjointly 2 votes in the general assemblies, but only one in the Committee of the Diet. Mecklenburg-Schwerin furnishes a contingent of 3,580 men to the army of the confederation.

Schwerin is the political capital, but Ludwigslust, a town with a pop. of about 5,000, 14 m. S.W. Parchim, is the usual summer residence of the grand duke. The palace, which is a large fine edifice, has a cabinet of pictures and a collection of slavic antiquities; the surrounding grounds are well laid out; but the neighbourhood is dull and not very healthy.

2. MECKLENBURG-STRELITZ (GRAND DUCHY OF), a state of N. Germany, consisting of 2 separate territorial divisions; the first and largest, or the duchy of Stargard, lying between lat. 53° 39' and 53° 47' N., and long. 12° 40' and 13° 57' E., having W. Mecklenburg-Schwerin, and surrounded on all other sides by the Prussian territories; and the second, or principality of Ratzeburg, between lat. 53° 40' and 53° 51' N., and long. 10° 36' and 11° E. The total area, 557 sq. m. Pop., in 1840, 89,528. The general features of the country are the same as those described in the above art.; its mean elevation is, however, somewhat less than that of Mecklenburg-Schwerin, though the Hinterpberg, near Woldeck, rises to 640 ft. above the sea. The chief river is Stargard is the Havel, and in Ratzeburg the Stepenitz. The land is divided among the sovereign, the nobility, and the towns, in the proportions of about 7-10ths to the first, 2-10ths to the nobles, and 1-10th to the municipalities. Nearly 1-4th part of the grand duchal property consists of forest lands. Agriculture and cattle-breeding are the chief branches of industry here, as in Mecklenburg-Schwerin. The manufactures are even more insignificant than in the latter grand duchy, and almost confined to leather, beer, and spirits, with copper wares in Ratzeburg. There is a brisk trade in rural produce. New Brandenburg is, next to Gustrow, the largest wool-market, and Old Strelitz the largest mart for horses, in Mecklenburg. Furstenburg has some trade in timber and butter.

The government is a limited monarchy, as in Mecklenburg-Schwerin. Justice is administered in 8 courts of primary jurisdiction, the superior courts of Rocksicht and Ratzeburg, and the court of chancery in New Strelitz, from which appeal lies to the supreme tribunal at Parchim. The principal public schools are, the *Gymnasium Carolinum* at New Strelitz, the high schools at New Brandenburg, Friedland, and Ratzeburg, and the school of arts (*Bildungsanstalt*), at Mirow. New Strelitz is the cap. and residence of the grand duke. The other chief towns are New Brandenburg, Friedland, and Old Strelitz. Mecklenburg-Strelitz holds, with Mecklenburg-Schwerin, the 14th place in the German Confederation, and has also, with it, vote in the committee, having in the full diet 1 vote independently. It furnishes 718 men to the army of the Confederation.

Mecklenburg has been several times conquered and disposed of by foreign powers; as by Henry the Lion, in the 12th century by Ferdinand II., who gave it to Wallenstein, and by Napoleon; but it has always reverted to its original dynasty. The reigning family is the only sovereign house of Slavonian origin, and is one of the most ancient in Europe, with all the principal reigning families of which it has been allied. The separation of Mecklenburg into two states took place in 1701, and both were recognised as grand duchies in 1815. (*Borghaus*, *Allg. Länder*, &c. iv. 395-411.; *Stein*, *Handbuch der Geog.*; *Jacob's Second Report on Agriculture*; *Parl. Papers*, 1836; *Almanack de Gotha*, 1841; *Germany and the Germans*, &c., *passim*.)

MEDINA, or MEDINET-EL-YABI, "the town of the prophet," one of the sacred cities of Arabia, the burial-place of Mohammed, and next to Mecca, the great centre of attraction to Mohammedan pilgrims. It is on the river el-Hedjaz, 100 m. N.E. its port of Yenbo on the Red Sea, and 290 m. N. Mecca. Lat. 25° 13' N., long. 40° 31' 15" E. Pop. of town and suburbs, according to

Burckhardt, 18,000. This celebrated city stands in a plain, close to a chain of hills which bounds the great desert westward. It is not open, like Mecca, but surrounded by a wall about 40 ft. high, and flanked by 30 towers; it was additionally fortified with a ditch by the Wahabees; but this is in most places nearly filled up. It is entered by three fine gates; one of which, towards the S., called Bab-el-Masry, is said by Burckhardt to rank second only to the noble gates of Cairo; a fourth gate, in the S. wall, was closed by the Wahabees, and has not since been re-opened. The houses are well built, of a dark grey stone; but it has a desolate appearance, owing to the lessened resort of pilgrims. Ruined houses and tottering walls are seen in every part of the town; and "Medina presents the same disheartening view as most of the eastern towns, which now afford but faint images of their ancient splendour." (*Burckhardt's Arabia*, ii. 150.) The principal street, in which are most of the shops, leads from the Cairo gate to the great mosque; another, of respectable size and breadth, runs from the mosque to the Syrian gate; but many of its houses are in ruins, and there are few shops. No shops or bazaars, however, are found in other parts of the town; and, in this respect, Medina differs from Mecca, which is one continued market. The suburbs cover more ground than the city itself, from which they are separated by an open space, narrow on the S., but widening on the W., before the Cairo gate, where it forms a large public place called *Mandha*, always crowded with camels and Bedouins. Provisions are sold here in sheds erected for the purpose, and the numerous coffee buns are beset the whole day with visitors. The greater part of the suburbs consist of large court-yards, built round with low houses, tenanted chiefly by the humbler classes. Each *kosh*, or court-yard, contains 30 or 40 families; the cattle belonging to the little community occupy the centre of each; and the only gate of entrance is regularly closed at night. Opposite, however, to the gate of Cairo are several regular and well-built streets, with houses similar to those within the town; one of these, called El-Amharyeh, comprises some of the handsomest residences in Medina, besides two rather large mosques, all now remaining, except the great temple, out of 14 mentioned by the Arabian historians. The town is supplied with good water, both from wells and open streams.

The glory of Medina, and that which places it, as a sacred city, almost on a level with Mecca, is the possession of the tomb containing the remains of the Prophet. This tomb, with the tombs of Abou-Beker and Omar, the friends and immediate successors of the prophet, are enclosed within the great mosque, situated at the E. end of the town. Though smaller than the mosque at Mecca, it is built upon the same plan, with minarets at the angles, and forms an open square, surrounded on all sides by covered colonnades. The tombs are enclosed within a curtain, in a square building of black stone, detached from the walls of the mosque, and surrounded by a close iron railing. People of rank are admitted gratis within the sacred precinct, called *El-Hedjaz*; and any one, indeed, who has money to spare, finds but little difficulty in being admitted. The ridiculous stories, long current in Europe, as to Mohammed's coffin being suspended in the air by a loadstone, are unknown in the East; and most part of the statements that have been put forth, as to the richness and magnificence of the tombs and the great mosque, have been absurdly exaggerated. The tomb of Fatima, the favourite daughter of the Prophet, and the wife of Ali, is also within the great mosque; but it is doubtful whether it really encloses her remains. The lofty dome, which rises above the tombs, is seen at a great distance from town. The ceremonies observed by persons visiting Medina are somewhat different from those customary at Mecca; nor is it absolutely required of the hadjis to visit the prophet's tomb, and hence is it that the enjoined religious duties are considerably less tedious. The building is lighted at night with lamps and candles, sent either from Cairo or Constantinople. The mosque has four gates, of which the principal, by which the pilgrims first enter, called Bab Merouan, is certainly very superior in beauty to any of the gates at Mecca. The police, cleansing and lighting of the mosque, are entrusted to about 40 eunuchs, somewhat similar to those of the Beitullah at Mecca, supported, like them, by salaries from Constantinople, and by fees and presents from the hadjis. Besides these, and the Imams, Muezzins, and Olemas, who are as indispensable here as at Mecca, there are upwards of 800 inferior servants. The mosque, founded by Mohammed himself, immediately after his flight from Mecca, on the spot where his camel first rested in the town, was enlarged by Omar after the prophet's entombment, and surrounded with walls by Othman. Subsequent caliphs and nobles of Arabia greatly embellished it; but the whole edifice was burnt down in 1508; and so complete was the destruction, that only the interior of the tomb was spared. The present building was erected,

in 1514, by Kayd Beg, then king of Egypt; since whose time only a few immaterial improvements have been made by the Ottoman emperors of Constantinople. (*Burckhardt's Arabia*, ii. 161—305.) The burial ground of Medina, called *El Baka*, is another object of extreme veneration, in consequence of its containing the tombs of Ibrahim, Othman, Ahas, the aunts of Mohammed, &c. Another place of pilgrim-resort is Djebel-Ohod, about 2 m. from the town; the scene of a conflict between the small army of Mohammed and a very numerous band of idolatrous Korcysch, under Abu Sofyan. The Prophet's uncle, Hamze, fell in the engagement, with 75 others, all of whom are buried on this mountain, the exact spot being marked by a mosque.

The people of Medina, like those of Mecca, are chiefly either foreigners or of foreign extraction, drawn thither by the prophet's tomb, and the gains which it ensures to its neighbours. The number of Sheriffs, indeed, descended from Hassan, the Prophet's grandson, is very considerable; but most of them come from Mecca, or elsewhere, and nearly all are clerics, or clergymen. The pop. presents, therefore, as molley a race as that of Mecca; and Arabians of every district, Egyptians, Africans, Syrians, and Turks of Anatolia, are found here, more or less naturalised by intermarriage; those long settled being characterised, as at Mecca, by the Arab face, expressive cast of features, and stout thick-set person.

With respect to commerce, Medina widely differs from Mecca; for, while the latter is enriched by a transit trade scarcely inferior to that of any great city in the East, the trade of the former is merely for the consumption of the town and its neighbourhood, the articles being chiefly received from Egypt, by way of Yembo. The provision-trade is a lucrative branch of traffic; and the richer merchants often realise enormous profits when the caravans stay for any considerable time, and exhaust the stores of the smaller dealers. The Bedouins supply the town with sheep, butter, honey, and charcoal, taking in return corn and clothing; but the trade is subject to great fluctuations, in consequence of continual enmities between the tribes. The date and lotus fruit are produced in large quantities in the neighbouring gardens, the former of these being the prime article of food, and brought thither from all the surrounding country. As respects native industry, Medina is as ill situated as Mecca; wanting the commonest mechanics, and not even possessing a pottery. Weaving, dyeing, and tanning are arts wholly unknown, nor is there a single person in the whole city capable of making either a nail or a horse-shoe, unless it be at pilgrim-time, when many of the poorest hadjis endeavour by hard labour to earn the money necessary for their journey homewards.

The climate of Medina is, during the winter, much colder than at Mecca. Rain falls irregularly at that season; often in violent storms, lasting for 2 or 3 days, but in some years so sparingly as to cause a general dearth, from the want of proper irrigation. The summer-heat is alleged to be greater than in any other part of the Hedjaz; and the salt-marshes, stagnant pools, and exhalations from the neighbouring date-groves, are powerful agents in producing those intermittent fevers, which are so common, and often fatal, in the city, especially to visitors. The deaths, indeed, are reckoned by Burckhardt (though, no doubt, very vaguely) at 1,200 annually; which, assuming the pop. at 18,000, is 1 in 15; and if this be near the truth, it is clear it must long ago have been depopulated, but for the continued supply of inhabitants from other countries!

Medina, though, probably, not entitled to rank as one of the cities of what, by the best authorities, is considered the Hedjaz, has always, since the establishment of Mohammedanism, been considered as a separate principality, and independent even of Mecca. The governor has, till recently, been appointed by the Grand Signior; but, in the absence of precise information, it is believed that Mehemet Ali now exercises supreme power over both the holy cities of the Mohammedan world. (*Burckhardt*, vol. ii. 145—252; *Mod. Trav.*, &c.)

MEDINA DEL CAMPO, a town of Spain, kingd. of Leon, prov. Valladolid, on the Zapardiel, a trib. of the Douro, 2 m. S. W. Valladolid, and 83 m. N. W. Madrid. Pop. 3,000. The town on both sides the river crossed here by a stone bridge, has a neat square, with a handsome sculptured fountain in its centre. The houses are mostly very old, and many of them quite in ruins. A collegiate and 6 other churches, several monasteries (now uninhabited), and 2 hospitals, one of which has considerable architectural merit, are its chief public buildings; but most of them show, by their dilapidated appearance, the degraded condition of the place. The inhab. are chiefly employed in agriculture. It has 2 weekly markets, and a fair in February, well attended by traders from Toledo, Segovia, Cuenca, &c.

Medina del Campo occupies the site of the ancient *Melthyma Campestris*, and was formerly a place of considerable importance; but in the 17th century, after the

discovery of America, a large part of its pop. emigrated, and its decay has since been hastened by the internal troubles of the country. (*Milano*.)

MEDINA DE RIO SECO, a town of Spain, kingd. of Leon, prov. Valladolid, on the Segurilla, a trib. of the Douro, 52 m. S. S. E. Leon, and 123 m. N. W. Madrid. Pop. 4,700. It stands in an open plain, W. of the river, crossed here by 3 bridges, and has narrow, badly-paved streets, and shabby decaying houses; there are 3 churches, 4 monasteries, 2 hospitals, and a castle; but, with the single exception of the church of St. Maria, all the public buildings are in a ruinous condition. The inhab. were once so celebrated for their industry and the variety of manufactured goods exhibited at its fairs in April and September, that the district acquired the name of *India chica* (the Little Indies); but every trace of its former prosperity has now disappeared, and the pop. ranks at present among the most degraded and least industrious in Spain. (*Milano*.)

MEDINA S. PONDONIA, a town of Spain, in Andalusia, prov. Cadiz, 22 m. E. by S. Cadiz, and 65 m. S. Seville. Pop., according to Milano, 9,337. It is an old walled town, beautifully situated on the brow of a rocky eminence, looking eastward over a fine champagne country. A castle, 2 par. churches, 6 monasteries (now unoccupied), and 2 hospitals, are the only public buildings. The chief employment of the inhab. is the manufacture of earthenware, which is conducted on a large scale, furnishing the principal supply for Cadiz, Seville, and, indeed, the whole of Andalusia. The neighbourhood is celebrated for its fine pastures; and the rearing of cattle forms the chief occupation of the rural pop.

MEDITERRANEAN SEA, the *Maris Internum* of the ancients, and, more recently, the *Maris Mediterraneum*, a large and very important vol. sea, bounded N. by Europe, E. by Asia, and S. by Africa, communicating at its W. extremity, by the Straits of Gibraltar, with the N. Atlantic Ocean, and at its N. E. extremity, by the Dardanelles and Bosphorus, with the Black or Euxine Sea. It extends, in a general sense, from lat. 30° to nearly 46° N., and from long. 50° 54' W. to 36° 8' E. Greatest length, 2,300 m.; do. breadth, from Venice to the Bay of Sidra, 1,200 m.; estimated area (acc. to Stein), nearly 690,000 sq. m. It is of an oblong, but very irregular, shape, especially on its N. side, into which project southward the two large peninsulas of Italy and Greece, which thus divide the Mediterranean into three basins, the most westerly of which is included between the Straits of Gibraltar and the passage, only 72 m. broad, between C. Boeo in Sicily and C. Bon in Africa; the central part extending eastward from the last-mentioned points to the meridian of C. Matapan in the Morea; while the E. basin, called the Levant, comprises the Grecian Archipelago and the sea that washes the coasts of Karamania, Syria, and Egypt. The principal inlets of the W. basin are the bays of Lyons, Genoa, and Naples; it contains, also, the three large islands of Corsica, Sardinia, and Sicily; the Lipari, and other islands on the W. side of Italy; and the Balearic group, off the coast of Spain. The central basin has a large arm projecting N. under the name of the Adriatic Sea; its smaller inlets being the Gulphs of Taranto in Italy, Lepanto in Greece, and Calés and Sidra (an. the two *Syrtes*) in Africa; Malta, the Ionian Isles, and the numerous rocky islets skirting the shores of Dalmatia, are its chief islands. The portion of the E. basin or Levant, which stretches N. from the Isle of Candia to the coast of Macedonia, is called the Archipelago, and is remarkable, not only for the extreme irregularity of its coast-line, but for the numerous clusters of volcanic islands and rocks that stud its surface; its chief gulphs are those of Egina, Salonika, Contessa, and Smyrna; and its largest islands are Lemnos, Mytilene, Thasos, Scio, and Naxia. The great island of Cyprus lies in the angle between the coasts of Asia Minor and Syria.

The coast of the Mediterranean is as remarkable for difference of altitude as for variety of outline. Its N. shores, as might be inferred from their jagged outline, are generally steep and bold; but in parts, as in Spain and France, near the mouths of the Ebro and the Rhone, and in Lucra, Tuscany, the Papal States, and Naples, as far S. as C. Campanella, the shores are low and gently shelving, varied only by a few bold rocky headlands; the S. side of Sicily and the W. shores of the Adriatic, are, also, with a few exceptions, flat and sandy; but in Istria, Dalmatia, and, in short, all along the E. side of the Adriatic, the coast is bold, broken, and irregular, often presenting cliffs rising between 600 and 700 ft. in perpendicular height, with deep soundings close to the shore. The shores of the Archipelago partake, more or less, of the same bold character, except in a few bays, where rivers, by the constant deposition of alluvial soil at their mouths, have formed low beaches, extending considerably beyond the high rocks usual to this coast.

The S. coast of Anatolia, which has a less indented line of shore, though by no means low, is much less

craggy and precipitous; extremely high promontories here and there stretch out into the deep sea; but beaches, more or less shelving, of shingle, gravel, or sand, are by far the most common on this coast. The cliffs about Iskenderoon are of great height, running round the bay, and furnishing complete security for shipping, except from the E., or land breezes, which are both violent and dangerous. The shores of Syria are mountainous between Tripoli and Tyre, but present, in many places, a large extent of low and flat coast, especially towards the S. extremity.

Near the mouth of the Nile the country presents a low uninteresting flat, with rocky reefs and shoals, projecting from 5 to 7 m. from the shore; and this continues as far W. as long. 27° E., beyond which a series of not very high cliffs, varied here and there by sandy bays (the largest being those of Sidra and Cabes), marks the whole African coast as far as C. Sparte. Submarine rocks and projecting shoals of mud and sand, not less than the roving piratical habits of the Moors, render the navigation of these shores both difficult and dangerous; and, in this respect, the S. side of this sea presents a striking contrast to the N. where, generally speaking, deep soundings may be had close in shore; while, in parts, particularly between Nice and Genoa, and near Gibraltar, no soundings can be found under 1,000 fathoms and upwards. The in-shore navigation presents some difficulties, in consequence of a few hidden rocks; but the chief skill of the mariner is required in the Archipelago, where, though there be few hidden dangers, it requires first-rate experience of its shifting winds and currents to guide him safely through its many intricate channels. (*Purdy's Sailing Dir. for the Med.*, part ii. p. 61.; *Lyell's Geology*, i. 347.)

It is a curious fact, that, though the Mediterranean generally be so deep that soundings, even where possible, are of no practical utility, except in some of its bays and harbours, the depth of the channel between Sicily and Tunis, according to Smith and Smythe, no where exceeds 30 fathoms, the average not being greater than the depth of the Straits of Dover between England and France. (*Smythe's Hydr. Maps of Sicily and Africa, and Memoir.*) The temperature of its water is, at an average, from 70° to 76°, or 34° Fah. higher than the W. part of the Atlantic Ocean; but it does not appear, from the experiments of Marce and Woollaston, that its density exceeds that of many ordinary samples of sea-water. (*Lyell's Geology*, ii. 17.) The chief feeders of the Mediterranean are the Ebro, Rhone, Po, and Nile, with the various waters brought from the Black Sea by the strong current that sets W. through the Dardanelles. But, notwithstanding this vast supply, the evaporation is so rapid, that water constantly passes in through the Straits of Gibraltar, to restore the equilibrium. The Mediterranean has long been considered a tideless sea; but this is not strictly true, for, in the Adriatic, as well as between that sea and the coast of Africa, tides rise 18 in. to 2 ft., and their influence is felt, more or less, along the shores of Sicily, and on the W. side of the Morea. The existence of this tide, indeed, may suggest an explanation of the loss of so many vessels in that region of mist and terror, the Gulph of Sidra, where there is always a lofty swell and accumulation of waters during the prevalence of N.W. winds. A tide of 8 or 9 ft. also ebbs and flows at pretty regular intervals in the smaller gulph of Cabes, on the same coast. In the Straits of Messina and Bonifacio, at Naples, in the narrow channel of the Euripus, and on both shores of the Straits of Gibraltar, there is an ebb and flow amounting to 3 ft. and upwards; but whether these movements are to be attributed to lunar influence, or to other causes, has not been determined. (*Purdy*, part ii. p. 9.; *Lyell*, i. 375.) The currents peculiar to this great inland sea vary in its different parts: a current sets E. along the African shores, which is turned northward along the coast of Syria, and then westward along that of Cyprus and Karamania; the current in the Archipelago sets almost continually to the S., being increased or retarded, according to the winds; in the Adriatic, the current runs N.W. up the coast of Albania, and S.E. down the Italian shores, bringing with it the waters of the Po. A strong current runs through the Faro of Messina (the Scylla and Charybdis of antiquity), and, by meeting a lateral current, causes numerous eddies and whirlpools. (*See SCYLLA and CHARYBDIS.*)

But this strait, notwithstanding the statements in the classics, presents no real danger; and, in the late war, it was traversed by the fleet under Lord Nelson. (*Smythe's Sicily*, pp. 110–113.) In the Straits of Gibraltar, the main current sets eastward, at a rate varying from 3 to 6 m. an hour: it is true that an under-current has long been supposed to run in an opposite direction; but the fallacy of this hypothesis has been fully shown by Mr. Lyell; and it seems that the only outlet for the superfluous water is by the lateral current, which runs westward close to the African shore. (*Geology*, ii. 19.) With respect to the winds of the

Mediterranean, it may be observed that the prevalent winds, except during spring, vary between N.W. and N.E., while those in spring are from S.E. to S.W. But the winds are extremely variable, and it is said that 3 or 4 vessels may occasionally be seen carrying different, and sometimes opposite, winds at the same time. The *Bora*, a violent N.E. wind in the Adriatic (the *Etesian*, or N.E., winds (called also *Tramuntana*) which blow for several months together in the Archipelago, and the *scirocco*, or *solano*, are peculiar to this sea. The last of these is described by Capt. Smythe as being extremely troublesome, and producing great dejection and lassitude. "At its commencement," he observes "the air is dense and hazy, with long white clouds floating just above, and parallel to, the horizon. The thermometer rises to 90° or 95°, sometimes 100°, and the barometer gradually sinks to about 29.60". It generally continues during three or four days; during which period such is its influence, that wine cannot be fined, or meal effectually salted: oil-paint laid on during its continuance will seldom harden. But, though blighting in its general effects during summer, it is favourable to the growth of many useful plants in winter, when, indeed, it has few disagreeable qualities." (*Smythe*, p. 63.)

Waterspouts are of very common occurrence, especially on the coast of Asia-Minor, where as many as sixteen have been seen at one time. Many volcanic phenomena have also been observed in this sea; among which may be mentioned the sudden appearance, in 1831, of an island, about 30 m. S.W. of Sciacea in Sicily, and its equally sudden disappearance, three years afterwards. These movements may result from the close proximity of the large igneous region of Italy and Sicily. The presence of electric fluid in the atmosphere is also proved by the play of flame round the mast-heads, called by sailors "the fire of St. Elmo." Several springs of fresh water rise in different parts of the Mediterranean; the largest of these is in the port of Turanto, near the mouth of the Galesus, where the fresh water ascends in such a volume, and with such impetuosity, that it may be taken up at the surface without the least impregnation of salt; but the most celebrated of these fountains is that of Arcthusa, in the harbour of Syracuse. (*See ARCTHUSA*, i. 152.)

The Mediterranean abounds with fish of many different varieties, as well as with mollusca. The tunny and anchovy fisheries are a source of great profit on the coasts of Italy and Sicily: the sword-fish is very common; and the *murex purpura* supplies the fine Tyrian dye, now, as anciently, celebrated for the brightness of its red colour. Coral is found in many parts of the Barlary coast, and in some of the bays of Corsica and Sardinia. The chief fishery, however, is in the Straits of Messina, where there is a coral-ground upwards of 6 m. in length.

In the Scriptures, the Mediterranean is called "the Great Sea" (Num. xxxiv. 6.). Herodotus calls it "l. 185.) "the Sea;" and Strabo, "the Sea within the Columns" (Σαλασσα ἡ ἐν στήλαις). It is probable that it witnessed the first rude attempts at navigation. "Having," as Dr. Smith has justly observed, "no perceptible tides, nor, consequently, any waves, except such as are caused by the wind only, the Mediterranean was, by the smoothness of its surface, as well as by the multitude of its islands, and the proximity of its neighbouring shores, extremely favourable to the infant navigation of the world: when, from their ignorance of the compass, men were afraid to quit the view of the coast, and, from the imperfection of the art of ship-building, to abandon themselves to the boisterous waves of the ocean." (*Wealth of Nations*, book i. cap. 3.) At all events it was navigated, and its islands occupied, in the remotest antiquity: it subsequently was traversed in all directions by the ships of the Phœnicians, and their descendants, the Carthaginians; and, at a later period, by those of the Greeks and Romans. During the middle ages, and down to the discovery of America, it was the grand centre of the commerce and navigation of the old world; and the Venetians and Genoese, by whom its trade was for a while principally engrossed, attained, in consequence, to great wealth and consideration. The discovery of America, and of a route to India by the Cape of Good Hope, opened new and far more extensive channels for maritime enterprise. But we incline to think that the depression of the Mediterranean trade, in the 16th, 17th, and 18th centuries, was principally owing to the circumstance of the countries round the Black Sea, the Levant, and the whole N. shore of Africa, having been shortly before subjugated by the Turks, the implacable foes of art, civilisation, and refinement. Happily, however, their empire has been, to a considerable extent, dismembered; and, within the course of the present century, the trade of the Mediterranean has begun to resume something like its former importance. The opening of the Black Sea, and the rise of Imperial Russia on its shores, the renewed intercourse with India by Alexandria, the occupation of Malta by the English, and of Algiers by the French, the independence

of Greece, and the establishment of steamers between the principal ports of the sea, have prodigiously extended its commerce and navigation. And when the old, worn out, imbecile despotism of the Turkish government has been overthrown, and the fine and fertile countries, now under its degrading yoke, have been emancipated, a vast additional stimulus will be given to its commerce; so that the fair presumption seems to be, that the ancient importance of the Mediterranean, as a field for the successful prosecution of commercial navigation, is destined, at no very distant period, to be again equalled, and most probably, surpassed.

The Mediterranean has on its shores the capital cities of Naples, Palermo, Athens, Tripoli, Tunis, and Algiers. Among its principal emporiums may be specified Marseilles, Genoa, Leghorn, Civita-Vecchia, Venice, Trieste, Syra, Smyrna, Alexandria, Malta, and Barcelona. Its most important naval stations are those of Malta and Toulon: Gibraltar is, as it were, the key of the sea.

To the scholar and classical traveller the Mediterranean has the most powerful attractions. Her shores were the earliest seats of art, science, and civilization. She has been surrounded and occupied by the most renowned nations of antiquity; and her coasts and islands have still to boast the ruins of some of the noblest and most splendid cities of the ancient world. In short, to use the language of Dr. Johnson, "the grand object of all travelling is to see the shores of the Mediterranean. On those shores were the four great empires of the world; the Assyrian, the Persian, the Grecian, and the Roman. All our religion, almost all our law, almost all our arts, almost all that sets us above savages, has come to us from the shores of the Mediterranean." (*Purdy and Norvis's Sailing Directions; Smyth's Sicily, and Hydro. Charts; Beaufort's Karamania, and Charts; Dict. Glog., &c.*)

MEDWAY, an important river of England, which has its embouchure in the estuary of the Thames. It rises in the S.E. corner of Surrey, between the N. and S. chalk ranges; being joined at Penthurst Place by streams from the S. of Sussex. Its course is thence N.E. to Maidstone, and then N. to Rochester and Chatham, about 2 m. below which it turns nearly E., expanding at the same time into a wide strait, interspersed with islands. After prosecuting an easterly course for 8 or 10 m., it turns once more to the N., uniting with the estuary of the Thames at Sheerness. The tide is interrupted by locks, otherwise it would flow up the river to Maidstone. In consequence of works begun in the reign of Charles II., and resumed at different periods, it has been rendered navigable as far as Tonbridge; affording a channel of communication of much importance to the surrounding country. From Sheerness to Chatham there is water to float the largest ships; and the ground being soft, and the reaches short, it forms an admirable harbour for men-of-war, many of which are usually laid up here when out of commission. (*See CHATHAM, 1.583.*) The Medway was called by the ancient Britons *Faga*, to which the Saxons prefixed the syllable *Mad*, signifying mid or middle, because it ran through the middle of the kingdom of Kent; hence it came to be called *Medweg*, and latterly *Medway*. Considering the shortness of its course, the Medway is one of the deepest of European rivers. (*Hasted's Kent, 1. 278, 8vo ed.; Statistical Account, &c., 1. 33.*)

MEERUT, a district of British India, presid. Agra (Benгал), chiefly between lat. 28° 30' and 29° 30' N., and long. 77° and 78° E., having N. the collectorate of Mozuffernuggur, E. that of Moradabad, S. Boodlunshahur, and W. Paniput, &c. Area, 2,250 sq. m. Land revenue, in 1822, 14,04,216 rup. The chief towns are Meerut, Sirduma, Katouli, and Mustinapoor.

MEERUT, a town of British India, presid. Agra, cap. of the above district, in an extensive grassy plain, 30 m. N.E. Delhi. This, which, like Cawnpore, is a military station, is a much more agreeable residence than the latter. The town is surrounded by a dilapidated brick wall, and has a ruined fort or citadel. The streets are narrow and mean, and the houses mostly of mud; but it has some good architectural remains of mosques and pagodas; and without the walls are various Mohammedan tombs, built of red stone. A small stream, which swells into a river during the rainy season, is here crossed by a handsome bridge. The cantonment is at some distance N. of the town, from which they are separated by a long and busy bazaar. The barracks are one story in height, and disposed in regular ranges, at intervals, along a space about 2 m. in length: the bungalows of the officers are surrounded with gardens, enclosed by tall hedge-rows. The church of Meerut is probably the largest in British India, being 150 ft. in length, by 84 ft. in breadth, and capable of accommodating 3,000 people. There is a good free school here, with about 100 native pupils. Meerut was a city of some consequence before the Mohammedan invasion of India. It was taken by Mahmood, of Ghiznee, in 1018, and by Timour in 1399. It was occupied, with

its district, by the British in 1803, and is now the residence of a revenue collector and a judge, and the headquarters of a force of about 20,000 men, of whom about 3,300 are Europeans. (*Hamilton's E. I. Gaz.; Modern Trav., x. 5, 3.; Part. Reports, &c.*)

MEININGEN (SAXE), or SAXE-MEININGEN-HILDBURGHAUSEN (DUCHY OF), an indep. state of Central Germany, consisting of a crescent-shaped territory, between the 50th and 51st degs. of lat., and long. 10° 10' and 11° 25' E.; enclosed on the S. by the territories of Coburg and Bavaria, and on the other sides by the dominions of Coburg, Schwartzburg, Prussia, Hessel-Cassel, and Weimar. Area, 968 sq. m. Pop. (1840), 148,078. This duchy comprises a portion of the Thuringian forest mountains; one of which, the Dollmar, rises to 2,370 ft. above the sea. The remainder of Saxe-Meiningen is chiefly comprised in the vale of the river Werra, by which it is traversed in a N.W. direction. This last portion of the duchy, though one of the most fertile districts in Germany, does not, however, produce enough of corn for the consumption of its inhab. Tobacco, turnips, and fruit are staple products; and the forests and cattle of the duchy are among its most important sources of wealth. Mining is pretty actively pursued; iron, a little copper, coal, alum, vitriol, &c., being produced: it has also marble quarries, and furnishes about 120,000 cwt. of salt a year. The manufacture of hardware and the weaving of linens and woollens are the chief remaining branches of industry; but a number of hands are also employed in making wooden articles, toys, &c. The government is a limited monarchy, and in nearly all respects, similar to that of Saxe-Weimar (which see). The high court of appeal in Jena is the supreme tribunal for this duchy. The inhab., who are nearly all Lutherans, are quite as well educated as those of the rest of Saxony. Primary schools are numerous; there are superior schools, or colleges, in all the towns, and the state has a considerable share in the direction and patronage of the University of Jena and of the Prussian gymnasium at Schleisingen, near Erfurt. Public revenue, in 1840, 1,147,000 fl., which was about equal to the expenditure. The public debt, at the same time, amounted to 5,000,000 fl. Saxe-Meiningen has one vote in the full council of the German Confederation, and a vote in the committee, conjointly with Saxe-Weimar, Cobourg, and Altenburg, together with which it holds the 14th place in the diet. It furnishes 1,150 men to the army of the Confederation: Adelaide, queen dowager of Great Britain, relict of William IV., is a sister of the present sovereign of Saxe-Meiningen.

MEININGEN, a town of Central Germany, cap. of the above duchy, on the Werra, here crossed by two stone bridges, 31 m. E.N.E. Fulda. Pop. about 6,000. It is encircled by wooded hills, is well built and laid out, and surrounded with ramparts and ditches. In the palace, which has been the residence of the dukes since 1081, are collections of paintings, engravings, natural curiosities, the archives of Meiningen and Weimar, and a library of 24,000 vols. The house of assembly for the states of the duchy, the *bernhardinum*, or gymnasium, the female seminary, riding-school, theatre, and hospital, are the other principal edifices. It has some manufactures of woollen, linen, and mixed fabrics, with tanneries, breweries, &c., and has some of the best public gardens in Germany. (*Berghaus, Allg. Länder, &c., iv. 381-9.; Stein's Handb. der Geog., Abn. d. Gotha, 1841.*)

MEISSEN, a town of the kindg. of Saxony, prov. Meissen, on the Elbe, here crossed by a handsome bridge, 14½ m. N.W. Dresden. Pop. in 1837, 7,858. "The castle, the Gothic church, and the lofty towers, perched high upon a rocky eminence, have a most imposing effect as you approach Meissen; but the streets are narrow, and the town has internally a gloomy appearance, which is considerably increased by the smoke constantly issuing from the porcelain manufactory." This establishment occupies the castle, built, it is said, by the emperor Henry I. "The beautiful pottery ~~was~~ that goes by the name of Dresden china, is all manufactured here; and though the Meissen potteries are now rivalled by those of Berlin and Vienna, they were at one time the first, and may still be considered the most celebrated, in Europe." (*Sirang's Germany in 1831, i. 84, 85.*) The Gothic cathedral is remarkable for the fine open-work of its spire and the elegance of its interior. In it are several antique monuments of the Saxon princes, and some fine old paintings by Albert Durer and Cranach: the latter has introduced into the altarpiece the portraits of Luther, his wife, and his friend, the Elector of Saxony. The neighbouring convent of Afra has been converted into a royal school. The chapter-house, 3 hospitals, and the orphan asylum, are the other chief public establishments. Besides the porcelain factory, founded by a chemist named Böttcher, in 1710, Meissen has manufactures of hats, stockings, leather, colours, &c., though none is very considerable. (*Berghaus; Stein, &c.*)

## MELCOMBE-REGIS. See WEYMOUTH.

MELFI, a town of the Neapolitan dom., prov. Basilicata, on a lofty and remarkable volcanic mountain, overlooking the plain of Capitanata, 34 m. S. Foggia. Pop. about 7,000. Like most other towns in an elevated situation, Melfi loses somewhat on a nearer approach. It is encircled by old ruined walls. The streets are narrow, ill-paved, and dirty; and most of them, as the town is built on the side of a steep acclivity, are impracticable for carriages. Many of the houses, however, have a respectable appearance; which they owe more to the solidity of their masonry than to their magnitude. The principal object is its castle; which, though partly fallen to decay, and partly restored in very bad taste, retains a venerable and imposing aspect. It stands at the higher extremity of the town, from which it is separated by a kind of platform, commanding a view of the opposite slopes of Mount Vulture. Considerable historical interest is attached to it, from its being the principal, and probably the first, fortress built by the Normans after their conquest of this portion of the kingdom. The large hall in which the meetings of the Norman confederates were held, and which afterwards accommodated the council of prelates, held here in 1059, and the parliament summoned by Frederick of Swabia, has been converted into a theatre. One only of its towers remains entire; but it affords, in height and solidity, a good specimen of the general structure.

The cathedral has attached to it a high tower, erected in 1151; which, like most of our English belfries, has small Saxon arches for windows. There are 8 other churches, with numerous convents, a magnificent bishop's palace, some excellent public cisterns, and a good private collection of the minerals of the neighbourhood. The atmosphere is damp, and the town is said to be at times unhealthy. "The pop. appears lively, industrious, and active; though there are no particular manufactures. Many of the inhabs. deal in cattle and wine, which last is somewhat less sweet and heavy than the produce of the surrounding towns: it constitutes an abundant article of commerce with the whole of the adjoining prov. of Capitanata, where, under the name of *Vino di Melfi*, it is sold, and held in general use." (*Craven's Abruzzi*, &c., ii. 294.; *Swinburne*, i. 409.)

MELFORD, LONG, a market-town and par. of England, co. Suffolk, hund. Babergh, 17½ m. W. Ipswich, and 51 m. N.E. London. Area of par., 4,320 acres. Pop., in 1831, 2,514. The town is very pleasantly situated in a picturesque and well wooded country, and consists chiefly of one main street, nearly 1 m. in length. A handsome Gothic church, two places of worship for dissenters, and an almshouse (founded in 1574) for 12 poor men and 2 women, are the only public buildings. *Spinning*, woollen weaving, and retail trade, are the chief occupations of the inhabs. The weekly market once held here has been discontinued for some years. Cattle and sheep fairs, Tuesday, Wednesday, and Thursday, in Whitsun-week.

MELKSHAM, a market town and par. of England, co. Wilts, hund. its own name, 26 m. N.W. Salisbury, and 86 m. W. London. Area of par., 8,020 acres. Pop., in 1831, 5,866. The town, formerly much more important than at present, on an acclivity rising from the Avon, consists principally of one long street, with stone houses. The church is a large, old, embattled building, with a central tower and two transepts, both on the S. side: the living is a vicarage, in the gift of the Dean and Chapter of Salisbury. There are, also, places of worship for Independents, Baptists, and the Society of Friends. Two mineral springs, one a strong chalybeate and the other a saline aperient, have been discovered about ¼ m. from the town; but, though they are reported to be as efficacious as those of Cheltenham, they have not led to any great accession of visitors. The staple business of Melksham is the manufacture of woollen cloth; but it has greatly declined, in consequence of the superior facilities enjoyed by the clothing district of Yorkshire. In 1839, 2 woollen mills employed 162 hands; besides which there are about 80 hand-loom weavers, whose weekly wages vary from 8s. 2d. to 14s. (*Hand-loom Weaver's Rep.*) Petty sessions for the hund. are held here. Markets for cattle, &c., on alternate Thursdays; fair for horses, cattle, and farming stock, July 27. (*Parl. Papers*, &c.)

MELROSE, a village of Scotland, co. Roxburgh, beautifully situated at the N. foot of the Eildon Hills, on the Tweed, 31 m. S.E. Edinburgh. The village has only about 700 inhabs., and would be unworthy notice, were it not for its possessing the finest monastic ruin in Scotland. The abbey of Melrose, originally founded by David I. in 1136, for Cistercian monks, was destroyed by the English forces, under Edward I., in 1322. The structure, of which the mutilated remains still attest the grandeur and magnificence, was founded by Robert Bruce, the hero of Bannockburn, in 1326. It was finally completed, in the perpendicular Gothic style, in the reign of James IV.; and must, when entire, have been one of the noblest structures of the kind in the kingdom. This splendid edifice was well nigh demolished by the

barbarous zeal of the early reformers. In fact, with the exception of a part of the cloister walls, the abbey has been wholly destroyed; but fortunately a considerable part of the church has been preserved. The great altar or eastern window, 36 ft. in height by 16 ft. in width, is unrivalled for its fine proportions, the richness of its tracery, and the beauty and delicacy of its workmanship. It has been admirably described by Scott:—

The moon on the east oriel shone,  
Through slender shafts of slantly stone,  
By faded tracery culminated,  
Thou would'st have thought some fairy hand  
"Twixt poplars straight the o'er-wind,  
In many a freakish knot had twined;  
Thou fould'st a spell when the work was done,  
And chang'd the willow-wreaths to stone.

*Minstrel*, canto II. st. 11.

The south transept window and door is, perhaps, the most perfect part of the ruin. It is in the decorated style, with crockets and creeping foliage. The compartment of the nave, from the screen work to the cross, was roofed over, and fitted up, in 1618, for the parish church. But this roof does not harmonise with the rest of the fabric; and it is obvious that the stones of which it consists had been quarried from other parts of the building! A great tower rose from the centre of the cross, of which a portion, 84 ft. in height, still remains; but the spire by which it was surmounted is entirely gone. The decorated work and masonry of the building have been most admirably executed; the mouldings are still as sharp as if they were fresh from the chisel.

In the centre of the village is a cross, said to be coeval with the abbey; a small property in the village is held on condition of the proprietor keeping up this fabric. The abbey is no longer used as the parish church, a handsome new edifice having been constructed for that purpose some years ago. Abbotsford, the seat and creation of Scott, is situated about 3 m. W. from Melrose; and Dryburgh Abbey, where the great minstrel is buried, is about 3 m. E. from the village. (See *Monastic Annals of Teviotdale*, a learned and able work; *Border Antiquities of Scotland*, &c.)

MELTON-MOWBRAY, a market-town and par. of England, co. Leicester, hund. Framland, on the Wreak (a trib. of the Ouse), crossed here by three stone bridges, 14 m. N.E. Leicester, and 92 m. N. by W. London. Area of par., 3,570 acres. Pop., in 1831, 3,356. The town has of late years been much improved and enlarged; the houses are generally well built, the streets are well paved, watched, and lighted, and there are some excellent hotels. The church is a large and somewhat striking cruciform Gothic building, with a highly ornamented pinnacled tower, rising at the intersection of the nave and transepts: the living is a vicarage, in private patronage. There are places of worship, also, for Wesleyan-Methodists and Independents. Three Sunday-schools give religious instruction to upwards of 500 children; and 2 free-schools, supported from the town's estate, are attended by about 400 children of both sexes. (*Educ. Rep.*, 1836.) Melton-Mowbray enjoys a small share of the hosiery and bobbin-net trade, which furnishes employment to many thousands in the co.; but the chief business and celebrity of the town is attributable to its situation in the centre of a fine hunting country, and to its being, as it were, the hunting metropolis. The hunting season lasts from the beginning of Nov. to the end of March; and during this time the town is frequented by the leading sportsmen of England, who resort thither from all parts of the country, and a few even from the Continent. The stabling is excellently arranged, as well as very extensive, there being accommodation for upwards of 800 horses, with their grooms, helpers, &c. The town supports a good subscription library and news-room; and there is a temporary theatre, in which performances are held during the hunting season. Melton has water-communication with Leicester by the Wreak and Soar, and with Oakham by a canal. Petty sessions are held here; and this town is one of the polling-places for the N. division of the co. It is likewise the chief place of a poor-law union, comprising 54 pars., and has a very large and well-arranged workhouse. Markets, well attended, for cattle and provisions, on Tuesday; horse fairs, Monday and Tuesday after Jan. 17.; cattle fairs, March 13., Holy Thursday, Whit Tuesday, Aug. 21., and Sept. 7. (*Parl. Papers*; *Sporting Review*, 1840, &c.)

MELUN (an. *Melodunum*), a town of France, dep. Seine-et-Marne, of which it is the cap., on an island in and on both sides the Marne, 26 m. S.E. Paris. Pop., in 1836, 6,830. It is badly laid out, but is tolerably well built; and, being pleasantly situated, has a prepossessing appearance from without. The different parts of the town are connected by 2 bridges, one of which admits of the passage of boats. The part of the town built on the island is the most ancient; it has a large central prison for 5 depts., the most conspicuous edifice in the town; and on its E. side are the remains of a palace, inhabited by several of the French kings.

he portion on the right or N. bank of the Marne, lies St. Aspais, is the most extensive: it is built on a declivity of a hill, and has a spacious square, an old catholic par. church, with some fine stained glass, the edifice, formerly a Benedictine abbey, a theatre, some pour-baths, and the remains of the Abbey of St. Pierre, under the Merovingian dynasty. The portion on the left bank of the river is less than either of the others: it comprises the cavalry barracks. Melun has a municipal college, a public library, with 10,000 vols., society of agriculture, arts, and sciences, a school of awing, &c., with manufactures of woollen cloths, luted cotton and linen goods, and glass, and some ale in corn and other products destined for the Paris markets. Melodunum is mentioned by Cesar in his commentaries: it was taken by his lieutenant, Labienus, in the middle ages, it was several times captured by the Normans and English, and was held by the latter from 19 to 1430. (*Hugo, art. Seine et-Marne, &c.*)

MEMEL, a fortified sea-port town of the Prussian m., being the most northerly of any size in the kingdom, and one of the principal shipping ports on the Baltic, prov. Prussia, gov. Königsberg, on the N.E. side of the entrance to the great salt lake, or lagoon called the Arische Hafl, but within the bar. 50 m. N.W. Tilsit, (47 41' N.E. Königsberg; lat. 55° 41' 42" N., long. 24° 14' E. Pop., in 1838, 9,334. It consists of the districts called the Old Town, New Town, and Frederick's Town, and has several suburbs. It was surrounded by walls in the time of the Teutonic knights, and has a citadel, founded in 1250, now partly used as a prison. It has 4 churches (2 Lutheran, 1 Calvinist, and 1 tom. Cath.), a synagogue, arsenal, exchange, theatre, school, school of industry, female seminary, school for neglected children, an hospital, and various charitable institutions. It is the seat of a council for the city (Landraths-amt), of judicial tribunals for the city and town, a board of taxation, police commission, &c.; and has manufactures of woollen cloth and soap, and docks for ship-building, sawing-works, distilleries, &c.

The harbour is large and safe, with deep water: to the bar, at the mouth of the Kurische Hafl, has more than 17 ft. water, and sometimes not more than 12 or 14 ft., so that ships drawing more than 15 or 16 ft. water are frequently obliged to load and unload a part of their cargoes in the roads, where the anchorage is not indifferent, particularly when the wind is at N. or W. A light-house, originally 75 ft., but now 100 ft. high, has been erected on the N.E. side of the entrance to the harbour. The light, which is fixed and powerful, is distinguished, in clear weather, at more than 10 m. distance. Timber, particularly oak-plank and fir, the very finest quality, is the great article of export from Memel; but corn, staves, flax and hemp, linseed, crushing, hides, bones, bristles, wool, &c., are also largely exported. Timber, hemp and flax, and most other articles shipped from this, and, indeed, from most Baltic ports, are *bracked*; that is, they are inspected, and sorted into three qualities, according to their degrees of goodness, by persons appointed by government for that purpose. (See art. *BRACKING* in this Dict.) Despite the serious difficulties which our corn laws and other duties throw in the way of the trade with Russia, we have a pretty considerable intercourse with Memel, especially when there is a demand for foreign corn in England. We send to it small quantities of colonial produce, cotton stuffs and yarn, and cutlery, and considerable quantities of coal, which, however, is considered merely as ballast. The trade of ship-building is recently been carried on to a considerable extent at Memel; and, in 1839, 64 vessels, of the aggregate burden 12,772 lasts of 4,000 lbs. each, belonged to the port. The present average export of timber is reckoned at about from 75,000 to 80,000 loads per timber, 5,000 loads of timber and plank, 700 mill-oak pipe-staves, and 600,000 fir planks. The exports of other articles are so very fluctuating as hardly to admit of their being reduced to an average. In 1837, of 602 vessels which were out from the port, 103 were laden with corn, 59 with linseed, 8 with flax and hemp, 5 with bones, &c., the rest being laden with timber, or in ballast. Of these ships 136 belonged to England. In 1838 201 English ships cleared out from the port. (*Zeditz, der Preussische Staat*; *Böhring's Report on the Prussian Commercial System*, &c.)

MEMMINGEN, a town of Bavaria, and formerly a free city of the empire, circ. Swabia, cap. distr. on a buttry of the Iller, 40 m. S.W. Augsburg. Pop. 7,000. It is walled, and has a handsome town-hall, an arsenal, barracks, a lyceum, an academy of instrumental and vocal music, &c. It has manufactures of woollen, cotton and linen stuffs, stockings, ribbands, oil-cloth, copper and iron wares, &c., with tanneries, linen and cotton mills, and dyeing establishments; and an active trade in the products of these, and in salt, wool, corn, hops, &c., which it sends to Switzerland and Italy. (*Berghaus, Allg. Länder, iv. 158.*)

MENTAI STRAIT, a strait or channel of N. Wales, separating the island of Anglesea from Caernarvon; it runs N.E. and S.W. about 14 m., varying in width from about 200 yards to about 2 m. Parliament having contributed a sum of money to assist in improving its navigation, the dangerous rocks, by which it was formerly encumbered, have been removed, so that vessels of moderate burden are able to pass without difficulty through the strait, when it would not be possible for them to double Holyhead. But the Menai Strait is now principally celebrated for the magnificent hanging bridge by which it has been recently crossed. Holyhead being the nearest port to Ireland, and the most convenient place at which to ship and receive the Dublin mails, it became of great public importance that the access to it should be rendered as safe and expeditious as possible. The usual ferry across the strait was in the vicinity of Bangor; and this being frequently attended with both danger and delay, it was resolved to erect, nearly at the same place, a chain bridge, elevated sufficiently above the water to allow ships to pass freely underneath. This great undertaking was begun in 1819, and completed in 1825. There are seven stone arches, each of 524 ft. span; and the length of the catenary, or chain part, is 579 ft. The bridge cost in all 211,791*l.* Its elegance and solidity reflect great credit on the engineer, Mr. Telford; but it is to the parliamentary commissioners for the Holyhead road, or rather their chairman, Sir Henry Parnell, that the public is mainly indebted for this signal improvement.

MENDE, a town of France, dep. Lozère, of which it is the cap., on the Lot, 48 m. E.N.E. Rodéz. Pop., in 1836, 5,109. It is badly built and laid out, but is well supplied with water by numerous public fountains, and surrounded by a boulevard, forming a public promenade. The cathedral, a Gothic building, has two light spires. The old episcopal palace, now the prefecture, has a gallery and hall, enriched with many paintings by Besnard, an artist of the French school. It has also a public library of 6,600 vols., a communal college, a court of primary jurisdiction, a society of agriculture, science, and arts, a chamber of manufactures, &c. Its inhabitants fabricate coarse woollen cloths, called *serges de Mende*, which are sent into Spain, Italy, and Germany.

Mende is a town of considerable antiquity. For at least 600 years its bishops possessed the privilege of coining money, and other rights of sovereignty, which, however, they began to share with the French kings in 1306. (*Hugo, art. Lozère.*)

MENTIN (Flemish *Meenen*), a town of Belgium, prov. W. Flanders, cap. cant. on the Lys, immediately within the Belgian frontier, and 64 m. S.W. Courtrai. Pop., in 1836, 7,394. It is well fortified, and tolerably well built; is the residence of a military commandant; and has manufactures of woollen yarn, and table and other linen cloths, lace, soap, linseed and other oils, &c., with tanneries, heweries, and large bleaching works. It has also a considerable trade in horses, cattle, and agricultural produce, and 2 large annual fairs. (*Fandermolen, Dict. Geog.*)

MENTZ, or MAINZ (Fr. *Mayence*, an. *Moguntiacum*), a strongly fortified city of Germany, the bulwark of the German Confederation towards the W., in the grand duchy of Hesse-Darmstadt, prov. Rhenish Hesse, of which it is the cap., on the left or W. bank of the Rhine, nearly opposite its junction with the Mayn, 18 m. W.S.W. Frankfurt, and 38 m. S.E. Coblenz; lat. 50° 0' 22" N., long. 8° 16' 41" E. Pop., estimated at 40,500, incl. its garrison of about 6,000 men. It is built partly on level ground, and partly on the declivity of a hill, in the form of a semicircle, the Rhine forming the basis of the arch. It is surrounded by strongly-built bastioned walls; and is further defended by extensive outworks, including a citadel, lunettes, and 6 forts. A bridge of boats across the Rhine, 1,666 Rhinish ft. in length, protected by a *tête de pont*, connects Mentz with its fortress, the *Fort de Castel*, a town of 2,200 inhabitants, near which is an island in the river, that is also strongly fortified. A garrison of 30,000 men would be required for the proper defence of the various works. The city is entered by 10 gates, 5 on the land side, and 5 along the river; all which, except on special occasions, are closed at 10 p.m. It has several good streets and squares, which present various indications of improvement; generally, however, it is in most parts irregular, and the streets, which are narrow and dirty, are rendered darker by the loftiness of the houses, many of which have strongly-staunched windows: the appearance of the town is, in fact, that of an ancient city, converted into a modern fortress; but it is, notwithstanding, interesting from its antiquity, and its numerous public edifices. The cathedral, built in the massive round-arched Gothic style, was commenced in the 10th, and finished in the 12th, century. Like the cathedral of Worms and Spire, it has a double choir, and a high altar at both the E. and W. extremities. It was nearly destroyed by fire in 1190, and suffered greatly during the siege of the town by the Prussians, in 1793; but, of late years, extensive repairs have been made upon it, by the

aid of voluntary contributions; the nave has been newly roofed with slate, and the great B. tower has been surmounted with an iron cupola, 70 ft. in height. The interior has numerous monuments of the former archbishops of Mentz, who were sovereign princes, and electors of the empire. It has also monuments of various other historical personages. The side chapels abound in fine old carving: the doors, of solid brass and great height, opening to the market-place, were cast by the founder of the cathedral and have engraved on them the charter given to the city by Archbishop Adalbert, in 1135. There are 6 other R. Cath. par. churches, several conventual churches, and a Calvinist church, most of which deserve notice. On the quay beside the river are two large red buildings; one of which, the ancient electoral palace, has been converted into the custom-house; and the other, the Teutonic House, once occupied by Napoleon, is now the residence of the military governor. The former palace of the Prince Dalberg, nearly destroyed by fire in 1793, is used for the courts of justice. The arsenal, on the bank of the Rhine, the theatre, a new and handsome edifice, and the episcopal and vice-governor's palaces, are among the remaining principal public buildings. But Mentz derives its principal celebrity from its having been the residence of Gutenberg, and the cradle of the art of printing. The house in which Gutenberg lived has been taken down, and its site is occupied by a casino, belonging to a literary club. In an adjacent court is a statue of Gutenberg, in bronze, from a model by Thorwaldsen; but this work is said (by Chambers) to be clumsy, gigantic, and tasteless; and it is proposed to raise a monument more commensurate with the signal merits of the individual in whose honour it is to be erected. Mentz has a gymnasium, an ecclesiastical seminary, schools of medicine and veterinary surgery, a public library of 90,000 vols., in which are preserved some of the earliest extant specimens of printing; a museum of natural history, antiquities, coins, &c. Outside the walls are some fine gardens along the bank of the river.

Mentz, formerly the first ecclesiastical city of the empire, is now of importance chiefly as its strongest fortress and principal military post. A mighty revolution has taken place since the visit of Dr. Moore, towards the end of last century, when the abbés, with their handsome equipages, lorded it over the well-behaved troops. "The chapter and the grenadiers have now precisely changed places. You see the meagre occupants of the stalls skulking to mass in threadbare *soutanes*, their looks proclaiming them no longer the monopolisers of the old hock of the neighbourhood; while the Austrian and Prussian soldiers are parading about in the insolence of military superiority. The *cafés*, the billiard-rooms, the promenades, are thronged with these smoking and swaggering gunsts, who impart a sort of unhalloved vivacity to the gloomy haunts of superstition and monachism; and the university building is converted into barracks, and hospitals and guard-rooms strike one at every corner." (*Autumn on the Rhine*, p. 5.) Mentz is garrisoned by a nearly equal number of Prussian and Austrian troops, and is commanded by a governor, elected alternately every five years from either nation. It is the seat of a military tribunal, and the high court of justice for Rhenish Hesse; its civil authorities being appointed by the government of Hesse-Darmstadt. The town is so environed, on the river side, by its fortifications and other erections, that the Rhine is but little available for commercial purposes, and the accommodation for craft is very inferior. Nevertheless, Mentz is the chief commercial town in the grand duchy (see also HESSE-DARMSTADT, I. 990.), and, next to Cologne, the chief mart for Rhenish produce in Germany. It has a considerable trade in corn, wine, timber, &c., and manufactures of leather, soap, hats, glue, vinegar, tobacco, musical instruments, &c.; steam-communications with Mannheim and Holland, and a steam-navigation assurance-company.

Though Mentz abounds in historical associations, its existing vestiges of antiquity are very few. Agrippa, the general of Augustus, established an entrenched camp on the site where Drusus Germanicus, about anno 10 n. c., erected a fort called *Moguntiacum*. Drusus afterwards founded a second fort (*Castellum*) on the opposite bank of the Rhine; and the two were at a subsequent period connected by a Roman bridge, portions of some of the piers of which may still be seen when the water is low. (*Schreiber*.) In the citadel is the *Elchelehn*, a stone tower, alleged to have been erected by Drusus. At Zahlbach, not far from Mentz, are the remains of an ancient aqueduct; and, between the two, a Roman cemetery has been discovered. The city, which was almost wholly destroyed in the wars at the fall of the Roman empire, was restored by Charlemagne, who erected a church, and rebuilt the bridge with timber. In the 13th and 14th centuries Mentz was a place of some note for literature and the arts. In 1631, it was taken by the Swedes; in 1644, 1648, and 1792, by the French; it was bombarded and taken by the Prussians in 1793; but,

being re-taken by the French in 1797, it became, during their ascendancy, the cap. of the dep. Mont-Tonnerre. (*Schreiber, Guide du Rhin*, p. 126—136.; *Autumn near the Rhine*, p. 1—13.; *Berghaus, Allg. Länder, &c.*, iv. 358, 359.; *Chambers's Tour*, &c.)

MEQUINEZ, a large city of Morocco, and one of the residences of the emperor, 70 m. E. Salee, and 235 m. N.N.E. Morocco; lat. 33° 56' N., long. 5° 49' W. Pop., differently estimated, at from 50,000 to above 100,000. It stands in a beautiful, well-watered, and very fruitful valley; and is surrounded by a wall about 6 ft. high, built for a defence against the marauding Berberbers. It owes its present extent and consequence to the late sultan, Muley Ismael; who, after having secured to himself the undisputed sovereignty of the kingdoms now forming the empire of Morocco, made Mequinez one of the caps., considerably enlarged it, and erected a fine palace, which, owing to its having only one story, is of great apparent extent. In the centre of the enclosure, which contains several well laid-out gardens, is the emperor's harem, formed by a four-sided colonnade, above which are various apartments for the women, eunuchs, and female attendants. The rooms are each about 20 ft. long, 12 ft. broad, and 18 ft. high; the walls are inlaid with red and blue tiles, and the light is communicated by means of 2 large folding-doors. Between the chief apartments are paved courts of chequered marble, in the centre of most of which is a fine marble fountain. The houses of Mequinez are neater than those of Morocco; but the streets are not paved; and hence in rains they are infested with mud, and in dry weather with dust. The millah, or Jews' quarter, is walled round, extensive, and in good repair; but the Negroes' quarter is now a mere ruin. About a century ago a convent was formed here by the Khag of Spain, for the relief and spiritual comfort of Rom. Cath. captives and Christian travellers; but it was deserted by the monks, previously to the accession of the late emperor, Muley Soliman. The inhabs. are described as being more courteous than those more to the S.; they are hospitable strangers, invite them to their gardens, and entertain them sumptuously. The women are beautiful, and have fair complexions, with black eyes, white teeth, and dark hair; and have a suavity of manners rarely to be met with even in the most polished nations of Europe. (*Jackson's Morocco*, pp. 126—129.; *Geog. Journ.*, vol. i.)

MERDIN (an. *Marde*), a city of Asiatic Turkey, at the N.W. extremity of the pach. of Bagdad, 50 m. S.E. Diarbekir, lat. 37° 19' N., long. 42° 20' E. Pop. about 11,000, of whom 1,500 are Armenians, and 200 Jews. It is situated on the slope of the Karadja-dagh, or ancient *Mount Masius*, and overlooks a very extensive and fertile tract of country. It is commanded by a castle, crowning the summit of a rock, and is very difficult of access, the best road to it leading up a steep about 1½ m. in length. The houses are all built of hewn stone, and appear to be very old; the windows are small, grated with iron, the streets narrow, and the buildings, being on an activity, seem to rise one on the top of the other. The walls are kept in tolerable repair, and a few old pieces of cannon are mounted on the towers of the castle. Merdin is the frontier town of the pachia towards Constantinople, and the residence of a mutselli appointed by the pacha. The industry of the inhabs. is confined to the manufacture of cotton fabrics and Turkey leather; but it has little external trade, in consequence of not being on any of the great caravan-routes. The neighbourhood produces an abundance of cotton, grain, and fruits, which find a ready sale in the market of Merdin. (*Orbier*, tom. iv. p. 242—245.; *Kiinner*, p. 265.)

MERG, a small market-town and par. of England, co. Wilts, hund. its own name, 20 m. W. Salisbury, and 96 m. W. by S. London. Area of par., 7,400 acres. Pop., in 1831, 2,708, of whom 1,482 belong to the town-tything. The town is very indifferently built, having in its centre an ancient cross, the interior of which serves as a market-house. The church is large, with a square tower at its W. end; the living is a vicarage in the gift of the Dean of Salisbury. The Wesleyan-Methodists, also, support a place of worship and attached Sunday-school. A silk-mill has recently been erected, and, in 1839, employed 71 hands. Dowls, also, and bed-ticking, are made here on a small scale; but the town (formerly of considerable importance, having a castle on an adjacent eminence) is now in a miserably decayed condition.

MERGUI, a town of the Tenasserim coast, in India-beyond-the-Brahmapoutra, cap. of the British prov. of Mergui, on the river Tenasserim, at its mouth, in lat. 12° 12' N., long. 98° 25' E. Pop. probably from 6,000 to 7,000, including natives and British residents, with Chinese, Siamese, Peguans, and descendants of Portuguese. It is built along the declivity and skirts of a steep hill, and, when taken by the British, was surrounded by a walled stockade. But it is not a place of any strength, being accessible to ships, and commanded by a high island in front. The streets are wide, but badly paved; and they

would be much filthier than they are but for the situation of the town on a slope, which facilitates their being cleaned by the rain. The houses are nearly all of bamboo, reeds, matting, and other fragile materials. A mean brick gateway stands at the entrance to the town from the river side, which, with some bastions at the angles of the works, a few small pagodas, and some houses erected by Europeans, are the only structures of any solidity. The harbour is safe for small vessels, having 12 ft. water over the bar at low water, with 18 ft. rise at springs. The climate is mild and salubrious: European invalids, sent thither from Rangoon during the war, speedily recovered their health. Mergul was taken by storm by the British in 1824. (*Low. Hist., &c., in Journ. of the Royal Asiat. Soc. II. 256-259; Hamilton's E. I. Gaz.*)

MERGUL ARCHIPILAGO. See TENASERIM PROVINCES.

MÉRIDA (an. *Augusta Emerita*), a town of Spain, in Estremadura, on the N. bank of the Guadiana, 29 m. E. Badajoz, and 176 m. S. of Madrid. Pop., according to Mifano, 4,890. It sits close to the river, on a slight eminence, in the midst of an open and gently undulating country, naturally very fertile, but almost uncultivated, and unhealthy in summer. Its chief public buildings are 2 par. churches, 8 ruined monasteries, 2 hospitals, and a prison: it is, in fact, one of the most decayed towns in the Peninsula, and is wholly unimportant except for its antiquities. But the remains of the power and magnificence of its Roman masters render it an object of great interest. These are scattered in all directions: in the walls, the houses, the churches, and even in the pavement of the streets are discovered fragments of columns, bases, capitals, frieses, statues, and inscriptions. Similar vestiges, and in a more perfect condition, are to be seen in the suburbs. The principal ruins comprise an amphitheatre (used also as a manufactory), circus, theatre, triumphal arch, baths, &c. The seats of the amphitheatre appear quite perfect; the vaulted dens for the beasts are uninjured; and the conduits by which the arena was filled with water are still distinctly visible. In one of the streets may be seen a large triumphal arch, 150 ft. high, but without any inscription or sculptures. The baths are surprisingly perfect, but not large; and round the top of the bathing-rooms runs a cornice of most curious and delicate workmanship, almost as perfect as if it had recently been executed. The bridge over the Guadiana is of stone, and portions of it may be of Roman architecture; but the greater part of the Roman bridge was swept away by a flood in 1610, and the present bridge has been constructed since. Two arches of this structure were blown up, in 1812, by the British troops under the Duke of Wellington. There are likewise 2 aqueducts, one of Roman, and the other of Moorish architecture, of brick and granite, the former having three, and the latter two tiers of arches.

Augusta Emerita was founded by order of Augustus, anno 25 B.C., who planted in it some of his veterans, called *emeriti*, whence its ancient and modern names. Though its ancient magnitude appears to have been greatly exaggerated, it was, no doubt, one of the largest Roman cities in the peninsula, and became the metropolis of Lusitania. From the Romans it passed, in 713, to the Moors, who destroyed and altered many of its old buildings. In 1228 it opened its gates to Alphonso IX., after his signal victory over the Moors in the contiguous plain of Matanzas; and from this period downwards it has been attached to the kingdom of Castile and Leon. (*Recollections of the Peninsula*, p. 178-181; *Cook's Spain*, I. 142-144; *Mifano*; *Ancient Universal History*, xlii. 492. 8vo. ed.)

MÉRIDA, a town of S. America, repub. Venezuela, dep. Zulia, cap. prov. Merida, on the Chama, 330 m. S.W. Caracas, and 325 m. N.E. Bogota. Previously to 1812, when it was destroyed by an earthquake, this was the largest city in Venezuela, and had a pop. of 12,000. It continued, for some years, to be little better than a heap of ruins; but it has been again rebuilt, and is now, probably, become more populous than before. It has a cathedral, several chapels, convents, &c., an ecclesiastical seminary, a college for philosophy, civil law, &c. The inhab. are said to be, for the most part, in good circumstances. The coloured races dye wool and manufacture carpets and other woollen and cotton fabrics. (*Geog. Account*, &c. 270-74; *Mod. Trav.* xvii.)

MERIONETH, or MERIONYDD, a marit. co. of N. Wales, having N. the cos. of Caernarvon and Denbigh, E. and S. those of Montgomery and Cardigan, and W. St. George's Channel. It is of a triangular shape, and contains 424,320 acres. This, next to Caernarvon, is the most mountainous co. in the principality. Among the principal summits are those of Ararat, Snowdon, Cadair Idris, and Arenig; respectively 2,955, 3,914, and 2,800 ft. above the sea. It has, however, some fine vales, especially that of Feestliog, celebrated for its romantic scenery. There are some considerable tracts of low swampy land along the sea coast; and in parts consider-

able tracts have been gained by embankments. The soil is very various; but, generally speaking, it is poor, and suited only for pasturage. Oats are the grain principally cultivated; but wheat and barley are also raised, though in no great quantities. Agriculture is in a very backward state; little or no attention is paid to a rotation of crops, and it is a frequent practice here, as well as in Denbigh, to burn the surface for manure. In some parts of the co. potatoes are pretty extensively cultivated. The principal dependence of the farmer is, however, on his cattle and sheep; of which great numbers are fed on the mountains, and in the valleys not fitted for husbandry. The small native Welsh ponies, called *Merlins*, are now rarely met with, except in this co. and Montgomery. They are sure-footed and exceedingly hardy. Dairy farming is carried on to a considerable extent. Farms usually small; and being mostly held at will, without any conditions as to management, the low state of agriculture need not be wondered at. Average rent of land, in 1810, 3s. 11d. an acre. Speaking generally, the cottages are wretched in the extreme; though happily they have been a good deal improved in some parts of the co. The minerals seem to be of less consequence than might have been supposed; lead and copper are raised, though in small quantities; large quantities of lime are produced at Corwen, and slates are quarried in different places. The manufactures, which also are unimportant, consist principally of coarse flannels, produced on the domestic system, at Dolgelly, Town, and a few other places. The Dee has its source in this co.; and it is also watered by the Dyfi, Maw, Dysynwy, &c., flowing W. Bala, the largest lake in the principality (see BALA) is in this co. Harlech is the co. town. Merioneth is divided into 6 hundreds and 37 parishes. It sends 1 mem. to the H. of C. for the co. Registered electors, in 1839-40, 1329. In 1831, the co. had 6,968 inhabited houses, 7,558 families, and 35,315 inhab.; of whom 17,194 were males, and 18,121 females. Sum expended for the relief of the poor, in 1838-39, 13,107.

MERSEBURG, a town of the Prussian dom., prov. Saxony, cap. reg. Merseburg, on the Saale, 56 m. S.S.E. Magdeburg; lat. 51° 22' 17" N., long. 12° 0' 35" E. Pop., in 1837, 9,413. It is walled, and is old and irregularly built. It has several suburbs, a cathedral, a castle, a gymnasium, an hospital, and various other public institutions. Merseburg is the seat of government for the regency, of the council and court of justice for the circle and town, a board of forests, &c.; and has manufactures of woollen and linen cloth, paper, tobacco, and vinegar. The beer of Merseburg is celebrated as the best in Saxony. (*Von Zedlitz, Der Preussische Staat*, iii. 223; *Reyhauss*, &c.)

MERSEY, a river of England, which has its embouchure on the W. coast of the island, in the Irish Sea. Though not large, the Mersey has, from its flowing through the principal manufacturing district of the empire, and giving its name to the gulph or estuary between Lancashire and Cheshire, become, in point of commercial importance, second only to the Thames. It has its sources in the great central ridge, or Pennine chain, on the confines of Yorkshire, Cheshire, and Derbyshire. After receiving the Goyt from the S., and flowing W. through Stockport, it is joined by its important affluent the Irwell. The latter, which has its source in the Lancashire moors, near Haslingden, flows S. through Bury to Manchester, where, being joined by two smaller streams, it takes a westerly course, till its confluence with the Mersey. After being still farther increased by the Boden from Macclesfield, the Mersey passes Warington, a little below which it expands into a magnificent estuary, having the great commercial port of Liverpool on its N. side, near its junction with the Irish Sea. The Mersey and Irwell have been rendered navigable from Sankey Bridge to Manchester; and projects are now on foot for improving and deepening the navigation. (*See MANCHESTER*.)

MERTHYR-TYDVIL, a parl. bor., market-town, and par. of S. Wales, co. Glamorgan, hund. Caerphilly, on the Taff, 19 m. N. by W. Cardiff, and 140 m. W. by N. London. Pop. of parl. bor., which includes nearly all the par. of Merthyr-Tydvil, and the entire par. of Aberdare, with a small portion of the par. of Vainor, 27,460 in 1831, but now (1841), probably, 35,000. "The town lies on the E. side of the valley, down which the Taff descends to Cardiff, scattered in detached masses about the valley and on the hills, sending forth branches in different directions; and fresh groups are continually rising in the neighbourhood of the great iron-works, so that it is somewhat difficult to point out where any collection of houses ends or begins." (*Bound. Rep.*) The houses, generally speaking, are mean-looking, comprising "labourers' cottages, or small ale-houses, beer-shops, or retail shops;" but in the centre of the town there are three tolerably respectable streets, forming a triangle at one point of which is the parish church, a modern and well-built structure: the living is in the gift of the Marquis of Bute. There is, also, a

chapel-of-ease, besides several places of worship for dissenters; and the various Sunday-schools of the town give religious instruction to nearly 6,000 children of both sexes. National, Lancastrian, and other subscription schools, have likewise been formed, and are well attended. A philosophical society and several book-clubs have been established; and there is abundant proof that education is advancing among all classes. A theatre has been built within these few years, and there are two good hotels. In the environs are many handsome seats, belonging to the wealthy iron-masters; and 3 m. N. of the town, on an insulated hill, stand the ruins of Morlais Castle, a very ancient building, demolished during the late civil wars.

The rise of Merthyr has been rapid, almost beyond belief. Towards the middle of last century it was an insignificant village; in proof of this, it is sufficient to state, that, in 1755, the lands and mines for several miles round the village, the seat of the great works now erected, were let for 99 years for 200*l.* a year. It is wholly indebted for its prosperity to its rich mines of coal, iron-ore, and limestone. The stratum of coal, which is of excellent quality, is accompanied by parallel veins of argillaceous iron, penetrating to a great depth, and yielding, at an average, about 35 per cent. of metal. The iron-works are on a vast scale; those of Sir John Guest and Co. at Dowlais, of the Messrs. Crawshaw at Cyfarthfa and Hirwain, having actually raised up very populous townships; the Pen-y-darran and Plymouth iron-works are also very extensive. In all, about 150,000 tons of iron a-year, are produced in the immediate vicinity of the town. Of this, a large proportion goes through the various processes of refinement and rolling into bars, previous to being shipped at Cardiff. The furnaces, refineries, and rolling-mills employ a great many persons; the wages for men ranging from 12*s.* to 60*s.*; of women, from 6*s.* to 10*s.*; and boys, 7*s.* to 11*s.* per week. The trade is of a very fluctuating character, and great numbers of workmen are often thrown out of employment by the stoppage even of 2 or 3 furnaces. Distress, however, is less permanent here than in many other districts, as "the work is one requiring less experience than many other manufactures; so that a demand for labour is readily met by a supply; while, on the other hand, the labourers feel no great reluctance to transfer themselves to fresh employments." (*Bound. Rep.*) It is said by Mr. Nicholson, in the last edition of the *Cambrian Guide*, that "there is a marked improvement in the houses of the workmen; most of them have good oak chests of drawers, bright as silver; cupboards, with a display of family china cups and glasses; some of the younger women have a venerated work-box; and all these little things display an attention to the lesser comforts and luxuries of life, of which, a few years ago, they had no idea. On the whole, there is a decided improvement in the general condition and circumstances of our workmen." (p. 421.)

But, notwithstanding their comparatively comfortable condition, and the great increase of temperance societies, it would seem that Chartist doctrines have made a very considerable progress among the labourers in this district, a circumstance for which it is not very easy to account. A large portion of the Chartists engaged in the outbreak at Newport, on the 4th of November, 1839, were understood to be from Merthyr and the adjoining iron-works. It is to be hoped that the severe, but wholesome, chastigation they received on that occasion may not have been thrown away; and that it may help to disabuse them of their prejudices, and hinder them from again becoming the dupes of designing demagogues.

The communication with Cardiff is effected by means of the Glamorganshire Canal (completed in 1794), which commences at Merthyr, and ends, after a course of 25 m., in the tideway of the Taff, near its entrance into Penarth harbour, the entire descent being 611 ft. (See *Cardiff*, i. 537.) In 1836, 118,000 tons of iron were sent down this canal. The late improvements of the Marquis of Bute in the port of Cardiff have also been of essential advantage to the export trade of Merthyr-Tydvil. The Taff-vale railway, for which the act of parliament was procured in 1836, and which is intended to connect the mining district of Merthyr with Cardiff, was opened as far as Newbridge, 14 m. N. Cardiff, in Oct. 1840; and it is stated that the traffic, as well as the number of passengers, already exceeds the original estimate. This railway, when completed, will, with its various branches, have a length of 25 m.; the capital is estimated at 620,000*l.*

The Reform Act created Merthyr a par. bor., with the privilege of sending one mem. to the H. of C.; the electoral limits comprising the par. of Merthyr-Tydvil, except parts of the hamlets of Forest and Taff and Cynon, the entire par. of Aberdare, and the hamlet of Cefn-Coed-y-Cumner, in the par. of Vainor. Reg. electors, in 1839-40, 562. Merthyr is also one of the polling-places at elections for the co. Petty sessions are held here for the upper div. of hudd. Caerphilly; and a court of requests sits monthly for the recovery of debts not exceeding 5*l.* An act was

passed in 1830 for the better security of life and property in this district; and the three par. of Merthyr-Tydvil, Aberdare, and Gellygare are under the superintendence of a stipendiary police magistrate, having a salary of 600*l.* a year, half of which is levied on the furnaces within the limits of his jurisdiction, and half on the inhabitants of Merthyr alone. Markets on Wednesday and Friday; cattle fairs May 14, 1st Monday in July, and 1st Monday in Aug.

MESAGNE, or MESSAGNA, a town of the Neapolitan dom., prov. Otranto, cap. cant., 8 m. S.W. Brindisi. Pop. 5,000. \* It has several convents, an hospital, and a fine palace, belonging to the Francavilla family. It manufactures kitchen utensils; and has some trade in oil and grain, considerable quantities of which are grown in its vicinity. Mesagne is supposed by many Italian authors to be the representative of the an. *Messapia*, but this is doubtful.

MESIED, a city of Persia, the cap. of Persian Khorassan, and esteemed as "holy" from its containing a very superb sepulchre, enclosing the remains of Imâm Reza and the caliph Harun al Raschid, 455 m. E. by N. Teheran; lat. 36° 17' 40" N., long. 59° 35' E. Pop., according to Kliner, 50,000. It stands in a rich and well-watered plain, is surrounded with a strong wall, and is divided into 12 quarters, of which 5 are in ruins. The houses are meanly built of sun-dried bricks, and the ark or palace is unworthy of its name. There were formerly 16 medressas or colleges; but most of them are either deserted or in ruins. Indeed the city has now little worth notice, except its fine and well supplied bazaar, and the mausoleum of Imâm Reza, the magnificence of which, with its silver gates, jewelled doors, rails once of solid gold, glittering domes and minarets, and handsome arcades, is almost unequalled in Persia. It has, however, been often plundered; and its resources are said by Mr. Frazer to be greatly reduced. Meshed carries on a considerable trade with Bokhara, Balkh, Candahar, Yezd and Herat; and many of the inhabitants are employed in weaving velvet and making fine pelisses, both of which are much esteemed throughout Persia. (*Kinncir's Persia*; *Frazer's Khorassan*, &c.)

MESSINA (an. *Zancle* and *Messana*), a celebrated city and sea-port of Sicily, cap. Intendency, near the N.E. extremity of the island, on the strait of its own name, 8 m. N.W. Reggio, 56½ m. N.N.E. Catania, and 120 m. E. by N. Palermo; lat. (of its lighthouse) 38° 11' 30" N., long. 15° 34' 40" E. Pop., in 1831, including that of its canton, 83,772.\* The city has a most imposing appearance from the sea, forming a fine circular sweep, about 2 m. in length, on the W. shore of its magnificent harbour, from which it rises in the form of an amphitheatre; and being built of white stone, it strikingly contrasts with the dark forests that cover the mountains in the background. Prior to 1783, the harbour was fronted by a magnificent terrace of lofty houses, called the *Pallazata*, having in front a broad quay decorated with statues and fountains. But the great earthquake of that year laid the city almost entirely in ruins, and though the terrace still exists, it is shorn of its former grandeur. The quay in its front, called the *Marina*, has now, as formerly, numerous fountains, and is the favourite promenade. Ruined buildings, and other vestiges of the earthquake, occupy a considerable portion of the city; and few houses have now more than 2 stories. Swinburne, who visited Messina before 1783, complained that its interior was dirty, with narrow streets, gloomy houses, little bustle of trade, and still less show of luxury. According to Smyth, however, the modern city is regularly built, well paved with square blocks of lava, and several of its streets are wide and handsome, ornamented with numerous churches, convents, statues, and fountains. The square in front of the cathedral, and that of *San Giovanni di Malta*, are both well-built and handsome. The fountain in the centre of the former ranks with the finest in Sicily. The cathedral, erected soon after the conquest of Sicily by the Normans, has been repeatedly damaged by earthquakes. It is a Gothic building, with a heavy and gloomy exterior: the interior, though devoid of taste, is richly ornamented. The principal entrance is handsome; and the nave is supported by immense granite columns taken from the ruins of a temple of Neptune. The great altar and the roof of the choir are set off with mosaics and precious stones: the carved work of the pulpit is gold, and bears the chisel of the Sicilian sculptor Gasparini. The church of *Monte Virgino* has some good paintings in fresco, and that of *St. Giorgio* is very rich in marbles and inlaid work, and has some tolerable pictures. Adjacent to the viceroy's palace, a noble building at the S. extremity of the city, is a large open space planted and laid out in public walks. The other public buildings include a large hospital, several asylums of various kinds, 2 theatres, town-hall, exchange, bank,

\* According to the official returns the pop., in 1798, was only 46,255, so that it would appear to have nearly doubled in the interval.

college, &c. Messina is surrounded by an old irregular wall, finished by Charles V. The citadel, a pentagonal fortress, erected on the S. side of the harbour, is constructed according to the principles of Vauban; but though well provided with bomb-proof quarters and stores, it is badly situated and commanded in almost every part. Two strong and well built forts have, however, been constructed on eminences above the town, that would greatly annoy and harass an enemy during any operation against the citadel. The town is further defended by a fort placed so as to command the mouths of the Finmare, which are the only places where an enemy could land with cannon. The port, to which Messina is wholly indebted for her prosperity, and even existence, is formed by a lengthened curved tongue of land, that might almost be supposed to be an artificial circular mole, projecting first N.E. from the main land, and then bending round to the W. in the form of a sickle. The entrance on the N. about 700 yards across, is defended on the W. on the main-land side, by the bastion of Porto Reale, and at the extremity of the curved promontory by Fort Salvatore. A light-house has been constructed on the extreme E. verge of the promontory. The noble basin thus enclosed is about 4 m. in circuit, and, having deep water throughout, is capable of accommodating the largest fleets: it is, in fact, not only the finest harbour in the Mediterranean, but one of the finest of which we have any certain knowledge. Men-of-war moor in the centre of the basin in about 35 fathoms; but merchantmen lie alongside the quay, and have every facility for loading and unloading. The practice-office, the fish-market, and the custom-house, are all on the Marina. The lazaretto, the best establishment of the kind in Sicily, is in the E. angle of the harbour. The situation of Messina, on the strait between Italy and Sicily, and her admirable port, give her great advantages as a commercial *entrepôt*, and were Sicily and Naples subject to an enlightened government, able and willing to put down abuses, and to call into activity their long dormant energies, Messina would certainly be one of the greatest emporiums of the Mediterranean. Even as it is, her trade is very considerable. Her exports consist principally of oranges and lemons, olive oil, silk, linseed, wines and spirits, shumac, liquorice, rags, corn, salted fish, &c. Almost all the silk exported from Sicily is shipped here. The imports consist of colonial produce, and cotton and woollen fabrics, hides, hardware, &c. We subjoin an

ACCOUNT of the Quantities and Value of the principal Articles exported from Messina in 1839.

Articles.	Weight or Measure.	Quantities.	Total Value.
Argols and cream of tartar	cwt.	4,941	6,925
Barilla	ditto	8,120	2,812
Brimstone	ditto	8,120	5,658

Total value	-	-	409,223

(Macgregor's Reports on Sicily; Smyth's Sicily, pp. 113-123.; Russell's Sicily, pp. 250-261., &c.)

Messina is the see of an archbishop, and the residence of a Greek *protopapas*, with authority throughout Sicily, but who is nominated by the pope. It is the seat of a royal court of appeal, and of criminal, civil, and commercial tribunals; and has a municipal bank, several *mouti di pield*, or government loan banks, and other benevolent institutions. Next to commerce, its inhabs. are chiefly occupied in the tunny and other fisheries; and in the manufacture of silk stuffs, especially damasks and satins. It has an ecclesiastical seminary, a lyceum, an extensive public library; but Simond says that Messina appears to have made slow progress in refinement, compared with Catania or Palermo. "The education of young people is more neglected; very few in the lower ranks can read; and the nobility do not in general reside in Messina: in short, it is neither fashionable, nor learned, nor rich; nor is it, I think, particularly hospitable." (Simond's Italy,

\* This, in the old Sicilian language, was called *Zaxela*, whence the original name of the town. (Thaurydes. lib. vi. cap. 5.)

&c., 525.) But, how deficient soever in these respects, Messina has advantages of another sort that entitle her, in the estimation of her citizens, to look down with contempt on most other places. These consist in the possession of an autograph letter of the Virgin Mary, addressed to the Messinians, and assuring them of her especial protection; and what is, if possible, still more precious, a lock of the Virgin's hair, given by her to the persons entrusted with the conveyance of the letter! To question the genuineness of these valuable relics would, in Messina at least, be rather hazardous; and, under such circumstances, we need not wonder that it is firmly believed that, on one occasion, the city was saved from famine by the opportune arrival of a supply of corn, sent by the Virgin. The only wonder is, that she has allowed it to be so often brought to the brink of destruction by earthquakes, and devastated by the plague. A splendid *fete* is annually given in the great square in honour of the exalted protectress and benefactress of the city. Very few vestiges of the ancient city remain; a consequence, no doubt, of the numerous earthquakes by which it has been visited.

The accounts of the origin and early history of Messina differ considerably. It is admitted on all hands to be very ancient; and most probably deriving the name it has so long borne from a settlement having been made in it by a body of emigrants from Messene, in Greece. Having been seized by the Mamertini, it became, under them, one of the most populous, wealthy, and powerful cities of Sicily. It was the first town of the island that came into the possession of the Romans. (Cellarii Orbis Antiqui, i. 973.; *Ancient Universal History*, iii. 513., 8vo. ed.)

The principal political events in the history of Messina, in modern times, are its successful resistance to Charles of Anjou, by whom it was besieged, after the Sicilian Vespers; and its revolt against the Spaniards in 1671, followed, in the ensuing year, by the defeat of the latter in its vicinity by a French force. In 1743 the plague broke out in Messina, with the most destructive violence, sweeping off the greater number of the inhabs.

METZ (an. *Dindurum*, afterwards *Mediomatrici* and *Metis*, whence its present name), a strongly fortified city of France, dep. Moselle, of which it is the cap., at the junction of the Moselle and Seille, 80m. W.N.W. Strasbourg, and about 180 m. E.N.E. Paris; lat. 49° 7' 5" N., long. 6° 1' 15" E. Pop., in 1836, 42,793. Metz is a fine old city; but, like most fortified places, the streets are narrow, and the houses lofty. Near the river it is more open, the quays are broad, and the bridges magnificent. The river is clear and rapid, and swells to an expanded stream where not confined by the embankments, as it is within the fortifications. (*Jacob's View of Germany*, &c., p. 436.) Metz was fortified by Marshals Vauban and Belisle: it has several strong outworks, and a citadel on the Moselle; but the latter was partly dismantled during the Revolution, and its esplanade has been laid out in public walks, which command a noble view of the valley of the Moselle and its bounding hills. The city has 9 gates and drawbridges, but only 6 are in use. The most conspicuous public building is the cathedral, a vast pile, commenced in 1614, but not finished till 1546. It is about 390 ft. in length, the height of the nave being about 140 ft., and that of the tower about 400 ft. The latter, which is a fine specimen of Gothic architecture, has in it a bell weighing 26,000 lbs. The whole edifice is remarkable for lightness. Mr. Jacob says that the cathedral of Metz was the most perfect Gothic structure he saw on the Continent; and that, though not so old as Westminster Abbey, it may vie in external beauty with that venerable pile. The military hospital, built in the reign of Louis XV., is a noble edifice, consisting of two ranges of building, and capable of easily accommodating 1,500 patients. The *Hôtel du Gouvernement*, a large, though rather heavy fabric, fronts the esplanade; it is appropriated to the courts of justice and the city library; the latter has above 30,000 vols., among which are numerous works printed in the 15th century, and about 800 MSS., some of the 10th century. (*Guide du Voyageur*.) The barracks, military magazines, prefecture, town-hall, and mint, several of the churches, the new market, the theatre, with a portico of the Tuscan order, &c., are among the other edifices. The Moselle and the Seille, in and near the city, are crossed by at least 20 bridges. The principal school of artillery and military engineering (*Ecole de Génie, or d'Application*) in France is established here. Its library has a choice collection of about 10,000 vols. of military and scientific works, with sundry MSS. of Vauban and other distinguished persons. Exclusive of the above, Metz has two other public libraries, with several convents and charitable asylums, a Protestant church, a synagogue, a royal college, a university academy, an ecclesiastical school, and other seminaries; a school for the fine arts, a royal society of arts and *belles lettres*; an agricultural society, a society for the encouragement of primary in-

† There is some discrepancy in the authorities as to these measures; but the above must be nearly accurate.

struction, and collections in natural history, mineralogy, and chemistry; a botanic garden, a lying-in hospital, a savings' bank, a *mont-de-piété*, &c.

Metz is the see of a bishop, and the seat of a royal court for the depts. of Moselle and Ardennes, and of tribunals of primary jurisdiction and commerce, and a chamber of commerce, and the head-quarters of the third military division of France. "It is also a manufacturing city, in which are made woollen goods of various kinds, hosiery, cotton goods, table-linen, printed paper, musical instruments, starch, and gunpowder; it has, besides, several extensive tanneries. Much trade originates here from the produce of the vines, some portion of which is converted into wine, but more into brandy and vinegar; and Metz is celebrated for the preparation of various kinds of confectionery. It is encircled by hills, covered from the bottom to the top with fruit-gardens and vineyards. The vineyards are mostly in small divisions, and principally cultivated by small proprietors, who are extremely poor, and almost all involved in debt to the capitalists of the city, who take from them their wine, brandy, and vinegar as soon as it is made." (*Jacob's View of the Agric. of Germany*, &c., 436—438.)

The royal gunpowder factory, on an island in the Moselle, near the city, is superior to most others in the kingdom. Metz has also a royal cannon foundry, a salt-petre refinery, and produces leather, cotton yarn, military and other hats, muslins, beet-root sugar, chicory, nails, and other articles of hardware, cutlery, buttons, glue, &c.

This is a very ancient city. It still possesses several ruins belonging to the Roman period, among which are the remains of an aqueduct, that appears to have conveyed water to a *naumachium* near the S. extremity of the city. The site of the latter is now occupied by outworks belonging to the fortifications. Parts of an amphitheatre and of a Roman palace are still traceable in the city. It suffered considerably, about *anno* 70, from some excesses of the troops of Vitellius (*Taciti Hist.*, lib. i. cap. 73.), and was nearly destroyed by the savage barbarism of Attila in 452. It had, however, recovered a large portion of its former prosperity in the Middle Ages, and became the cap. of the kingdom of Austrasia. From the 11th century to 1552, when it was taken by Henry II., it was an independent flourishing city. In the same year that it was taken by Henry, it was besieged by the Emperor Charles V., with an army of 100,000 men, but the Duke of Guise successfully defended the town, and Charles was obliged to relinquish the siege. It was finally annexed to the French crown by the treaty of Westphalia, in 1648. (*Hugo, art. Moselle; Guide du Voyageur*, &c.)

MEURTHE, dep. of France, reg. N.E., formerly part of the prov. of Lorraine, between lat. 48° 20' and 49° N., and long. 5° 40' and 7° 20' E., having N. the dep. Moselle, E. Bas Rhin, S. Vosges, and W. Meuse. Length, E. to W., 74 m.; average breadth, about 35 in. Area, 608,922 hectares. Pop., in 1836, 424,396. The Vosges mountains run through the E. part of the dep., the surface of which is mostly covered with their ramifications, though these rise to no great elevation. The dep. belongs almost wholly to the basin of the Moselle, which river intersects its W. part from S. to N., and is joined, within its limits, by the Meurthe. The latter rises in the dep. Vosges, runs generally in a N.W. direction, and, after a course of between 70 and 80 m., unites with the Moselle about 5 m. below Nancy, to which it is navigable. Besides Nancy, St. Dié and Lunéville are on its banks; and it receives the Mortagne, Vezouze, and Mezelles. The Seille and Sarre are the other chief rivers of the dep. There are numerous small lakes, one of which occupies an area of 622 hectares. In 1834, it was estimated that 304,636 hectares of the surface were arable, 71,581 in pasture, 16,371 in vineyards, 1,299 in wood, and 6,226 in orchards, &c. The land is very unequal in point of fertility, and is very indifferently farmed; but more corn is grown than is required for home consumption. The total produce of the harvest of 1835, was estimated at 3,431,500 hectolitres, chiefly wheat and oats; in the same year, the crop of potatoes was estimated at 2,142,000 hectolitres. Before the Revolution, the culture of the vine was limited to the declivities of hills with a southern aspect; but its culture has since been very much extended, the quality of the produce being less regarded than the quantity. About 550,000 hectolitres of wine are supposed to be produced annually, of which the greater part is consumed in the dep. The wines are generally inferior, though the growths of Pagny, Thiaucourt, Arncliffe, Haudonville, and others, may be classed among the secondary qualities of *vins ordinaires*. (*Julien, Topographie*, p. 46.) Dried plums and preserved apricots form important articles of commerce; and the forests, which are more extensive than in most depts., furnish a good deal of timber. The pastures are naturally good, but receive little attention from the farmer. In 1839, there were estimated to be 81,000 head of black cattle, and 167,000 sheep. In the dep., but both are of indifferent

quality. The breed of horses has been improved by the fine stud of Rosières. Hogs of an improved breed are numerous, and their flesh and lard are sent to distant parts of France. A great many poultry are reared. Property is much subdivided. In 1835, of 171,682 properties subject to the *contribution foncière*, 100,343 were assessed at less than 5 fr., and 24,437 at from 5 to 10 fr. Turf and lime are among the chief mineral products; there are some quarries of marble and alabaster, and a few iron mines; but the latter have been abandoned. The salt mines and springs at Dieuze, Vie, Mouvevic, &c., yield about 45,000,000 kilogr. of salt, and 1,000,000 do. of soda a year. About 22,000 hards are said to be employed in the manufactures of cotton cloth and yarn, woollen stuffs, glass, and earthenware, and in embroidery, dyeing cotton stuffs, tanning, &c. At Baccarat is a large glass manufactory, employing a great many hands.

Meurthe is divided into 5 arrondis: chief towns, Nancy the cap., Toul, Château-Salins, Sarrebourg, and Lunéville. It sends 6 mems. to the Ch. of Dep. Number of electors, in 1838-39, 1,219. Total public revenue, in 1831, 16,794,392 fr. (*Hugo, art. Meurthe; Official Tables*.)

MEUSE, a dep. of France, reg. N.E., formerly part of the prov. of Lorraine, chiefly between lat. 48° 25' N., and 49° 35' N., and long. 5° and 6° E.; having N. Dutch Luxemburg and the depts. Ardennes and Moselle, E. Moselle and Meurthe, S. Vosges and Haute Marne, and W. Marne and Ardennes. Length, N. to S., 80 m.; greatest breadth, about 40 m. Area, 620,555 hectares. Pop., in 1836, 314,588. Surface generally hilly, the hills being ramifications of the Vosges and Fancilles mountains, with an average height of from 1,000 to 1,300 ft., though they sometimes reach an elevation of 1,600 ft. The Meuse traverses the dep. in its entire length; the other principal rivers are the Ornain, Chiers, and Aire. The plateau, in the E., separating the basins of the Meuse and the Moselle, and other portions of the surface, are not very productive; but there are, notwithstanding, about 225,000 hectares of rich soil in the dep., chiefly in the valleys of the Meuse and Ornain. In 1834, according to the official tables, 333,150 hectares were arable, 49,431 do. in meadows, 13,540 do. in vineyards, 7,387 do. in orchards, &c., and 137,755 do. in woods. The produce of corn in 1835 was estimated at 2,440,000 hectolitres, of which 1,192,000 were wheat. Potatoes, oleaginous plants, hemp, and flax, are among the other articles of culture. Gooseberries are extensively cultivated in the gardens round Bar and Ligny, and enter largely into the confectionary, for which those towns are celebrated. The produce of wine is estimated at about 400,000 hectol. a year. The wines of Bar-le-Duc, Bussey-la-Côte, Preuilly, Ligny, &c., are delicate light wines, ranking in the first class of *vins ordinaires*; but they do not keep above two years, and do not bear carriage. (*Julien*, 43.) Along the Meuse are rich pasture lands; and at Vold, chesses, similar to that of Gnyère, and excellent butter, are made. A good many cattle and sheep are reared in the dep.; but live stock is in general indifferent. The produce of wool is estimated at upwards of 140,000 kilogr. a year. In 1833, of 157,180 properties subject to the *contribution foncière*, 89,566 were assessed at less than 5 fr., and 22,169 at from 5 to 10 fr. Iron, slates, and good building-stone, are the chief mineral products. There are between 20 and 30 iron furnaces (*hauts fourneaux*) in the dep., and the establishments at Thonelle and Stenay produce each about 1,500,000 kilogr. of iron a year. About 500,000 kilogr. a year of cotton yarn are made at Bar-le-Duc, which, also, has factories of paper, glue, &c., and is the *entrepôt* of a large trade in timber from the forests of the dep. There are numerous glass-works, with lime-kilns, potteries, beet-root sugar factories, &c. Many working cutlery, shoemakers, and other artisans, emigrate for a part of the year from this to other parts of France, and even to the adjacent foreign countries, with the products of their industry, or in search of employment. Meuse is subdivided into 4 arrondis: chief towns, Bar-le-Duc, the cap., Commercy, Montmédy, Verdun. It sends 4 mems. to the Ch. of Dep. Number of electors, 1838-39, 1,186. Total public revenue (1831) 9,071,543 fr. (*Hugo, art. Meuse; Official Tables*, &c.)

MEUSE or MAËR (Dutch *Maastricht*, an. *Mosa*), a river of W. Europe, flowing through the N.E. part of France, Belgium, and the S. of Holland; its basin being situated between those of the Marne and Scheldt to the W., and of the Moselle to the E. It rises in the dep. of Haute Marne, in France, 10 m. N.E. Langres, in about lat. 48° N., long. 5° 20' E., and runs at first generally N. through the depts. of Haute Marne, Vosges, Meuse, and Ardennes. Near Charlemont it leaves France, but it continues its previous direction to Namur, where it receives the Sambre from the W. It here makes a sudden bend to the N.E., in which direction it continues through the provs. of Namur, Liege, and Limburg, to about lat. 51° 30' N. It afterwards curves to the W., flowing between N. Brabant and Guelderland; and finally at Woudrichem, in lat. 51° 49', and long. 5°, enters the Rhine or Waal, which loses its own name to

assume that of the Maas. (See RHINE.) Its entire course may be estimated at 400 m.; nearly the half of which is in France. It is navigable for 3-4ths of this extent, or as far as Verdun, dcp. Meuse. Its chief affluents are the Bar in France, the Lesse, Sambre, and Ourte in Belgium; and the Roer and Niers in Holland. Proceeding from its source to its mouth, the chief cities and towns on its banks are Neufchâteau, Verdun, Sedan, Mézières, Charlemont, and Givet in France; Dinant, Namur, and Liège in Belgium; and Maestricht, Roermond, Venloo, and Grave in Holland, before its junction with the Rhine.

The Meuse communicates with the Aisne, and thence, with the Seine and Somme by the canal of Ardennes; with the Scheldt, by means of the Sambre and the Charleroy canal; and with both the Scheldt and the Rhine by the various branches of the Great North Canal; in addition to which, many other canals connected with it are in progress. (See also BELGIUM, I. 325-6. 337.)

MEXICO (UNITED STATES OF), a federal republic of N. America, lying between the 15th and 33d parallels of N. lat. and 97° and 113° W. long., being bounded N. and N.E. by the W. districts of the United States of N. America and that wild region called New California, E. by the Gulf of Mexico and the Republic of Texas, S. by Guatemala, and W. and S.W. by the Pacific Ocean. The line dividing Mexico from Texas commences with the river Nueces, which it follows up to its source, and then runs N. to the head of the Colorado, whence it stretches W., forming the N. boundary of the confederation. The line of separation on the side of Guatemala is very irregular, commencing E. with the river Sarstoon, which it follows to its source, and then takes a S. direction to lat. 17° 30' N.; it thence runs W. and S.W. to lat. 15° 45', where it assumes a N.E. course, including the prov. Chiapa. Greatest length from N.W. to S.E., 1,700 m.; greatest breadth about 600 m. Area estimated at 1,230,442 sq. m. Nothing can be more unsatisfactory than our acquaintance with this vast country: few even of the principal towns and rivers are correctly laid down, except, indeed, within the small circle personally visited by Humboldt, so that not even the elements of a good map exist; and, with respect to pop., and other statistics, the unsettled, disorderly, and almost lawless state of the country, makes inquiry all but impossible. The following table has been printed in the American edition of Murray's *Encyclopædia of Geography*, and some other works, and though little dependence can be placed on it, it is probably as near an approximation to the truth as can, at present, be arrived at:—

States.	Extent in sq. m.	Pop. in 1857.	Pop. to sq. m.	Capital Cities.
Chilaps	18,750	92,000	4.9	Ciudad de las Cañas
Chihuahua	107,500	180,000	1.7	Chihuahua.
Cobahua	195,700	300,000	0.5	Saltillo.
Durango	54,500	150,000	2.8	Victoria.
Guanaxuato	8,000	500,000	62.5	Guanaxuato.
Mexico	55,450	1,500,000	42.5	Tecame.
Michuacan	7,500	300,000	20.5	Valledad.
New Leon	81,000	100,000	4.8	Montevideo.
Oaxaca	32,550	600,000	20.2	Oaxaca.
Puebla	18,440	900,000	48.5	La Puebla.
Querétaro	7,500	100,000	13.5	Querétaro.
San Luis Potosi	19,000	300,000	15.8	S. Luis Potosi.
Sonora and Sinaloa	254,700	300,000	1.2	Y. I. del Fuerte.
Tamaulipas	14,676	75,000	5.1	Villa Hermosa.
Tamulipas, or New Santander	35,100	150,000	4.3	New Santander.
Vera Cruz	27,600	150,000	5.4	Xalapa.
Yucatan	70,000	870,000	12.4	Quintana Roo.
Zacatecas	19,950	200,000	10	Zacatecas.
Federal district	-	200,000	-	Mexico.
Total of States	1,030,412	7,557,000	7.3	
Territories.				
New Mexico	200,000	250,000	3.5	Santa Fé.
Colima	-	250,000	-	Colima.
Tlaxcala	-	250,000	-	Tlaxcala.
Total	1,230,412	7,725,000	6.3	

The most populous cities are Mexico (150,000), Guanaxuato (60,000), San Luis Potosi and la Puebla (55,000 each), Oaxaca and Querétaro (40,000 each), Guanaxuato (34,000), and Merida (28,000).

Of this great tract of country, which is about 1-3d as large as Europe, the portion lying S. of the tropic of Cancer, and comprising a large part of the long and narrow isthmus that connects the American peninsula, and separates the Atlantic from the Pacific Ocean, is by far the most populous and rich, both in mineral and vegetable productions; and nearly all the information gained respecting Mexico has been collected in that part, to which consequently it is primarily applicable. The regions N. of the tropic become less populous as we proceed northward, and many large districts claimed by the republic, and divided into states and territories, are almost unknown, being inhabited only by wild Indian tribes, bailing all the empts of their nominal masters to violence or subjugation.

The surface of Mexico is extremely varied, and to

this circumstance, nearly as much as to the difference of latitude in so extensive a country, may be attributed that singular variety of climate by which it is distinguished from most other regions. The Cordillera, or chain of mountains, generally regarded as a portion of the great chain of the Andes, that enters Mexico on the S., where it borders with Guatemala, diverges, as it proceeds N., into two great arms, like the upper part of the letter Y, following the line of the coasts on either side. The most westerly of these chains, or that parallel to the shores of the Pacific Ocean, has some very high summits; and preserves its mountainous character all the way, on the border of the United States, with the Oregon, or Rocky Mountains. The other, or eastern arm of the Cordillera, begins to subside after reaching the 21st or 22d deg. of lat., and ultimately subsides, about the 26th or 27th deg. of lat., into the vast plains of Texas. Now, the whole of the vast tract of country between these two great arms, comprising about three-fifths of the entire surface of the republic, consists of a central table-land, called the Plateau of Anahuac, elevated from 6,000 to upwards of 8,000 ft. above the level of the sea! Hence, though a large portion of this plateau be within the limits of the torrid zone, it enjoys a temperate climate; inclining, indeed, more to cold than to excess of heat. Some very high mountains are dispersed over the surface of the central table-land; and it is also traversed in parts by pretty well defined ridges, which divide it into extensive sub-plateaus, to which different names have been given. But the surface is interrupted by few transverse valleys; and in some directions it is quite unbroken, either by depressions or by hills. Thus, it is mentioned by Humboldt, that carriages proceed from the capital, in the centre of the plateau, to Santa Fé, in New Mexico, a distance of 1,400 m., without any important deviation from an apparent level. (Essai sur la Nouvelle Espagne, i. 254.) The most remarkable tract in this elevated region is the plain of Teuhtitlan (in which is the cap.), surrounded by ridges of porphyritic and basaltic rocks, running S.E. and N.N.W. It is of an oval form, 55 m. long, and 37 m. broad, occupying an area of 1,700 sq. m., of which about 100 sq. m. are covered with water. Its S.E. side is that most elevated, and here are seen towering above the plain the volcanoes of Popocatepetl 17,716 ft., Iztaccihuatl 15,700 ft., Citlaltépetl or Orizaba 17,380 ft., and Naucampactl or the Cope de Perote 13,416 ft. above the sea. The waters of the valley are deposited in 5 principal lakes situated on different levels: that of Texcoco, which is near the centre of the valley, and covers 70 sq. m., is the least elevated. Further N. are the lakes of St. Christoval and Tonalitla; while S. is the lake Chalco, occupying an area of 50 sq. m.; and these three are 5 ft. higher than lake Texcoco. The most elevated, however, of the whole, though the smallest, is the lake Zimapano, the level of which is 30 ft. above that of Texcoco. These lakes are fed by small rivers, and having no natural outlet, are drained by the Desague of Huehuetoca, an artificial canal cut through the rock, 12 m. in length, 15 ft. deep, and 300 ft. wide; having its embouchure in the river Panuco, which flows into the Gulf of Mexico. This great work, completed in 1780, at an expense of 1,292,000*l.*, was undertaken to obviate the frequent inundations, some of which did great damage to the capital. The water of lake Texcoco is salt, that of the rest is fresh; but from those to the S. sulphuretted hydrogen gas is copiously disengaged, the smell of which is often perceptible at Mexico.

Besides the volcanoes already noticed, those of Tuxtla, Jorullo, and Colima, in the table-land, are at present in a state of activity, and there are several others now extinct. Jorullo, which stands W. of the city of Mexico, first broke out in 1759; when a tract of ground, from 3 to 4 m. square, swelled up like an inflated bladder, emitting flames and fragments of rock through a thousand apertures. These active volcanoes seem to be connected with others parallel to them, and obviously of similar origin. Earthquakes are frequent in Mexico, but they seldom do much mischief.

The geological formation of the Mexican Cordilleras differs considerably from that of the great mountains of Europe and Asia, in which granite is overlaid by gneiss, mica, and clay-slate; for here we seldom meet with granite, as it is covered with porphyry, greenstone, amygdaloid, basalt, obsidian, and other rocks of igneous origin. Granite, however, appears on the surface in the chain bordering the Pacific, and the port of Acapulco is a natural excavation in that species of rock. The great central plateau of Anahuac, between lat. 14° and 20° N., is a mass of porphyry, characterised by the constant presence of hornblende, and the entire absence of quartz; and in it are contained large and valuable deposits of gold and silver. These ores, however, are found in various rocks: in the mines of Cananah rich veins of silver occur in sienite; in those of Guanaxuato, which are the richest in Mexico, the metal lies in a primitive clay-slate passing into talc-slate; and those of Real del Cardenal, Zacala, and Lomo del Toro, are situated in a bed of transition limestone. Humboldt says that there was at the

time of his visit 3,000 mines of gold and silver in Mexico; but the ignorance and misrule which prevail in the country have greatly diminished their importance as a source of wealth.

**Rivers.**—Mexico suffers serious disadvantages from the want of water, and the rivers, as compared with the extent of territory, are few and unimportant. The Rio Grande del Norte, indeed, has a course of more than 1,300 m., and the Colorado runs about 700 m. into the Gulf of Mexico. The Rio Grande de Santiago, called by the natives Tolo-tolan, rises in the centre of Mexico, not far from the capital, and, after traversing the lake Chapala, falls into the Pacific at San Blas. The Balsas, or Zacuata, and the Yopez, are the only other rivers on the W. side of the plateau, and on the E. side are the Tula and Tampico and the Tabasco, flowing into the Gulf of Mexico; but they have bars at their mouths, which prevent the entrance of large vessels. The other rivers are short, and might more properly be called torrents. The lakes are numerous and extensive; and the principal, besides those in the plateau of Tenoctitlan, already mentioned, are Chapala, in Xalisco, which, according to Humboldt, covers an area of 1,300 sq. m.; Pascuara in Michoacan, Mexitlan, Cayman and Parras, the two last being in the tract called the Bolson de Mapimi.

**Climate.**—The temperature and climate of Mexico is, of course, extremely various; owing, not only to its great extent from N. to S., but also to the rapidity of the slope both on the E. and W. side. The climates, especially on the E. side, are most distinctly marked by the vegetation. On the ascent from Vera Cruz, says Humboldt, climates succeed each other in layers; and the traveller passes in review, in the course of two days, the whole scale of vegetation, from the parasitic plants of the tropics to the pines of the arctic regions. (*Essai Pol. sur la Nouv. Espagne*, i. 270—283.)

Mexico is divided, as respects climate, into the *tierras calientes*, or hot regions, the *tierras templadas*, or temperate regions, and the *tierras frias*, or cold regions. The first, or the *tierras calientes*, include the low grounds, or those under 2,000 ft. of elevation, on its E. and W. coasts, comprising the greater part of the states of Tamaulipas, Vera-Cruz, Tabasco, and the peninsula of Yucatan, on the former. The *tierras calientes*, on the W. coast, are less extensive, the eastern arm of the Cordillera approaching nearer to the sea. The mean temperature of this region, or, at least, of that portion of it between the tropics, may be estimated at about 77° Fahr., being from 14° to 16° above the mean temperature of Naples. It is especially suited for the growth and cultivation of sugar, indigo, cotton, and bananas, which flourish in the utmost luxuriance.

This region labours under the serious disadvantage of being nearly inaccessible by sea for half the year, and of being extremely unhealthy during the other half. The winter, on the E. coast, extends from about Oct. to the vernal equinox; and during this season, in the Gulf of Mexico, N. or N.W. winds (*los norics*) are extremely prevalent, blowing with more or less violence. Frequently, especially in the month of March, the N. winds approach to the strength of a hurricane, and continue to blow with the utmost violence, and without intermission, for 3, and, sometimes, even for 10 or 12 days together. During the whole of this season the navigation of the gulf is exceedingly dangerous; but on shore the heat is moderate, and the coast free from fever and tolerably healthy. Unluckily, however, it so happens, that during the other half of the year, or from the vernal equinox to October, when the N. winds are comparatively rare, and the ports are easily accessible, the heat is oppressive, a great quantity of rain falls, and the coast becomes the seat of pestilential fevers. A European arriving for the first time at Vera-Cruz, or any other part of the coast, between the tropics, in August, September, or October, has but little chance of escaping the *vomito prieto*, or yellow fever; and individuals who have merely landed at Vera Cruz, and posted on immediately for Xalapa, have, notwithstanding, caught the infection. The scourge, however, does not extend its ravages beyond the low grounds on the sea-coast; and at the height of 2,000 or 2,500 ft. above the sea it is wholly unknown. The ports of Acapulco and the low grounds along the W. coast are also extremely hot and unhealthy; and, owing to the prevalence of strong gales, approaching to hurricanes, during the months of July, August, September, and down to October, the navigation is then extremely dangerous.

The *tierras templadas*, or temperate regions, which are of comparatively limited extent, occupy the slope of the mountain chains, or barriers, which bound, on either side, the central table-land. It extends from about 2,500 to about 5,000 ft. of elevation. The mean heat of the year is from 62° to 70° Fahr., and the extremes of heat and cold are here equally unknown. The Mexican oak, and most of the fruits and cerealia of Europe, flourish in this genial climate. The cities of Xalapa, on the E., and Chilpanzingo, on the S.W. slope, are in this region, and are famous for their salubrity and, for the abun-

dance of their fruit trees. The frequency of fogs, and the consequent humidity of the atmosphere, is the greatest drawback on the climate of the *tierras templadas*; but this, how injurious soever in some respects, produces great beauty and strength of vegetation.

The *tierras frias*, or cold regions, include all the vast plains elevated 5,000 ft. and upwards above the level of the sea. In the city of Mexico, at an elevation of 7,400 ft., the thermometer has sometimes fallen below the freezing point. This, however, is a rare occurrence, and the winters are there usually as mild as in Naples. In the coldest season the mean heat of the day varies from 55° to 70° Fahr.; while in summer the thermometer seldom rises in the shade above 75°. The mean temperature of the city is about 64°, and that of the table land generally may be taken at about 62°, being nearly equal to that of Rome. But, wherever the table land rises to more than 8,000 ft. above the sea, it has, though between the tropics, a rude and disagreeable climate. Under the parallel of Mexico the limit of perpetual snow varies from about 12 to near 15,000 ft. Vegetation in the central plateau is not, owing to the rarity of the air, so vigorous as on the *tierras calientes*, or along the coasts, and the plants of Europe do not succeed so well as in their native soil. In the tropical and central region of Mexico, and as far N. as lat. 28°, there are only two seasons; that of the rains, lasting from July to the middle of Sept., and the dry season, continuing from Oct. to the end of May. From the 24th to the 30th parallel the rain falls less frequently; but this deficiency is compensated by the abundance of snow during Jan. and Feb.

The climate of the table-land is, on the whole, favourable to human life. But, though intermittent fevers be of rare occurrence, the natives are occasionally visited by a peculiar epidemic, called by them the *mal de S. Antonio*; but it owes its origin more to the habits of the people than any other cause. Indeed, famine, and its concomitant privations, have thinned the pop. more than epidemic complaints. The indolence of the natives prevents all exertions to raise more food than requisite for the wants of a single ordinary season; and no one ever thinks, when there is a surplus, of laying up a stock against future contingencies. Hence, when droughts and severe frosts occur, they are compelled to seek their subsistence in the forests, where roots and wild berries constitute their sole diet; and multitudes are often carried off by hunger and unwholesome food.

**Animals.**—The zoology of Mexico is but imperfectly known. The domestic animals introduced by the Spaniards have so much increased, that vast herds range wild through these thinly inhabited regions. The wool of the sheep is of inferior quality; but this is attributable more to neglect and mismanagement than to nature; mules are much used in the mining districts. Buffaloes abound in the prairies bordering on the Arkansas and Red River, and during winter they migrate westward, in quest of pasturage, to the milder climate of the plains along the lower part of the Rio Grande del Norte. Carnivorous animals are not numerous. Bees abound in the low country of Yucatan.

**Agriculture.**—Mexico, not only from its extent through 21 degrees of latitude, but also from the varying elevation of its surface, and consequent variety of climate, produces most of the plants peculiar to the tropics, as well as those belonging to the temperate regions of S. and middle Europe. "Indeed," says Humboldt, "there is scarcely a plant in the rest of the world which is not susceptible of cultivation in one or other part of Mexico; nor would it be an easy matter for the botanist to obtain even a tolerable acquaintance with the multitudes of plants scattered over the mountains, or crowded together in the vast forests at the foot of the Cordilleras." (*Essai*, tom. ii. p. 370.) The soil also is, in most parts, extraordinarily fertile; and wherever water can be procured for irrigation, the most abundant crops may be raised with very little labour. This, however, is very far indeed from being an unmixed advantage; and it is, in fact, more than doubtful, whether a very fertile soil and a genial climate, that makes warm clothing and comfortable lodgings of comparatively little importance, be consistent either with active industry and exertion or with a high state of civilisation. In most parts of Europe, continuous industry is indispensable to existence; but it is otherwise in Mexico and many other countries, and it is found that industry is uniformly proportioned to the strength of the motives by which it is occasioned, and that, wherever the ordinary necessities and comforts of life may be procured with little labour, the mass of the people are invariably indolent. To suppose, indeed, that they should be otherwise, is to suppose what is contradictory and absurd. This effect of the peculiar nature of the soil and climate was less sensible in Mexico under the Spanish government, because it was then daily receiving adventurers from Europe, imbued with European notions, and anxious to accumulate a fortune. But now that the influx of such parties has nearly ceased, and that there are no such extrinsic and

adventitious motives to prompt to activity and enterprise, every thing appears to be falling into a state of apathy and languor; and indolence, with its necessary accompaniments of poverty, ignorance, and pride, bid fair to be, for a lengthened period, the distinguishing characteristics of the Mexicans.

We have stated, under the head of climate, how the more useful plants are distributed through the zones into which the country is divided. The banana, which flourishes up to the point where the mean temp. is 75° Fahr., bears the same relation to the Mexicans, in the lower provinces, that the various cerealia bear to the inhab. of Europe and W. Asia, and the different kinds of rice to the Bengalees and Chinese. About 450,000 sq. m. in the *tierras calientes* are said by Humboldt to be adapted for its cultivation. It is propagated by cuttings; and there is probably no other plant which produces on the same extent of land, and with so little labour, so great a quantity of food. Humboldt affirms that 1 hectare (about an acre) of land, planted with bananas, will furnish food for more than 50 individuals; whereas the same extent of land, if sown with wheat, in Europe, would not support more than 2 individuals! And all the labour required to raise this enormous produce is to cut off the stems when the fruit is ripe, and to give the earth a slight digging about the roots of the plant once or twice a year. Hence, says Humboldt, nothing strikes an European recently arrived in Mexico with more astonishment than the smallness of the patches of cultivated ground round cabins that swarm with children. It cannot be said of such a country:—

Pater ipse

COLONNI haud facilius esse viam voluit.

But the ease with which subsistence may be procured, and the fewness of their wants, have made the natives in the last degree slothful. Indeed, Humboldt tells us that it has been gravely proposed, in order to stimulate their industry, and rouse their torpid faculties, to grub up and destroy the banana plantations! (*Essai*, &c., ii. 396.) Such a project is, of course, impracticable and absurd; but the nature of the proposed remedy serves, at all events, to show the violence of the disease.

The same parts of the country which produce the banana produce also the cassava; or manioc, the farina of which yields a very nourishing bread: it requires more care than the banana, somewhat resembles the potato, and arrives at maturity about 8 months after the slips have been planted. The culture of maize is scarcely less important in the *tierras calientes* than that of the plants before named; it is not confined, however, to the low lands, but ascends as high even as the plain of Toluca (9,100 ft. above the sea), the lowest average temperature favourable to its growth being about 49° Fahr. The plant, under favourable circumstances, rises to the height of 7 or 8 ft., and the returns, in common years, are most abundant; but they are more uncertain than those of any other kind of grain. Maize is the principal food of the people, as well as of most domestic animals; and a deficient harvest, whether from want of rain, or excess of cold, produces a general famine, and compels great numbers of the rural pop. to seek the deserts in search of wild plants.

There can be no doubt, however, that if agriculture were pursued with any spirit, and the system of irrigation generally introduced on corn lands, or even if there were the slightest degree of providence in the natives, those dearths would not occur that on several occasions have been so fatal, especially in the mining districts. The European *cerealia*, such as wheat, barley, &c., succeed best in the temperate regions, where the mean heat does not exceed 66° Fahr.: in fact, in the equinoctial regions of Mexico these grains are not found under the level of 2,500 ft. above the sea. The Mexican wheat is of excellent quality; equal, says Humboldt, to the best of the Andalusian: it is large, white, and nutritive. In well irrigated lands, and on good soils, the produce is said to average 24 for 1; but, since the revolution, this necessary branch of agriculture has been much neglected. Rye and barley resist cold better than wheat, and are cultivated in the highest regions; barley yielding abundant harvests, even where the thermometer indicates a heat during the day of only 57°. Oats are little cultivated. Among the other alimentary plants, most of which have been introduced by Europeans, are the potato (confined chiefly to the table-land), the yam, common both to the high and low country, the capsicum, raised in immense quantities for its spice, which is universally used instead of salt for seasoning food, beans, and various other garden vegetables common to Europe and America. Most of the fruits of Europe are common and plentiful; the olive and vine, introduced since the revolution, generally succeed well; and nowhere are there finer pine-apples, pomegranates, guavas, alligator pears, &c. One of the most valuable plants in the country is the maguery (*Agave americana*), which Humboldt not unaptly terms the vine of Mexico. The maguery plant-

ations are principally found in the states of La Puebla, Mexico, and Guanajuato; but the plant is very hardy, and occurs in a wild state all over the country. Its

growth is slow; but when arrived at maturity its leaves are from 5 to 8 ft. in length, and the stem often attains a height of 20 or even 30 ft. Its period of flowering is very uncertain, but once in 10 years may be considered a fair average. At the flowering season, when the plant first begins to be useful, the exact time is watched when the stem of the flower is about to shoot up; the top is then cut off, so as to form a hollow, for the reception of the sap, which is regularly drawn off; and a vigorous plant will yield 15 quartillos daily for four or five months successively. The sap, which has a slight sub-acid taste, ferments readily in three or four days, being in its vinous state called *pulque*, a beverage which somewhat resembles cider, though with a disagreeable smell. Immense quantities of it are drunk by all classes, and many whites as well as Indians use no other liquor. A kind of brandy, called *merical* (very like whiskey), is made from the distillation of pulque. The maguery is useful, also, in other ways: its fibres are converted into thread ropes and paper, its prickles serve for pins and needles, and its juice is effective in healing green wounds. Large quantities of sugar are raised in the neighbourhood of the capital, and the crops are very abundant: the lands are cultivated by free labourers, and the farming seems pretty good, though the process of refining be very clumsily conducted. In the commencement of the present century there was a large export of sugar; but this has for some years wholly disappeared, and the present supply is barely sufficient for the home consumption.

Vanilla is extensively raised in the *tierras calientes*, E. of the Cordilleras, particularly in the state of Oaxaca. The cultivation of coffee is on the increase, and the quality of that raised on the best soil near the coast is said to be equal to the best produced any where else. Tobacco is a government monopoly, and its growth is confined to a small district near Orizava and Cordova. Its quality is inferior to that of Cuba; and, as the consumption exceeds the growth, considerable quantities are imported from the Havannah.

On the whole it might be fairly concluded, on general grounds, that agriculture in Mexico must have retrograded since the revolution. And such, in point of fact, has been the case, and to an extent that we should hardly have conceived possible. This is evident from the following statement by M. Chevallier\*, who visited Mexico in 1833. "Agriculture," says he, "is neglected. No law, indeed, prevents the planting of the vine and olive tree; not only, however, has no advantage been taken of this change, but the very lands which were cultivated in the time of the Spaniards are now lying fallow. In a circle of a few leagues round Mexico I have seen large villages almost abandoned. In this delightful climate, the only manure which the land ever requires is water; this is rather scarce, yet many of the hydraulic constructions raised by the Spaniards at a great cost are in ruins, and seem likely to remain so. The lands, which, by means of this artificial irrigation, were the most fertile in the world, are gradually becoming completely sterile. Their ploughs, and other agricultural instruments, are of the rudest description. No one troubles himself to introduce European improvements, nor even to import better tools from the United States. I made the passage from New Orleans to Vera Cruz with General Arista, who had been exiled in consequence of some insurrection or other in which he was concerned. Wearied with the chances of revolutions, he had determined to devote himself to agriculture. He had scarcely, however, landed at Vera Cruz, when he was thrown into prison under some vague pretext. He still continues under arrest, and his ploughs, harrows, and winnowing machines remain under sequestration, suspected, probably, of abetting the general in some subversive designs."

**Mining Industry.**—The silver and gold mines of Mexico have always been deemed the main sources of its wealth; and, unquestionably, its mineral riches far exceed those of any part of America, except, perhaps, Peru. Before the war of independence there were the 37 mining districts of New Spain, somewhat more than 3,000 mines, producing annually about 21,000,000 dollars in silver, and about 2,000,000 in gold. Towards the close of the struggle many of the mines had been deserted, and their produce had declined a half, and does not yet materially exceed that amount. Several of the so called companies, formed in Great Britain for working the Mexican mines, during the memorable, and, we may add, disgraceful, era of 1824-25, were mere swindling engines, and fell to pieces in a very short while. There were others, certainly, that had a more

\* The promised work of this able and intelligent traveller on Mexico has not yet appeared. We have borrowed the following extracts from letters addressed by M. Chevallier to his friends in France, that were published at the time in the Paris journals. The information they contain is by far the most important that has appeared respecting Mexico since the publication of Humboldt's work.

solid foundation; but these were mostly gone into without due consideration, and without any practical knowledge of the country, of the practices that had been followed, and the difficulties to be overcome. We need not, therefore, be surprised at the enormous losses the companies sustained at the outset, and of their want of success in the first instance. But, had the Mexican government been able and willing to repress disorder, and to enforce the observance of contracts, it is probable that the produce of the mines would have been very different at this moment from what it really is. Unluckily, however, no government has yet been established in Mexico with power, even if it had the desire, sufficient to put down disturbances or to enforce engagements. So long, indeed, as the companies were struggling to put their mines in order, they sustained comparatively little inconvenience from this circumstance; but, as soon as they had succeeded in bringing them once more into a productive state, and were beginning to have some prospect of a return for their enormous outlays, they were annoyed by questions as to title, and by the setting up of claims on the mines of which they had never heard before. Owing to these causes, as well as the general insecurity of property, the bad condition of the roads, and imperfect mining processes, the results have, on the whole, been very unfavourable, notwithstanding the reduction of the export duty on specie from 10 to 3 per cent.

The following statement of M. Chevallier, as to the insecurity of the miners, in 1835, discovers a state of things disgraceful to the government; and such, indeed, as could hardly have been credited on any inferior authority.

"How," asks he, "can the mines be worked with any feeling of security, when it requires a little army to escort the smallest portion of the precious metal to its place of destination? Between the mine of Real del Monte and the village of Tezeyuco is a mountain pass, where a grand battle was fought between the miners and the banditti of the country. The former were defeated, overpowered by numbers; but not without having sold their lives as dearly as possible. The mine is now guarded by artillery and grape-shot, and the Englishmen employed there are regularly drilled in the use of the musket." In such a state of things the wonder is, not that the produce of the mines has declined, but that it continues to be so great as we find it to be. The mineral riches of the country are, however, inexhaustible; and there wants only a government able and willing to afford security to make the produce of the mines greater than ever. The subjoined statement, which cannot, however, be altogether depended on, exhibits an

Account of the Number of Dollars coined at the different Mints of Mexico during each of the Four Years ending with 1837; the proportion of gold to silver being as 1 to 26 nearly:—

Mints.	1831.	1835.	1836.	1837.
Mexico	5,922,000	5,617,115	7,511,136	5,265,432
Guanaxuato	2,705,000	2,107,608	2,311,972	3,008,924
Zacatecas	5,275,000	6,155,499	5,115,252	5,285,253
Guadalupe	715,000	628,250	585,231	579,634
Durango	1,215,000	1,253,995	1,422,718	998,000
San L. Potosi	928,000	1,038,205	1,099,112	1,110,777
Chihuahua			221,215	225,162
Total	12,010,000	12,005,154	12,055,193	11,616,302

The theory of mining is little understood by the Mexicans, the oldest modes of working being still generally practised, notwithstanding the improvements that have been introduced by the English; and the machinery for draining the mines and raising the ore is of the most primitive description. Indeed, many of the mines have been abandoned, owing to the imperfections of the machinery, which, under more favourable circumstances, might be again worked with profit. The ignorance of the miners is only equalled by their obstinate adherence to old, and elsewhere long exploded, practices. But this should not be matter of surprise, if the testimony of M. Chevallier respecting the education of engineers may be depended on. The school of mines (*Mineria*), the more building of which cost 120,000*l.*, is at present in the most pitiable condition, although the learned Andres del Rio is still one of the professors. It is unprovided with the means even of the most elementary instruction. It contains a vast chemical laboratory, but without the instruments requisite for the most simple experiments. The collection of minerals is in disorder, badly classed, and very incomplete; the library and the mechanical cabinet are deplorable. The school seems to have shared the fate of the public treasury,—of having been pillaged three or four times over. The very building seems on the point of falling to pieces—an appropriate emblem of the Mexican Republic. But it cannot surely be supposed that the anarchy which has led to such deplorable results is to continue for ever. If nothing may be hoped for from within, it is to be wished that foreign interference may rescue this fine country from the barbarism in which it is now involved.

The quantity of silver annually extracted from the mines of Mexico very much exceeds that furnished by all the mines of Europe; but, on the other hand, the gold is not much more abundant than in Hungary and Transylvania; the proportion which the gold of Mexico bears to silver being as 1 to 26 nearly. Little native silver is found in any of the mines: sulphuretted and black prismatic silver is both very common and exceedingly productive in the veins of Guanaxuato and Zacatecas, two of the richest mining districts: the muriate abounds in the mines of Catorce and San Pedro, near San Luis de Potosi; and the martial pyrites of Pachuca yield three marks to the hundred weight. The Mexican ore, however, is poorer than that of Europe, 1,600 oz. of ore yielding only about 4 oz. of silver. The gold is produced by washing the earth and sand in some few places; but in the province of Oaxaca occur veins of native gold, usually mingled with the silver veins: the returns, however, seldom exceed 1*l.* to the cwt. (*Poinsett's Notes on Mexico*, p. 226.) Slave labour is not tolerated in the mines; but it would be difficult to find workmen so ignorant, brutalised, and wholly worthless as the native miners. Indeed, the ill success of the English mining companies is owing, in part at least, to the want of honest and efficient labourers. The business of the mines is followed by the native tribes from generation to generation: they lead a migratory life; removing, with their families, to districts where they expect the greatest profit from their labour: they are always paid by a share in the produce; regular wages, however high, being invariably rejected. The principal mines are in the states of Guanaxuato, Zacatecas, San Luis Potosi, Chihuahua, Durango, Guadalupe, and Mexico. The richest mineral tract between the 21st and 25th parallels of N. lat. Many of the mines have been very imperfectly wrought; and by far the larger part of the richest veins is yet unexplored. It is worthy of remark, also, that the ores appear to increase in richness on proceeding N. The mines in the confines of Durango and Sonora are peculiarly rich, lie near the surface, and hold out, wherever they have been tried, a promise of riches superior to any that Mexico has yet produced.

Iron is found in great abundance in Guadalupe, Mechoacan, and Zacatecas; but no mines of that metal were worked before 1825. Copper is raised in Mechoacan and Guanaxuato. Large quantities of copper money have been coined in the mint of the city of Mexico, the total value, during the seven years ending with 1837, having amounted to 4,712,000 dollars, or 942,400*l.* Tin is obtained partly from mines, but principally from washings in the ravines. The lead mines, though rich, are quite neglected. Zinc, antimony, and arsenic have been found; but neither cobalt nor manganese. A quicksilver mine is wrought in the state of Queretaro. Carbonate of soda, used for smelting the silver ore, is found in great abundance crystallised on the surface of several lakes.

**Manufactures.**—The selfish policy of Old Spain, by which she endeavoured to keep her colonies as much as possible dependent on her own markets, or on supplies furnished by her, led to the enactment of laws prohibiting the rearing of silk-worms, and the cultivation of flax, and of the vine and olive. Coarse woollen and cotton fabrics, worth about 1,500,000*l.* were formerly made; but these have greatly diminished since the revolution. The system on which the cloth and other factories are conducted is disgraceful to persons having the smallest pretensions to civilisation, and is wholly subversive of all improvement. Each factory is, in fact, a prison, in which the work-people are treated with the greatest rigour, and from which there is no escape; the proprietor, instead of paying his workmen in money, supplies them with spirits, tobacco, and food, at prices fixed by himself. An intelligent German, who resided 40 years in Mexico, states, that the high walls, strong double doors, barred windows, and severe corporal punishments common to these factories, make them as bad as the worst-conducted gaol in Europe. Criminals and insolvent debtors are condemned to work in the factories as a punishment. This state of things existed before the Revolution, and we regret to say that it has not been at all improved by the free intercourse which the Mexicans have now for several years enjoyed with the manufacturers and capitalists of Europe and the United States. "One might," says M. Chevallier, "have supposed that when the ports were thrown open to the commerce of Europe, manufactures would soon have been established in a country where manual labour is cheap, where the workmen are submissive and skilful at imitation, where the soil produces the raw cotton, where the Spaniards had multiplied their flocks of sheep to a great extent, and where the rearing of the silkworm might be carried on with astonishing facility. The native Mexicans are, however, destitute of all spirit of enterprise, and strangers cannot attempt any permanent establishment in a country from which, during every session of congress, they are periodically threatened with expulsion. A more than ordinary display of industry would excite the jealousy of the natives; for nothing exal-

perates a Mexican more than to see Europeans and North Americans growing rich before his face. A flourishing factory, established by a foreigner, would be very likely to be pillaged during the first popular tumult. Instances of the kind have already occurred. The only European manufactory existing at Mexico, is one founded by M. Dupont, a French merchant, for making *mandus*, a coarse cotton stuff much worn in the country. The looms were made at Patterson, near New York. When the Mexicans had achieved their independence, and were organising their government, they created a fund for the encouragement of national industry (*banco de aris*), and endowed it with an additional duty of 2½ per cent. on foreign importations. In this way a few hundred thousand piastres were soon procured, which were expended in the vain attempt to establish manufactories. At present, the receipts for this fund are thrown into the abyss of the national deficit, which every year increases in depth, and where they are lost like a drop of water in the sea. Cigars, hats, glass, and earthenware, are produced on a large scale; but the furries are, for the most part, extremely ill-conducted. Mexican leather is very indifferent; paper is of bad quality, and exorbitantly dear; the making of cutlery and hardware is scarcely attempted, and what is done, is badly executed; the use of cast-iron and tin for culinary utensils is almost unknown, and a very few years ago there was only one manufacturer of watches and optical instruments in the whole of Mexico. "The Spaniards," says Chevalier, "are bad mechanicians, and no efforts of foreigners have been able to prevail on the Mexicans to deviate from the routine of their forefathers. All their tools are wretched; the common wheelbarrow even is unknown. Some merchants had imported two models, to be used in moving the bales of goods at the custom-house, but the workmen refused to make use of them."

*Commerce.*—An individual, looking at a map of the world, would be apt to conclude that Mexico is one of the most favourably situated countries for commerce; and, in some respects, this is true. But her trade labours, notwithstanding, under some serious disadvantages. Though washed by the Atlantic and Pacific Oceans, neither of her coasts is accessible for several months of the year. On the E. coast, or that bordering the Gulf of Mexico, there is not a single good harbour; and during the season when the coasts are accessible they are extremely unhealthy. Owling, also, to the rapid ascent from the shores to the interior, the construction of roads, and the transport of commodities to and from the inner provinces, is alike difficult and expensive. No doubt, however, an efficient government and an industrious people would speedily, in a great measure, overcome these obstacles to an extensive intercourse with the foreigner. But Mexico has neither the one nor the other; and, at present, her trade is confined within the narrowest limits. Down to 1778, when the Spanish government relaxed the old prohibitive system, the foreign goods legally imported into Mexico comprised only a few Chinese and European manufactures; the former brought annually in *one* galleon of about 1,400 tons, and the latter sent *once in three years* exclusively in ships chartered by government from Seville or Cadiz! On the opening of the trade in 1779, private capitalists engaged in it, and after that period, at an average

of 12 years before and after, the returns for exports alone rose from 11,000,000 to 19,000,000 of dollars, the difference being chiefly in the quantity of specie. How much greater would the increase have been, if the trade had not been fettered with vexatious duties, first on articles of Spanish produce in the markets of Seville and Cadiz; 2. on shipping for Mexico; 3. at Vera Cruz; and, 4. with an *alcabala*, or transfer duty, at every step, from the merchant to the consumer? On the breaking out of the civil war, the ports of Tampico, Mazatlan, and San Blas were opened by the new government; and soon afterwards foreign vessels were admitted into all the ports on the same terms as Spaniards. The Spanish capitalists retired to Cuba or Spain; and their places were supplied by British and American merchants, who established themselves in the interior, and supplied the inhabs. in return for dollars with manufactured goods, the superior quality and cheapness of which has, no doubt, had some influence in depressing native manufactures. The jealousy of the natives, however, and the absurd threats of the government against foreign artificers and traders, has tended to prevent their settling in the country, and engaging in any considerable undertaking, other than the mines; and the depressed state of the latter, which have always furnished the principal article of export, has tended still further to depress and paralyse commerce. The roads, too, instead of being improved, have been suffered to fall into a state of almost irreparable decay. In this respect, the evidence of M. Chevalier is decisive. "The splendid road which, during the domination of the Spaniards, was constructed across deserts and precipices, by the merchants of Vera Cruz, to the summit of the upper country, is a melancholy instance of the carelessness with which the public interests of the country are directed. During the war of independence, this road was cut up in various points; and, down to this day, the enfranchised Mexicans have not replaced a single stone, nor filled up a single trench, nor even cut down one of the trees, which, in the absence of any considerable traffic, and under the influence of a tropical sun, are rapidly growing up to a magnificent size in the very middle of the road. In the upper country nothing would be more easy than to open noble means of communication. The soil is naturally level; and basaltic rocks, particularly adapted for the construction of roads, are found in great abundance. But even where there are roads, the Mexicans make little use of them. They carry to a yet more extravagant length the inconceivable predilection of the Spanish race in favour of transporting their goods on the backs of animals. You expect to meet with carts and waggon: no such thing; every thing is conveyed on the backs of mules or Indians. Troops of little consumptive donkeys bring into the city in parcels, not much bigger than a man's two fists, the charcoal required for the culinary operations of the inhabs. The price of every bulky article is thus increased to an enormous degree. The interior districts are as inaccessible as if they were cut off by an enemy's army, and famine frequently ensues." The following table furnishes an official account of the vessels entering the ports of Vera Cruz, Tampico, San Blas, and Mazatlan during the year 1838, with the invoice value of their cargoes, &c.

Countries.	Inward.			Outward.		
	Ships.	Tons.	Value.	Ships.	Tons.	Value.
			L.			L.
I. <i>Vera Cruz</i> :—			167,750

	147	18,019	1,143,870 ?	112	16,876	1,672,621

The above statement, though not complete, shows the comparative trade of different countries with Mexico, and proves that about half her imports come from Great Britain, which also takes off about 5-6ths of her exports, bullion, the chief article amounting to about 1,000,000.

The nature and amount of the direct trade with this country will be seen by the following statement of the different articles of home and colonial produce sent to Mexico in 1838:

Articles.	Quantities.	Declared Value.
<b>I. British produce and manufactures:—</b>		
Cotton fabrics:—		
Cotton fabrics - - -	8,485,864 yds.	259,580
Hosiery - - -	8,114	8,114
Yarn and twist - - -	311,900 lbs.	16,707
Linen fabrics - - -	1,836,028 yds.	76,758
Woolen do. - - -	9,537 pieces	57,380
Do. - - -	85,166 yds.	
Silk goods - - -	- - -	8,999
Hardware and cutlery - - -	1,120 cwts.	7,566
Iron wares and iron - - -	257 tons	5,592
Machinery - - -	- - -	8,533
Tin and pewter wares - - -	- - -	2,361
Earthenware and glass - - -	- - -	4,176
Other articles - - -	- - -	7,247
<b>II. Colonial and foreign produce:—</b>		
Quicksilver - - -	353,042 lbs.	360,833
Cinnamon - - -	31,911 -	
Raw silk - - -	3,000 -	
Linen fabrics - - -	2,084 pieces	
Wine - - -	2,150 gallons	- - -
Total of British exports to Mexico - - -	- - -	800,589

These returns show a great apparent increase of trade since 1831, when the exports from Great Britain to Mexico amounted only to 160,752*l.*; but, instead of going direct, as at present, the exports then were mostly indirect, through Jamaica and other places. The foreign trade is in truth quite insignificant, regard being had to the extent and resources of the country and its pop.

The Mexican congress has fixed a tariff regulating the duties on the chief articles of import, and all articles not specified pay an *ad valorem* duty of 40 per cent.; quicksilver, wooden frames for houses, printed books, maps, and music, philosophical and musical instruments, artificers' tools, agricultural and mining implements, seeds, and plants, are admitted duty free. All articles which are the growth and produce of Mexico may be exported duty free, except gold, in coin or wrought, which pays 2 per cent. *ad valorem*, and silver, the duty on which is 3½ per cent. *ad valorem*. Gold and silver ore, ingots, or dust, are prohibited under penalty of seizure.

**Government.**—On the resignation of Iturbide, the Mexicans determined on establishing a federal government. The present constitution, dated Oct. 4, 1824, is modelled on that of the United States; the republic was then divided into 19 states, each of which is permitted to manage its own local affairs, while the whole were cemented together in one body politic by fundamental and constitutional laws. The powers of the supreme government are divided into 3 branches—legislative, executive, and judiciary.

The legislative power was vested in a congress consisting of a house of representatives, a senate, and a president. Representatives, elected by each state at the rate of one member for 80,000 inhab., hold their places for two years. The qualifications requisite are 25 years of age, and 8 years' residence in the state. The senate consists of 2 mems. for each state, of 30 years of age each, who are elected by a plurality of votes in the state congress. The members of both houses receive salaries of 2,000 *doll.* a year. The president and vice-president are elected by the congress of the states, hold office for four years, and cannot be re-elected for four years after. Congress sits annually from January 1, to April 15. A council of government, consisting of the vice-president and half the senate, sits during the recesses of congress.

The city of Mexico is the seat of government. The legislatures of the 19 states are similar to that of the republic in general. But the federal has lately been consolidated into a central government with a single legislative body for the entire republic, the states being formed into departments with subordinate councils.

These arrangements appear, however, to be disliked by a large proportion of the people; at all events Mexico has continued, since the establishment of the federal government, to be little better than a theatre for insurrections. The testimony of M. Chevalier is conclusive with respect to the condition of the country in 1835, and there has been no material improvement in the interval. "I have only been two months in Mexico, and already I have witnessed five attempts at revolution. Insurrection has become quite ordinary occurrences here, and their settled forms been gradually established, from which it is not considered fair to deviate. These seem almost as positively fixed as the laws of baggaimon or the recipes of domestic cookery. The first act of a revolution is called *pronunciamento*. An officer of any rank, from a general down to a lieutenant, pronounces himself against the established order, or against an institution which displeases him, or against any thing else. He gets together a detachment, a company, or a regiment, as the case may be, and these, generally, without more ado, place themselves at his disposal. The second

act is called the *grito*, or outcry, when two or three articles are drawn up, to state the motives or objects of the insurrection. If the matter is of some importance, the outcry is called a *plan*. At the third act, the insurgents and the partisans of government are opposed to one another, and mutually examine each other's forces. At the fourth act they come to blows; but, according to the improved system lately introduced, the fighting is carried on in a very distant, moderate, and respectful manner. However, one party is declared victor, and the beaten party *dispronounce*. The conquerors march to Mexico, and their triumphal entry into the capital constitutes the fifth act of the play; the vanquished meanwhile embark at Vera Cruz or Tampico with all the honours of war."

The laws are alleged to be mild and just, but they are almost powerless; for nothing can well be conceived more appalling than the state of anarchy described by the very intelligent traveller just quoted.

With tranquillity, unfortunately, every thing else is also lost. There is no longer any security. It is a mere chance if the diligence from Mexico to Vera Cruz proceed the whole way without being stopped and robbed. It requires whole regiments to convey the *conducta* of piastres to Vera Cruz. Travellers who cannot afford to pay for an escort go armed from head to foot, and in little caravans. Here and there, rude crosses erected by the side of the road, and surrounded by heaps of stones, thrown by passers-by, in token of compassion, point out the spot where some wayfarer, and almost always a stranger, has perished by the hand of robbers. "The immediate environs of the most populous cities are infested by malefactors, and even in the interior of cities, not excepting the capital, there is no longer any security. There are numerous instances of people being robbed on a Sunday, and at the hour even when the greatest number of people are abroad, within a league of Mexico. An English charge d'affaires was loosed on the Alameda, the public walk, in the middle of the day. In the evening, after sunset, notwithstanding the numerous guardias of the night (*serenos*), notwithstanding the videttes of cavalry at every corner of the streets, notwithstanding the law prohibits the riding on horseback through the streets after eight o'clock, in order to prevent the use of the *luzo*, a man is not safe in Mexico, not even in his own house. If, in the evening at 8 or 9 o'clock, you visit a friend, before the porter consents to open the enormous gate lined with iron or bronze, there pass as many formalities as if it were a question of letting down the drawbridge of a fortress. Persons on whose words I think I can rely have assured me that as many as 900 dead bodies are yearly deposited in the *morgue* of Mexico."

**Revenues.**—The amount of the revenue at different dates has been as follows:—

	<i>Doll.</i>		<i>Doll.</i>
1700 - - -	3,000,000	1827 - - -	10,491,400
1763 - - -	5,708,876	1828 - - -	12,992,585
1802 - - -	20,200,000	1829 - - -	14,435,180
1825 - - -	10,690,000	1830 - - -	18,925,220
1826 - - -	13,389,682	1831 - - -	16,413,000

About half the Receipts proceed from the customs' duties: the other sources are, the mint, monopolies of tobacco, salt, plique, and gunpowder; lotteries, post-office, stamps, tolls, and privileges. The produce of the state lauds, none of which have been yet put up to sale, is estimated to be capable of producing from 3 to 4 millions of dollars.

**Army.**—The army consisted, in 1839, of about 20,000 men, exclusive of an active militia of about 30,000. But the troops are without science or a proper feeling of honour, so that they are really worth very little. The military, however, is a favourite service, from the high pay and privileges of the soldier. There are 5 fortresses—San Juan de Ulloa, Campeche, Perote, Acapulco, and San Blas.

**Religion.**—The Roman Catholic is the only publicly recognised religion, but others are tolerated. The church establishment consists of the archbishop of Mexico and 9 bishops, having an aggregate income of 539,000 *doll.*, with 3,677 parochial clergy. There are also 10 cathedrals, having 168 canons and other dignitaries, and 1 collegiate church. The regular clergy comprise 1,378 monks, chiefly Franciscan; and there are 156 convents. Ecclesiastical property is free from taxation, and they have the sole management of all money bequeathed for pious uses. The annual income of the ecclesiastics is valued at about 12,000,000 dollars. The Spaniards and priests were expelled during the revolution; and their places are filled by creoles, whose morals are at the lowest ebb. Hellion has little influence over the white pop., and the hold of the church over the Indians, never complete, is now fast lessening; for they are all, more or less, inclined to idolatry. (*Kidwards's History of Texas.*)

**Education.**—The necessity of education is recognised by the new constitution, which requires that the priests

should teach all persons to read and write; but the regulation has little practical effect. Under the old government, botanical pursuits were much encouraged; chemistry and mineralogy were taught in the school of mines; but the progress of science, literature, and the arts have all been checked by the unsettled state of the country since the revolution.

"In fact," says M. Chevalier, "elementary instruction has remained what it was in the time of the Spaniards. The clergy had then the exclusive management of it, and having so still, show but little inclination to enable the poor to read the books published under the régime of a free press. There are even fewer schools than there were, in consequence of the diminution in the number of the clergy. Education of a superior kind is even worse provided for. Under the Spaniards, there existed at Mexico a school for the fine arts, richly endowed; I have been unable to discover its existence now. There is a building called a museum, where I found nothing of interest except a collection of the portraits of the viceroys since the time of Cortez, and a few Aztec manuscripts. Some years ago, the establishment of a polytechnic school was decreed, but the decree has yet to see the commencement of its execution. There is not even a military school, though the attention of the government is almost exclusively devoted to the army. There is nothing deserving the name of a school of law or medicine; and it may be well imagined that schools of industry or commerce are wholly unknown."

**Population.**—The amount of the pop. has been estimated at different periods, both before and after the revolution; but, owing to the jealousy of the old government, and the distracted state of the country since the declaration of independence, very little credit can be attached to these estimates. The following are those by the best authorities:—

1791	-	Humboldt	-	5,900,000
1803	-	Do.	-	6,500,000
1813	-	Poinsett	-	6,562,125
1825	-	Do.	-	6,400,000
1827	-	Ward	-	8,000,000
1835	-	Chevalier	-	7,000,000

The lower estimate of Chevalier may be explained by the emancipation of Texas and California, and by the continuance of the disturbances. The classes of the pop. are singularly varied, and are characterised by distinctions more striking than those in any other country. Four distinct and rival classes may be enumerated: 1. the *Chapetecas*, or pure Spaniards, never exceeding 90,000 in the rainy days of New Spain, but now hardly amounting to 24,000, and, politically considered, a degraded class; 2. the *Crecos*, or native whites of European descent, forming the wealthiest and most powerful part of the pop., estimated by Chevalier at 1,300,000; 3. the *Indians*, or native Mexicans, constituting the great mass of the rural labourers, and supposed to amount to 3,800,000; 4. the mixed castes, comprising *Mestizos*, *Mulattos*, *Zambos*, *Quadroons*, and *Quinte-rooms*, somewhat exceeding 1,900,000.

The king of Spain formerly exercised a right of conferring the exclusive privileges enjoyed by the white pop. on individuals of any shade by a decree of the *audiencia*. *Que se tenga por blanco*—that he be deemed white. These distinctions of colour have been done away with, as far as political privileges are concerned, by the revolution, which admits persons of all colours to the equal enjoyment of civil rights; and hitherto, indeed, this has been by far its best if not its only good effect. The *mulattos* and *zambos* principally reside in the low country, the whites on the table land. The Indians are divided into numerous tribes, speaking upwards of twenty languages, totally distinct from each other, and of which fourteen grammars and dictionaries have been published. Their character remains much the same as it is alleged to have been at the time of the conquest. Indolence, blind submission to their superiors, and gross superstition, are as much their characteristics now as formerly. The form of their religion is changed, and that is nearly all: they take the same childish delight in the idle ceremonies and processions of the Catholic church as they once took in the fantastic mummeries of their aboriginal idolatry. They are scattered over the country as labourers, distributed in villages, or else live in the towns as artisans, workmen, or beggars. In a few instances they have accumulated property, and acquired respectability; but, in general, they are indolent, ignorant, and poverty-stricken. We believe them to be wholly incapable of any high degree of civilisation; but they might, perhaps, be improved, were measures taken to enforce their education, and to make a fair distribution among them of the many thousands of acres which have been thrown out of cultivation by the consequences of the revolution. They are classed in two great divisions: 1. *Mansos*, comprising those who have a fixed residence, cultivate the land, adopt the habits of civilised society, and maintain an amicable intercourse with the other races; 2. *Bravos*, comprising those who live a wandering life, sup-

porting themselves by hunting, and avoiding all intercourse with the other classes, with whom many of their tribes are in a state of perpetual warfare. The latter principally inhabit the N. states along the river Gila, and the extensive and little known mountain ranges on the upper part of the course of the Rio Grande del Norte and the N. W. of Texas, called the *Bolsor de Mapimi*, from the lake of Man. An independent tribe, called *Mayas*, inhabits the tract between Yucatan, Tabasco, and central America. It has made some progress in civilisation, cultivating maize and cocoa, and wearing garments made of cloth prepared from cotton and the bark of the caoutchouc tree.

"Mexico," says Chevalier, "is a country so rich, that famine scarcely visits even the most indigent. In the *terras calientes*, and even on the plateau, the natives are content to dwell with their families in a cabin of bamboo trellis-work, so slight as scarcely to hide them from the stranger's gaze, and to sleep either on mere mats, or at best on beds made of leaves and brushwood. Their dress consists simply of a pair of drawers, or petticoat, and a *serape* (a dyed woollen garment), which serves for a cloak by day, and a counterpane by night. Each has his horse, a sorry beast, which feeds at large in the open country; and a whole family of Indians is amply supplied with food by bananas, chili, and maize, raised, almost without labour, in a small enclosure round the hut. Labour, indeed, occupies but a trifling portion of the Indian's time, which is chiefly spent in drinking *pulque*, sleep, or singing to his wretched mandolin hymns in honour of Notre Dame de Guadalupe, and occasionally carrying votive chaplets to deck the altar of his village church. Thus, he passes his life in dreamy indifference, and utterly careless of the ever-reviving *encuentros* by which the peace of Mexico is disturbed. The assassinations and robberies which the almost impotent government allows to be committed with impunity on the public roads, and even in sight of the capital, are to him only matter for conversation, the theme of a tale or ditty. And why should he trouble himself about it? Having nothing in the world but the dress in which he stands, his lance, spurs, and guitar, he has no fear of thieves; nor will the poniard of the assassin touch him, if he himself, drunk with *pulque* or *chingarito*, do not use his own."

**Antiquities.**—Humboldt, Bullock, and other European travellers, have furnished excellent descriptions of numerous ancient monuments, which show that the native Mexicans, before the loss of their independence, had been in some respects a comparatively civilised and ingenious people. Among the most extraordinary are pyramids, somewhat similar in exterior form to those of Egypt, and in some instances even of larger dimensions. The base of the pyramid of Cholula is a square of 1,123 ft. on each side, and its height is estimated at 177 ft. A far more elegant building, of similar shape, is situated in the N. part of the state of Vera Cruz; it is formed of large blocks of porphyry, highly polished, and arranged in six stages, diminishing in size according to the elevation, and having all its materials most nicely adjusted. The base is a square of 82 ft. on the sides; it is 65 ft. high; and the ascent to its top is by a flight of 55 stairs; the front is richly adorned with hieroglyphics and curious sculptures. The mountains of Tezcucoc are nearly covered with the remains of ancient buildings and cities. The ruins of Palenque, near the Rio Chucamax, a branch of the Usumacinta, extend upwards of 20 m. along the ridge of a mountain; and their architecture resembles more that of Europe than Mexico. The remains of an Aztec city, called by the Spaniards *La Casa Grande*, are to be seen about a league S. of the river Gila, in the state of Occidente. They are spread over a space of more than a square league. In the centre is a teocalli, laid down according to the cardinal points, its sides being 445 ft. by 276 ft. It has 3 stories and a terrace, but no stairs. Within are 5 apartments, each 27 ft. long, 11 broad, and 11 high. A wall with towers surrounds the main building. The traces of an artificial canal to the river are visible. The neighbouring plain is strewn with fragments of red, blue, and white earthenware, and pieces of obsidian, which prove that the Aztecs had passed through a country abounding with this volcanic substance before they dwelt on this spot, previously to their final settlement in Mexico. In the W. part of the state of Chihuahua are similar ruins of great extent, which are also considered to have been the site of one of the temporary stations of the Aztecs during their migration southwards. Besides sculptures, vases of elegant form have been found, similar to those of Etruria and Egypt. Roads formed of large hewn blocks of stone may be traced, not only in the neighbourhood of those ruined cities, but at great distances from them.

**History.**—The first settlers in Mexico are believed to have been the Toltecs, a tribe of Indians from the rocky mountains, who fixed themselves, after several migrations, near the present city of Mexico, and flourished there for nearly four centuries. Drought, famine, and pestilence

at length exterminated them, but not till they had imparted some degree of civilisation to the barbarous Chichimecas, who were the next possessors of the soil, and were in their turn displaced by the Aztecas, who, in 1150, migrated southward from a country N. of the Gulf of California, and first fixed themselves in the city of Zumpango, in the valley of Mexico, but afterwards in some islands in the lake Texcoco. Here they maintained themselves by fishing and agriculture, till, in 1325, they founded their chief city on the island of Tenochtitlan, and called it *Mexico*, in honour of their martial deity Mexitli. This nation rapidly increased in power; and, if the remains of monuments and large cities were a just test of civilisation, the Aztecas might claim to rank pretty high among the nations of antiquity. But they had invented no alphabet, and had nothing better than a rude species of picture writing to record events, and were ignorant even of the useful metals. Their barbarism is sufficiently shown by their custom of sacrificing great numbers of human victims on coronation feets. Montezuma I., the greatest of their sovereigns, extended the Aztec dominions on one side to the Gulf of Mexico, and on the other to the Pacific Ocean; but it must be stated at the same time, that many tribes within this tract yielded only a reluctant obedience, and some even retained their independence. Such, briefly, was the state of Mexico when Muniz de Balboa first landed on its shores. Its conquest was effected by Fernando Cortes, who sailed thither in 1519 with a small force, comprising, on the whole, only about 700 men. He was met at Vera Cruz by ambassadors from Montezuma the younger, sent to discover his intentions, and to command him to withdraw from the country. But Cortes having refused to return till he had communicated in person with the emperor, at once proceeded to the capital. Here having got possession of the person of Montezuma, Cortes endeavoured by his intervention to effect the subjugation of the empire. But the Mexicans having recovered from the surprise into which they were at first thrown by the seizure of the emperor, resolved at all hazards to attempt the expulsion of the Spaniards. Montezuma was soon after killed in a conflict in the city; and Cortes was compelled to retreat to Tlascala. Here having re-organised his small force, secured the co-operation of a large body of Indians, and built brigantines to be employed in the navigation of the lake Texcoco, he again pushed forward to the city; and having recommenced the siege, took it after an obstinate resistance of 75 days. The fate of the cap. decided that of the empire. Province after province submitted, and the power of Spain was extended from Vera Cruz to the Pacific. Cortes, on his return to Spain, was received at first with high honours and liberal rewards; but his court favour soon declined: the emperor refused to appoint him captain-general of Mexico; and, after some adventures, suited to his ardent and determined spirit, he died near Seville, in 1551, at the age of 63.

Under the Spanish arrangements Mexico was a subordinate kingdom, governed by a viceroy, with powers nearly equal to those of the sovereign, checked only by the *residencia*, or court of investigation, before which he was liable to be called to account for his administration, on his return home, and by the *audiencia*, or court of final appeal in Mexico. By these arrangements, also, the natives were to be considered as freemen and vassals of the crown; and the Spanish discoverers, settlers, and their posterity, were to have a preference in all civil and ecclesiastical appointments. The natives were thus, in fact, excluded from holding all offices of trust or profit. The great object of the Spanish government was to keep the country in the hands of the European or white population; and the means adopted to effect this object were, 1st, to discourage native manufactures, for the benefit of those belonging to the mother-country; 2nd, to make all the ecclesiastical establishments wholly dependent on the king, without any interference of the pope. The growth of flax, hemp, and saffron was prohibited under severe penalties; that of tobacco was made a government monopoly. The cultivation of the vine and olive was likewise prohibited; that of coffee, cocoa, and indigo tolerated only under certain restrictions, and in such quantities as might suffice for the demands of the mother-country. This system was maintained nearly three centuries; during which Mexico continued to be a blank in the history of nations, and known only by the issue of the precious metals. In 1808, however, the news of the abdication of Charles VI. of Spain gave a shock to the royal authority which it never recovered. The natives and coloured population embraced this opportunity of asserting their claim to the rights of freemen, which was opposed by the audacious, who also seized on the viceroy, Hurrigarry, and sent him prisoner to Spain, where he was confined till the general amnesty. An open insurrection against the European authorities broke out in 1810, at the head of which were Hidalgo and Morelos, two chiefs of New Spain; and under the auspices of the latter the first national congress assembled at Chilpancingo in 1813. One of its

earliest acts was a declaration of the independence of Mexico.

For several years the history of the revolution is only that of a sanguinary guerrilla warfare, leading to no permanent results. At length, in 1821, Iturbide, who had previously been a royalist, declared suddenly in favour of the liberals, and published his celebrated manifesto of Iguala in favour of a constitutional monarchy. His cause was embraced with such enthusiasm by the whole population, that he succeeded not only in putting down the Spanish government, and forming a national congress, but also prevailed on that body to make him emperor of Mexico, under the title of Augustin I. His dissolution of the congress, however, by military force, raised a feeling against him, which, finding it impossible to repress, he abdicated the throne. He was not only allowed to withdraw from the country, but rewarded for his past services by an annual allowance of 5,000*l.*, accompanied by an edict of outlawry in case of return. In spite, however, of this prohibition, he returned clandestinely, and was soon discovered, apprehended, and executed.

On the expulsion of Iturbide the congress was re-assembled, a provisional government formed, and an executive appointed consisting of Victoria, Bravo, and Negrete, all persons of proved patriotism. The government was modelled on that of the United States; but the hopes then formed of its stability have proved fallacious. Since this epoch repeated attempts at revolution have convulsed the country. During the whole of the struggle for independence, the population had been split into two parties; at first distinguished by the names of Imperialists, who adhered to the mother country, and Republicans, who asserted its independence: but these parties afterwards merged into those of Centralists and Federalists; the former advocating a single superintending government, and the latter that of the independent government of states, only federally connected. This struggle between the rival parties has now continued for about 17 years, and been a fertile cause of insurrection. Texas and California have already separated from the confederacy, and it is probable that their example will be followed by other states. In fact, there can hardly be said to be any thing like regular government. The Centralists are lords of the ascendant to-day; but a successful *émancipé* (as the Parisians term it) may dash all their prospects to-morrow. Meanwhile, all the bonds of society are loosened, property has become almost worthless from its utter insecurity, and life is not safe from assassination and violence. Whether the proposal of the 8. American republics to unite their interests with those of Mexico, and form together one grand federation, will be accepted, and whether, if accepted, it would contribute to the improvement of Mexico, is matter for speculation only; but certainly that country, as it exists at present, affords one of the most melancholy examples that modern history has presented of an extensive, fertile, and well-situated region being reduced, through anarchy and misgovernment, to a state bordering on barbarism.

MEXICO, or MEXICO (Mex. *Tenochtitlan*), the cap. of the United States of Mexico, and anciently the chief city of the empire of Montezuma, 7,426 ft. above the sea; lat. 19° 25' 40" N., long. 101° 25' 30" W. Pop. 150,000. It stands nearly in the centre of an elevated plain, or plateau, surrounded by mountains, and having an area of about 1,700 sq. m., 1-10th of which is covered by 4 lakes, the largest of which (Texcoco), nearest the city, has an area of 77 sq. m. The old city of Mexico, or that taken by Cortes, was built on a group of islands in the lake Texcoco; but though the modern city occupies its site, it is, owing to the diminution of the waters of the lake, partly originating in natural and partly in artificial causes, situated about 21 m. W. from the lake. The ground on which it stands is, as might be anticipated from the statement now made, low and swampy; the largest buildings are erected on piles, and the roads leading to it are raised 6 or 8 ft. above the surrounding flat. Though within the tropics, it is so elevated that its mean temperature is only 65° Fahr., coincident with that of May in England. It is said, by Humboldt, to be "undoubtedly one of the finest cities ever built by Europeans in either hemisphere; being inferior only to Petersburg, Berlin, London, and Philadelphia, as respects the regularity and breadth of its streets, as well as the extent of its public places." The architecture is generally of a very pure style, and many of the buildings are of noble construction, though usually of somewhat plain exterior. Two sorts of hewn stone, porous amygdaloid and porphyry, are used in the better parts of the city. The bastiades and gates are of Blacay iron, ornamented with bronze; and the houses, which are 3 or 4 stories high, have flat-terraced roofs, like those in Italy and other S. countries. (Note. *Espagne*, il. 51.) The streets are wide, well-paved and flagged, but not lighted or watched at night; so that robberies and assassinations are scarcely less common than in Spain. They run al-

most uniformly at right angles to each other, many of them being nearly 2 m. in length, perfectly level and straight, and offering, from every point, a view of the mountains that surround the valley. Nearly all the houses are hollow squares, with open courts surrounded by colonnades, and ornamented with plants, &c. The stairs to the interior front the outer gate, and the best apartments, which are showily painted in mosaic and arabesque, generally face the street. (*Poinsett's Notes on Mexico*, p. 66.) Numbers of houses are covered with glazed porcelain, in a variety of elegant designs and patterns. The *Plaza Mayor*, or grand square, is one of the finest to be seen in any metropolis: its E. side is occupied by the cathedral and *segrario*, or par. church, and its N. side by the palace, while on the other sides are handsome rows of shops and private dwellings. In its centre is a colossal statue of Charles IV., said to be the finest work of its kind in the new world. The effect of this square, however, is much impaired by the introduction of a paltry building, called the Parlan, a large ungainly pile, an angle, used as a market or bazaar, appropriated to the sale of miscellaneous articles, and the resort of the idlest portion of the inhabs. The palace, or government-house, a fine building, nearly square, with a front several hundred feet in extent, comprises 4 large courts, in which are the public offices, barracks, prison, and a large botanic garden; but almost every part of it is falling to decay: the massive tables, staircases, and chandeliers have disappeared, and all is now in the most appalling disorder. (*Latrobe's Rambles in Mexico*, p. 168.) In this building, also, is the mint of the state of Mexico. The coinage has greatly decreased; for whereas, before the revolution, it amounted to 16 or 18 millions of dollars, it was estimated, in 1823, at 1,250,000 dollars, and, in 1835, at only 547,145 dollars. The cathedral, on the N. side of the square, on the site of the great temple of the god Mexitli, is a heterogeneous edifice: one part of the front is low, and of bad Gothic architecture, while the other and more modern part is in the Italian style, and displays much symmetry and beauty: its two towers are ornamented with pilasters and statues. The interior is imposing, lofty, and magnificent; but the grandeur of the effect is much diminished by the ponderous erections in different parts, and a profusion of massive carved ornaments, pictures, and painted statues. The high-altar and its appendages are inclosed by a massive railing of mixed metal; so valuable, on account of the gold it contains, that a silversmith of Mexico is alleged to have offered the bishop a new silver rail of equal weight in return for the old metal! (*Bullock's Mexico*, l. 143.) In the interior, also, are some curious remains, including several idols and a "stone of sacrifice," that is, a stone on which the human victim was placed when the priest tore out his heart! On the outer wall is fixed the *Kellenda*, a circular stone of basaltic porphyry, covered with hieroglyphic figures, by which the Aztecs, or native Mexicans, used to designate the months of the year, and which is supposed to have formed a kind of perpetual calendar. (*Latrobe*, p. 171—175; *Ward*, ii. 48.)

Few monuments of antiquity, however, remain; and we may echo the exclamation of Antonio de Gama, the first among Mexican antiquaries, "*Quantos preciosos monumentos da antiguedade, por falta de intelligencia, hubran perecido es esta mañera*." "How many remains of antiquity have thus perished through ignorance of their value." The church services are celebrated with great magnificence; nor even in Rome herself is greater attention paid to the external minutiae of religious observance. Besides the cathedral, there are said to be from 50 to 60 other churches, most of which display, more or less, the barbarous mixture of style that characterised Spanish architecture during the 16th and 17th centuries; there are, also, numerous religious houses, two of which, viz. the Franciscan and Dominican convents, are extensive and wealthy establishments. Opposite to the latter of these is the Palace of the Inquisition, now applied to other, and, it is hoped, more useful ends. Bullock describes it as "very elegant, exhibiting little or no appearance of the purposes for which it was intended." This tribunal was abolished by Iturbide, in 1822. The Papal religion, however, still maintains its ascendancy; few buildings, whether public or private, are without their patron saint; and the traveller every where meets with shrines, pictures, and processions. The *Mineria*, or college of engineers, was originally a large and handsome building; but, owing either to a want of care in making the foundations, or to the effect of earthquakes, the walls have settled in several parts, and the front is visibly out of the perpendicular. Lectures are given occasionally on the sciences connected with mining; and in one of the rooms is a tolerably good collection of minerals, though generally very inferior to those in European museums, and, as respects a country like Mexico, quite insignificant. In fact, not only the *Mineria*, but the Academy of Fine Arts, the university, founded in 1526, and public library, are in a state of neglect, disgraceful alike to the government and the people; and we are afraid that the diffusion of elementary

instruction since the revolution has not been such as to compensate for the decline of the institutions for the higher branches of instruction. We have seen, in the previous article, the statements of M. Chevalier as to education generally in 1835, than which nothing can be more deplorable. The *Acordada*, or public prison, is a large substantial structure, fitted to contain about 1,300 prisoners; the barracks, also, formerly used as an hospital, are very extensive and well constructed. The theatre is a respectable building, of considerable size; but the establishment has for some years had so little success that it is very seldom opened. The *Plaza de Toros*, for the exhibition of bull-fights, consists of a great circular inclosure, fitted up exactly like that of Madrid, and fitted to accommodate from 2,000 to 3,000 spectators. The great cigar manufactory, which belongs to the government, stands at the S.W. angle of the city, and comprises a very extensive establishment, which supplies the whole legitimate demand of the confederation for cigars.

The Alameda, or public walk, at the W. end of the city, somewhat resembles a park, but has the stiff formal appearance of Dutch and French grounds. In the centre is a fountain, supplied with water from the great aqueduct leading from Santa Fé to the city. Another open space, called the *Paseo*, about 2 m. in length, planted with double rows of trees, is much frequented, on holidays, by persons in carriages and on horseback. In the city, also, are several *Portales*, or covered colonnades, lined with shops and stalls, and forming a favourite evening promenade long after the Alameda and *Paseo* have ceased to be frequented. The environs, also, present, on fine dry evenings, a very lively scene of bustle and gaiety: hundreds of canoes of various sizes, mostly with awnings, and crowded with native Indians or *Mestizos*, are seen passing in every direction along the lake and canals, each boat with its guitar-player at the stern, and some of the party either singing or dancing.

The manufactures are not generally remarkable, either for extent or fineness of workmanship. Nothing is exposed in the shop-windows, and most of the articles are made in the places where they are offered for sale. Gold and silver lace, trimmings, epaulets, &c., are made in great perfection, and are sold at a much lower rate than in England. Silversmiths' work is also done on a pretty extensive scale: the ornaments are finished by hand; the chasing is sometimes well executed, but in general the articles are clumsy and heavy. Jewellery employs a few hands; but all precious stones, except rubies, are scarce, and the work is much dearer than in Europe. Cabinet-work is extravagantly dear, and of very inferior quality, made with clumsy tools, and of bad wood; the saw is scarcely known, and the turning-lathe is of the most primitive construction. Coach-making is much better understood: the Mexican vehicles are firmly put together, of handsome shape, and well finished; and, in respect of painting, gilding, or varnishing, they are but little inferior to those made in Europe, whence the handles and metal furniture are procured. There is a considerable manufacture of hard soap here and at Puebla; but it has greatly fallen off since the time of Humboldt, who states the quantity made in Mexico, in 1802, at 200,000 arrobas. Beaver and felt hats and cotton cloaks are made on a large scale, for the supply of all parts of the Union, these being important articles in the internal trade of the country. Woollen clothes are three times as dear as in England, and are uniformly ill-made. Men, not women, are milliners; and it is not uncommon to see some 20 or 30 fellows, who should be porters or coalheavers, employed in decorating ladies' dresses, making flowery, and trimming caps and bouffes. (*Bullock*, i. 202.) The bakehouses are large establishments; and the bread, which is excellent, is made exclusively by slaves, who also perform the work in the cloth factories. (See *Manufactures*, in art. MEXICO, UNITED STATES &c.) Shops for the sale of *pulque* (a kind of beer made from the aloe), and native and Spanish brandy, are very common, and have a gay appearance. The markets are well supplied with animal and vegetable productions, brought along the lake and canal of Chalco by crowds of canoes, usually navigated by women. Turkeys, fowls, pigeons, and many varieties of wild water-fowl, are very abundant and cheap; as are hares, rabbits, tortoises, frogs, and salamanders, all of which are esteemed good eating by the inhabs. The meat-market is well supplied with beef, mutton, and pork, but veal is prohibited. The meat, however, is not of the best quality, though, perhaps, this may be owing to its bad preparation by the butcher and cook. There is great variety of vegetables and fruits, and a most enormous consumption in proportion to the pop. The vegetable market is larger than Covent Garden, but yet unequal to the daily supply; and the ground is entirely covered with bananas, plantains, citrons, shaddocks, melons, pomegranates, dates, mangoes, tomatas, and other vegetable productions of tropical countries.

The greater part of these are cultivated on the *chinampas*, or floating gardens, of which there are two sorts;

one movable, the other fixed, and attached to the shore. On the marshy banks of the lakes of Xochimilco and Chalco, the water, in the time of the great floods, carries away pieces of earth covered with herbs; and bound together by roots. These, being driven about by the wind, sometimes unite into small islands, which, being taken possession of, are planted with flowers and roots. Artificial *chinampas*, or islands, are also frequently formed, of reeds, rushes, roots, brushwood, &c., well compacted together, and covered with black mould: these sometimes contain the cottage of the Indian who acts as guard. They are towed or pushed with long poles, and are thus removed from one side of the banks to the other. The fixed *chinampas* are parallelograms from 300 to 400 ft. in length, and from 10 to 20 ft. in width. They rise about 3 or 4 ft. above the water, and afford, from their command of water, beans, small peas, pimiento, potatoes, artichokes, cauliflowers, and a great variety of other vegetables.

The pop. of Mexico is of an extremely mixed character, comprising about 68,000 creoles, or descendants of Spaniards; 28,000 *Mestizos*, or half-casts between Europeans and Indians, but many of whom are scarcely distinguishable by colour from the former; about 35,000 copper-coloured natives; 10,000 mulattoes; and only about 6,000 Europeans. There is, or at all events, used to be, an extreme disparity of wealth in this city. Many of the nobles and successful speculators in mines were excessively rich; but the bulk of the pop. were at once indolent and indigent. The lower orders are filthy, despise labour of every kind, and are constantly seen lying in the church porches, leaning against the walls, and loitering about the markets. In many respects they bear a striking resemblance to the *lazzaroni* of Naples; but the latter are not stained with the crimes of robbery and assassination, for which the *leperos* of Mexico are disgracefully notorious. There is here, also, a general torpor of the faculties, and the *dolce far niente* seems to be the *summum bonum* of all classes. The dress of the higher orders of men closely resembles that of Europeans, the large cloak being as common here as in Spain. The costume of the ladies is universally black, with the veil and mantilla; but, on holidays and public occasions, their dresses are remarkable as well for gayness of colours as for expensiveness of material. Indeed, when in their carriages on the Paseo, they contrast somewhat strangely with the same persons, when seen at home in complete *deshabille*, without stockings, squatting on the floor, and either pursuing their favourite amusement of cigar-smoking, or eating cakes and capiscum out of the dirty earthenware basins of the country. (*Latrobe*, p. 150.) The ladies seldom go out during the day; but, after sunset, young and old come forth from their hiding-places, and the Alameda, Paseos, and Portales swarm with the *damas* and *signoritas* of the city, chatting and smoking with their gallants. Many gentlemen belonging to the higher classes are intelligent, and a few even fond of literature; but the city is so badly supplied with libraries, and other means of study, as to give little encouragement to such pursuits. There are three or four newspapers; but they are miserable productions, containing little besides the merest chit-chat, copiously interspersed with advertisements. The white creoles are distinguished by their mildness, courtesy, and hospitality; their besetting sin is gambling. Female virtue is on the same low level as in Old Spain; but the Mexican ladies are better educated, and would be agreeable but for the practice of smoking, which is bad enough in men, and intolerable in women. (*Poinsett's Notes*, p. 160.)

The original city of Mexico, or, as it was called, *Tenochtitlan*, built, as already stated, on a group of islands in the Lake Texcoco, was founded in 1325: it was connected with the main land by three principal causeways of stone and earth, about 30 ft. in breadth, and extending from 2 to 6 m. over the surrounding marshes. These dikes still exist, and their number has since been increased. They form, at present, paved causeways across the marshy grounds, which were formerly covered with water; and, being of considerable elevation, are useful in securing the city from inundations. The better to preserve the city from the chance of this calamity, the great drain alluded to in the previous article, was commenced in 1607, which has now reduced the lakes of Ximipango and San Christoval within comparatively narrow limits, and prevented their waters in the rainy season from flowing into the lake of Texcoco, and threatening, as they sometimes did, to submerge the city.

Mexico, when first discovered by the Spaniards, was a rich and populous city; the seat of government, religion, and trade. According to Cortez, it was as large as Seville or Cordova, was well built, and well supplied with various products; but these are the statements of parties naturally disposed to magnify their own services, and should be received with considerable modification. It was taken by the Spaniards in 1521, after a protracted siege, in the course of which it was nearly destroyed. (See previous article.)

MEXICO (GULPH OF), a large inland sea connected by

the Florida channel with the N. Atlantic Ocean, and by the channel of Yucatan with the Caribbean sea, sit. between lat. 18° and 31° N., and between long. 81° and 98° W. Length from E. to W. 1,200 m., average breadth, 650 m.; area, about 800,000 sq. m. This sea, which is of an irregular circular shape, is, unlike the Caribbean sea, almost clear of shoals and islands, none being found except on the coasts of Yucatan and Florida. Along the coast of Mexico its soundings are very regular, with 100 fathoms at a distance of 30 m. from the shore. On the N. side, and especially opposite the mouths of the Mississippi, the depth is considerably diminished, and at its E. extremity the navigation is rendered intricate and dangerous by the Tortugas bank, Florida reef, and various other keys, shoals, and islets, including the great Bahama bank, which surround the N. coast of Cuba. The E. trade winds prevail from April to October, this being usually the wet season: the *Nortes* begin in October, but are not violent till the middle of November, from which time till the end of February they blow with great fury, and are objects of much dread to navigators. These gales last for four or five, and occasionally even ten, days; but their extreme fierceness is usually spent in the first 48 hours. At these times the larger vessels, which cannot enter the shallow harbours of the Mexican coast, are obliged to slip their anchors, and keep as far as possible off shore. Examples are not wanting, also, of *nortes* happening between May and August, at which time they are particularly furious. Luckily, however, the hurricanes and tornados of the gulph are by no means so fierce and destructive as those in the Caribbean Sea.

The principal current of the Gulph of Mexico, and the only one worth mention, is that which sets W.N.W. between Cape St. Antonio and Cape Catoche: this runs from 12 to 30 m. a day, and is perceptible even during the *nortes*, except close along the shores of Mexico. At the N.W. extremity of the gulph its course gradually changes, till, at the mouth of the Mississippi, it turns E., and afterwards S.E., as it again rushes out into the Atlantic Ocean, at the rate of 60 m. in the twenty-four hours. (This remarkable current, commonly known as the *Gulph stream*, is described in the article ATLANTIC OCEAN, I. 212. of this work.) The tides of the Gulph of Mexico are of no great importance, they nowhere exceed 3 or 4 ft.; but their average rise is not more than 2 ft. The colour of the water is a deep indigo, darker or more intense than that of the ocean: phosphorescent lights shine on it with great brilliancy, and between the coasts of Yucatan and Louisiana great quantities of *fucus natans* occur in parallel lines from S.E. to N.N.W., and are carried out in large masses through the straits of Florida. (*Bhuit's American Pilot*; *Purdy's Atlantic Ocean*; *Darby's Geogr. of United States*; *Humboldt's Pers. Narr.*, i. 50—69.)

MEZE, a town of France, dép. Hérault, cap. cant. on the lagoon of Thau, 5 m. N.W. Cett. Pop. (1836) 4,240. It has a small port, capable of receiving 60 vessels of 40 tons each, and manufactures of brandy and liquors. Near it is the abbey of Vallemagne, an edifice of the 13th century, well worth the traveller's notice. (*Guide du Voyageur en France*.)

MEZIERES, a fortified town of France, dép. Ardennes, on the Meuse, which mostly surrounds the town, and is here crossed by two stone bridges, 80 m. N.W. Metz. Lat. 49° 45' 47" N., long. 4° 43' 31" E. Pop., in 1836, 3,817. It is walled, and is further defended by a strong citadel. It is ill built, and has few edifices worth notice, except the town-hall, the prefecture, the hospital, founded in 1412, and a par. church of considerable antiquity. Mézières, though the nominal cap. of the dep., has no court of primary jurisdiction, that tribunal being seated at Charleville (which see): it is, however, the seat of boards of taxation, artillery, and forest inspection, a society of agriculture, &c.; and has tanneries, breweries, and some trade in leather, coarse woolsens, and flens. The Chevalier Bayard, with a garrison of only a few thousand men, successfully defended Mézières, in 1520, against a powerful Austrian army; and, in 1815, the town held out for two months against the Prussians. (*Hugo*, art. *Ardennes*, &c.)

MIAKO, a large city, and the ecclesiastical cap. of the Japanese empire, in the island of Niphon, on the Yedogawa, 230 m. W. by S. Yedo; lat. 35° 24' N., and long. 153° 30' E. Pop. (according to the Dutch traders, on whom, however, little reliance can be placed), 600,000, exclusive of the *Daiki*, or Mikado's court, supposed somewhat to exceed 50,000. It is situated in a spacious plain, enclosed on all sides by high mountains, and almost entirely formed into fine gardens, interspersed with temples, monasteries, and palaces. It is nearly 4 m. in length, and about 3 m. broad, with narrow but regular streets, lined by houses two stories high, built of wood, lime, and clay, most of them being very slightly and poorly constructed. The sacred Mikado, or supreme emperor, emphatically termed, "the Son of Heaven," has his residence on the N. side of the city, in a quarter

comprising about a dozen streets, and separated from the rest of the buildings by walls and ditches; but, owing to the great diminution of the revenues furnished by the *shōgun*, or viceroy (the substantial sovereign), the whole is reported to have a very shabby and dilapidated appearance, little in accordance with the rank of a being more divine than human! On the W. part of the town is another palace, built of stone, and strongly fortified: it belongs to the *shōgun*, who resides in it when he comes to pay his respects to the emperor. This practice, however, has long been discontinued, and the building is now used for the accommodation of certain functionaries, sent thither from Yedo to watch the proceedings of the *Dairi*. The members of this court, who view themselves as a species of superior beings to the rest of the Japanese, are chiefly engaged in the study of literature and science, the *Dairi* being, in fact, the highest college in Japan for the cultivation of theology, and various other branches of learning. The almanacks, formerly imported from China, are now constructed, including the calculation of eclipses, in the *Dairi* college; and, at least,  $\frac{2}{3}$  of all the works, published in Japan, are produced by the *literati* of Miako, some of whom, however, are connected with other colleges and high schools, wholly independent of the *Dairi*. This city is likewise the principal manufacturing depot of the empire, every kind of handicraft known in Japan being carried to the greatest perfection. Nearly every house has its attached shop well provided with every description of goods, and the Japanned wares, carved ornaments, &c. of Miako, are unequalled either in Japan or China. Minko is one of the places visited by the Dutch traders, when they, once in four years, pay their respects to the *shōgun* at Yedo: they usually spend some days here, which are chiefly occupied in making purchases of Japanese manufactures. Various celebrated temples (of which there are many, though not described), are freely exhibited to them; and in the gardens attached to one of these buildings, tents are pitched for the purpose, not only of giving a sumptuous entertainment to the *Capitan Holanda* (as they term the Dutch president of the mission), but also of gratifying the curiosity of the natives with a sight of a few strangers from a distant land. (For further particulars, see JAPAN; see also, *Manners and Customs of the Japanese*, p. 140–157; *Siebold*, i. and ii.)

MIAVA, a market-town of N.W. Hungary, co. Neutra, on the Miava, a tributary of the Morava, 48 m. N.N.E. Presburg. Pop. 8,650, mostly of Slavonian origin, and Lutherans. It has manufactures of woollen stuffs and bagging, several distilleries, and some trade in hemp and flax.

MICHAEL (ST.), an inconsiderable bor. and market-town of England, co. Cornwall, in pars. Newlyn and Enoder of hund. Pyder. This, which is said to have been a town of some importance, previously to the Norman conquest, is now, like others of the Cornish bors., an inconsiderable village. It returned 2 mems. to the H. of C. from the 6 Edward VI. down to the Reform Act, by which it was disfranchised. The market has long been extinct; but sheep fairs are held here July 28. and Oct. 15.

MICHIGAN, one of the U. States of N. America, in the N.W. part of the Union; its territory, consisting of two distinct peninsulas, comprised between lat.  $41^{\circ} 30'$  and  $47^{\circ} 20' N.$ , and long.  $82^{\circ} 25'$  and  $90^{\circ} 30' W.$  Area, estimated at about 60,800 sq. m.; of which, 39,850 are supposed to be included in the Lower, and 20,950 in the Upper, or N.W. Peninsula. Pop., in 1837, 174,169. The Upper Peninsula is, for the most part, inclosed between Lake Superior to the N., Lake Michigan to the S.E., and the Wisconsin or N.W. territory to the S. and W. Its surface and soil are very various, a considerable portion consisting of sterile sand ridges and marshy tracts; while the other, or hilly tracts, are generally covered with dense pine forests. The whole region is, however, known but imperfectly, being inhabited principally by wild Indians, and only occasionally visited by traders in furs and peltry. The climate is severe; little or no corn is grown, and the fur trade and fisheries are at present the only sources of wealth in this part of the state.

The Peninsula-Proper, or Lower Michigan, is enclosed by Lake Michigan on the W., and Lakes Huron, St. Clair, and Erie, and their communicating rivers on the N. and E., and is in a much more advanced state of civilisation than the other. Its shores are in some parts rocky and broken, and along Lake Huron, high and precipitous; but its surface is mostly level, or merely undulating: the central region consists of a table-land little elevated above the level of the surrounding lakes, to which it slopes in every direction. There are many rivers, some of which are navigable for a considerable distance. Grand River, St. Joseph's, and the Saginaw, are the largest: the first two fall into Lake Michigan, and the last into Lake Huron. Small lakes and ponds are also numerous.

The land in the N. is covered with dense forests of pine-trees, &c.; and some parts to the S. are richly wooded. Fewer prairies exist in this than in any other of the N.W. states, and the largest is only a few miles in circuit. They are principally in the W. and S.W., and are divided into the wet and the dry. The dry prairies have a rich soil from 1 to 4 ft. deep, are easily cultivated, and yield abundant crops; the wet afford early pasturage and hay for wintering stock, and with little labour may be converted into excellent artificial meadows. The winters are long, and often severe, but the atmosphere is more humid, and the climate, upon the whole, milder than that of the states more to the E. The soil is very various; but there is a great deal of good land, especially in the S. Nearly all kinds of corn are raised, oats being the most abundant. Turnips, and other field vegetables, are a good deal grown. All kinds of garden vegetables, and the fruits of temperate climates, thrive with care; and many flourish wild. Hemp and flax have been recently introduced, and succeed well. Pasturage is good; but the live stock are generally inferior. Horses and mules are less employed than in the states more to the S., oxen being mostly used for field labour. Sheep are few; but hogs are very numerous. Large masses of native copper, lead, iron, bituminous coal, gypsum, &c. are met with, and salt springs are both many and abundant.

The arts and manufactures of Michigan have hitherto been limited, for the most part, to those of prime necessity; both steam and water-mills are, however, now in use. Grinding flour, sawing timber, distilling, carding wool, and making woollen cloth, are the principal branches of manufacturing industry. In summer some trade is carried on from the E. shore of the state with Ohio, Pennsylvania, and New York; but for 4 or 5 months of the year the navigation is closed by the ice. A fund for the construction of railroads and canals, and the improvement of the river navigation, has been established; and in 1840, 40 m. of the central railway, from Detroit to Ann Arbor, had been completed, and several similar public works were in a state of active progress.

In 1838, Michigan comprised 39 organised counties, 2 cities, Detroit, the cap., and Munroe, and 23 incorporated villages. The legislative authority is vested in a senate of 17 mems., and a H. of Reps. of 52 mems.; the senators being elected every 2 years, and the representatives annually, by all the white male citizens above 21 years of age, who have resided in the state for 6 months preceding the election. The executive power is in the hands of a governor and lieutenant-governor, who are chosen by the people, and hold office for 2 years. Justice is administered in a supreme court, a court of chancery, 3 circuit courts, and inferior tribunals, established at the pleasure of the legislature. The judges of the Supreme Court are nominated by the Governor, with the consent of the Senate, and hold office for 7 years. In each of the 3 circuits a court is held twice a year. The constitution provides that neither slavery nor involuntary servitude shall be introduced into the state, except for the punishment of crimes. A university was established at Ann Arbor, in 1837, which, in 1840, had 200 students, in 6 branches. Colleges have also been founded at Marshall and at St. Philip's, near Detroit; and a system for the foundation of primary schools has been adopted by the legislature, though not yet put in operation. In 1839, 31 periodical publications were issued in this state. It sends 1 mem. to congress.

Michigan was discovered and settled by the French, who founded Detroit in 1670. In 1763, this territory, with other possessions conquered from the French, became subject to Great Britain. In 1805, the Lower Peninsula was erected into a territorial government, distinct from the rest of the N.W. territory; and, in 1836, Michigan with its present limits was constituted a state of the Union. (*Bliss's Michigan Gazetteer*, 1838; *Flint's Geography of the U. States*; *Darby*; *American Almanack*, 1840–41, &c.)

MICHIGAN (LAKE), one of the five great lakes of N. America, in the basin of the St. Lawrence, being the third, in point of size, and intermediate, in position, between Lakes Superior and Huron, with which last it communicates, at its N.W. extremity, by the Straits of Michilimackinac. Unlike the other great lakes, it is wholly surrounded (except at the above-mentioned strait) by the territories of the U. States, having N. and E. the state of Michigan, S. Indiana, and W. Illinois and the Huron territory. Its shape is an elongated oval. It is usually laid down as extending between lat.  $41^{\circ} 40'$  and  $46^{\circ} 10' N.$ , and long.  $85^{\circ} 10'$  and  $87^{\circ} 30' W.$ ; and is stated by Darby to have a mean length of nearly 300 m., with an average breadth of about 50 m., and an area of 15,000 sq. m. But, according to the more recent statement of Bradford, it "has hitherto been erroneously delineated upon our maps; late surveys having shown that its W. shore extends along the meridian of  $89^{\circ} W.$  long., thus giving it a width of from 80 to 100 m., its length is about 860 m., and it has an area of about 26,000 sq. m." (*Encyc. of*

*Geog.*, Amer. edit., iii. 568.) Mr. Stevenson gives it an area of 16,200 sq. m. (*Sketch of Civil Engineering*, p. 53.) Its mean depth is estimated by Darby at 900 ft., or about the same as that of Lakes Superior and Huron; it is elevated 600 ft. above the tide level, being 14 ft. under the level of Lake Superior, and 4 ft. above that of Lake Huron. In general, it is remarkable for the absence of bays, harbours, and islands; at its N.W. side, however, is Green Bay, an inlet about 25 m. in width, accessible to vessels of 200 tons, near which are the Manitou and Beaver islands. Lake Michigan receives numerous rivers on every side, but they are not very important. No towns of any consequence are yet seated on its shores, though in the S. are the flourishing settlements of Michigan, Chicago, Milwaukee, &c. The waters of this lake are clear and salubrious, and it abounds with fish. In 1838, it was navigated by several large steam-boats, and by about 200 schooners and brigs, &c. (*Encyc. Americana*; *Darby's Geog. View*, &c.; &*Encyc. of Geog.*, Amer. edit.)

MIDDLEBURG, a town of Holland, prov. Zealand, which it is the capital, nearly in the centre of the island of Walcheren, 4 m. N.; by E. Flushing, and 47 m. S.W. Rotterdam; lat.  $51^{\circ} 30' 56''$  N., long.  $37^{\circ} 30' 0''$  E. Pop. 3,500. Though no longer fortified, it preserves its circular mound of earth, divided into bastions and surrounded by a broad and deep ditch. The approaches to Middleburg are somewhat more varied than to most Dutch towns, the roads passing through a number of small plantations and country houses. It is nearly circular; some of its streets are wide and handsome, and the whole are tolerably regular. The market-place forms a spacious square; and part of the town is traversed by canals, crossed by draw-bridges. The whole is extremely clean; the private houses are uniform, and some of the public buildings spacious, particularly the town-house and the Oostkerk (east church); the former is in the Gothic style, and has several statues and paintings. The other objects most worthy of notice are several of the churches, a high spire, commanding a prospect over the whole island, the public walks along the bastions, and the Molenwater, an extensive reservoir or backwater. The chief literary institution is the atheneum, or academy, which affords nearly the same course of instruction as a university, but without the privilege of conferring degrees. It has also a Latin school; a school of design; the Zealand society of literature, arts, and sciences, which possesses a good library, a collection of medals, &c.; and a society of agriculture.

Middleburg has manufactures of starch, glass, and paper, a cannon foundry, and several saw-mills, and salt refineries. Though 4 m. from the sea, it has quays of considerable extent, and formerly had a considerable share in the Dutch E. India trade. Its other branches of commerce are the importation of wine, chiefly from Bordeaux, and the exportation of corn, brought to its market from the fertile tracts to the eastward of the island. It was the head-quarters of the British army in the unfortunate expedition of 1809. Its atmosphere, like that of the rest of Zealand, is loaded with moisture, which tends to engender agues and bilious complaints, particularly in autumn.

Middleburg is of considerable antiquity, having been first surrounded with walls in 1132. It was taken by the Dutch from the Spaniards in 1574. In 1795 it was ceded to the French, under whom it was the cap. of the *dép.* Bouche-de-l'Escaut. It sends 8 deputies to the Provincial Assembly of Zealand. (*De Cloet*; *Stein's Handbook*; *Dict. Géog.*, &c.)

MIDDLESBOROUGH, a river-port, town, and par. of England, N. Riding co. York, hund. Langborough, on the Tees, about 34 m. from its mouth, 16 m. E. by N. Darlington, and 215 m. N. London. Area of par., 2,300 acres. Pop. of township, in 1821, only 40; in 1831, 154; but in 1841 estimated at 4,500, an increase attributable to the rapid rise of its coal trade, consequent on the opening of the Stockton and Darlington railway from the collieries of S. Durham. It consists of a main street facing the river, and of another wide avenue running at right angles to it, at the corner of which are the commercial hotel and reading-rooms, surmounted by an observatory. There are also several other respectable streets; and the whole town is regularly and substantially built, under the superintendence of a joint-stock building company. The church, erected at an expense of 3,500*l.*, raised by subscription, and opened in 1840, is a neat Gothic structure, with a rather elegant spire. A national school has been formed, and the church has likewise a well-attended Sunday school. The Wesleyan Methodists, Baptists, and primitive Methodists have also their respective places of worship, with attached Sunday schools, furnishing religious instruction to about 600 children of both sexes.

Middlesborough, the site of which only eleven years ago was occupied by a solitary farm-house, has already become the most considerable port of the Tees, though still regarded as subordinate to Stockton, from which it has

taken nearly all its coal-trade, and a large portion of its ship-building. Its rapid rise is owing to its convenient position near the bar of the Tees, and the spirited conduct of Messrs. Pease, Backhouse, and other wealthy coal-owners, who, in connection with other shareholders, have built excellent staiths for loading colliers at the wharfs, and constructed a railway communicating with the important coal-field near Bishop's Auckland. The line was opened to Middlesborough (a distance of 32 m. from Wilt. Park colliery) in 1832; and the export of coal was stated by J. Pease, Esq., M.P., to amount, in 1839, to 510,000 tons, and the number of passengers in the same year somewhat exceeded 16,000. The entire cost of this undertaking was about 450,000*l.*, and the present gross income is upwards of 70,000*l.*, the average dividends being about 10*l.* per cent. The staiths, which are 450 yards in length, and worked by two large steam-engines, are capable of shipping 4,000 tons of coal *per diem*. Large docks are also in process of excavation, which, when completed, will comprise a water area of several acres. Steam tug-boats are constantly employed in bringing in and taking out vessels under bar of the river: steamers run twice or three times a week during summer between this port and Sunderland and Newcastle; and there is a weekly steamer to and from London. Two ship-building yards, an extensive pottery, and some sail-cloth and rope manufactories are in active operation. The trade of Middlesborough, independent of coal, is already important; and it bids fair to rival, both in trade and industry, the flourishing towns of Tynemouth and Sunderland. (*Gris Railway Comm. Rep.*; *Sir G. Head's Home Tour*; *Granville's Spas of England*; *Priv. Inform.*)

MIDDLESEX, a co. of England, containing the greater part of the metropolis, having E. the river Lea, which divides it from Essex, N. the co. Hertford, W. Buckingham, and S. the Thames, which separates it from Surrey and Kent. It is one of the smallest of the English counties, comprising only 180,480 acres: surface very various. The highest eminences are Hampstead, Highgate, and Harrow-on-the-Hill. In some parts along the Thames there are extensive tracts of rich loam; but the higher grounds are mostly gravelly and clayey, and not naturally fertile. There are numerous unenclosed commons in different parts of the co., and Hounslow Heath, on its S.W. angle, is as poor and unimprovable a tract as can well be imagined. Contrary to what might have been expected, agriculture is but little advanced in this co.; and, although considerable improvements have been made, the implements and processes of husbandry are still very inferior. But by far the largest portion of the co. is in grass, and the business of haymaking is as well understood here as in any part of the kingdom. The rich tract of land along the Thames from Kensington to Isleworth is principally occupied by market gardeners, who send a large supply of fruits and vegetables to the London market. The cows kept for the supply of London with milk are all short-horned. Property is very much divided, and in several districts it is mostly portioned out into villas and pleasure-grounds; farms seldom exceed 200 acres, and their average size is supposed to be about 100. Leases pretty common, and mostly for 14 and 21 years. Average rent of land, in 1820, 3*8s.* 8*d.* Minerals of no importance; but in the vicinity of London in many places vast quantities of land have been dug up, and converted into bricks. Middlesex is well watered; besides the Thames and the Lea, by which it is bounded, it is intersected and partly bounded on the W. by the Colne; and it is also intersected by the Brent, and by the Grand Junction Canal, &c. It is divided, exclusive of the metropolis, into 6 hundreds, and 75 pars. It returns 14 mems. to the H. of C.—viz. 2 for the co., 4 for the city of London, 2 for Westminster, 2 for the Tower hamlets, 2 for Finsbury, and 2 for Mary-le-Bone. Registered electors for the co. in 1839-40, 13,919. In 1831, Middlesex had 180,493 inhabited houses, 314,039 families, and 1,358,230 inhabs.; of whom 631,410 were males, and 726,920 females. Sum expended for the relief of the poor in 1838-1839, 386,679*l.*

MIDDLETON, a manufacturing market-town and par. of England, honor of Clitheroe, hund. Salford, co. Lancashire, 5 m. N.N.E. Manchester, and 165 m. N. by W. London. Area of par., 11,510 acres. Pop. of par. (comprising 8 townships), in 1831, 14,373; pop. of township, 6,903. This town, which is 17 m. from an inconsiderable village, containing only 300 inhabs. has, owing to the extension of the cotton-trade, become a large place, with several good streets and well-built houses. The church, rebuilt in 1524, has a low-tower, partly of wood, and some fine carvings and painted windows: the living is a rectory, in the gift of Lord Suffield, the lord of the manor. Within the par. are, also, 3 episcopal chapels, and 7 places of worship for different denominations of dissenters, with 17 attached Sunday-schools, furnishing religious instruction to about 2,400 children. A free grammar-school was founded in 1672; and within the last few years, 3 subscription schools have been formed for the education of the children of the working classes.

The principal employments of Middleton are silk and cotton weaving, cotton spinning, calico and silk printing: there are, within the township, about 2,000 silk-weavers, and 1,000 persons employed in the cotton-mills; besides nearly 500 engaged in subordinate trades. The Rochdale Canal, the Manchester and Leeds Railway, and the Bolton Railway pass through the par., and afford the greatest facilities for the conveyance both of passengers and goods. The town is governed by the county and manorial constables; and courts leet and baron are held twice a year. Markets on Saturday, 1st Monday after 10th March, ditto after 15th April, and 2d Thursday after 29th Sept. (*Butterworth's Stat. of Lanc.; Baines's Lanc., &c.*)

MIDDLETON, a market-town of Ireland, co. Cork, prov. Munster, at the confluence of the Curra and Lewis rivers, at the N.E. extremity of Cork harbour, 14 m. E. Cork. Pop., in 1831, 1,946. Middleton, so called from being midway between Cork and Youghal, has a par. church, a Rom. Cath. chapel and convent, an endowed grammar-school, and 2 schools partially supported by the commissioners of education, a fever hospital and dispensary, a market-house, and bridewell. It is built in a very straggling manner, and is neither lighted nor paved; but it contains several respectable dwelling-houses, and good shops: it is increasing, and is generally admitted to be in a thriving condition. It has two extensive distilleries, and a brewery; and it has the advantage of being in the immediate neighbourhood of the harbour of Ballinacorra, where the merchants ship their commodities, especially flour and agricultural produce. (*Mun. Bound. Rep.*) The corporation, consisting of a mayor, 12, 2 bailiffs, 12 burgesses, and commonly, returned 2 mems. to the Irish H. of C. till the Union, when it was disfranchised. Quarter sessions are held in June and Nov.; and it is a constituency for 1. Duty was paid, in 1840, on 96,192 bush. malt, and 597,533 galls. whisky. Markets on Saturday; fairs on the 14th Feb., 14th May, 5th July, 10th Sept., 10th Oct., and 22d Nov. Post-office revenue, in 1830, 2,551; in 1836, 4,482.

MIDDLEWICH, a market town and par. of England, hund. Northwich, co. Chester, at the confluence of the Dane and Croke, 18 m. E. Chester, and 151 m. N.W. London. Area of par. (which comprises 14 townships), 13,330 acres; pop. of do., in 1831, 4,758; pop. of township, 1,325. The town, though small, is neat and regularly built, its principal public edifices being a large church, three places of worship for dissenters, and a free school. Middlewich has long been celebrated for its brim-stonings, the water of which is alleged to yield 4 lbs weight of salt (muriate of soda). The manufacture of salt is hence the chief employment of the inhab.; but some additional advantages have been derived, within the last 20 years, from the introduction of the cotton trade: there is also a silk-mill, which employed, in 1839, about 40 hands.

Middlewich has an extensive internal navigation by means of the Grand-trunk Canal, which passes through the town, and by a branch connecting the town with the Chester Canal. It is distant only 2½ m. from the Winsford station, on the Grand Junction Railway, and about 3½ m. from the yet unfinished Manchester and Birmingham Railway. Petty sessions are held here for the hund. of Northwich. Markets on Tuesday; cattle fairs, May 1, Holy Thursday, and Aug. 5.

MIDHURST, a par. bor., market-town, and par. of England, co. Sussex, hund. Eastbourne, and rape Chichester, near the Arun, 10 m. N. by E. Chichester, and 46 m. S.W. London. Pop. of par. bor. (which includes the entire pars. of Midhurst, Easebourne, Heyshot, Chilthurst, Graftham, Didding, and Cocking, with portions of pars. Steep, Bignor, Wool-Lavington, Bep-ton, Woolbeding, Lynch, Stedham, Sping, Trotton, Selham, and Lodswoth), in 1831, 5,627. The town is small, but particularly clean-looking, and has several good detached houses in its immediate neighbourhood. The church is a small stone building, with a square tower surmounted by a diminutive steeple: the living is a curacy in private patronage. A free grammar-school was founded here in 1672, and there is a national and Sunday school for poor children of both sexes. "Midhurst has very little trade, except in corn, large quantities of which are sold at its weekly markets. The surrounding district is entirely agricultural, though formerly iron-works existed within a few miles of it." (*Bound. Rep.*) It is a bor. by prescription, and sent 2 mems. to the H. of C. from the reign of Edward II. down to 1832, the right of voting being in the holders of burgage tenures. The Reform Act deprived it of one of its mems.; the electoral limits being, at the same time, so much enlarged as to include, in addition to the par. or old bor. of Midhurst, 6 entire pars., and portions of 11 others, as above specified. Registered electors, in 1839-40, 261.

Petty sessions are held here for the hund. of Easebourne. Markets on Thursday; cattle fairs 5th of April and 29th of Oct.

About ¼ m. E. of Midhurst, and close to the Arun, are the ruins of Coudry House, formerly the residence of the family of Montague, destroyed by fire, with its costly furniture, pictures, books, &c., on the 24th Sept., 1793; the same day that its noble owner was drowned in an attempt to sail down the Falls of the Rhine at Schaffhausen.

MIDNAPORE, a dist. of British India, presld. Bengal, properly belonging to the prov. Orissa, but which has long been attached to that of Bengal; principally between lat. 21° 40' and 23°, and long. 86° and 88° E.; having N. the Jungle Melais, E. the Hooghly distr. and river, S. Cuttack, and W. some zemindaries, tributary to the British. Area, 8,260 sq. m. Pop., in 1822, 1,514,060. Notwithstanding this amount of pop., a considerable portion of the surface consists of jungles, partially inhabited by a very low caste of Hindoos called *sontals*. The land is generally very fertile, and most part of the articles grown in Bengal are cultivated here; the people, however, are poor and depressed, and it is doubtful whether they ever enjoyed a much higher state of prosperity and civilisation than at present. Midnapore has some manufactures of fine calico and gauzes, but of late these have greatly declined. Land revenue in 1823-24, 1,307,614 rup. Chief towns, Midnapore, Jellapore, and Piple. Midnapore, the cap. and residence of the judge, collector, &c., of the district, is in lat. 22° 25' N. long. 87° 25' E. Its chief buildings are the gaol, hospital, and barracks. (*Hamilton's E. I. Gaz.*)

MILIEL (S.T.), a town of France, dép. Meuse, cap. cant., on the Meuse, 20 m. N.E. Bar-le-Duc. Pop., in 1836, 5,706. It was formerly surrounded with walls, but these were demolished in 1635. It is well laid out, and has several remarkable churches, in one of which is a fine piece of sculpture, representing Christ laid in the sepulchre, the work of J. Richier, a pupil of Michael Angelo. It is the seat of the court of primary jurisdiction for the arrond. of Commercy, and of the court of assize for the dep.; and has a communal college, a public library, and manufactures of cotton cloth and yarn. (*Hugo, art. Meuse, &c.*)

MILAN (Ital. Milano, Germ. Mailand, Lat. *Mediolanum*), the capital city of N. Italy, and the cap. of the Austrian dom. S. of the Alps, in a fertile and highly cultivated plain, between the Olona and Lambra, with which rivers it is connected by the *Naviglio Grande* and other canals, 150 m. W. Venice, and 79 m. E. N.E. Turin; lat. 45° 28' 10" N., long. 9° 11' 30" E. Pop., in 1837, 145,600, including only the inhab. of the city-proper; but, with the immediate suburbs, 171,258; and including the garbison and strangers, about 185,500. (*Borghaus.*) It is nearly circular, and is surrounded, except on the N.W., by a bastioned wall of little strength, and broad ramparts, planted with trees, and about 10 m. in circuit. The area thus enclosed comprises, however, not only the city and its suburbs, but a number of gardens and orchards. The city-proper, or closely peopled part in the centre, is surrounded by a canal nearly 5 m. in circ. Like other old cities, it is irregularly laid out, and most of its streets are narrow and winding; but it has some noble thoroughfares, and is generally extremely well paved. Upon the whole, it is one of the finest and most pleasing cities of Europe. "Milan," says Von Raumer, "stands in a sea of green trees, as Venice in a sea of green waters. In the latter city every thing reminds you of the past, as the great and important period; here, on the contrary, the present is full of life, and all that belongs to antiquity is thrown into the background. Every thing reminds one that Milan is a great central point of wealth and activity. No signs of decay, no unoccupied people, unless in the upper classes, where the possession of fortune invites to the *far niente*, which, in Venice, goes hand in hand with wretchedness and want. In Venice, and also in Verona, each house is built according to individual fancy or convenience, and the greatest variety of architecture, and the most wanton deviations from all law, order, or harmony, are seen. In Milan, on the contrary, every building is perfectly symmetrical, and scrupulously kept in repair; and not the least symptom is to be seen of a poor or declining pop., so evident is everywhere the progress of improvement." (*Italy and the Italians*, i. 100.)

The principal public edifice is the cathedral; an immense and imposing Gothic structure, inferior in size only to St. Peter's, Rome, and St. Paul's, London. It stands in the centre of a spacious square, nearly in the middle of the city, and is built wholly of white marble. It was begun by John Galeazzo, first Duke of Milan, in 1385; but on so large a scale, that it is not yet quite finished; and, from having been continued by many different architects, of adverse tastes, it has a great admixture of styles. Its principal *façade* has a fine general effect; but it presents the incongruity of Grecian doorways and windows introduced into a Gothic front. The entire building is in the form of a Latin cross; its length internally is 493 ft.; width, 177 ft.; total length of the transept, 283 ft. 10 in.; height of the nave, 151 ft. 11 in.; height to the top of the lantern, 247 ft., do. to

the top of the spire and statue, 356 ft. There are 52 piers, 98 pinnacles, and, inside and out, no fewer than 4,400 statues. (*Wood's Letters of an Architect*, p. 307.) In fretwork, carving, and statues, it goes beyond all churches in the world. St. Peter's itself not excepted. "Its double aisles, its clustered pillars, its lofty arches, the lustre of its walls, its numberless niches, all filled with marble figures, give it an appearance novel even in Italy, and singularly majestic." (*Classical Tour*, &c., iv. 7.8.) In this cathedral there is no screen, and the chancel is entirely open, and separated from the nave only by its elevation. Neither are there any chapels, properly so called; and the high altar stands, as in the Roman *Basilica*, and, indeed, in all ancient churches, before the choir, and between the clergy and the people. The pillars, or rather clusters of pillars, which support the vault, though above 90 ft. in height, are only 8 ft. in diameter, from which comparative thinness they scarcely conceal any part of the interior from the eye. The pavement is of different coloured marbles, disposed in various figures. The dome is surmounted by a tower and obelisk, which was erected about the middle of the 18th century, adding, however, little to the beauty or magnificence of the edifice. On the top is the figure of the Virgin, to whom the church is dedicated. In a subterranean chapel immediately beneath the dome is the shrine, enclosing the remains of St. Charles Borromeo, archbishop of Milan in the 16th century, to which numerous pilgrims resort. On the whole, however, the cathedral is, both internally and externally, overlaid with ornaments; and there can be no doubt that the removal of 2,000 or 3,000 of its statues would be a signal improvement; but, with all its faults, it is certainly the finest Gothic edifice in Italy; and, in the opinion of some travellers, the finest church after St. Peter's.

Several other churches in Milan are worthy of notice. The first is that of St. Ambrose, the scene of many ecclesiastical councils and civil conflicts, and in which the German emperors usually received the Lombard crown. It is of high antiquity, and possibly some remains of the original edifice, erected by St. Ambrose towards the end of the 4th century, may form part of the modern building; but the bronze doors, and the court in front, surrounded by arcades, are acknowledged to belong to the 9th century; and the most ancient part of the building, having any character of architecture, appears to be of the same period. This church is divided by arcades into a nave and two aisles, and vaulted in nearly the same manner as the church of the Carthusians at Rome (the great hall of Diocletian's baths). Among its curiosities are the tombs of St. Ambrose and other saints, some Greek mosaics, old paintings in stucco, sarcophagi of considerable antiquity, and a large brazen serpent, said to be that fabricated by Moses in the wilderness! The churches of St. Victor, St. Mark, San Celso, St. Eustorgio, the *Madonne della Grazia*, &c., are among the handsomest or most remarkable in Milan, and some of them are adorned with rare works of art. Eustace, however, notwithstanding his disposition to eulogise, says that many of the churches "lose much of their majesty, and even of their beauty, by the profusion of rich and splendid decorations that encumber them. The materials of all are costly, the arrangement of most is tasteless; yet there are few which do not present some object of curiosity worthy of a visit." (*Classical Tour*, iv. 27.) The steeple of St. Gothard is a curious specimen of the architecture of the 14th century.

In the old Dominican convent is the famous *Cinacolo*, or "Last Supper," by Da Vinci. This magnificent work has suffered severely from damp and age, and, also, as is alleged, through the wantonness of the French soldiers and prisoners when they were quartered in the building. But what better could be expected from common soldiers, when a superior of the convent did not hesitate to cut away the feet of the principal figure, that a doorway might be heightened! It occupies one side of the refectory, and is about 30 ft. in length, by 15 in height. It has been so often repaired and retouched, that it is now nearly in the condition of Sir John Cutler's silk stockings: three of the apostles' heads are said to be all that remains of the original work, and even they owe their colouring to the pencil of restorers. Morgagni's admirable engraving gives now, perhaps, the best idea of the picture and of the genius of the painter. On the wall opposite the "Last Supper" is a fresco, by Mototarra, an artist of the 15th century; more curious on account of its age, than remarkable for beauty.

The Royal Palace (*Palazzo del Corte*), now the residence of the viceroy of Austrian Italy, a noble structure fronting the square of the cathedral, was erected by the French on the site of the old Sforza palace. It has numerous spacious apartments, and some admirable frescoes by Apollini. The floors are beautifully inlaid, and some of the rooms are hung with Gobelin tapestry; but the magnificent paintings, representing the exploits of Napoleon, that formerly decorated the two large saloons, have been removed. The government, judicial, and

archiepiscopal palaces, the city-hall or mansion-house, the mint, and the custom-house and treasury, are among the other principal edifices. The large hospital (*Ospedale Grande*), is of much greater extent than Bethlehem Hospital in London; being about 880 ft. in length, by 360 ft. in depth, and enclosing several open courts. It is not remarkable for its architecture, but is under excellent regulations. It was founded by Francis Sforza in the 15th century, and was left by one individual 4,000,000 livres (about 150,000*l.*), and by another three fourths of that amount. It is open to all applicants, whatever their country, religion, or disorder: attached to it is a dispensary, whence medicines are distributed to the poor gratis, on the specification of any physician. The most extensive building in Milan is, however, the Lazaretto, beyond the walls, also founded in the 15th century, for those infected with the plague. It consists of four ranges of building, about 1,200 ft. each in length, enclosing an area of more than 30 acres. The city abounds in charitable institutions, including several other hospitals, four asylums for poor children, two workhouses, a government loan-bank, in a magnificent edifice built in 1496, &c. (*Oesterr. Nat. Encyc.*)

One of the principal attractions of Milan, especially to strangers, is the famous *Teatro della Scala*. This, which is the largest theatre in the Austrian empire, and, next to San Carlo at Naples, the largest in Italy, has 6 tiers of boxes, exclusive of the pit, which accommodates 800 visitors. Simond gives the following account of his visit to this theatre. "The house, which is certainly very fine, exceeds perhaps any in Paris or London, and the full band in the orchestra filled it well. Soon, however, the flapping of doors, incessantly opening and shutting, the walking to and fro over that part of the pit which is without seats, and, above all, the universal chattering, overpowered the music. Disappointed in our expectations of hearing this, and finding our attention to what was passing on the stage altogether fruitless, we turned to the spectators, and observed that the boxes, which are little rooms very neatly fitted up, had, by degrees, filled with company; and the lights in some of them (for there were none in the house except the row of lamps on the stage) enabled us to see the people receiving company, taking refreshments, gesticulating in earnest conversation, and laughing. In those boxes where there were no lights, the company remained invisible, and a sort of *chiaro-scuro* pervaded the fore part of the house. But, when the ballet began, the general hubbub at once ceased, and heads suddenly popped out, cards and conversation being suspended to look at the dancing. This, though much inferior to that of Paris or London, evidently possessed attractions superior to those of music, which was no sooner resumed, after the ballet, than the noise began again as before. A box at the opera, holding 8 persons, of whom 4 only can see, costs 11 francs; and 3 additional francs are paid by each person for his ticket of admission." (*Travels*, p. 17, 18.) There are 8 other theatres, 2 of which are open for performances in the day-time.

Milan has many spacious and extensive barracks, nearly all of which are in the W. suburbs. The largest, or *Caserna Grande*, occupies an area of about 900 ft. in length, by 700 ft. in width, having in front, and on either side the Foro (*Foro Bonaparte*), an esplanade, planted with trees, and laid out in elegant public walks. Behind the Caserna is a large open space, called the Place of Arms (*Piazza d'Armi*), from which the Simplon road opens by the *Arco della Pace*, one of the finest monuments erected in modern times. This arch, commenced in 1807 and finished in 1837, designed and principally completed by the Marquis Cagnola, is altogether of marble, richly adorned with statues and bas-reliefs. It is nearly 73 ft. in length, 42 ft. in depth, and 74 ft. in height; but to the summit of the principal statue is 98 ft. Four fluted Corinthian columns decorate either front; and on the top a bronze herald of victory stands at each angle; and facing the city is a colossal bronze statue of Peace, in a car drawn by 6 horses. On another side of the *Piazza d'Armi* is the amphitheatre, built by the French in 1806, a poor imitation of the antique structures of the same kind. It is nearly 300 yards in length by 168 in breadth, and is capable of accommodating 30,000 spectators. It may be made an amphitheatre, a circus, or a *naumachia*, "for charloiters to drive, and athletes to wrestle, and a navy to give battle on an ocean 4 ft. deep; for the area could be laid under water at pleasure. The walls of this counterfeit of Roman work are scarcely 25 ft. high; and their thin facing of stone, already giving way, shows the rubbish underneath. But the palace annexed to this circus is adorned with columns of red granite, of great size, and each made of a single block. It is, in every respect, as beautiful as the rest is paltry and contemptible." (*Simond*, p. 19.)

The private palaces of Milan have received little notice from travellers, but some have considerable elegance, as the Palazzo Belgioioso, formerly the villa of Napoleon, and afterwards the residence of Prince Eugene Beau-

harnois, the Serbelloni, Vittl, Marino, and Visconti palaces, &c. Besides the *Arco della Pace*, the city is entered by 10 gates, of which the *Porta Orientale* is the richest and most remarkable.

Milan, though less striking in its general appearance than Turin or Genoa, is much richer in objects of varied interest, art, and science. The Ambrosian Library, founded in 1609 by Card. F. Borromeo, comprises, according to the Austrian Encycl., 95,000 printed vols. and 15,000 MSS. Many of the latter are highly valuable, including the note-book of Leonardo da Vinci, some MSS. supposed to date as far back as the 4th century, containing fragments of Cicero's lost orations discovered by Mail. Attached to the library is a hall of painting, with several fine works by Titian, Da Vinci, Luini, Albano, &c., and sketches by Raphael, Pietro da Cortona, Carravaggio, &c. The *Brera*, formerly the principal establishment of the *Umilianti*, is now converted to the use of the Royal Academy of Arts and Sciences. It has a noble collection of pictures by almost all the first and second-rate masters of Italy, collections of casts and engravings, rooms for the exhibition of the produce of the useful arts, a well-furnished observatory, a good library, and a botanic garden. Many of the private collections in art and literature are excellent; in the Trevisio palace is a library of 30,000 printed vols. and many MSS., a considerable collection of coins, and many curious relics of antiquity.

Milan is the seat of government for Austrian Italy, and of the provincial assembly, the court of appeal, and high criminal court of Lombardy. It is the residence of a delegate, and an archbishop's see; and has 2 lycæums, 6 gymnasia, a teachers' seminary, a high female school, many primary schools, a deaf and dumb school, colleges of medicine, midwifery, veterinary surgery, and architecture, a military geographical institute, various societies of literature, agriculture, &c.; and a tribunal of commerce.

This city is the centre and most important emporium of the silk trade of Lombardy. Not only do the transactions of the Lombard-Venetian provinces in silk centre here, but many of the neighbouring states either sell their silk in Milan, or remit it thither in transit to foreign countries; and this is the case, not for raw silk alone, but also for organzine and tram. English houses, in particular, frequently make their advances at Milan to the consignees of silk. The spinning and throwing of silk is also extensively carried on in the city and its immediate neighbourhood, and many of its throwing-mills have steam-engines. (*Bouring's Reports*.) Velvets, silks, ribbands, lace, cotton stuffs, carpets, artificial flowers, paper, goldsmiths' wares, glass, felt hats, leather, earthenware, chocolate, &c., are exclusively made in Milan, and it has a royal tobacco manufactory. In addition to silk, Milan has an extensive commerce in rice and Parmesan cheese, and is next to Venice, the largest book mart in Italy. As a place of residence, it has the advantages of cheap and plentiful provisions, every facility for study and amusement, a well-regulated police, and polite society. Among its drawbacks, are the heats of summer, and the fogs of the autumn; the climate is, however, considered healthy.

*Mediolanum*, supposed to have been founded by the Insubrian Gauls, was annexed to the Roman dominions by Scipio Nasica, anno 191 B.C. In the 4th century, it held the rank of the sixth city in the Roman empire; and is one of the few, in Italy, which have survived the devastations of the Middle Ages, and brought down its celebrity to modern times. It retains, however, but few antiquities; the only good specimen of ancient Roman architecture remaining being a range of 16 beautiful Corinthian columns, with their architrave, before the church of San Lorenzo. In the 12th century, Milan was the capital of a republic, and it subsequently became the capital of a duchy, in the families of Visconti and Sforza. After the battle of Pavia it was held by Spain, until, in 1714, it was ceded to Austria. The French took it in 1796, and again in 1800, after the battle of Marengo. Under their government it was at first the capital of the Cisalpine republic, and, from 1805 to 1814, it was the capital of the kingdom of Italy. Milan has given birth to many distinguished individuals, among whom may be specified the illustrious painter Leonardo da Vinci; the mathematician Cavalieri; Beccaria, the author of the celebrated treatise on Crimes and Punishments; Signora Agnesi, famous for her mathematical and scientific attainments; the poets Parini and Manzoni, &c. There appears to be no foundation for the statement that Valerius Maximus was a native of Milan. (*Eustace; Classical Tour*, iv. 1-36; *Simond's Trav. in Italy*, 9-22; *Wood's Letters of an Architect*, 205-221; *Forstyth; Von Bammer, Italy and the Italians*, i. 100-122; *Cramer's Anc. Italy*, i. 61, 52; *Berghaus; Oesterr. Nat. Encyc.*, &c.)

MILAZZO, or MELAZZO (an. *Myæ*), a fortified sea-port town on the N. coast of Sicily, intend. of Mes-

sina, cap. canton, on the E. side of an elevated narrow promontory, at the bottom of a bay 25 m. W. by S. the Faro point of Sicily; lat. of lighthouse 38° 15' 58" N., long. 15° 14' 10" E. Pop., in 1831, 9,206. It is divided into the upper and lower towns, both of which are irregularly built; and though it has a number of large edifices, none of them are remarkable. "The churches, with the exception of that of St. Francis, are generally mean, and the convents poor and dirty; the prison is a filthy sink; the public hospital is badly provided; and the *monte-di-pietà* languishes in bad hands." (*Smyth's Sicily*, p. 103.) The town is principally distinguished by its fortifications; being so strong, by nature and art, that it may be regarded as the Gibraltar of Sicily. Besides subordinate fortifications, it has a citadel on the highest point of the promontory, 320 ft. above the sea, commanding the town and the port. Beneath it is a spacious grotto, called the Cave of Ulysses. The promontory is bounded on all sides by steep rocks, inaccessible from the sea; and might, according to Capt. Smyth, be easily rendered impregnable. In the lower town is the fountain of Mylas, one of those alluded to by Pliny (*Hist. Nat.*, lib. xxxi. cap. 4.) as existing in this part of Sicily, the waters of which (in consequence, perhaps, of the melting of snow) are most abundant in summer.

Milazzo is the residence of a military commandant. Its inhab. are occupied chiefly in the tunny fishery, and in the export of wine, silk, fruit, rags, soap, white and red argols, corn, olive and linsed oils, and *vino collo*; the last is a cordial made by boiling must with potash. Its trade is principally with Marseilles, Leghorn, and Genoa. Its bay is large and the water deep. Ships may anchor abreast of the town in from 10 to 25 fathoms stiff mud, about ¼ m. from the shore.

The Gulph of Milazzo (an. *Basilius Sinus*), between the peninsula on which the town stands and Cape Rasaculmo, has been the theatre of some important naval conflicts. The first of these occurred anno 261 B.C., when the consul Duillius defeated a Carthaginian fleet; and showed his countrymen how to conquer by sea as well as by land. Another and far more important contest, which influenced, indeed, in no small degree, the fate of the Roman world, took place in this gulph anno 31 a.c., when the fleet of the younger Pompey was entirely defeated, and all but destroyed, by Octavius Caesar, or rather by his general, Agrippa. (*Ancient Universal History*, xiii. 459. 8vo. ed., and the authorities there referred to.) A third action took place here in 889, between the fleet of the Saracens and that of the Greek emperor Basilus.

MILBORNE-PORT, a decayed bor., market-town, and par. of England, co. Somerset, hund. Horethorne, on the Ivel, 28 m. E. by S. Taunton, and 108 m. W.S.W. London. Area of par. 3,150 acres. Pop., in 1831, 2,072. The town, though considerably enlarged and improved within the last few years, is very irregularly built, consisting chiefly of detached houses, and having the appearance of a mere village. An ancient guildhall stands in the High Street, and near it is the market-house, now converted into warehouses. The church, an ancient cruciform structure, is surmounted by a massive square tower, supported by two pointed and two semicircular arches: the living is a vicarage, in the gift of the Marquis of Anglesey. The Wesleyan Methodists and Baptists have likewise their respective places of worship, with attached Sunday-schools. Milborne-port has formerly considerable manufactures of dowlas, ticking, and sail-cloth, but they have long ceased to exist. The glove trade, however, was introduced here from Yeovil about 25 years ago; and it is stated in *Tait's History of the Glove Trade*, published in 1834 (p. 74.), that about 25,000 dozen pairs were then annually produced; and that great efforts had been made by several intelligent and persevering manufacturers to equal the French in this department, and that in some kinds of gloves they had succeeded. The market is disused; but fairs are held for cattle and pedlary June 5. and Oct. 25.

Milborne-port, which, at the time of the Norman conquest, had a market and 56 burgesses, is a bor. by prescription, and sent 2 mems. to the H. of C., with some interruption, from the reign of Edward I. down to the Reform Act, by which it was disfranchised. It had been for a lengthened period a mere nomination bor.

MILDENHALL, a market-town and par. of England, hund. Lackford, co. Suffolk, on the Lark, 33 m. N.W. Ipswich, and 63 m. N.E. London. Area of par. 13,710 acres. Pop., in 1831, 3,267. The town is of considerable extent, and well built, consisting of several detached streets, or *roves*, that form, as it were, a series of little villages. The church is a large and handsome structure, with a rich carved roof and lofty tower: the living is a vicarage, in the gift of Sir H. Bunbury, the chief landowner of the par. The inhab., with the exception of a few retail traders, are chiefly engaged in agricultural pursuits. Petty sessions for the hund. are held here. Markets on Friday; fair for wool, Oct. 10.

**MILETUS**, (Gr. *Μίλητος*), a once famous but now ruined city of Asia Minor, the cap. of Ionia, near the mouth of the Mæander (hod. Mendere), 65 m. S. Smyrna. This is a very ancient city, and had borne several names before it received that of Miletus, given to it by Neleus, son of Codrus, king of Athens, who conducted thither a colony of Ionians, anno 1120 B.C. Few cities have been more celebrated for their population, wealth, commerce, and civilisation. The citizens of Miletus early distinguished themselves by their skill in navigation, and still more by the number of the colonies they had established along the coast of the Hellespont, the Propontis, and the Euxine; which enabled them to engross the greater part of the trade in slaves, which, in antiquity, were principally furnished by the country round the Euxine, as well as the trade in corn, fish, and furs. She was also famous for her numerous works of art, the magnificence of her festivals, and the luxury, refinement, and opulence of her people. Among her most illustrious citizens were the venerated names of Thales, one of the sages of Greece; Hecæatus, one of the most ancient historians; the philosophers Anaximander and Anaxagoras; Cadmus, the first who wrote in prose, and Timotheus, a famous musician and poet.\* She also gave birth to Aspasia, the most accomplished and celebrated of courtesans; and Venus had nowhere more numerous and beautiful priestesses. Miletus was, in fact, the Athens of Ionia, *urbem quondam Ionie totius belli pacisque artibus principem*. (Mela, lib. i. cap. 17.)

Near the *Posideum Promontorium* (hod. Cape Arhora), about 12 m. S. by W. Miletus, was an oracle and splendid temple of Apollo, surnamed Didymæus. This temple having been burnt down by Xerxes, was rebuilt on a still more magnificent scale, by the Milesians. Part of the ruins yet remain; and "the columns are so exquisitely fine, the marble mass so vast and noble, that it is impossible for those to imagine greater beauty and majesty of ruin." (Chandler.) Miletus had also within her territory, Mount Latmos, famous for the loves of Endymion and Diana; and the fountain Byblis, so called from the unhappy sister of Apollo, who here expired of love and grief. (*Ovidii Met.* lib. ix. lin. 454, &c.)

But *quantum mutatus!* Miletus is now a mean deserted place, which still, however, bears the name of Palat, or Palatia, the *Palaces*. The principal existing memorial of her ancient grandeur is a ruined theatre, which must, when entire, have been a magnificent structure. It is 457 ft. in front, and is visible at a great distance. The site of the ancient city is encumbered with heaps of rubbish, and overrun with thickets, interspersed with fragments of walls, broken arches, fallen columns, and pedestals. It is evident, from the remains of a number of mosques, that Mohammedanism had once flourished here; but, with a single exception, the ruins seem to have belonged to mean and paltry structures.

In antiquity, Miletus underwent many vicissitudes. Having joined in the revolt of the Ionian cities, she was besieged and taken by the Persians, in the reign of Darius Hystaspes, anno 493 B.C., when the inhab. were obliged to evacuate their city. But being afterwards allowed to return, Miletus again rose to great wealth and distinction. She opposed a vigorous resistance to Alexander the Great; but, instead of punishing, the conqueror magnanimously restored the city to her ancient freedom. She appears to have been indulgently treated by the Romans; and continued to be a considerable city, till she fell, in an evil hour, under the ferocious and brutal sway of the Turks, who first sacked, and subsequently destroyed, this ancient glory of Ionia! To complete her misfortune, her port is now almost filled up.

The government of Miletus, and of the other cities of Ionia, was usually popular and republican; but, like their mother cities, they were distracted by faction, and frequently subjected to oligarchs or tyrants. Of the Milesian tyrants, the most celebrated was Thrasylbulus, whose answer to the inquiry of Periander of Corinth may be seen in *Aristotle's Politics*, lib. iii. cap. 10.

Miletus and the principal states of Ionia, including the islands of Chios and Samos, being connected by the ties of a common origin and interest, were in the habit of sending deputies to a general council or assembly, to deliberate and determine upon measures for promoting their union and security. This council met at Panionium, so called from the circumstance, on the N. side of Mount Mycale, opposite Samos, about midway between Ephesus and Miletus; the place was regarded as sacred, and was put under the especial protection of Neptune, the chosen guardian and favourite divinity of the Ionians. (*Ibi est Panionium, sacra regio, et ob id eo nomine appellata, quod cum communiter Iones colunt.* — Mela, ubi supra; see also *Pliny, Hist. Nat.* lib. v. cap. 19.; and *Hero-*

*dotus*, lib. i. cap. 148.) Thales, who saw that, without a more intimate union, the Ionians could make no effectual resistance to foreign aggression, advised his countrymen to establish a really federal system of government, and to concert and execute their public measures in common. (*Herod.* lib. i. cap. 170.) But this judicious advice was not acted upon; and it was only on urgent occasions, such as the invasion of Ionia by the Persians, that a sense of common interest and danger prevailed over their mutual jealousies and antipathies, and made any considerable number of the cities act in union.

Most commonly the debates and decrees of the assembled deputies seem to have referred only to matters connected with religion, precedence, or ceremony. This appears evident from the circumstance of the deputies meeting at Panionium, when the Ionian cities were subject to the Persians and others, as well as when they were independent. (For farther information as to Miletus, see *Herodotus*, lib. i. caps. 142, 143, 148, &c., and lib. vi. caps. 18. and 21.; *Strabo*, lib. xiv.; *Chandler's Travels in Asia Minor*, caps. 42, 43, and 45.; *Sz. Croix, de l'Etat et du Sort des Anciennes Colonies*, pp. 223-225, &c.)

**MILFORD HAVEN** is an extensive basin, or inlet of the sea, deeply indenting the S. part of the co. Pembroke, in S. Wales, and forming one of the most capacious and safest asylums for shipping in the British dominions. St. Anne's Head, forming the N.W. extremity of the entrance to the Haven, lat. 51° 41' N., long. 5° 10' 25" W., is 145 ft. in height, and is surmounted by two light-houses, with fixed lights, respectively 15 and 45 ft. in height. The entrance is about 1½ m. in width; what may be called the Haven is from 10 to 11 m. in depth; but it branches out into an immense number of deep bays, creeks, and roads. The water is deep; and being completely land-locked, and the anchorage-ground of the very best description, ships ride within the Haven as safely as if they were in docks. At springs the tides rise from 28 to 30 ft., affording unusual facilities for the repair of ships, enabling them to get to sea with comparatively little difficulty, and to sail in even though the wind should be contrary. It may be entered without a pilot as well by night as by day.

**MILFORD TOWN**, on the N. side of the basin, 6 m. W. by N. St. Anne's Head, was founded in 1784. It is finely situated; is especially remarkable for the mildness of its climate, and has some good buildings, including a handsome church. A dockyard constructed here in 1790 has, however, been removed to Pater-Dock, on the S. side of the haven, and the town has not increased in the degree that was anticipated. It is probable, too, that the advantage of having the rendezvous for the fleets in stations better adapted for watching the coasts of France will always prevent Milford, or any other port on the haven, from attaining that importance as a naval depot which the excellence of the haven might seem to insure; while the barrenness of the surrounding country, and the want of all internal communication with any considerable manufacturing district, have prevented, and most likely will continue to prevent, any of the places on the haven from becoming of much consequence in a commercial point of view. The mail-packets for Waterford sail from Pater. (*Stat. of the Brit. Empire*, i. 61.; *Nicholson's Cambrian Guide*, p. 425.)

**MILHAU** (an. *Emilianum*), a town of France, dép. Aveyron, cap. arrond., on the Tarn, 30 m. S.E. Rodez. Pop. in 1836, 9,437. It is generally well built, and its streets, though narrow, are regular. It has several squares and public fountains, and a good bridge over the Tarn. Few vestiges exist of its ancient castle and walls; the latter were demolished by Louis XIII. in 1629, after which, says Hugo, *La ville cessa de s'occuper des affaires politiques ou religieuses, et tourna tous ses efforts vers le commerce et l'industrie, qui en ont fait la ville la plus riche et la plus peuplée du département*. It produces woollen cloth, leather and leather gloves, silk twist, and has a considerable trade in cheese, timber, cattle, wool, almonds, wine, and other agricultural products. It is the seat of a court of primary jurisdiction, a tribunal and a chamber of commerce, a communal college, society of agriculture, &c.: it was one of the strongest holds of the Calvinists in the French religious wars.

**MILLEDGEVILLE**, a town of the U. S. of N. America, state Georgia, of which it is the cap., and seat of government, on the Oconee, at the head of the steamboat navigation. Lat. 33° 6' N., long. 83° 20' W. Pop. between 2,000 and 3,000. Its state-house, penitentiary, and arsenal, are large and conspicuous buildings; and it has several churches, academies, and printing-offices. It is a place of deposit for cotton, and has some trade; but in this respect it has been in a great measure superseded by Macon, a village about 30 m. S.W. (*Encyc. Americana*, &c.)

**MILO** (an. *Melos*), an island of the Archipelago, belonging to Greece, in the group of the central Cyclades, the summit of Mount St. Elias; in its S.W. angle, 2,036 ft. above the sea, being in lat. 36° 40' 28" N., long. 24° 23' 14"

\* This Timotheus must not be confounded with his namesake whose music embellished the fêtes given by Alexander the Great, and whose wonderful powers are the subject of Dryden's noble ode. The latter belonged to Thebes. (*Biographie Universelle*, art. *Timothee*.)

**E.** Pop. 2,500? This island is said by Pliny to be circular (*Omnium rotundissima*, lib. iv. cap. 12.); but it is really of an oblong shape, being about 13 m. in length from E. to W., and where broadest about 7 m. across: it is indented on its N. side by a spacious bay, stretching N. W. and S. E. about 6 m., which has deep water throughout, and forms one of the best asylums for shipping in the Levant. This island is obviously of volcanic origin: Mount Calamo, indeed, is at this moment a semi-active volcano, emitting smoke and sulphureous vapours; in many places the earth is hot, and there are numerous hot springs, one of which, in a natural grotto, is used by the natives as a sudatory. It also furnishes abundant supplies of iron, alum, sulphur, and salt.

A considerable portion of the surface is rugged and mountainous, and has a naked and sterile appearance; but the valleys and low grounds are extremely fertile, such small portions of them as are cultivated producing corn, wine, oil, cotton, oranges, and other fruits in the greatest profusion. In point of fact, however, Milo is now almost depopulated, and nearly a desert; a result that is partly to be ascribed to the ravages of the plague, the badness of the water, which is generally brackish, and the prevalence of malaria; but far more to the influence of that brutalising despotism under which it has groined for centuries. Milo, the capital, situated near the bottom of the bay, is rendered unhealthy from the vicinity of salt marshes, and is an inconsiderable, wretched place.

Castro, another town, near the entrance to the harbour, on its E. side, is built on the summit of a conical hill, the houses appearing to rise above the roof of each other. A little to the S. W. of Castro, near the shore, are the ruins of the ancient city. The remains of a theatre, built of large masses of the finest marble, and fragments of solid walls have been discovered. In the vicinity are numerous catacombs, cut in the porous rock. (*Tournefort, Voyage du Levant*, lettre iv.; *Olivier, Empire Ottoman*, ii. cap. 9.; *Turner's Tour in the Levant*; *Purdy's Sailing Directions for the Gulf of Venice*, &c., p. 97.)

Such is the present state of this once famous island. Melos is said by Thucydides to have been independent 700 years before the Peloponnesian war. The most probable opinion seems to be that the Melians were descended from the Lacedæmonians; but, however that may be, they declined taking any share in that contest, and though pressed by the Athenians to espouse their cause, declared their neutrality. The Athenians, however, having the command of the sea, determined to coerce the Melians into submission to their mandates; and though the first expedition sent against them failed of its object, the second was more successful. Thucydides gives the substance of the speeches made by the Athenian commanders to the Melians previously to their commencing hostilities; and on no occasion has the robber's plea, that whatever the powerful may please to command, the weaker are bound to obey, been more broadly and unequivocally asserted. The sequel of their conduct was worthy of the principle thus laid down; for the Melians having after a stout resistance surrendered at discretion, the Athenians put all the full-grown males to the sword, and carried the women and children to Attica, where they were sold as slaves! This detestable atrocity was perpetrated shortly before the Athenians engaged in their expedition against Syracuse; and is related by Thucydides, without note or comment, as if it had been a legitimate and ordinary occurrence! (*Thucyd.* lib. vi. *ad finem*.) The fortune of war having, however, soon after turned against the Athenians, the captive Melians were restored to their native country; and the island continued to be comparatively prosperous till, after innumerable vicissitudes, it was seized upon by the Turks, under whom it has been reduced to the abject state in which we now find it. It seems to have retrograded materially between the visit of Tournefort, in 1700, and that of Olivier, at the end of the century. It is now, however, included in the kingdom of Greece, and will, most probably, recover some portion of its former prosperity.

**MILTON**, or **MILTON-ROYAL**, a fishing town and par. of England, iathe Scray, co. Kent, hund. its own name, 11 m. N.E. Maidstone, and 36 m. E. by S. London. Area of par., 2,340 acres. Pop., in 1831, 2,233. The town, on the declivity of a hill sloping down to a creek which opens into the channel between the Isle of Sheppey and the coast of Kent, is old and irregularly built. It has a market-house and shambles near its centre; and at its N. end is an old court-house. The church, which stands at a considerable distance from the present town, is a spacious fabric, with a square tower of flint stone laid in even rows. The living is a rectory in the gift of the dean and chapter of Canterbury. There are places of worship, also, for Wesleyan Methodists and Baptists, with attached Sunday schools; a free school was founded in 1718.

Milton has, for many centuries, almost entirely de-

pended on its oyster fisheries, the produce of which is highly esteemed, and distinguished as the "Milton natives." The right of the fishery, within certain limits, formerly belonging to the abbey of Faversham, and afterwards to the crown, is now held on lease from the lord of the manor by a company of free dredgers, composed of the principal fishermen of the town; and in 1831 there were 119 families immediately dependent on the trade in oysters, which is principally carried on with the metropolis. The town has four wharfs; and, besides oysters, considerable quantities of corn and farm produce are shipped for the London market. Both the town and port are under the jurisdiction of a portreeve, elected annually by the inhabs, paying poor's rates.

Milton disputes with Richborough the honour of having furnished the Roman epicures with the oysters alluded to by Juvenal:—

"Rutupinovæ edita fundo  
Ostrea." *Sæc.* iv. 141.

**MILVERTON**, a market-town and par. of England, co. Somerset, hund. its own name, 6½ m. W. Taunton, and 139 m. W. S. W. London. Area of par., 6,400 acres. Pop., in 1831, 2,233. The town, situated in a richly-wooded and well-cultivated country, is small and ancient, consisting chiefly of three irregular streets, with the church, a large building, standing on an eminence in the centre. An extensive manufacture of serges and flannels is carried on here; and there is a silk-mill, which, in 1839, employed 54 hands. Milverton was formerly a bor., and is still governed by a portreeve, appointed by the lord of the manor. Petty sessions for the hund. are held here. Markets on Friday; cattle fairs, Easter Tuesday, July 25., and Oct. 10.

**MINCHIN-HAMPTON**, a market-town and par. of England, co. Gloucester, hund. Longtree, 12 m. S. by E. Gloucester, and 89 m. W. by N. London. Area of par., 8,800 acres. Pop., in 1831, 5,114. The town, on the W. escarpment of the Cotswold hills, consists of a long irregular street, extending N. to S. along the road from Gloucester to Chippingham, and crossed by another leading to the par. church, near the market-house. The church is a large cruciform structure, surmounted by an octagonal embattled tower, rising from the intersection of the nave and transepts; the living is a rectory in private patronage. The Wesleyan Methodists and Baptists have also their respective places of worship, with attached Sunday schools; and there is a well-attended national school, for children of both sexes, besides a respectably endowed grammar-school. Minchin-Hampton, which is only 4 m. S. E. of Stroud, the centre of one of the largest clothing districts of the co., has numerous cloth-factories on the banks of the numerous brooks in the vicinity; and in 1839 it had 12 woollen-mills, furnishing employment to 785 hands. Nearly 100 hands were then, also, engaged in hand-loom weaving. Trade, however, has for some years been on the decline, and its fluctuations have caused great distress among the weaving pop.: the average earnings of each family when in full work amount to 10s. per week, of which 6s. 10d. may be assumed as the produce of hand-loom labour. Markets on Tuesday: fairs for cattle, horses, and cheese, Trinity-Monday and Oct. 29. See *STROUD*. (*Hand-loom Weavers' Rep.*, &c.)

**MINCIO** (an. *Mincius*), a considerable river of N. Italy, which has its source in the Lago di Garda; and which, flowing S., with many windings, by Mantua, unites with the Po 12 m. S. E. that city. It rises in the upper part of its course, till it approaches Mantua, it is rather rapid; but from near Mantua to the Po it has a sluggish current, and is navigated by the boats that ply on the latter. Virgil, who first saw the light on the banks of this river, has celebrated its praises:—

"tardis ingens ubi flexibus errat  
Mincius, et tenera prætexit arundine ripas." *Georg.* lib. iii. lin. 14.

**MINDEN**, a strongly fortified town of the Prussian states, prov. Westphalia, cap. reg. of its own name, on the Weser, here crossed by a bridge 600 ft. in length, near the Hanoverian frontier, 60 m. E. N. E. Munster, lat. 52° 17' 47" N., long. 8° 53' 26" E. Pop. (1838) 7,800. It is irregularly built, and has no remarkable edifice, except a handsome cathedral, and new and good barracks. Minden has a gymnasium or college, a normal school, an orphan asylum, 4 hospitals, and other public institutions, and is the seat of a court of justice for the town and district, and of a board of taxation; but the court of appeal for the regency is at Faderborn. Manufactures considerable: consisting of woollens, stuffs, linen, hosiery, hats, gloves, tobacco, soap, refined sugar, &c. A number of saw-mills are employed in the preparation of the wood brought down the Weser, and it enjoys a considerable share of the transit trade on this river between Bremen and Prussian Westphalia, Hesse-Cassel, &c. In the neighbourhood are coal mines and salt springs, both very productive. The fortifications of Minden have been much improved since 1815. This

town was the residence of several early German emperors, and various diets were held in it.

The French were defeated in the vicinity of Minden in 1793, by the Prussians under Prince Ferdinand, brother to Frederick the Great, and the British under Lord George Sackville. The non-compliance of the latter with the orders of the former is said to have saved the French from a complete rout, and gave rise at the time to a great deal of acrimonious discussion. (*Berghaus, &c.*)

MINEHEAD, a sea-port, decayed bor., and market-town of England, hund. Carhampton, co. Somerset, on the Bristol Channel, 20 m. N.W. Taunton, and 149 m. W. by S. London. Area of par., 3,780 acres. Pop., in 1881, 1,481. The town comprises 3 distinct masses of building, forming a triangle, the sides of which are about  $\frac{1}{2}$  m. long; the best part, which contains some good houses and inns, being about  $\frac{1}{2}$  m. from the sea. The church, which is large and handsome, stands on the slope of a hill N. of the town; there is also a place of worship for Wesleyan Methodists, and a well-attended Sunday-school. A free school for 30 boys is supported by the lord of the manor; besides which, there are several bequests of money-charities for the relief of the poor. Minehead formerly had a considerable share in the herring fisheries; and had a large trade with Ireland, as well as with the Mediterranean and N. America. Its consequence, however, as a port, has greatly declined, notwithstanding its commodious harbour and pier; but it has lately been much frequented as a watering place, and the inbabs. are at present mainly supported by the influx of visitors. Minehead received its charter of incorporation in 1 Eliz., from which time down to the Reform Act, by which it was disfranchised, it returned 2 mems. to the H. of C. the right of election being vested in the resident housekeepers in the pars. of Minehead and Dunster. The corporation was considered too insignificant to be mentioned in the Mun. Reform Act. Markets on Wednesday.

MINORCA (*Balearis Minor*), the second in size of the Balearic Islands, belonging to Spain, in the Mediterranean, off the E. coast of Spain, from which it is distant about 140 m., Mahon its cap. being in lat.  $39^{\circ} 51' 10''$  N., long.  $4^{\circ} 18' 7''$  E.; it is of an oblong shape, extending from W.N.W. to E.S.E., but somewhat concave on its S. side. Length, 32 m.; average breadth, 9 m.; area about 290 sq. m. Pop., according to Miñano, 44,147. The coast is indented on every side, but particularly on the N., with small bays, or deep creeks, and is surrounded with islets, rocks, and shoals. Surface very uneven, with abrupt hills and knolls; but there are no mountains, except El Toro, near its centre, which rises 4,793 ft. above the sea. Iron, lead, and copper have been found, though in too small quantities to be wrought; but marble is extremely abundant, and of many beautiful varieties, as is seen in the churches and houses of Port Mahon. Water is scarce, and the climate is less mild and agreeable than that of Majorca. The air in winter is damp and raw, owing to the frequency of N. winds; but snow is seldom seen. The temperature during spring is mild, and the air pure, though somewhat moist; the summer heat is very oppressive, and the autumn is remarkable for its frequent and heavy rains. The soil is in most parts poor, sandy, and unproductive; but on the hill-sides are several fertile tracts, on which good crops of corn and wine are raised with little labour. Excepting a few evergreen oaks near the centre of the island, Minorca is almost destitute of trees; a circumstance attributable partly to the devastations of war, and partly to the violent N. winds, which are extremely injurious to plantations. Wheat and barley are the grains chiefly cultivated; both being of middling quality, and scarcely sufficient to supply two-thirds of the consumption of the island. Red and white wines are made in large quantities, and about 10,000 arrobas a year are exported, but the olive will not thrive in consequence of the cold N. winds. Capers grow spontaneously, and form an important article of export. Flax, hemp, saffron, and the cotton plant succeed well, but are not extended to. Fruits of various kinds are abundant, though much inferior in flavour to those of Majorca. Vegetables, also, are plentiful, and of good quality. The island is well suited for pasturage, and is well supplied with cattle, sheep, goats, and mules; wool is exported in considerable quantities; and the cheese of Minorca is considered by the Italians as equal, if not superior, to Parmesan. Bees, also, are reared in great abundance, and furnish large supplies of excellent honey and wax. Partridges, quails, and other game, are plentiful. Lizards swarm; and there are several varieties of venomous reptiles, but no beasts of prey. Fish, especially anchovies, abound on the coast, and the oysters of Minorca are held in high estimation by the Catalonians.

The trade of Minorca, chiefly carried on at Port Mahon, consists in the export of wine, wool, cheese, capers, honey, and wax, chiefly to Spain, but also to Genoa,

Leghorn, and the ports of France. The imports comprise wheat, oil, linen, cotton and woollen fabrics, wood, tobacco, and a variety of manufactured goods and colonial products from Spain, France, and Italy. The possession of Minorca by the British during the greater part of last century did something to awaken a spirit of activity and enterprise among the inhabitants. Since its restoration to Spain, however, its industry and commercial importance have greatly declined. Accounts are kept in Spanish money; but some of the inbabs. still retain the English mode of accounting.

"The inbabs. of Minorca," says Fischer, "are ardent, courageous, ingenious, and make excellent sailors. That activity of mind which distinguishes the Mallorcans, they possess, perhaps, in a still higher degree; for they are extremely lively, sociable, and even convivial. As the climate and soil of Minorca are greatly inferior to those of Majorca, the people of the former island are much less opulent than the Mallorcans; but they bear a close affinity to each other in language, manners, and religion." (*Pict. of Valencia*, p. 289.) They are enthusiastically fond of religious processions, and are as bigoted and ignorant as possible. Dancing and playing on the mandolin are their chief amusements. The modern inbabs. are said to be as expert as their ancestors in the use of the sling.

Minorca is divided into the four districts, or *terminos*, of Mahon, Alayor, Mercadel, and Ciudadela, which are the names also of the four largest towns. Mahon, the cap. (an. *Portus Magonis*), at the E. end of the island, with a pop. of about 19,000, is, on the whole, well built, chiefly in the English style; but the older streets are narrow, crooked, and badly paved. The harbour is one of the best and most capacious in the world; three large squadrons have, more than once, been at anchor in it at the same time, and there is excellent mooring ground in five and six fathoms, sheltered from every wind. It has three rocky islets: on one stands an hospital, on another the lazaretto, and on the third is an arsenal, with naval store-houses, all built by the English. Ciudadela (which see) is the ancient capital, but its pop. is not above 8,000. The other towns are little more than mere villages.

The ancient history of Minorca is nearly identical with that of Majorca. In 1285 the Moors were finally expelled from both islands, which were then formally annexed to the crown of Arragon. In 1704, during the war of the Spanish succession, the English took possession of the island, with the intention of making it a naval station. It was confirmed to the British by the peace of Utrecht, and remained in their possession till 1756, when it was taken by a French fleet and army, after the failure of the attempt to relieve it by Admiral Byng, which led to the memorable trial and death of the latter. At the peace of 1763 Minorca was restored to Great Britain, but in 1782 it was retaken by the Spaniards. It was once more taken by the British in 1798, and was finally ceded to Spain at the peace of Amiens in 1802. (*Fischer's Valencia*, p. 280—289; *Sir G. Temple's Excursions in the Mediterranean*, i. 13—15.; *Miñano*.)

MINSK, a government of Russian Poland, comprising the former palatinate of Minsk, and part of the palatinates of Polock, Wilna, Novogrodek, &c. It is principally included between the 52d and 56th degs. of N. lat., and the 26th and 30th of E. long., having N. and E. the govs. Vitsebsk and Moghilev, S. Kief and Volhynia, and W. Grodno and Wilna. Area about 42,000 sq. m. Pop., in 1838, 1,034,800, of whom about 100,000 were Jews. Surface mostly level, but in the N. a chain of hills separates the waters flowing towards the Black Sea from those that fall into the Baltic. In the S. is a large extent of marsh land, along the banks of the Pripiet. Exclusive of this river and the Dnieper, the other principal rivers are their affluents, the Beresina, Styr, Gorlun, Pechiza, &c.: the Dvina forms, for a short distance, the N. and the Niemen the W. boundary of the government. There are a number of small lakes, and in spring a great portion of the country is inundated, so as to form a vast sheet of water. Though one of the poorest and worst cultivated parts of the empire, Minsk produces more corn, principally rye, than is required for home consumption. Hemp and flax are important products, as are potash and tar. The forests are very extensive; and, next to agriculture, sawing and trading in timber is the principal occupation of the pop., and numerous large rafts are floated down the rivers to Kherson on the one hand, and to Riga and Konigsberg on the other. The rearing of live stock is mostly ill-conducted; pasturage is good in some parts, but the sheep yield only inferior wool. A great many bees are reared. Some little iron is obtained. Linen weaving and distilling are pretty general; a little woollen cloth is made; and there are some iron forges and glass factories; and at Pinsk, in the S.W., Russian leather is prepared. The trade of the gov. is chiefly conducted by strangers. In 1832, only 2,159 children were receiving public instruction, and

there were but 8 printing establishments in the gov. Chief towns, Minsk the cap., Boubronah, and Sloutsk.

Minsk, a town of Russian Poland, cap. the above government, and one of the largest in Lithuania, about 400 m. W.S.W., and 150 m. W. by S. Erodio. Lat. 53° 54' 9" W.; long. 27° 52' 19" E. Pop. 14,600. Its streets are narrow, irregular, and dirty, and its houses nearly all of wood; but the town has, upon the whole, a respectable appearance, and some good buildings, among which are several Greek, Greek-united, and Rom. Cath. churches, a synagogue, a gymnasium founded in 1773, and a handsome theatre. It is the see of a Greek archbishop, and a R. Catholic bishop, and has manufactures of woollen cloths, hats, and leather. Under the Poles, Minsk was the cap. of the palat. of same name. (*Schnitzler La Russie*, p. 402—408.)

MIRANDOLA, a town of N. Italy, duchy of Modena, cap. cant., on the Burana, 18 m. N.N.E. Modena. Pop. 4,600. It is walled, and has a castle, but its fortifications have fallen into decay. Among its principal edifices are a handsome cathedral and numerous churches, an hospital, and a palace belonging to the Cico family. It has manufactures of silk stuffs and twist, and woollen and cotton yarn, and an active trade in these articles and in rice, a good deal of which is grown in the neighbourhood. (*Rampoldi; Dict. Géog.*, &c.)

MIRECOURT, a town of France, dép. Vosges, cap. arrond., on the Madon, a tributary of the Moselle, 16 m. N.W. Epinal. Pop., in 1836, 5,597. It is ill-built, and has no remarkable public edifice; it is, however, the seat of tribunals of original jurisdiction and commerce, and has a public library of 6,500 vols., &c. It is principally noted for its manufactures of violins, guitars, barrel organs, and other musical instruments, which occupy most part of the male pop., while the females are employed in making lace. (*Hugo, art. Vosges*.)

MIREPOIX, a town of France, dép. Ariège, cap. cant., on the Lers, a tributary of the Ariège, 15 m. N.E. Foix. Pop., in 1836, inc. com., 4,060. It is well built and clean, and has a large hospital, a par. church, a town-hall, and a bridge over the Lers, all handsome structures. Its inhabs. manufacture coarse woollen and cotton cloths.

MIRZAPORE, a distr. and town of British India, presid. Bengal. The district is included in the prov. of Benares, and is in about lat. 25° N., and between long. 82° and 83° E. Area, estimated at 3,650 sq. m. Pop. uncertain, but probably about 1,000,000. Land revenue (1829-30), 10,82,391 rupees. The cap., Mirzapore, is on the Ganges, 30 m. S.W. Benares. Lat. 25° 10' N., long. 83° 35' E. It has numerous handsome European and native houses, Hindoo temples and ghauts, and is the chief mart for silk and cotton goods in the British middle provs. Cotton stuffs and carpets, of a superior kind, are made here; and there are some iron works in the vicinity. (*Hamilton's E. I. Gaz.*)

MISITRA. See SPARTA.

MISKOLCZ, a large market-town of Hungary, co. Borsod, of which it is the cap., on the great road from Pesth to Upper Hungary, 22 m. N.E. Erlau. Pop. acc. to the *Austrian Encyc.*, nearly 27,700, principally Protestants. It is well built, and has numerous churches, a Protestant and a R. Catholic gymnasium, a Greek national school, a synagogue, a Minorite convent, &c. The wine grown in the vicinity is the chief article of traffic at Miskolcz.

MISSISSIPPI, one of the U. States of N. America, in the S.W. part of the Union, between the 30th and 35th degrees of N. lat., and the 88th and 91st of W. long., having N. Tennessee, E. Alabama, W. Arkansas and Louisiana, and S. the last-named state and the Gulf of Mexico. Length, N. to S., 335 m.; average breadth, about 140 m. Area, estimated at about 47,000 sq. m. Pop., in 1837, 308,744; of whom 164,393 were slaves. North of lat. 31° the W. boundary is wholly formed by the river Mississippi; the country along which is a continued swamp, occasionally interspersed with patches sufficiently elevated to admit of cultivation. From this low plain the surface gradually rises towards the E., where a tract of moderately high land, stretching from S.W. to N.E., forms the watershed between the rivers joining the Mississippi in this state, and those flowing separately into the Gulf of Mexico. Many other hill ranges, of no great height, traverse the state, giving to the greater part of it an undulating surface. Next to the Mississippi, the Yazoo, Pearl, and Pascagoula rivers are the principal, and lie wholly within this state. The Yazoo, a tributary of the Mississippi, has a general S.W. direction, and an entire length of 240 m., 50 m. of which are navigable. The Pearl and Pascagoula rivers have a general S. direction, and both flow into the Gulf of Mexico. Both are navigable, also, to a considerable distance from their mouths.

Mississippi has about 30 m. of sea-coast, but no harbour except Pascagoula. A few low islands lie along the coast, but they are generally sterile, and of little

consequence. The climate nearly resembles that of Louisiana, but it is said to be healthier. But, during summer, fevers and bilious affections are more or less prevalent in all parts of the state. A large proportion of the soil is fertile, and covered with timber; oak, hickory, black walnut, maple, and pine being the principal forest trees.

The sugar-cane grows in the S., and the orange on the lower banks of the Pearl and Pascagoula rivers; in the central region, maize, rice, tobacco, indigo, figs, grapes, melons, sweet potatoes, &c., attain to excellence; while apples and pears thrive in the N. Tobacco and indigo were formerly the staples of Mississippi; but cotton is now the principal product, and its culture engrosses by far the greater portion of the attention of the planter. The crop of 1837 amounted to nearly 320,000 bales, and there has been a considerable increase in the interval. Most estates raise enough of Indian corn for their own consumption, and breed hogs sufficient to supply them with bacon. The trade of the state centres in Natchez.

In 1837, Mississippi had 56 organised counties. Jackson, on Pearl River, is the seat of government; but its pop. is small, and it has no recommendation other than its central situation. Natchez is by far the most important town in the state. The legislative power is vested in a senate of 30 members, chosen for four years, and a House of Representatives, elected for two years, by the white male citizens, 21 years of age, who have resided a year in the state. The governor is elected for two years, and the General Assembly meets also biennially at Jackson. Justice is administered in a high court of errors and appeals, a superior court of chancery, 11 district courts, and circuit courts in each co., which last have original jurisdiction in civil causes above 50 dollars. Imprisonment for debt has been recently abolished, and the Penitentiary system adopted. In 1838, the state had 23 banks and 15 branch banks, with a united capital of 21,900,000 dollars. In 1840, 80 m. of railroad had been completed in the state. There are colleges at Washington, Oakland, and Clinton; though only the first, established in 1802, and called Jefferson College, seems to have made much progress: it has usually about 100 students. In Natchez, Woodville, Monticello, &c., are flourishing public schools; but no general system of primary education is yet in force. In 1839, 36 periodical publications were issued in Mississippi.

This territory was first settled by the French about 1716, and originally formed part of Louisiana. It was ceded to Great Britain in 1763. It was united in a territorial government with Alabama in 1801; and, in 1817, was admitted as a separate state into the Union. It sends 2 representatives to congress. (*Flint's Geog. of the U. S., Appendix; Darby; American Almanack*, 1837—1841, &c.)

MISSISSIPPI (from an Indian word, meaning "Father of waters"), a great river of the United States of N. America; forming, with its various tributaries, one of the most extensive water systems in the world, and draining above 1-7th part of the N. American continent. It extends N. and S., between the 29th and 48th parallels of N. lat.; and from the sources of the Alleghany, eastward, to those of the Missouri, westward, is a distance of 1,830 m., measured in a straight line between the 77th and 111th meridians of W. long. Length, from Lake Itasca, the source of the Mississippi Proper, 3,200 m.; but, from the sources of the Missouri, the true head of this mighty river, 4,400 m. Estimated area of the country drained by it and its tributaries, about 1,100,000 sq. m. The Mississippi divides the territory of the Sioux Indians, with the states of Missouri, and Arkansas, lying on its W., from the Huron territory and the states of Illinois, Kentucky, Tennessee, and Mississippi, on its E. side; but the entire basin receives the drainage, not only of these districts, but also of Ohio and Indiana, with parts of Pennsylvania and Alabama, besides that of an immense extent of hitherto unsettled country in the "Far West." The lake Itasca, in which the river rises, and which was first discovered by Schoolcraft in 1833, at a level of 1,330 ft. above the sea, is a beautiful sheet of water, about 8 m. in extent, lying among pine-covered hills of diluvial formation, based on primitive strata. The river flows thence N.N.E., about 180 m., to Lake Cass, where it takes a S.S.E. course, and pursues it, with some deviations, to the junction of the Ohio. (*Geog. Journal*, iv. 242—251.) The velocity during its passage through the last region, bordering on British America, is in many parts very considerable. There are several falls, the largest being the Big Falls, at a spot where the stream divides, and forms several islands: about 60 m. lower down, also, are the Falls of St. Anthony, 9 m. above the confluence of St. Peter's River; and here the stream, flowing in two channels, each between 200 and 300 yds. broad, is precipitated over a limestone rock, 16 ft. in perpendicular height. At this point ends the upper course of the Mississippi: though rapids occur for several miles farther down, and even as low as the junction of the *Rivière des Moines*,

in lat.  $40^{\circ} 20' N.$  It is here about a mile broad, with transparent light blue, though not very deep, water; numerous islands stud its surface; and the current averages 2 m. an hour. Its banks are in many places bounded by broken and precipitous bluffs, ranging from 150 to 750 ft. in height, intersected here and there by deep ravines and covered with forests of pine, birch, maple and cedar; but in some parts are rather extensive prairies, covered with the *Zizania aquatica*, a species of the cerealia, commonly, though incorrectly, called wild rice, which forms a considerable article of food among the native Indians. (Darby, p. 311.) Its principal affluents here are the St. Peter's, St. Croix, Chippeway, Wisconsin, Rock, riv. des Moines and Illinois; the last being by far the most important, and admitting of boat-navigation as far as the rapids, 250 m. above its mouth. The waters of the Missouri join those of the Mississippi in lat.  $38^{\circ} 50' N.$ , and long.  $90^{\circ} W.$ , from which point the latter entirely changes its character. It is here about  $\frac{1}{4}$  m. broad; and the Missouri enters from the W., nearly at right angles, not being more than  $\frac{1}{4}$  the breadth of that into which it empties itself.\* "At this point," says Capt. Hall, "such is the impetuosity of the Missouri, that it fairly divides the Mississippi, even to the left, or E., bank; nor were there above 10 or 12 yds. of clear water on that side of the river, while all the rest was muddy. The line of actual contact was particularly interesting; it seemed as if the dirty Missouri had insinuated itself under the clear Mississippi, for we saw it boiling up at a hundred places. First, a small curdling white spot, no bigger than a man's hand, appeared near the surface, which rapidly swelled and boiled about, till, in a few seconds, it became as large as a steam-boat, spreading itself on all sides in gigantic eddies and whirls, in a manner astonishingly grand and striking. At other places, the two currents ran along, side by side, without the least intermixture, like oil and water; but this separation was never of long continuance, and the contaminating Missouri soon conquered the beautiful Mississippi: indeed, the stain is never for one moment got rid of during the 1,200 m. that the stream runs over, before it falls into the Gulph of Mexico." (N. America, iii. 329.)

The addition of the Missouri waters, however, has not the effect, that might naturally be expected, of widening the surface of the main stream; for the united waters have only, from their confluence to the mouth of the Ohio, a medial width of about  $\frac{1}{4}$  m. The junction of the Ohio seems also to produce no increase, but rather a decrease, of surface; and the river, in its natural state, is still narrower at New Orleans, which is only 120 m. from its mouth. (Lyell's Geology, i. 268.) Its depth, however, is so much increased, that, at the shallowest places, there are usually 6 ft. water, when the river is lowest. The rapidity of the current is more than doubled; and it presents, except in the dry season, a turbid and dangerous mass of waters, passing between jagged and continually falling shores, and leaving, wherever its waters have receded, large deposits of mud. Accidental circumstances often shift the current on to the islands or bends of the river, and every season makes great revolutions in the course of the channel. Sometimes entire bends are broken through by the impetuosity of the waters; sometimes large islands are entirely melted away; at other places, they have been united to the main shore by myriads of logs, that have floated down, and become cemented together by mud and rubbish. Thus, by continually shifting its course, the river sweeps away, during a great portion of the year, considerable tracts of alluvium, which were gradually accumulated by the overflow of former years; and the matter now left during the spring floods will be, at some future time, removed. (Hall, iii. 361; Lyell, i. 271.) About 190 m. below the confluence of the Missouri, it receives the Ohio, or *La Belle Rivière* of the French, flowing, with its light green stream, from the E. bank, bringing with it also the waters of its great tributaries, the Wabash, Cumberland, and Tennessee. At this point, not only does the stream turn S.W., but the bluffs on both sides retire, and a fine, well-timbered plain extends on both sides of the river, ranging (except at the Iron-banks and Chickasaw Bluffs, on the E. banks) from 30 to 50 m. in breadth; still expanding as it approaches the mouth, where it is probably three or four times that width. About 380 m. below the influx of the Ohio, is the junction of the Arkansas and White River, which enter the main stream close to each other, on the W. bank. Thence to the confluence of the Red River, is a distance, S. by W., of 360 m., measured along the stream, and below this latter point, the river bends S.E., and enters the Gulph of Mexico, after a course of 335 m. from the Red River, of 1,075 m. from the confluence of the Ohio, and of 1,270 m. from that of the Missouri. The lower part of the Mississippi is so much flooded after the rainy season,

that there is often a space of inundated woodland from 30 to 100 m. in width: large swamps, also, are found, during the whole year, on both sides the river; and indeed the whole country nearly as far up as Natchez, 422 m. from its mouth, presents nothing but a swampy tract, the abode of alligators, and subject to epidemic and other diseases most calculated to shorten and destroy human life. The lower part of the Mississippi, for 30 m. above the mouth, as far as the head called Plaquemines, is a reedy marsh, without trees, and containing only a few fishermen's huts and a residence for pilots at Balize; in fact, nothing can well be conceived more dreary than the aspect of the river, even as far as 70 m. above the mouth. The principal entrances for vessels are the N.E. pass, lat.  $29^{\circ} 7' 25''$ , about  $\frac{3}{4}$  m. S.E. of the light-house on Frank's Island; the S.E., or main pass, lat.  $29^{\circ} 8'$ ,  $\frac{1}{4}$  m. S.S.E. from the light; and the S.W. pass, about 22 m. S.W. of that land-mark. On all these passes there are bars at the outlets, with comparatively shallow water: the main pass has about 13 ft., the S.W. pass 12 ft.; but the rest are much shallower. The tide rises only from  $\frac{1}{4}$  to 2 ft. at Balize, and is not perceptible more than 30 m. above the mouth. (Blunt's Amer. Coast Pilot, p. 270.) The Mississippi has four other outlets; one, called the Iberville, on the E. bank, flowing through the lakes Maurepas and Pontchartrain; the others being on the W. bank, viz., La Fourche, which leaves the main stream 186 m. from its mouth; Plaquemines, about 31 m. higher up; and the Atchafalaya, which defects south-westward, in lat.  $31^{\circ} N.$ , and long.  $91^{\circ} 42' 30'' W.$ : the last-mentioned branch partly empties itself into the bay of its own name, but also returns a portion of its waters into the main current, with which, indeed, all the more branches of the delta are more or less interlaced. A great raft, or accumulation of drift-timber, in the Atchafalaya, varying in length from 8 to 12 m., and about 220 yds. wide by 8 ft. in depth, is covered with vegetation; and, as it rises and falls with the river, is, in fact, a floating island. Occasionally breaches occur in it, and immense masses separate, but they soon lodge again, in consequence of the pressure and entanglement of the trees. The prodigious quantity of timber annually drifted down the Mississippi and its tributaries is so great as to be a subject of geological interest; not merely as showing how vegetable matter becomes imbedded in submarine and fluvial deposits, but likewise attesting the constant destruction of soil, and transportation of matter to lower levels, by the tendency of rivers to shift their courses. Each of these trees must have required many years or even centuries to attain its full size: the soil, therefore, wherein they grew, after remaining long undisturbed, is ultimately torn up and swept away; but still, notwithstanding such constant destruction of land and timber, the region which yields the supply is densely covered with forests, and almost unrivalled in its resources for the support both of animal and vegetable life. (Lyell's Geology, i. 271—273.)

*Tributaries.*—By far the largest of all the tributaries of the Mississippi is the Missouri (or "mud-river"), which, indeed, brings down more water than the main stream itself; and, from its prodigious length of course, uncommon turbidness, impetuosity, and wild character, as well as the singular country through which it runs, possesses a natural grandeur, nearly approaching the sublime. Its sources, discovered by Lewis and Clarke in 1812, are in the Rocky Mountains, and nearly under the same parallel as that of the Mississippi. The river rises in two branches, which collect all the water flowing from the Rocky Mountains, between  $42^{\circ}$  and  $48^{\circ} N.$  lat. The most northerly of these sources, called the Missouri, rises in about lat.  $45^{\circ} N.$ , and long.  $110^{\circ} 30' W.$ , taking an easterly course, including to the N. for about 620 m., receiving in its course many considerable affluents, and having a stupendous fall of 170 ft., about 300 m. from its source: the other branch, called the Yellowstone River, rises by several heads between lat.  $42^{\circ}$  and  $44^{\circ} N.$ , and in the N.N.E. course of more than 900 m., joins the Missouri in lat.  $48^{\circ} 10'$  and long.  $104^{\circ} 0' W.$ , where its stream is 860 yards wide, or nearly treble the breadth of the Thames at London Bridge. The united river flows hence through a fine open prairie; and, after reaching its utmost N. bend, in lat.  $48^{\circ} 30'$ , curves southward past Fort Mandan, maintaining the same course to the confluence of the White River, in lat.  $43^{\circ} N.$ , below which it takes a general S.E. course, by Council Bluff, to the junction of the Kansas, and then runs nearly E. to its union with the Mississippi; its entire length, from the source of the Yellowstone to this point, being 3,130 m. Its largest tributaries are the Platte (1,800 m.), Kansas (1,200 m.), and Osage (680 m.), all rising on the E. offsets of the Rocky Mountains, and joining the Missouri on its W. bank: the E. affluents, except the Grand River and Chicago, are quite inconceivable. The navigation of the Missouri, from the Mississippi to the falls, a distance of 2,575 m., may be

\* This is Plint's account; but Capt. B. Hall says that the two rivers are nearly equal in breadth, each being somewhat more than  $\frac{1}{4}$  m. wide.

generally deemed good; though the season be short, and the boats run only during day-light. It seems probable, however, that, as the country becomes more settled, steamers will be found, not only to carry up merchandise, but to take return-cargoes. The main difficulties of navigation (*Wetmore's Gaz. of Missouri*, p. 35.) arise from its falling banks, the timber imbedded in the mud of its channel, its sand-bars and rapids, and the rapidity of its current, which ranges from 5 to 6 m. an hour. All these may be overcome by using the necessary precautions; but the falls entirely interrupt the navigation, and a portage becomes necessary at the point where, for about 2½ m., the Missouri rushes down a succession of tremendous cataracts and rapids.

Above the falls, the current is frequently interrupted by shoals and rapids; and, as the river issues from the Rocky Mountains, its banks are shut in on both sides for more than 5 m., by rocks rising perpendicularly from the water's edge to the height of nearly 1,200 ft., and forming a sublime and extraordinary spectacle. This stupendous range of rocks was denominated by Lewis and Clarke "the Gates of the Rocky Mountains."

In the lower parts of the river well-wooded valleys occur, varying from 4 to 6 m. in breadth, and, as far up as 400 m. from its union with the Mississippi, the country is partially settled, but above the Plate open prairies develop themselves, stretching indefinitely on either side in naked grass plains, forming the home of buffaloes, elks, white bears, antelopes, and mountain sheep; regions that are traversed only by the Red Indian, the huntsman, and the trapper. (*Flint's Geog. of U. States*, i. 300-305.; *Darby*, p. 320-324.)

The Ohio, though of far less magnitude than the Missouri, is certainly more beautiful, and, at present at least, more important in a practical sense. It is formed by the junction, at Pittsburg, of the Alleghany and Monongahela (the former rising 12 m. E. of Coudersport in Pennsylvania, while the latter has its source about 40 m. S. E. of Clarkburg, in Virginia). Its level at this point is stated by Darby to be about 140 ft. above the Atlantic, its breadth somewhat exceeds 600 yards, and it immediately assumes that broad, placid, and beautiful aspect which it maintains, except at the rapids of Louisville, all the way to its confluence with the Mississippi. Its valleys are of great depth and fertility, generally high, dry, and healthy; and the country on both sides presents a variety of scenery not elsewhere to be found in the Mississippi valley. It varies in breadth from 400 to 1,400 yards. At Cincinnati it is nearly 600 yards, which may be regarded as its mean breadth. At Louisville, at the rapids, the descent of the river, in 2 m., is 2½ ft.; but the current is not so broken but that boats have, in many instances, ascended the falls. A canal, however, 2 m. in length, and 200 ft. wide, with a depth sufficient for large steam-boats, was completed in 1831, by which the rapids are avoided. The rise of the Ohio, during the floods, which occur between March and July, varies from 45 to 60 ft.; but in the dry season it may be forced, in several places, near Louisville. Its higher parts are annually frozen over, and the navigation is usually suspended 8 or 10 weeks, during winter, by floating ice. Its current, when at mean height, is estimated at 3 m., and when very low, at 2 m., an hour. It has many islands; but there are none between the states of Ohio and Kentucky. The principal towns on the Ohio, below Pittsburg, are Wheeling, Gallipolis, Cincinnati, Louisville, and Jeffersonville. The length of the Ohio, from Pittsburg to the Mississippi, including its windings, is about 950 m. It enters that river nearly in a S. E. direction. "In ordinary seasons, and under ordinary circumstances," says Mr. Stuart, "these rivers are nearly 2 m. wide, and with a volume of water pretty much alike at the point of junction. When floods take place, and the Ohio is the highest, it was no easy matter, before the introduction of steamers, to accomplish its ascent at the confluence; but when the Mississippi is the highest, the Ohio is often, as it were, dammed up for several miles. On the one side, you perceive the Mississippi, presenting a vast agitated and turbid body of water, and on the other hand, the Ohio, comparatively clear and calm, descending from the N. The point where their streams unite, though rising 20 ft. above them when at an average height, is not visible in great inundations, when their united waters form a prodigious lake." (*Stuart's America*, ii. 283.)

The Ohio separates Virginia and Kentucky, on the S., from Ohio, Indiana, and Illinois, on the N. Its N. affluents are the Big Beaver, Muskingum, Scioto, and Wabash, the last of which is navigable for 400 m. from its mouth; the S. tributaries are the Kenhawa, Sandy-river, Green-river, Cumberland, and Tennessee, all rising on the W. side of the Alleghanies, and flowing, by very tortuous courses, through some of the richest districts of the United States. The last two rivers are navigable for steamers, during spring, upwards of 200 m. from their mouth; and the Ohio, with its tributaries, cannot have less than 5,000 m. of navigable waters. It

is traversed, in all directions, by an immense number of steamers; and, taking all circumstances into account, few rivers can vie with it, either in utility or beauty. (*Flint*, p. 399.; *Darby*, p. 299-308.; *Murray's Encyc.*, American ed., iii. 554.)

The Arkansas, which, in point of magnitude, ranks next to the Missouri, joins the Mississippi, on its W. bank, in lat. 34° N. Its length has been estimated at above 2,000 m.; and in summer it pours a broad and deep stream over dry sandy plains, which so absorb the water, that, several hundred miles below the mountains, it may be crossed, in summer, without wading as high as the knees. During the floods, however, it is navigated by steamers, far above the limits of the state which has assumed its name. (For further particulars, see *ARKANSAS*, I. 154.)

The Red River, and its branch, the Washita, join the Mississippi from the W., in lat. 30° 57' N., 30 m. above Baton-rouge. The most remote sources of the former are in the range of mountains called Sierra del Sacramento, skirting the E. bank of the Rio Bravo del Norte, in New Mexico. It runs E., through a mountain-country, for about 800 m., and then turns S. S. E., which direction it pursues till its junction with the Mississippi; its total length being 1,500 m. It is navigable by steamers for about 300 m.; but the existence of a low, swampy district, clogged with drift-timber, about 60 m. N. of Nachitoches, is an effectual bar to its further navigation, except for small boats. It is believed, that the Washita rises in the Masserne mountains of Arkansas, and pursues a general course S. by E., having a length of about 360 m. Both the Red River and Arkansas have their spring-floods, and supply an immense volume of muddy water, to swell the vast lagoon which is formed at the mouth of the Mississippi during its inundation. Their waters, owing to saline impregnations, and the suspension of ochreous earth, are at once brackish, and nauseous to the taste; indeed, that of the Red River is so bad at Nachitoches, as to be wholly unfit for culinary purposes. The Yazoo and Big Black River are the only E. tributaries of the Mississippi below the Ohio; and are not of sufficient importance to require a separate notice. (*Murray's Encyc.*, Amer. ed., iii. 550.; *Flint*, i. 250.; and *Darby*, p. 316.)

**Inundations.**—This mighty river, the recipient of all the waters flowing eastward from the Rocky Mountains, and westward from the Alleghanies, is subject to periodical inundations, the effect of which is greatly heightened by the flatness of the country in the lower part of its course. It is intersected, also, in every direction, by numerous natural canals, or *bayous*, which, during the floods, are constantly in motion, and render it impossible to carry on any internal intercourse, except by means of boats. The waters, however, which are thus sent down from the colder regions of the W. and N., and the temperate region of the Ohio valley, are not supplied simultaneously; the southern rivers sending down their floods early in the year, while the northern furnish their supplies as late as Midsummer. Hence, the Mississippi appears to have two annual floods; the first, in ordinary seasons, beginning with the new year. Few years pass without a swell about this season. This first flood is uniformly succeeded by a depression, previously to the great spring inundation, which begins in April, commencing with the first flood of the Missouri, in March, on the breaking up of the ice; this is followed by that of the Upper Mississippi, and afterwards by those of the Ohio, Illinois, and all the other tributaries. The great flood of the Missouri begins in June; about the middle of the same month, the Mississippi attains its greatest height at Natchez, about 400 m. from its mouth; and in the first week of July the flood at New Orleans is generally at its height. Considerable variations, however, occur in the periods, as well as extent, of the inundation. In the years 1800 and 1801, the river did not overflow its ordinary channel.

The swell of the Mississippi during the inundations is, near the sea, only 3 ft.; at New Orleans (120 m. from its mouth), 12 ft.; at Baton-rouge, 138 m. higher, 25 ft.; at Fort Adams, and generally thence to the Ohio, 45 ft.; and in the Upper Mississippi, the rise is from 18 to 22 ft.; the diminution near the mouth being a consequence of the large expanse of the country over which the waters are spread. To secure the land from these inundations, immense embankments, or *levees*, as they are sometimes called, have been formed along the Mississippi and the canals, (or *bayous*, as they are called), through which its waters overflow. The principal of these commences at the head of the island of Orleans, and extends down the river for about 130 m. The water, however, not unfrequently bursts through this embankment, and submerges the adjoining country.

**Depth, and Fitness for Navigation.**—The Mississippi differs from most of the other great American rivers, in the uniformity of its width and depth for many hundred miles. Indeed, it is navigable, at every period of the year, considerably above the junction of the Mis-

south, and at least 2,000 m. above its mouth. The width of the main river averages about 900 yards below the Ohio, and its medial depth varies from 90 to 120 ft. (*Stuart's America*, ii. 247.) The current of the Lower Mississippi, though strong, does not equal that of the Missouri. Its velocity may be ascertained from the progress made by boats in descending the stream. When the water is low a boat will float from 45 to 50 m. a day; when in a middle state, from 60 to 70 m.; and, during the inundation, from 90 to 100 m. This, however, applies only to that part of the river above the Arkansas; for, below this, a small dilatation occurs, and the swamps also receive a vast body of water, by which means the current becomes less rapid. As soon as the river enters the Delta, its rapidity is farther slackened through the diffusion of its waters into various subordinate channels. From this point to New Orleans no variation is perceived; but, between the Arkansas and the Delta, the velocity of the current is diminished nearly a third; and thence to the sea about a half. Outside the bar the current sets eastward; but there are counter-currents, which, in no small degree, perplex the mariner on entering or leaving the river. The white waters of the Mississippi do not readily mix with the sea, and may be readily distinguished from 9 to 14 m. from Balise.

By far the most dangerous obstruction to the navigation of the Mississippi arises from the multitude of large trees precipitated from its banks into the water. These frequently become firmly fixed in the bed of the river. Some of them are called *planters*, because they are immovable, and constantly expose their pointed shafts above the water. Others are denominated *sawyers*, from their alternately rising above and falling below the surface. It is dangerous for boats to run against either of these; and the best way of avoiding them, is to keep in the mid-channel, where they seldom make their appearance; and, for farther security, the steamers have now frequently double bows. The number of trees visible to the eye is greater or less, according to the high or low state of the water. But within the last few years steam-boats have been fitted up with machinery for removing these obstructions to navigation; and it is believed that, in no very lengthened period, this impediment will no longer exist, at least in any dangerous degree. (*Capt. Hall's N. America*, iii. 362; and *Wetmore's Gaz. of Missouri*, p. 34.)

**Navigation and Trade.**—The facilities afforded by the Mississippi and its various tributaries for internal navigation are wholly unequalled, except, perhaps, by the Amazon and its tributaries, in S. America. In so far, indeed, as navigation is concerned, the Mississippi should be regarded, from its great depth and comparative freedom from shoals and cataraacts, not so much a river as a vast internal sea, a Mediterranean in fact, extending through all the central and most fertile portion of N. America; and enabling its remotest recesses, though 2,000 or 3,000 m. inland, to maintain a direct communication, by water, with the most distant quarters of the globe. It is but yesterday, as it were, since the valley of the Mississippi began to be occupied by civilised man, and reclaimed from the wilderness; and its astonishing increase in population and wealth is principally ascribable to the facility afforded by this noble river for its intercourse with the other parts of America, and of the world. The trade and navigation of the Mississippi is already, indeed, incomparably greater than that of the Ganges, the Danube, the Elbe, or any other river of the ancient continent. And yet civilisation has hitherto done little more than take root in its basin; by far the largest portion of which is at present not merely uncultivated, but, in a great measure, unexplored. Let, then, the reader, who comprehends the commerce and importance of the Mississippi at this moment with its state only half a century ago, imagine, if he can, what it must be when all the vast country between the Rocky Mountains and the Alleghanies has been fully peopled, when New Orleans has become a second London, and large cities have been built on its most distant affluents!

Vast as are the natural capacities of the Mississippi for navigation, they have been, and, no doubt, will continue to be, greatly extended by canals and artificial means. It is already united with the grand chain of lakes and the basin of the St. Lawrence; and goods taken on board at New York may at present be conveyed to New Orleans without being unshipped, and conversely.

Sailing-boats are totally unable to stem the current of the Mississippi above Natchez, and are obliged to have recourse to oars and long poles; nor is it easy to give any adequate idea of the laborious and tedious operation of propelling them against the stream, from 12 to 16 days being usually consumed in ascending from New Orleans to Natchez (320 m.). The navigation, however, has been prodigiously facilitated by the introduction of steamers, which stem the current at a rate varying from 5 to 6 m. an hour: indeed, a family in Pittsburg considers it a light

matter to visit relations on the Red River, at the distance of 2,000 m.; nor is it a difficult matter to accept an invitation to breakfast at a distance of 70 m. down the stream. "In fact," says Mr. Stuart, "it is refreshing to see the large and beautiful steam-boats scudding up the eddies, as though on the wing. Where they have run out the eddy and strike the current, it is a still more noble spectacle. The foam bursts in a sheet quite over the deck; the boat quivers for a moment with the concussion; and then, as if she had collected her energies, she resumes her stately march, and mounts against the current five or six miles an hour." (*Stuart's America*, ii. 256.)

The steamers built for, and employed in, the navigation of the Mississippi are said to have amounted, in 1839, to 378, of the average burden of about 300 tons each; of these, 138 were built at Pittsburg, and 83 at Cincinnati. The following is an

ACCOUNT of the Tonnage of the Principal Ports of the Mississippi Basin in 1839; distinguishing between the aggregate Tonnage and the Tonnage of Steamers.

Ports.	Aggregate Tonnage.	Tonnage of Steam-boats.
Pittsburg	11,864	11,864
Wheeling	305	305

St. Louis, on the Missouri	9,373	9,373
Total of tonnage	142,566	110,542

\* New Orleans has a great many ships employed in the trade to other parts of the Union, the W. Indies, &c.

The principal drawback on the navigation of the Mississippi consists, at present, in the fool-hardiness of the captains of the steamers (nearly all of which are propelled by high-pressure engines), which too often results in explosions and other accidents, that frequently occasion great loss of life and property. There is, however, reason to hope that the salutary act of congress (passed 7th July, 1839) will go far to prevent those catastrophes. The passage prices (including board) are, from Pittsburg to Cincinnati, 10 dollars; to the mouth of the Ohio, 20 dollars; and to New Orleans, 35 dollars; but the prices for deck-passengers amount only to 1-4th part of the above fares. The common and only safe rate of these steamers is about 12 m. an hour with the stream, and 6 m. against it. The number of flat-bottomed and keel-boats worked by manual labour is hence, of course, rapidly decreasing. Still, however, in 1836, about 4,000 boats, of the burden of about 150,000 tons, entered the port of New Orleans; but the probability is that steam-navigation will very soon supersede every other medium of communication on the Mississippi, whether for passage or commerce. (*Darby's View of the United States*, pp. 296—325; *Flint's Geog.*, passim; *Amer. Almanack*; *Stuart's Amer.*, vol. ii.; *Murray's Ency. of Geog.*, Amer. ed., vol. iii.; *Peck's Gaz. of Illinois*, &c.)

**MISSOURI**, one of the U. States of N. America, and, in point of extent, the second in the Union, in the W. part of which it is situated, between lat. 36° 30' and 40° 30' N., and long. 89° and 94° 30' W.; having N. and W. the Wisconsin and Missouri territories, E. the Mississippi river, by which it is separated from Illinois, Kentucky, and Tennessee, and S. the Arkansas territory. Length, N. to S., 280 m.; average breadth, 220 m. Area, estimated at 61,000 sq. m., exclusive of the newly attached Platte country, to the W. of which no survey has yet been made. Pop., in 1836, 244,208; of whom, 40,540 were slaves.

No part of this state can be called mountainous, though its S.W. portion has some elevated land. The country in the S.E. is a morass, forming a portion of the great Arkansas swamp; the rest of the surface consists principally of rolling prairies continuous with those of Illinois, Indiana, and Ohio. It is watered by the two largest rivers of the American continent, which, notwithstanding its internal situation, afford it facilities for communicating with the most distant countries: the Mississippi has a course of 550 m. along its E. boundary; and the Missouri intersects the state near its centre, and joins the Mississippi within its limits. There are numerous tributaries of the above rivers, which are navigable to some distance; as the Osage, Gasconade, Grand River, Charifon, Merrimac, &c. The Osage is navigable for keel boats for above 200 m. On the banks of the rivers, especially the Missouri, the soil is deep, and extremely fertile, and, also, in the alluvial prairies of the N. The hill country is much less productive, a considerable part of it being either barren or covered with pine woods. But in those parts where the soil is the least fertile, the mineral products are abundant, and, in fact, these at present constitute the chief wealth of the state. Great quantities of iron ore and coal exist throughout the

Missouri valley; and lead, antimony, zinc, manganese, cobalt, arsenic, plumbago, nitre, salt, jasper, and marble, are found elsewhere. The great mineral district of Missouri extends over about 3,000 sq. m. to the S.W. of St. Louis. This region is principally celebrated for its lead mines. Potosi may be considered its centre; in 1835, upwards of 75 lead mines had been opened within 16 m. of that town. The ore is the galena or sulphuret of lead, and is found in detached masses, yielding from 60 to 85 per cent. of metal.

The annual produce of lead in this state is estimated at 3,000,000 lbs.; and, in 1831, as many as 6,000,000 lbs. were raised. Copper, tin, gold, and silver are met with in some places, but the precious metals are not in sufficient quantities to pay for their working.

The agricultural staples consist of hemp, flax, tobacco, and corn of various kinds. Common and sweet potatoes, turnips, garden vegetables, and artificial grasses are plentiful. Cotton is cultivated in the S., but not to any great extent. Large herds of cattle, horses, and hogs are reared; and beef, pork, tallow, hides, and live stock constitute, together with lead, furs, buffalo hides and tongues, lumber, and maize, the principal articles of export. The prairies are excellent natural pastures, "and the business of rearing cattle is almost reduced to the simple operation of turning them upon these prairies, and letting them fatten until the owners think proper to claim the tribute of their flesh." Some of the prairies appear peculiarly fitted for sheep walks; but sheep are not yet reared in any great numbers. The principal manufacturing establishments are smelting works, forges, shot factories, &c. in the mining district, and flour and sawing mills on the various rivers. A good deal of shot is annually exported from Herclanum and other towns.

In 1835, Missouri comprised 50 organized counties. St. Louis, on the Mississippi, is the chief commercial town, and was formerly the cap.; but the seat of government has been removed to Jefferson city on the Missouri, nearly in the centre of the State. The legislative power is vested in a Senate, and a H. of Representatives, the members of both being elected by the white male citizens 21 years of age, who have resided in the state for a year previously to the election, and the latter 3 months in the case for which they are to vote. The senators are elected for 4 years, and the representatives for 2; the General Assembly convenes every 2 years. The Governor and Lieut.-gov. are chosen by the people every 4 years, and are not again eligible till after the lapse of a similar period. The state is divided into 4 judicial districts, in each of which the supreme court sits twice a year. There are 11 circuit courts, with civil and criminal jurisdiction, and a superintending control over the county courts. The judges are nominated by the governor, and confirmed by the senate. They hold office during good behaviour; but not beyond 65 years of age. The constitution provides trial by jury for the slaves; and otherwise enforces humanity on the part of their owners. A fifth part of the land of the state is appropriated by Act of Congress for the support of primary schools; and the *saline fund*, derived from the sale of salt springs, &c., and other special funds, have been devoted to purposes of public instruction. St. Louis has a university, which, in 1838, was attended by about 200 students; St. Mary's college, in Perry co., had, in the same year, 124 pupils; there are some other colleges, and flourishing private seminaries in the state; and in 1840, the buildings for the Missouri university were commenced at Jefferson. A railway from Marion to New Palmyra has been commenced, and several others have been projected.

At the beginning of the 18th century, a brisk traffic in furs and minerals being maintained between the Europeans and Indians, induced the former to settle in this territory. About the middle of that century, St. Louis, St. Genevieve, and other towns, were founded by the French; but in 1762 the country was given up to Spain. In 1800, it was restored to the French, who ceded it to the U. States in 1803. Missouri became a State of the Union in 1821. It sends 2 representatives to Congress. (*Missouri Gazetteer* for 1836; *Darby's View of the U. States*; *American Almanack*, 1834—1841.)

MISSOURI (RIVER). See MISSISSIPPI.

MISTRETTA (an. *Anastra*, or *Mystratrum*) a town of Sicily, intend. Catania, on a high hill, 5 m. S.W. Catania. Pop. about 8,000.

MITCHELSTOWN, an inland town of Ireland, prov. Limerick, co. Cork, on an affluent of the Fincheen, 26 m. N.N.E. Cork. Pop. in 1831, 3,545. It consists of a well-built square, and 2 principal streets. It has a par. church, and Rom. Cath. chapel, both handsome modern structures; a college, which maintains 12 poor Protestant gentlemen, and 16 gentlewomen, endowed by the Kingston family; a small barrack, and a market-house. A major court for pleas of the amount of 2l. is held every third Monday, and petty sessions every Wednesday. It is a constabulary station. Markets on Thurs-

days: fairs on the 10th Jan. 25th March, 23d May, 30th July, 12th Nov., and 2d and 6th Dec. Post-office revenue in 1830, 2642; in 1836, 2642. Adjoining the town, on the W., is the magnificent seat of the Earl of Kingston, erected in 1823.

MITTAAU, a town of European Russia, cap. Courland, on the Aa, 25 m. S.W. Riga, lat. 56° 30' 10" N., long. 23° 43' 30" E. Pop. 13,000. It is but indifferently built; the houses being mostly of wood, and the streets, with a few exceptions, unpaved. It has a castle, erected in 1739, which served in 1796 as an asylum for Louis XV. of France, and is now the residence of the governor and the official authorities. It has a gymnasium and a good library; a theatre, capable of accommodating 3,000 spectators, an hospital, a literary society, &c. The nobility and gentry of the prov. assemble here at stated times for the despatch of business connected with the administration of the prov., and many of them reside in town during the winter, when it becomes unusually gay. Its situation is low, sandy, and exposed to inundation. (*Schneitzler, La Russie*, &c., p. 583; *Granville's Travels*, i. 370.)

MOBILE, a city and sea-port of the U. States of N. America, State Alabama, cap. co. of its own name, at the mouth of the Mobile river, in Mobile Bay, 175 m. S.S.W. Tuscaloosa, and 115 m. N.E. by E. New Orleans. Lat. 30° 40' N., long. 88° 21' W. Pop. estimated, in 1835, at above 6,000. It is situated on dry and elevated ground; but, being surrounded by a low swampy tract, it was formerly very unhealthy. But this has been in part obviated by a system of drainage, and Mobile is now tolerably salubrious. Among the public buildings are the court house, gaol, and churches for R. Catholics, Episcopalians, Presbyterians, and Methodists. A Rom. Cath. college was founded in 1830, at Spring Hill, about 6 m. from town.

Within the last few years Mobile has become one of the principal ports in the Union for the shipping of cotton. It is, in fact, the entrepôt for nearly the whole of Alabama, and for parts of Georgia and Mississippi. A light-house with a fixed light, having the lantern elevated 55 ft. above the sea, has been erected on Mobile point, at the E. entrance of the bay. There are 15 ft. water over the bar at low ebb; but a shoal within the bay prevents vessels drawing more than 8 or 9 ft. water coming to the town at ebb tide. In 1839 there belonged to the town 16,107 tons of shipping, of which 6,702 tons were steamers. In 1837, the export of cotton from Mobile amounted to about 230,000 bales, of which 172,124 were shipped for foreign ports, and 58,648 coastwise. The shipments now amount to about 280,000 bales. The total value of the exports from Alabama during the year ending 30th September, 1839, almost the whole of which was shipped here, amounted to 9,688,049 dollars: the imports are comparatively trifling, not amounting to 600,000 dollars. (*See ALABAMA*, in this Dict., i. 47.; and *American Official Returns*, &c.)

MOCCHA, the principal port in the Red Sea frequented by Europeans, in that part of Arabia called Yemen, about 40 m. from the Strait of Bab el Mandeb. Lat. 13° 10' 30" N., long. 43° 20' E. Pop. variously estimated; but may, perhaps, amount to from 5,000 to 7,000. It is encircled with walls, and indifferently fortified. Its appearance from the sea is imposing, but internally it is poor and mean.

Mocha is situated on the margin of a dry sandy plain. It is built close to the shore, between two points of land, which project and form a bay. Vessels drawing from 10 to 12 ft. water may anchor within this bay at about a mile from the town; but large ships anchor without the bay in the roads, in 5 or 7 fathoms water; the grand mosque bearing E.S.E., and the fort to the S. of the town S. by E., distant about 2 m. from the shore. The great article of export from Mocha is coffee, which is universally admitted to be of the finest quality. It is not possible to form any very accurate estimate of the quantity exported; but we believe it may be taken at 10,000 tons, or perhaps more. The greater portion is sent to Djidda and Suez; but there is a pretty large export to Bombay and other parts of India, whence some is sent to Europe: occasionally, however, the exports from Mocha and Hodeida, direct for Europe, are very considerable. Besides coffee, the principal articles of export are, dates, adjou, or paste made of dates, myrrh, gum Arabic, oilbanum, senna (*Cassia Senna*), sharks' fins, tragacanth, horns and hides of the rhinoceros, balm of Gilead, ivory, gold dust, civet, aloes, saffron, &c. The principal articles of import are, rice, piece goods, iron, and hardware, &c. The ivory, gold dust, and civet, met with at Mocha, are brought from the opposite coast of Abyssinia: whence are also brought slaves, ghee, &c.

MODBURY, an old bor., market-town, and par. of England, hund. Ermington, co. Devon, 29 m. S.S.W. Exeter, and 181 m. S.S.W. London. Area of par., 5,910 acres. Pop., in 1831, 2,116. The town, which is very irregularly laid out, has four principal streets, meeting in a large open market-place. The church is large and well built, having a spire 134 ft. high: the living is

a vicarage, in the gift of Eton college, to which Henry VI. gave the estates of an alien priory of Benedictines that formerly stood near the church. The Wesleyan-Methodists, Independents, Baptists, and the Society of Friends have their respective places of worship; and there were, in 1835, three Sunday schools, furnishing religious instruction to about 300 children. A Lancasterian school is attended by 70 boys; and about 80 children receive instruction in two infant schools.

Modena had formerly a considerable share in the manufacture of serge, plush, and felt hats; but these branches of industry have long decayed, and the present inhab. are mostly engaged in agriculture and retail trade. The town, which is a bor., though without an act of incorporation, is governed by a portreeve and other officers; and in the reign of Edward I. it sent 2 mems. to the H. of C.; but it afterwards was divested of this privilege, because of its inability to bear the expense! Markets, for corn and other provisions, on Thursday; large cattle fairs, the second Tuesday in each month, and an annual fair, May 14.

MODENA (DUCHY OF), called by the Italians *Stato Estense*, a state of N. Italy, consisting of the united duchies of Modena and Massa-Carrara, principally included between the 10th and 11th degs. of N. lat. and the 44th and 45th of E. long.; having N. Austrian Italy; E. the N. delegs. of the Papal states; W. Parma, and a portion of the Sardinian doin.; and S. Tuscany, Lucca, and the Mediterraneo. Area estimated at 2,000 sq. m., and the pop. at 403,000. The N. part of this duchy consists of a portion of the great plain of Lombardy; the S. is traversed from W. to E. by the Appennines, one of the summits of which in this duchy, M. Cimone, rises to upwards of 5,500 ft. above the sea. The Po constitutes a small portion only of the N. boundary; next to it the principal rivers are its affluents, the Panaro, Secchia, Crostolo, Enza, &c.; which have their sources on the N. slope of the Appennines, and flow N. to the Po; and the Magra and Serchio, which rise on the S. slope of the Appennines, and fall into the Mediterraneo. The climate differs on the different sides of the mountains. On the N. it is similar to that of Parma and the Lombardo Venetian kingdom; snow falls and cold weather lasts for several weeks in the winter; while to the S. of the mountains the climate is like that of Genoa, and the olive and orange flourish in the open air. The plain country is very fertile, and abundantly watered by rivulets and canals. In the mountains there are many peasant proprietors, but not in the plains. A great evil here, as in other parts of Lombardy, is the practice of the lords and the possessors of lands in mortmain letting to middlemen, who relet to metayers; under which tenure are all the lands of the duchy. The tenant furnishes half the cattle, and the landlord the other half. Apparently there is not a labourer's house in the country, all being metaying farmers. (*Arthur Young's Trav.* ii. 157.)

The distribution of the land is much the same as in the rest of the plain of Lombardy, where, according to Chateaubriand, very few farms exceed 60 acres. The metayers should receive half the produce for their labour and attention, but the actual quantity falling to their share varies considerably according to circumstances, and in many cases is not more than 1-3d part of the crops produced. The custom of sharing the produce is, however, almost universal; and a lease at a fixed rent belog extremely rare, we need not wonder at the low state of industry. (*Chateaubriand, Italy and its Agric.* p. 17, &c.) Rice, wheat, maize, fruits, wine, oil, and hemp are the principal articles of culture; but the supply of corn is notwithstanding inadequate for the consumption. The wine of the duchy is strong, but not of superior quality; the oil S. of the mountains is equal to that of Genoa, but that produced in the N. plains is very inferior. Bees, poultry, and hogs are numerous. Cattle breeding is not very extensively pursued, except in the valley of Garfagnana, where it is almost the sole occupation of the inhabs. The pasturages on the mountains are excellent; but only the duke and a few of the larger proprietors possess any considerable flocks of sheep. Horses few; oxen of the Lombard and Swiss breeds, and asses, supplying their place for draught, &c., on almost every farm. The delicacies of the Appennines are clothed with fine woods of oak, beech, pine, and chestnut; indeed, chestnut flour forms the principal food of the peasantry in the upland region for a considerable portion of the year. The labouring classes, even in the more productive parts of the duchy, live very sparingly; soup of Turkish wheat, or *polenia*, salads, and beans or other pulse, fried in oil, are their ordinary food. Butcher's meat scarcely ever appears except on the tables of the more opulent farmers, and their best beverage is refuse wine, or wine of the second pressure.

Next in importance to rural husbandry, is the culture and manufacture of silk, though the products be of inferior quality. The other manufactures are on a small scale. They consist principally of canvass, leather, paper, glass, and earthenware. In Garfagnana some iron is

forged. The finest statuary marble is found in inexhaustible quantities at Carrara; and amber, petroleum, sulphur, &c. are met with elsewhere.

This duchy is divided into 4 districts, Modena, Reggio, Garfagnana, and Massa-Carrara. Modena is the cap.: the other principal towns are Reggio, Carrara, Massa, and Finale. The government is an absolute monarchy, and perhaps the most despotical in its form of any in Europe. The duke monopolises both the legislative and executive power; but he avails himself of the services of a prime minister, 2 secretaries of state, and a privy council. The Austrian civil code of laws has been adopted since 1815. There are tribunals of primary jurisdiction in Modena, Reggio, and Massa, and a high court of appeal in Modena. A college is established in each of the principal towns, and the capital has a university and some superior schools; but owing to the jealousy of the government and the restraints laid on the press, public instruction is in a very backward state. The military force consists of 1,750 men. It is recruited by volunteers; the recruit receives a premium, and the family of which he is a member is exempted from all personal taxes. The public revenue is estimated at about 1,500,000 florins a year.

The greater part of this territory was erected in 1452 into a duchy, under Borso D'Este, son of Duke Nicolas I. It was divided by the French in 1737, and subdivided into the depts. of Panaro and Crostolo. In 1814 it was given to the present ducal family, a collateral branch of the House of Austria.

MODENA (an. *Mulina*), a city of N. Italy, cap. of the above duchy, in a fine plain between the Panaro and the Secchia, 24 m. W. N. W. Bologna; lat. 44° 38' 35" N., long. 10° 55' 13" E. Pop., about 27,000. Modena has a citadel, and is surrounded with ramparts, which, however, conduce less to its strength than to its beauty. It is regularly laid out, well built, and clean. It has been much improved and embellished within the last fifty or sixty years, and is divided into the new and the old city by the *Strada Maestra*, a part of the Emilian way, which bordered it from east to west. The general appearance of Modena is striking and agreeable; almost all its streets are bordered with arcades over their footways. The ducal palace is the finest public building; it stands isolated in the great square, and, unlike the palace of Parma, it has been completed, and is superbly furnished, and kept up in suitable style. It had formerly a noble collection of paintings; but some of its *chefs d'œuvre* were purchased by the elector of Saxony, and conveyed to Dresden in 1746, and others were taken away by the French; still, however, it is one of the best collections in Italy; it includes works by Raphael, Carlo Dolci, Andrea del Sarto, Guido, Guercino, the Caracci, and Procaccio, the Crucifixion by Pomarancio, a copy of the famous *Notte by Correggio*, &c. The ceiling of the gallery is painted in fresco by Francesconi; and in one of the rooms is a recumbent Cleopatra by Canova. The ducal library, known as the *Biblioteca Estense*, is a valuable collection of 60,000 vols. Two of the best scholars, and most laborious, diligent, and able writers of whom Italy has to boast, Muratori and Tiraboschi, were successively librarians during the last century. In the square before the palace is a fine statue of Duke Francis III., the founder of the university. The cathedral is a Gothic edifice of considerable antiquity and imposing appearance, but not in a pure style. It is principally remarkable for a square marble tower, one of the loftiest in Italy, in which is kept the famous bucket, once the cause of a serious feud between Modena and Bologna, and which has been immortalised by Tassoni in the *Secchia rapita*. One of the most celebrated works of Guido, the Presentation in the Temple, formerly adorned the cathedral, but it was carried off by the French, and has not been restored. (*Conder's Italy*, ii. 45.) The churches are numerous; but few deserve notice, except those of St. Vicenzo, St. Agostino, and the Dominican church, with some colossal statues. The city has several hospitals and asylums, a theatre, some public baths, better inns than most Italian towns, various good scientific collections, and a public library of 80,000 vols., comprising many rare editions of the 15th century, and some valuable MSS. It is well supplied with water by numerous subterranean cisterns; and is united to the Panaro by a canal navigable by boats of 30 tons. Its inhab. depend principally on the supply of necessaries to the court and government functionaries. Weaving and spinning silk were formerly important branches of industry; but these have greatly declined; and manufactures of hemp, woollen cloths, leather, hats, and glass have, to a great extent, taken their place. It has a large weekly market for agricultural produce, provisions, &c.

Mulina is supposed to have been founded by the Etruscans. It is said, by Livy, to have been colonised by the Romans, A. U. C. 569, (xxix. 55.); and it is styled by Cicero, "*firmistimam et splendidissimam populi Romani coloniam*." (Phil. v. 9.) A few Roman anti-

quities, mostly tombs, still exist at Modena. It suffered many disasters in the times of Attila, Odoacer, and the Lombard kings; and was afterwards governed successively by its bishop and magistrates, and belonged to the Popes, Venetians, and the dukes of Milan, Mantua, and Ferrara, before it became the property of the house of Este. Under the French it was the cap. of the dep. Panaro. The learned antiquary Sigonius, the poets Molise and Tassoni, and the celebrated anatomist Fallopius, were natives of Modena. (*Conder's Italy*, ii. 42—46; *Cramer's Anc. Italy*, i. 86, 87; *Thomson*; *Starke*, &c., *passim*.)

**MODICA** (an. *Motyca*), a town of Sicily, intend. Syracuse, cap. district of its own name, on the Scicli, 31 m. W.S.W. Syracuse. Pop., in 1831, incl. cant., 25,839. It is situated among craggy rocks, and generally ill built. According to Smyth, it has some fine edifices; but it appears to possess few conveniences, for a recent English traveller could find only one inn in the town, which was wretched and dirty in the extreme. Among the public buildings are a castle, numerous churches and convents, a ducal residence, a town-hall, 2 hospitals, several public schools, and a government loan-bank. The Franciscan convent is said to possess some fine mosaics. In the adjacent valley of Ipsica are numerous troglodyte caves, fully described by Smyth (*Sicily*, p. 190.) and Russell (*Tour in Sicily*, pp. 134—137.) In 1833, a good many houses and upwards of 100 persons were buried by the fall of a mountain near Modica.

The district of which this town is the cap., has an area of nearly 120,000 acres, with several towns, and a pop. of about 80,000. It was endowed with peculiar privileges by Roger, king of Sicily, the principal being that its courts of justice should be independent of those of Sicily. These privileges would appear to have been productive of a good effect. "There is a very superior spirit of activity and industry among the natives, attended by greater affluence and comfort than any other agricultural part of Sicily displays, though it is not naturally so fertile as the rest. Modica is, in general, rocky and hilly, with very bad roads; but it boasts several fine plains, and fertile valleys. The soil is mostly loose, calcareous, and dry; but many successful agricultural efforts are made to render it productive, as is testified by the abundant produce of corn, tobacco, oil, wine, soda, hemp, canary-seed, cheese, butter, and carobs; while, from the attention paid to pasturage, the cattle are in great request. This co. also produces bitumen and salt; and there is so great a quantity of game, as to form an article of export. The trade is principally with Malta, which is supplied from hence with the above necessities, in exchange for cloth, spirits, hardware, and colonial produce." (*Smyth's Sicily*, p. 191.)

**MOFFAT**, a village of Scotland, celebrated for its mineral springs, co. Dumfries, on the Annan, at the head of an extensive valley, and bounded, almost immediately on the S., by an amphitheatre of hills, the highest in the S. of Scotland, 45 m. S. Edinburgh, and 20 m. N. by E. Dumfries. Pop. 1,600; in summer, during the season of the Spa, the pop. may be 2,000. This, which is an extremely neat, clean, and well-built village, consists principally of a wide street along the line of road from Dumfries to Edinburgh. The public buildings are the par. church, a dissenting chapel, and two good inns. The Earl of Hopetown has a house in the town. The mineral springs, which are sulphureous and chalybeate, rise at no great distance from the town, on the slope of the adjacent hills. One of these springs was discovered in 1633, the other in 1748. They are a good deal resorted to, but less now than formerly.

**MOGADORE**, or **MOGODOR**, called by the Moors *Shuwa*, a sea-port town, and the principal emporium of Morocco, on the Atlantic, about 105 m. W. Morocco; lat. 31° 50' N., long. 9° 20' W. Pop. estimated at 10,000. It stands on a patch of granular sandstone rock, which, at high water, is nearly insulated by the sea. The country around is low, flat, and unproductive; so that vegetables have to be brought from gardens from 4 m. to 12 m. inland, and cattle and poultry from a still greater distance. Water is also scarce, and rather dear; being either rain water collected and preserved in cisterns, or brought from a river about 2 m. distant. The white stone buildings give the town an imposing appearance from the sea. It is divided into 2 contiguous portions, both surrounded by walls: that called the citadel, comprises nearly half the entire town, with the royal palace, the houses of most of the governors and chief officers, the custom-house, the foreign consulates, and a street of well-built shops of red sandstone, formerly occupied by European traders. Beauclerk says, that the houses in this part are well-built and lofty, that the streets are swept, and that it was cleaner than any other town he had seen in the Moorish dominions. It is shut off from the rest of the town by a high wall, with a strong gate, which is closed at 9 o'clock every night. The other portion of Mogadore is not so well laid out, nor so clean, the Jews' quarter, in particular, being excessively filthy; it has, however, a very extensive mosque, with a

high square tower, and other public buildings. It is entered by 3 principal gates; which, with many in the interior, are closed at sunset. To the S. of the citadel, is what is called the port, being an inner roadstead, protected by a rocky island, about  $\frac{1}{2}$  m. in length, 3 m. from the shore. It has not more than 10 ft. or 12 ft. water at ebb tide, and 23 ft. when deepest; it is therefore fit only for small vessels, large ships anchoring outside the harbour, the long battery bearing E., distant  $\frac{1}{2}$  m. The island bounding the harbour is appropriated exclusively to a state prison; and is supposed to be defended by a few crazy pieces of ordnance, ensconced behind mud-wall embrasures. The landing-place is a long stone slip, near the arsenal, protected on the W. by a long battery, mounting several brass cannon, and containing a large tank, and a number of prison cells. The arsenal with which this battery communicates, is a really handsome structure, consisting of a large range of bomb-proof casemates, flanked at either end by an elegant square tower, with turrets at their angles, connected by a battery of 2 tiers, having in its centre a lofty arched gateway. The long battery defending the whole town on the W., is an extensive line-wall along the shore, crowned with brass ordnance, and having beneath a range of bomb-proof casemates capable of containing 4,000 or 5,000 men. On the land side, Mogadore is protected from the attacks of the Arabs by a round tower, furnished with brass cannon. All the fortifications were erected under the superintendence of a European engineer in the last century, and, to an unskilled eye, they appear strong, and well executed; but Beauclerk says they are too flimsy to bear 5 minutes' breaching. The long battery offers, however, a fine promenade for enjoying the fresh air of the ocean.

The trade of Mogadore was formerly very extensive; her port was open to the ships of the different European countries, most of whom had consuls here. Most part of the commerce between Europe and Morocco is still carried on through Mogadore; but England and Holland are the only states that retain consuls. The principal imports are English woollen and cotton stuffs and hardware, German linens, tin, copper, earthenware, mirrors, glass, sugar, pepper, paper, &c. The exports principally consist of sweet and bitter almonds, gum Arabic, and other gums, bees' wax, cow and calf skins, ivory, ostrich feathers, gold dust, olive oil, dates, &c. Accounts are kept in *nutkeels* of 10 ounces; the ounce being divided into 4 *blankets*, of 24 fluce each. The blanket may be valued at *1d.*, the ounce at *4d.*, and the nutkeel or dicat, at *3s. 4d.* The corn measures are, for the most part, similar to those of Spain. The quintal = 119 lbs. avoird. The market lb., for provisions, = about 13 lb. avoird. The canna, or cubit, = 21 English inches, is the principal long measure. Mogadore has no peculiar manufacture; but a good deal of the excellent woollen cloth of the country is sold in its markets.

The mutton of Mogadore is of a very inferior quality, and the beef but poor. Kids form a great part of the consumption of those who indulge in meat: fowls are very cheap, and a dozen eggs may be bought for *1d.* Red-legged partridges are always to be had in abundance. The climate is decidedly healthy, the heats being moderated by the sea breezes. Agues are, however, sometimes prevalent. Mogadore was founded in 1760, by the emperor Sidi Mohammed, who himself worked at its construction, and granted many privileges to mercantile settlers. (*Beauclerk's Journey to Morocco*, 220—267; *Jackson's Morocco*.)

**MOGHILEF** (Pol. *Mohylow*), a town of Russian Poland, gov. Podolia, cap. circ. on the Dniester, 58 m. E.S.E. Kaminitz, and 180 m. S.W. Kiev. Pop. nearly 7,000, of whom many are Jews. From its situation, sheltered on every side by mountains, its climate is milder than that of the rest of Podolia; its fruits are excellent, and the silk-worm thrives well. It has several Greek, Rom. Cath., and Armenian churches, and a Greek convent; and is the residence of an American bishop. It has a brisk trade with Wallachia, and the adjacent provs., in raw produce, and some well-attended fairs. (*Schneider, La Russie*, 502; *Malte-Brun*; *Tableau de la Pologne*, 443.)

**MOHACZ**, a mean but large village of Lower Hungary, on the Danube, co. Barany, 25 m. E. by S. Fünfkirchen. Pop. 8,300. Near this village, on the 29th of August, 1826, the Turks, under Solymán the Magnificent, obtained a great victory over the Hungarians. Louis, king of Hungary, 2 archbishops and 6 bishops, many nobles, and about 22,000 private soldiers, are said to have been killed in the battle and in the pursuit. In 1687, the Turks were themselves defeated in the vicinity of this village by the Imperialists, under the Duke of Lorraine.

**MOHILEF**, or **MOGHILEV** (Pol. *Mohylow*), a gov. of European Russia, formerly included in the gov. of Vitepsk, between the 52d and 55th degs. of N. lat., and the 26th and 33d of E. long., lying N. Vitepsk, E. Smolensk, S. Tchernigov, and W. Minsk. Length, N. to S., 210 m.; average breadth nearly 85 m. Area about 17,470 sq. m.

Pop., in 1838, 846,600. The only physical difference between it and the gov. Vitepsk is, that it belongs to the basin of the Dniepr, while the latter gov. belongs to that of the Dwina. In the N. of the government is a low chain of hills, separating the two river basins; but the rest of the surface is an extended plain, partly covered with forests, and in many parts marshy. The course of the rivers is mostly S.; the principal, next to the Dniepr, are its tributaries, the Soja and Dronetz. Small lakes are numerous. The climate is milder and drier than that of Vitepsk. The soil is generally fertile; and though agriculture is extremely backward, nearly four million *chvertoks* of corn are annually grown, a quantity considerably exceeding the home demand. Rye, barley, oats, hemp, and flax are the principal products; and in the gardens, hops, pulse, &c. The breeds of cattle and horses are very inferior; but lately the sheep have been improved, by crossing with the breed of Saxony. Goats and hogs are numerous. This is one of the most richly wooded of the Russian governments; and its forests, the produce of which are floated down the rivers to the Black Sea, furnish the building-yards of St. Petersburg, Sevastopol, &c., with timbers and masts for the largest ships. Only a small portion of the forest land belongs to the crown. Bog iron is plentiful, but it is dug only by the poorest classes. In respect of manufactures, Mohilev is behind almost all the other governments of the empire. There is no capital, and the inhab. are without enterprise. The condition of the mass of the pop. appears to be most wretched. According to Schmitzler, *le régime Polonais et l'établissement des Juifs, qui ne sont pas admis à habiter l'intérieur de l'empire Russe, ont produit ici de tristes fruits.* Except a few tanneries, all the manufactures are in the hands of the Jews; but, with the exception of some distilleries, and soap and potash works, they are quite unimportant, and did not, in 1838, employ 1,950 hands. It is divided into 12 districts; Mohilev, the cap., and Mstislavl are the principal towns. The inhab. are mostly Russians and Jews, with some Poles, Lithuanians, Moldavians, and Wallachs: their religion is partly that of the Greek and partly of the Roman church, each of which has an archbishop in the gov.

MOHILEV, a town of European Russia, cap. of the above gov., on the Dniepr, 85 m. S.W. Smolensk, and 110 m. E. by S. Minsk: lat. 53° 53' 49" N., long. 30° 21' 45" E. Pop. estimated, in 1831, at 21,080, of whom above 2,000 were Jews. It has a better appearance than most Russian towns, many of its houses being of stone or other solid material. It is divided into four quarters, one of which consists of the *kreml* or castle, built on an eminence, and two of the other quarters are surrounded by ramparts. In the centre of the town is a large octagonal area, with neat stone buildings, including the residence of the Greek archbishop. It has at least 20 churches, three fourths of which are Greek; there are also several convents, a Lutheran church, and two synagogues. The government offices and magazines are handsome edifices. Mohilev is the head quarters of the Russian "army of the west," and the seat of Greek and R. Catholic archbishops, the latter having authority over all the R. Catholics of Poland and Russia: it has two episcopal seminaries, a gymnasium, a town-school, and various charitable institutions. The business of tanning is extensively carried on; it has an extensive trade with Riga, Königsberg, Dantzke, and Odessa, to which it sends leather, hides, lard, wax, honey, especially the latter, potash, hemp, flax, oil, corn, and other raw products; receiving, in return, among other foreign goods, a good deal of thrown silk. The fairs of Mohilev are well frequented. The epoch of its foundation is unknown. After several times changing masters, it was finally annexed to Russia in 1772. (*Schmitzler, la Russie*, pp. 395-400.)

MOISSAC, a town of France, dep. Tarn et Garonne, cap. arrond., on the navigable river Tarn, crossed here by a handsome stone bridge, 14 m. W.N.W. Montauban, and 97 m. S.E. Bordeaux. Pop., in 1836 (ex. com.), 6,190. It is tolerably well built, and has an elegant fountain in its principal square. The most remarkable feature of the place, however, is a ruined abbey founded in the 11th century, formerly possessing great wealth and importance; the buildings are of great extent, but are for the most part either in ruins, or converted into private dwellings. The church-porch is of high antiquity, and has some curious sculptures; the cloisters also are highly interesting; but the church itself is more modern, and of a heavy style. A good deal of corn is ground here for the use of the colonies; and the town has a considerable trade in wheat, oil, saffron, wine, &c.

Moissac, founded in the 5th century, appears from its walls to have been formerly much larger than at present. It suffered severely from the religious wars. (*Hugo, art. Tarn et Garonne*, &c.)

MOLA DI BARI, a sea-port town of the Neapolitan dom., prov. Bari, on the Adriatic, 13 m. S.W. Bari. The pop., which at the beginning of last century amounted to 13,000, is now reduced to about 6,000. It consists of an old and a new division; the former, which has a

castle and is surrounded by a wall and ditch, has narrow, crooked, and gloomy streets, and poor houses. The other, or more modern division, is, on the contrary, comparatively well built along the sea-side, and has 3 creeks, where the small vessels which frequent the port load oil, cotton, and carobs. The traces of an unfinished mole show that this was formerly a place of some commercial importance. The port, between this mole and a rocky reef to the N., is insecure; but there is an open roadstead on either side the town, where vessels may anchor in 10 fathoms water with sandy bottom. (*Cyprus's Tour*, &c., pp. 154, 155.; *Purdy's Sailing Directions*.)

MOLLY, a market-town, par. and parl. bor., contrib. to Flint, hund. of its own name, co. Flint, 10 m. W. by S. Chester, and 171 N.W. London. Pop. of par., in 1831, 9,385, ditto of township and parl. bor., 3,152. The town, situated in a valley, close to the Alyn, and surrounded by lofty hills, is small and irregularly built; but there is a very handsome town-hall, and, in the environs, are numerous handsome seats and elegant mansions. The church, a large structure of the 16th century, has highly ornamented and battled towers, and contains some curious monuments. The Wesleyan Methodists, Calvinists, and Baptists, have, likewise, their respective places of worship, with attached Sunday-schools. A cotton-mill, in the town, gave employment, in 1839, to 296 hands; but "there is no other particular branch of trade carried on here, nor is it likely, judging from its present appearance, that it will increase either in size or importance; within the par., however, there are extensive coal-pits, lead and iron mines, which, in 1831, employed 629 labourers." (*Bowd. Rep. and Parl. Census*.) Mold was constituted, by the Reform Act, a parl. bor. contrib. (with six others) to Flint. Registered electors in Mold, in 1839-40, 87. The co. assizes are held here. Markets on Wednesday and Saturday. Fairs, Feb. 13, March 21, May 12, Aug. 2, and Nov. 22.

About 1 m. W. from the town is a noted spot called Maes-Garmon, the scene of a victory gained in the 5th century, by the Welsh over the Picts and Saxons: a pillar, with an inscription, commemorates the event. About 1½ m., also, on the Chester road, are some remains of Offa's Dike, the ancient boundary between Wales and England. (*Hall's King's Pan. of N. Wales*; *Parl. Papers*, &c.)

MOLDAVIA. See WALLACHIA and MOLDAVIA. MOLDAU, a river of Bohemia, and, next to the Elbe, the principal in that kingdom, through the S. and central parts of which it flows. It rises in the Bohemian Forest, about lat. 49° N. and long. 13° 35' E.; runs at first S.E. to Rosenberg, and thence generally N. to its junction with the Elbe at Mchlik, in about lat. 50° 20', long. 14° 30', after a course estimated at somewhat more than 200 m. It is properly the head stream of the Elbe, being continuous with the latter in a direct line, and carrying more water to it than the river called the Upper Elbe. It receives the Woltawa, Luschnitz, Sazawa, and Beraun; Rosenberg, Budweis, and Prague are on its banks. The Danube and Elbe have been united by a railway 75 m. in length, completed in 1829, from Linz, in Upper Austria, to Budweis, where the Moldau becomes navigable for boats of from 10 to 15 tons. This railway consists of one line only, and the carriages on it are drawn by horses. The line was rendered unnecessarily expensive through an ill-judged economy, inasmuch as it became necessary to take up the original wooden rails, which were covered with metal plates, and substitute others of cast iron in their stead. The traffic on this road has hitherto chiefly consisted in salt sent from Upper Austria into Bohemia. The net revenue derived from it amounted, in 1837, to 8,130l. It belongs to about 13,000 shareholders, at 50 fl. a share; hitherto, however, they have derived no profit from the undertaking. (*Oester. Nat. Encyc.*, &c.)

MOLFETTA (an. *Respa*), a sea-port town of the Neapolitan dom., prov. Bari, cap. canton, on the Adriatic, 16 m. W.N.W. Bari. Lat. 41° 12' 32" N., long. 16° 36' 30" E. Pop. about 12,000. Its appearance from the sea is imposing; and though its streets be narrow and dirty, it has many good houses, among which Mr. Burgess remarked some elevations in a chaste style of architecture, and of a stone almost equal in beauty to white marble. (*Greece*, &c., l. 13.) It has a cathedral, several other churches, a college, &c., and is the see of a bishop. Its port, formed by a mole, is sheltered from all winds except the N. Opposite to it is a sand-bank, which serves as a natural breakwater; the entrances to the harbour being at either extremity of the bank. It has some linen fabrics, a saltpetre manufacture, and some ships for ship-building; and has a considerable trade in the shipping of corn, oil, almonds, &c. (*Napoli*; *Schütz, Allg. Erdkunde*; *Dict. Géog.*, &c.)

MOLTON (SOUTH), a man. bor., market-town, and par. of England, hund. of its own name, co. Devon, on the Mole, 24 m. N.N.W. Exeter, and 164 m. N. by S. London. Area of par., 6,160 acres; pop., in 1831, 8,826.

The town, occupying an embuence W. of the river, at the union of several high roads, comprises a large market-place, and several well paved and lighted streets, the whole having a peculiarly clean and neat appearance. The guildhall is a handsome and commodious building, near which is a small gaol. The church, adjacent to the market-place, is built in the perpendicular style: the living is a perpetual curacy in the gift of the dean and canons of Windsor. The Independents and Wesleyans have also their respective places of worship, and there are 3 Sunday-schools, attended by about 600 children of both sexes. A grammar-school, founded in 1614, is respectably conducted, and there are 2 other schools supported by endowments and subscriptions. S. Molton has a manufacture of serges, shalloons, and felts, employing about 70 families, besides which there is a woollen mill, which, in 1839, employed 79 hands. The lace manufacture has lately been introduced, but with no great success. The bor. is governed (according to the Mun. Reform Act) by a mayor, 3 other aldermen, and 12 councillors. It is one of the polling places at elections for the N. division of the co. Quarterly and petty sessions are held here, and a court of record sits once in three weeks. Markets on Tuesday, Thursday, and Saturday; that on Saturday being one of the largest in N. Devon. Great markets (not chartered as fairs), Saturday after Feb. 13. and April 27., Wednesday before June 22., and after Aug. 26. Saturday before Oct. 10. and Dec. 12., chiefly for cattle. (*Parl. Papers, &c.*)

MOIUCCAS, or SPICE ISLANDS. See AMBOYNA.

MOMPOX, or MONPOX, a city of S. America, repub. New Granada, and, next to its cap., the most important in the prov. Cartagena; on the Magdalena, about 25 m. above the confluence of the Cauca; lat. 9° 14' 20" N., long. 74° 27' 30" W. Pop. estimated at 10,000, or, with the neighbouring villages, 15,000. "At a distance, on ascending the river, the white houses, with their red roofs, have a neat and clean appearance; but on a nearer approach this is exchanged for the general distressed look of Spanish cities. The town is above a mile in length; the streets are of a good breadth, crossing each other at right angles, and some are even furnished with footways. The only decent-looking houses, however, are in the centre of the place, the rest being mere sheds." (*Mollien*.) It has a custom-house and a fine quay, built very high, on account of the floods which take place in Dec. Several gun-boats are stationed here, for the protection of the navigation. Mompox is a place of some commerce. The chief exports are corn, hides, and Brazil wood. Pamplona and Cuenca transmit some tobacco, sugar, and chocolate to this *entrepôt*. Antioquia sends gold, and Bogota the produce of the Upper Magdalena. Mompox is surrounded by swamps, and liable to inundations; and alligators come up to the very banks of the river to feed on the offal thrown from the city. "The climate, in the daytime, is burning, the thermometer ranging from 25° to 30° Reaumur; the inhabs. consequently pass the evenings seated in the streets, to breathe the fresh air, and to escape the stings of the mosquitoes. The sky is constantly cloudy, and scarcely a day passes without showers. The nights, on the contrary, are beautifully clear, and truly delicious. It is then a great pleasure to promenade the streets and observe the lively parties which present themselves before the doors of the houses. Loud bursts of laughter are heard on every side, in which the passenger takes part without the least ceremony. Far from this familiarity being offensive, it gives great satisfaction, for the frankest cordiality presides at these meetings. Thus passes the life of the inhabs. of Mompox. The day is spent in their hammocks, the night in the street." This manner of living differs little from that which the inhabs. of the other hot countries in S. America have adopted. All classes in Mompox are said to be much addicted to ardent spirits. The surrounding country is wholly in a state of nature. (*Mollien, &c., in Mod. Trav.* xvi. 301-2. *Geog. Account of Colombia*.)

MONACO, a town and small principality of N. Italy. The principality, which is under the protection of the king of Sardinia, is about 8 m. in length by 6¼ in breadth, having W. the div. of Nice, E. that of Genoa, and S. the Mediterranean. Area, 52 sq. m. Pop. about 7,000. Being sheltered on the N. by lofty mountains, its climate is very mild, and it produces large quantities of oranges, lemons, and other fruits, from which the revenue of the prince, amounting to about 5,000*l.* a year, is mostly derived. The pastures are tolerably good, and cattle numerous. Its inhabs. are occupied almost wholly with agriculture, fishing, and petty coasting trade.

Monaco, the cap. (an. *Portus* or *Arx Herculis Monacensis*), is built on an elevated promontory stretching into the sea, about 9 m. N.E. of Nice. Pop. 1,200. It is walled and defended by a fort; and has an appearance of strength, but is entirely commanded by an adjacent hill. The largest town in the princip. is Mentone, about 6¼ m. E.N.E. Monaco, with a tolerable port and 3,000 inhabs.

This principality was founded in the 10th century, and has remained ever since in the Grimaldi family. The reigning prince is a peer of France, with the title of Duc de Valentinois, and usually resides in Paris. (*Abma-nack de Gothia, &c.*)

MONAGHAN, an inland co. of Ireland, prov. Ulster, having N. Tyrone, E. Armagh, S. Louth and Meath, and W. Cavan and Fermanagh; area, 327,048 acres, of which 9,236 are unimproved mountain and bog, and 7,844 water. Surface hilly, but the hills are mostly arable; soil moderately fertile. There are some large, and a great many small, estates. The land is very much subdivided; so much so, that it is said by Mr. Wakefield that the larger class of farms do not average 25, nor the smallest 6 acres (1. 270.); and but little change has taken place, in this respect, in the interval. *Con-acre* is very general here, and agriculture is in the most depressed state. Principal crops, oats, potatoes, and flax, the latter being very extensively cultivated; but a good deal of wheat is now grown, and its culture is extending. Considerable improvements have latterly been effected in the breed of cattle; and a good deal of butter is made, though there are no large dairies. Goats are very generally kept by the cottiers for the sake of their milk. A great deal of work is done by the spade. Average rent of land, 13*s.* 3*d.* an acre. The linen manufacture was at one time very widely diffused over the co., most of the small farmers having looms; but this combination of employments, which has been injurious alike to agriculture and manufactures, is now, owing to the greater cheapness of machine-made yarn and fabrics, greatly diminished. The value of the unbleached linen sold in the co. in 1824, was estimated at about 126,000*l.* (*Railway Report, Append. B.*, p. 31.) The co. has vast beds of limestone; and lead ore, and indications of coal have been discovered. There are no rivers of any importance. Monaghan has 5 baronies, and 19 parishes; and sends 2 mems. to the H. of C., both for the co. Registered electors, in 1839-40, 3,421. Principal towns, Monaghan, Clontarf, Carrickmacross, &c. In 1831 this co. had 35,225 inhabs. houses, 36,766 families, and 195,536 persons; of whom 95,679 were males, and 99,857 females.

MONAGHAN, an inland town of Ireland, prov. Ulster, co. Monaghan, of which it is the cap. on the main road from Dublin to Londonderry, nearly half way between them. Pop., in 1831, 3,818. The town, consists of a central square, called the Diamond, with several diverging streets. Its public buildings are the par. church, Rom. Catholic chapel, three Presbyterian, and two Methodist meeting-houses; the co. gaol on the radiating plan, court-house, diocesan school for the sees of Raphoe, Kilmore, and Clogher, a national school, a cavalry barrack, a market-house, and the co. infirmary. "It does not appear to possess any important advantages or consequence, except as a market-town, chiefly for the sale of agricultural produce, linen, &c." (*Mun. B. and Report*.) The corporation, consisting of a provost, 12 burgesses, and commonly, sent 2 mems. to the Irish H. of C. down to the Union, when it was disfranchised. The assizes for the co. are held here, with general sessions 4 times a year, and petty sessions on Thursdays. It is a constabulary station. It has a considerable linen trade, a large brewery, and is a great mart for agricultural produce. Markets on Mondays, Tuesdays, Wednesdays, and Saturdays; fairs on the 1st Monday in every month. The Ulster canal passes near the town. Post-office revenue in 1830, 758*l.*; in 1836, 918*l.* Branches of the provincial and Belfast banks were opened in 1831 and 1835.

MONASTIR, or BITOLIA, a town of European Turkey, prov. Macedonia, cap. sanjak of same name, on the Vestrizza, 82 m. N.N.E. Yanina, and 90 m. W.N.W. Salonika. The pop. has been estimated at 15,000, but we incline to think that this is much beyond the mark; it is the principal entrepôt for merchandise passing from Albania into Roumelia. It suffered great injury from fire in 1806; and was plundered by Ali Pasha. (*Diet. Geog.*, &c.)

MONDONEDO (an. *Brittonia*), a city of Spain, in Galicia, cap. prov. same name, 30 m. N.N.E. Lugo, and 76 m. W. Oviedo. Pop., according to Milano, 6,674. It is situated on the N. side of the Asturian chain, and is old and irregularly built: its principal public buildings are a cathedral, with 11 dignitaries and 24 canons, a par. church, 2 convents, now converted into hospitals, and a royal seminary and college. Linen-weaving, tanning, and brick-making are the only branches of manufacturing industry in the town; two large fairs are held in May and Oct., and the oak-timber of the neighbourhood is better adapted for building than any other in Spain. (*Milano*.)

MONDOVI, a town of the Sardinian dom., div. Coni, cap. prov. Mondovì, on and round a hill near the Ellero, 12 m. E. by S. Coni. Pop., in 1838, inc. com. 15,521. It is divided into four parts; the town proper, called the Piazza, on the hill, at an elevation of 1,700 ft. above the

level of the sea; and the three suburbs of Carassone, Bred, and Piana della Valle, built at its foot. The distance between the upper and lower part of the town is considerable; and the road by which they are connected is inconveniently steep. The town proper has a small citadel, and is surrounded with walls, of no great strength, instead of ramparts. It has a great number of religious houses and churches; the latter including a cathedral, with a handsome altar and sacristy. Its inhab. are chiefly clergy and country gentry, and it has very little commerce or wealth. The suburbs, on the contrary, are entirely devoted to trade, and have manufactures of woollens and cottons, with tanneries and iron forges; but the chief branch of industry is the spinning of silk. Monghir is the see of a bishop, and has several seminaries of education. It is comparatively modern, having been founded, according to an inscription on one of the chapels in the cathedral, in the year 1232. It was taken and sacked by the French, under Marshal Soult, in 1799. Beccaria, the natural philosopher, was a native of Mondovì; but he must not be confounded with the Marquis Beccaria, author of the famous treatise on Crimes and Punishments, who was a native of Milan.

MONGHIR, or MUNGGER, a town of British India, prov. Bahar, distr. Bhagulpore, 80 m. E. Patna; lat. 25° 23' N., long. 86° 20' E. Pop. estimated at 30,000. It is finely situated on a bend of the Ganges, and is of great extent, its ramparts being about 1½ m. in length by 1 m. in width. The houses, however, are much scattered, and in one quarter only are so close as to resemble a town. Monghir, while a British frontier town, was a station of considerable importance; and when Hoher visited it, was in a better condition than most native towns. Though the houses are generally small, there are many with an upper story; and the roofs, instead of the flat terrace or thatch, as in Bengal, are generally sloping and covered with red tiles. The principal edifices are an old Hindoo temple, now occupied by some invalid soldiers; an elegant small mosque; the residences of the commandant and other military officers; barracks for 5 companies of sepoys; and the remains of a palace built by a brother of Anrangzeb. The shops are numerous; "and I was surprised," says Hoher, "at the neatness of the kettles, tea-trays, guns, pistols, toasting-forks, cutlery, and other things of the sort, which may be procured in this tiny Birmingham. I found afterwards that the place had been from very early antiquity celebrated for its smiths, who derived their art from the Hindoo Vulcan, who had been solemnly worshipped, and was supposed to have had a workshop here. The only thing which appears to be wanting to make their steel excellent is a better manner of smelting, and a more liberal use of charcoal and the hammer. As it is, their guns are very apt to burst, and their knives to break; precisely the faults which, from want of capital, beset the works of inferior artists in England. The extent, however, to which these people carry on their manufactures, and the closeness with which they imitate English patterns, show plainly how popular those patterns are become among the natives." (i. 290—293.) Monghir has also excellent gardeners and tailors. A great deal of clothing for the native army is made here, with shoes in the native and European fashion, furniture, palanquins, carriages, &c. There are several native schools, and the town is a station of the Baptist Missionary Society. (*Hamilton's E. I. Gaz.*; *Heber's and Valentin's Trav.*; *Mod. Trav.* ix.)

MONGOLIA, an extensive tract of country in the N. E. part of Asia, and one of the colonial possessions of China, between the 35th and 52d degs. of N. lat., and the 82d and 123d of E. long., being bounded N. by the gov. of Irkutsk, N.E. and by Manchouria, S. by China, and W. by Chinese Tartary. Length, from E. to W., about 1,700 m.; greatest breadth, 1,000 m.; area, about 1,400,000 sq. m. The limits, however, are subject, in consequence of wars among the tribes, to constant and great variation. Pop. conjectured by Tinkowsky to be about 2,000,000. Mongolia may be generally described as an elevated plain, almost destitute either of wood or water, enclosed southward by the mountains of Thibet, and northward by various offsets belonging to the great Altaic Range. The central part of Mongolia is occupied by the great sandy desert, or Ta-Gobi, which stretches from S.W. to N.E. about 1,200 m., with a breadth, in some parts, of from 500 to 700 m. (*See ASIA*, I. 169.) The most desolate part of the Gobi is called, by the Chinese, the Shimo, or sand sea, from its surface consisting of moveable sand. The desert is, however, intersected by some comparatively fertile tracts, and in other parts a few stunted trees are met with. The chief mountains of this region are, 1. the Altai and its various subordinate chains, extending eastward, under the names of Tangon, Khangai, and Kente, as far as the banks of the Amour, by which the range is deflected northward and joins the Yablonoi-khrebet; 2. the Tchaataloola and Inchan ranges, which commence in lat. 42° N., long. 107° E., and curve N.N.E. and north-

ward as far as the Amour in lat. 53° N., where they join the Altai. The mountains of Inner Mongolia are very little known. The rivers are numerous, chiefly in the N., belonging to the basins either of the Irkisch or Amour. Connected with the former are the Selenga, Orkhon, and Tula, which unite their streams and flow into lake Baikal; the Keroulin and Onon, which are tributaries of the Amour, rise near each other on opposite sides of the Kente range, and, taking a N.E. course, unite in lat. 53° 30' N., and long. 121° E. In the S. are the Leani-ho, rising on the E. slope of the Irchan range, and falling into the gulph of Leou-tong, and several rivers in the region of Koko-nor, some independent, and connected only with lakes, but others tributary to the Hoang-ho. The chief lakes S. of the great Gobi desert are the Koko-nor, the Oring, and Dzaring, the two latter being near the sources of the Hoang-ho. Inner Mongolia has no lakes of any importance, and those in the N. region, inhabited by the Kalkas, are of inferior size; but Kohdo, the N.W. district, is a country of lakes as well as mountains, the principal being Upa-nor, Altai-nor, and that called the Ike-aral-nor, which receives the waters of the Djabkan, the largest internal river of Mongolia. The air of this country is cold, owing chiefly to its great elevation, but also to the abundance of sulphate of natron, with which the steppes are in many parts covered. Tinkowsky reports that the temperature, during Oct. and Nov., ranged between 22° and 10° Fahr.; but, we are assured, that it was an unusually severe season. Great quantities of snow and rain fall in the Kalkas country; where, also, fogs and heavy dews, with cold mornings, are common in the height of summer. There is no great diversity of soil throughout this vast territory, which is generally sandy, stony, and barren. The banks of the rivers and the mountain valleys abound in good pastures, and in some places there is land fit for tillage. The N. part of the Kalkas region, in particular, is well wooded, and would be very suitable for agriculture; but the people are wholly nomad, and averse to the formation of permanent settlements. The S. sides of the Altai abound also with gold and silver; but the Mongols are entirely destitute of the knowledge necessary for the working of mines. \* S. of Oring, in lat. 47° N., begin the arid steppes of Gobi: the soil is gravelly, pasturage and water are rare, the grass is short and poor; and yet in these tracts, so little favoured by nature, are to be seen numerous herds of large camels, vigorous horses and oxen, with flocks of sheep and goats, all in good condition. The steppes abound in salt, and the atmosphere is dry and bracing; but there is a total absence of wood, and the ground is quite unfit for agriculture. Caravans are liable to great hardships in passing through the great desert, owing to the want of water and pasturage: the valleys, hills, and mountains offer nothing to the view but a yellow sand. S. of the 39th parallel the arid soil ceases, and is succeeded by lands well watered by rivers, and pretty well adapted to agriculture. Wheat is raised by the Mongols of Koko-nor, and also by those living more eastward, in the fertile districts near the great wall of China. The people, however, generally speaking, are too indolent to be good cultivators: they sow millet, barley, and wheat, but in small quantities, and in the most careless manner. Most of them, indeed, pass their whole lives in the open air, on the steppes, and disdain the laborious occupation of cultivating the ground.

"When we asked them," says Du Halde, "why they did not raise even a few vegetables in small enclosures, their prompt reply was, that herbs were the food of animals, whose flesh was the only proper support of man." (*Desc. de la Chine*, iv. 38.) In fact, so gross is their love of idleness, that, even in those countries which abound with wood and pasturage, they never make any provision for the winter, except, perhaps, a few stacks of hay; and consequently when there is a heavy fall of snow, and the cold is severe, they sometimes lose 9-10ths of their flocks and herds. The quadrupeds of Mongolia are the wild horse, wild boar, stag, goats of various kinds, bears, wolves, hares, foxes, sables, and squirrels: the birds are cranes, wild geese and ducks, moor-fowl, quails, and swans. Of the domestic animals it may be remarked that the horse, though small and shabby-looking, is strong and spirited; that the camels have two humps, and that the sheep are white, with long black wools, and furnish very delicate meat. The Mongols have dogs, but very few cats; and mules, as well as asses, are bred in large quantities by the tribe of Karatchin immediately N. of the great wall.

Mongolia is composed of 26 aimaks, or principalities, all recognising the sovereignty of the emperor of China, and each governed by one of its oldest princes, called *taishis*. The division of the Mongol hordes is founded on the necessity of a military administration; but all the officers

\* Du Halde mentions some tin mines in the Kalkas country; and Muller-Bron says that there are iron-foundries about 50 versts from Khabarovsk; but Tinkowsky doubts their existence. (*Comp. Du Halde*, iv. 22; *Muller-Bron*, ii. 484; and *Tinkowsky*, ii. 244.)

superintendent likewise the direction of civil affairs. According to this military division (introduced by the Manchus), the whole nation is divided into 135 banners, which are again subdivided into regiments and companies. Each Mongol is bound to serve as a horseman from his 18th to his 60th year. The property of the soil is in the princes, to whom their subjects pay a moderate contribution of cattle, supplying them also with servants and shepherds for guarding their flocks and herds. These princes decide in the last instance all disputes between their subjects, according to the laws established to preserve order in their armies; but the supreme administration is confided to the tribunal of foreign affairs at Peking, which appoints inspectors-general for the different principalities; these are always chosen from the Manchoo nation. With respect to the attachment of the Mongols to the present Manchoo dynasty of China (Ta-Tsing) it is difficult to speak positively. The Mongols still maintain their ancient hatred of the Chinese; and, though the latter have been enabled to subdue the warlike spirit of these nomads, and to declare them tributary, the court of Peking sends to Mongolia about 10 times the value of the tribute received from it, under pretext of rewarding the zeal and fidelity of its princes and military officers. Thus, the native Mongol chiefs are bribed into subjection and obedience; but they are, at the same time, vigilantly watched by the Manchoo inspectors, and any misconduct, or show of opposition, is speedily visited by an abridgement or deprivation of their usual presents. The religion of the Mongols is Buddhism, supposed to have been introduced in the 17th century. The temples are not numerous, nor are the lamas much distinguished from the common people by their knowledge and morals. They learn to read Tibetan, because the sacred books and services are copied and printed in those characters; but few of them are even tolerably acquainted with the language, or know the origin and meaning of the religious ceremonies. The lamas observe celibacy, and follow a strictly monastic life: there are also female recluses, who submit to an austere and holy life; but some are married.

The proper or E. Mongols are divided into three great nations: the Kalkas, northward, the Ishkhans, near the wall of China, and the Sumits, who range over the great desert of Gobi. Their physical conformation, language, general habits, and history, have already been described at some length in the article ASIA, in this work (Vol. I. pp. 192-194.), to which the reader is referred for these particulars. The dress of the men is very simple, consisting of a long dark-blue robe, either of cotton or cloth, secured by a leather girdle; their shirts and under garments are of coloured nankeen, their boots of leather, and very thick: in winter they wear pelisses of sheepskin, and fur caps. The costume of the women resembles, in many respects, that of the men. The saddles and bridles of the Mongols are furnished with copper or silver. A bow and arrow, with a short sword, are the arms of a soldier; and muskets or rifles are used only in the chase. Their tents consist, like those of the Khirgiz, of a skeleton of osier, covered with felt, of which there are in winter three layers: the door commonly faces the S.; the hearth is in the centre; and the right side, near the entrance, belongs to the women. The tents of the common people are low, close, and disagreeable; but those of the richer Mongols are spacious and lofty, comprising two or three distinct apartments, the best of which is covered with a Persian or Turkish carpet. Milk, cheese, and butter, with a little mutton and game, form the chief food of this robust and active nation: brick-tea is the principal beverage of the rich as well as the poor. In summer, also, they drink *arak*, a fermented liquor made from milk, besides *koumiss* and brandy, purchased from the Chinese. Hunting, horse-racing, wrestling, and archery are their chief amusements: they seem to have no idea of dancing, but their songs are poetical and highly characteristic. The Mongols marry young: a plurality of wives is not forbidden, and divorces are frequent, the least discontent on either side being deemed a sufficient reason for the step. They generally bury their dead, but sometimes burn them, and occasionally even leave them exposed to the birds and wild beasts. Almost every Mongol is a skilful warrior and huntsman; but there are very few workmen or artificers; and, on examining his dress, furniture, and saddle, we find that he is supplied with every thing by the Chinese, who give in exchange for horses, camels, oxen, and sheep, large quantities of brick-tea, tobacco, brandy, silk, cotton, and woollen fabrics, boots, and various utensils in iron, tin, and copper. To carry on this trade, the Chinese go to Mongolia to the towns of Dolon-nor and Kalgan, or to the great entrepôts of Kiakhta and Ourga, in the country of the Kalkas. The Mongols receive considerable profits from the conveyance of goods through their country: payment is made by the Chinese sometimes in silver, but more frequently in articles of commerce. (*Tinkowsky's Travels through Mongolia*, li. 207-208.; *Du Halde, Desc. de la Chine*, iv. 21-38.; *Chinese Rep.*, i. 117-121., &c.)

MONMOUTH, a marit. co. in the W. of England, adjoining Wales, having N. the cos. of Brecknock and Hereford; E. Gloucester, from which it is separated by the Wye; S. the Bristol Channel; and W. Glamorgan, from which it is separated by the Rumney. Area, 317,440 acres, of which 270,000 are supposed to be arable, meadow, and pasture. It is divided into 2 not very unequal parts by the Usk, which flows through it from N. to S.; the tract to the W. of that river being comparatively rugged and mountainous, and that to the E. comparatively level, and well-wooded. The S. part of both divisions along the Bristol Channel, contains large tracts of marshy land; in some parts of a deep, rich, loamy soil; and in others, of a black peat earth. Large embankments have been raised in different places along the shore, to protect the marsh land from inundation. In other parts of the co. the soil, which is in general good, mostly consists, in the elevated grounds, of a red sandy loam, and in the valleys of a red clay; the substratum is frequently limestone. The arable land is generally clean, and in good order; but the rotation of crops might be a good deal improved. Draining is extensively practised. Cattle principally of the Hereford breed; and inferior only to the same breed in their native co. There are numerous orchards; and, in a few places, hops are cultivated. Stock of sheep estimated at from 170,000 to 180,000. There are some large estates; but property is, notwithstanding, a good deal subdivided. The size of farms varies from 60 to 300 acres, 140 acres being supposed to be about the average. They are generally held at will; and the want of leases is much and justly complained of. Average rent of land, in 1810, 12s. 9½d. an acre. Principal minerals, coal, iron, and limestone. The abundance of these has led to the establishment of many very extensive iron works, especially in the N. and W. parts of the co.; which were estimated to produce, in 1840, about 200,000 tons of iron. The access to the mines has been facilitated by the formation of canals and railways. A good deal of flannel is made in different parts of the co. Besides the Wye, Usk, and Rumney, it is watered by the Avon, Sirhowy, and Ebury. Monmouth has 6 hundreds, and 127 parishes; and sends 4 members to the H. of C., viz. 2 for the co., and 2 for the bor. of Monmouth. Registered electors for the co., in 1839-40, 4,447. In 1831, Monmouth had 18,612 inhab. houses, 19,911 families, and 98,130 persons; of whom 51,065 were males, and 47,065 females. Sum paid for poor-rate, in 1838-39, 20,874l. Annual value of real property, in 1815, 298,981l.; profits of trade and professions in ditto, 102,571l.

MONMOUTH, a parl. bor., market-town, and par. of England, cap. of the above co., bund. Skewerth, on the Wye, 25 m. N. by W. Bristol, and 112 m. W. by N. London. Pop. of parl. bor. (which includes the par. of Monmouth and a part of that of Dilton), in 1831, 4,916. The town, which is well built, well paved, and lighted with gas, comprises a principal avenue with other smaller streets, one of which leads to an old stone bridge over the Wye. The guildhall, in the market place, is a neat and commodious edifice; and at the N. end of the town is a prison, which, though externally of imposing appearance, is much too small for the wants of the district. The par. church, partly rebuilt in 1740, has a spire 200 ft. in height: the living is a vicarage in the gift of the Duke of Beaufort. Another small church stands at the S.W. angle of the town, besides which, there are four places of worship for Dissenters, with attached Sunday-schools. A free grammar-school was founded here in the reign of James I.; an infant-school has recently been opened, and there is a large almshouse for 20 old men and women. The town is not flourishing in appearance, and, in point of prosperity, is said to be almost stationary. Independently of the conversion of pig-iron into bars, and of tin plates, the chief trade of Monmouth consists in the export of bark and timber to Bristol and Ireland, and the general supply of the neighbouring agricultural districts. Coal, for the use of the town, is obtained from the forest of Dean, by means of a railroad; but it is alleged to have been an unprofitable speculation to the projectors. (*Mun. Corp. Rep.*) Monmouth is also a considerable thoroughfare; and from its situation on the romantic banks of the Wye, is likely to maintain its respectability, its neighbourhood having been selected as the residence of numerous persons of independent fortune. Woollen caps were once largely manufactured in Monmouth. They are referred to by Shakespeare (*Henry V.*, act v., scene 7.); and it was ordered by the act 13 Elizabeth, cap. 19., that they should be universally worn on Sundays and holidays.

Monmouth, which was first incorporated in 1550, has been governed since the passing of the Mun. Reform Act by a mayor and 3 other aldermen, with 12 councillors: it has likewise a commission of the peace, under a recorder. The bor., in conjunction with Usk and Newport, has sent 1 member to the H. of C. since the 27th Henry VIII., the right of election down to the Reform Act being vested in burgesses residing within 7 m. of the bor. The electoral limits were left unchanged by the

Boundary Act; and in 1839-40 Monmouth, with its contrib. bors., had 1,304 registered electors. It is also the principal polling-place and election-town for mems. of the co., as well as the chief town of a poor-law union. Markets on Saturday; wool fairs, Whit-Tuesday, June 18., and Sept. 4.

**MONOPOLI**, a sea-port city of the Neapolitan dom., prov. Bari, on the Adriatic, 27 m. S.E. by E. Bari, and 32 m. N.N.E. Taranto; lat.  $40^{\circ} 57' 19''$ , long.  $17^{\circ} 18' 58''$  E. Pop., in 1833, 15,535. It stands on an eminence surrounded by a wall, and is defended by a castle. Swinburne calls it "a dark, disagreeable town, with narrow crooked streets and very lofty flat-roofed houses;" but the account given by Craven is not quite so unfavourable. It is approached from the N. by a newly-built suburb, the small but regular houses of which have each a neat garden. The city has several churches, including a cathedral, which has a fine painting of St. Sebastian by Palma, and a chapel dedicated to the Virgin, and enriched with inlaid marbles of all colours. The town has 2 ports capable of accommodating vessels of large size; but the deepest is open to the N., and is consequently exposed to the *Bora*, or N.E. wind, which often blows in the Adriatic with much violence. Monopoli has manufactures of cotton and linen cloths, and some trade in wine and olives. It is not very ancient, being probably built by the Greeks of the lower empire, partly with the ruins of *Egnatia*, which stood about 3 m. S.E., and some traces of which still exist. (*Swinburne*; *Craven's An. Italy*, &c.)

**MONREALE**, a city of Sicily, intend. Palermo, on a steep hill, 4 m. S.W. Palermo, with which city it communicates by a fine road and causeway, supported by strong buttresses, ornamented with many seats, fountains, urns, &c., laid down at the expense of a late archbishop of Monreale. Pop., in 1831, 12,903. Monreale, though not a fine town, has several remarkable edifices. The cathedral, a large edifice founded in 1174, ranks next, after that of the cap., for though heavy, and without symmetry, it has an imposing appearance. Its architecture is a mixture of Lower Greek and Saracenic, and its interior, above the pillars and arches, is wholly incrustured with mosaic work, representing different subjects from the Bible. A destructive fire, in 1811, did great injury to the structure; but the portions destroyed have been since rebuilt exactly in the former style. An adjoining Benedictine convent has a magnificent cloister, a large library, a collection of coins, and numerous paintings, including one of the finest pictures, of the Sicilian artist, Novelli Monreale. Near the town is also another rich Benedictine establishment, founded by Pope Gregory the Great. (*Smyth's Sicily*, pp. 90-92.) Monreale is healthy, and commands fine prospects. Its vicinity is very fertile, corn, oil, and fruit being exported from it to Naples, Genoa, and other parts of Italy. (*Ortolani, Dizion. della Sicilia*; *Smyth's Sicily*, &c.)

**MONS** (Flem. *Berghen*), a town of Belgium, prov. Hainault, of which it is the cap., on the Trouille, by which it is separated into 2 parts, 32 m. S.W. Brussels, and 20 m. E.N.E. Valenciennes. Lat.  $50^{\circ} 27' N.$ ; long.  $3^{\circ} 37' 30'' E.$  Pop., in 1835, 23,081. The town is built partly on level ground, and partly on the declivity of a hill, crowned by a lofty tower, rebuilt in 1662 on the site of an ancient castle, said to have been built by Julius Caesar. Mons has been since 1818, when its works were considerably augmented and strengthened, one of the principal Belgian fortresses. Its walls are flanked with 11 bastions, and on its E. sides are two extensive pools, by the aid of which, and the river, its ditches may be easily filled, and the environs laid under water. Without the walls are several suburbs. The town is entered by five gates; several of its streets are steep and winding, but they are in general wide, clean, well paved, and bordered with good houses, many of which are of stone. It has several good squares: of these the *Place d'Armes*, or great market-place, is the principal, and has in it the government-house, and the hall of the provincial council. The ramparts are planted with trees, forming pleasant promenades; and within the precincts of the citadel is a garden open to the public. The Trouille is here crossed by three bridges, and numerous stone pumps supply the town with water. The town-hall, erected, according to Vandermacken, in 1440, is a large Gothic edifice, surmounted by a fine cupola. The church of St. Waudru, on the site of a chapel founded by that saint in the 7th century, is a fine specimen of Gothic architecture; and the church of St. Elizabeth is also handsome in some of its parts, but it has the incongruity of Gothic pillars supporting Corinthian capitals. The court-house, the new college, the military hospital designed by Vauban, the arsenal, the new barracks, the theatre, and the academy of arts, are among the most conspicuous public buildings. There are civil, orphan, founding, and other hospitals, a house of correction, a workhouse, various asylums, a government loan-bank, and other charitable institutions.

Mons is the residence of a civil governor, and of a provincial and a municipal military commandant, and the seat of tribunals of primary jurisdiction and commerce, a chamber of commerce, &c. It had formerly a flourishing manufacture of lace, now much decayed, and several sugar refineries, which have been abandoned. It still, however, produces some woollen and cotton stuffs, gloves, cutlery, hardware, soap, and vinegar; and has copper and lead foundries, flour-mills, &c.; but its chief source of wealth is in the numerous and productive coal mines by which it is surrounded, and which employ a great number of workmen and steam-engines. There are also extensive bleaching grounds in the vicinity. The canal from Mons is sent by part to Paris, by a long line of internal navigation, of which the canal from Mons to Condé forms a part. This canal, completed by the French in 1807, and finished in 1814, is perfectly straight, 15 m. in length, with 7 locks, and at Condé joins the Scheldt. The greater part of it is in the Belgian territory; but a new branch of the *Canal d'Antoine* has been recently cut from it, avoiding France altogether, and entering the Scheldt not far from Tournay. Mons has sustained many sieges. It was taken in 1691, by Louis XIV., after an obstinate defence; and was occupied by Eugene and Marlborough in 1709. The superintendent Joseph II. demolished its former fortifications in 1784. During the French ascendancy it was the cap. of the dep. of Jemmapes. (*Vandermacken, Dict. Geog. de l'Hainault*, &c.)

**MONTAIGNANA**, a town of Austrian Italy, deleg. Padua, cap. distr., on the Frassinia, 22 m. S.E. Padua. Pop. 6,337. It is walled; and has a castle, several churches, an hospital, and a high female school. It has manufactures of woollen and linen stuffs, hats, and leather, and a brisk trade in agricultural produce. It has several annual fairs, one of which lasts from Nov. 25 to Dec. 24. The hemp grown in the vicinity of this town is esteemed the best in the Lombardo-Venetian kingdom. (*Borghesi*, &c.)

**MONTARGIS**, a town of France, dép. Loiret, cap. arrond., at the confluence of the canals of Orleans, Briare and Loing, 39 m. E. by N. Orleans. Pop., in 1836, 7,757. Though ill laid out, it is pretty well built; it is in part surrounded by old walls, and has the ruins of a large castle, in which the French kings often held their court. The par. church is remarkable for the elevation and boldness of its pillars and nave. Montargis has 2 hospitals, a small theatre, and manufactures of coarse woollen cloths. (*Hugo, art. Loiret*.)

**MONTAUBAN**, a town of France, dép. Tarn-et-Garonne, of which it is the cap., on an eminence on the banks of the Tarn, crossed here by a brick bridge of 7 arches, 122 m. E.S.E. Bordeaux; lat.  $44^{\circ} 1' N.$ , long.  $1^{\circ} 20' 45'' E.$  Pop., in 1836, *ex com.*, 17,531, 1-3d of whom are Protestants. The town, properly so called, is small, and irregularly laid out, with narrow ill-paved streets, lined by old houses having projecting gables; but the suburbs, which are of considerable extent, present a totally different appearance, having straight, wide, and regular streets, with new, large, and elegant mansions. It has three public squares; that of the Prefecture, the *Place d'Armes*, and the *Place Royale*, the last of which is spacious, and has many handsome houses. The chief public buildings are the cathedral, a cruciform structure with 2 towers; the town-hall, a large and fine square edifice; the church of St. James, with a lofty brick tower and steeple; the prefecture, bishop's palace, the public library, with 11,000 vols., a small theatre, and several hotels. Near the prefecture commences a noble avenue, shaded with 6 rows of acacias, leading to the terraces of some adjacent promenades, which command extensive prospects of the surrounding country. The beautiful situation of Montauban, the purity of its atmosphere, the good quality, as well as abundance of its water, and the cheapness of all the necessities of life, render it a pleasant and favourite retreat for persons of small fortune. It is the seat of a tribunal of primary jurisdiction, and has a chamber of manufactures, a society of agriculture and science, and a communal college. It has manufactures of serges, flannels, coarse cotton fabrics, and silk stockings, earthenware, soap, brandy, starch, leather, and beer. It likewise carries on a considerable retail trade, and is a large entrepôt for corn.

Montauban was built in the beginning of the 14th century, and owes its foundation to the protection afforded by the Count of Toulouse to the oppressed vassals of certain barons, who claimed, among other privileges, that of *prélibation*. It afterwards acquired celebrity on account of its early adherence to the cause of the Huguenots, and its great sufferings in their behalf. In 1621, it successfully resisted an army under Louis XIII.; but a few years subsequently, after the siege of Rochelle, it was compelled to open its gates to that monarch. A few years after it was exposed to the *dragonnades*, that disgraced the reign of Louis XIV. This was the last disastrous event connected with the town, which has since

gradually risen to its present importance. (*Ilugo*, art. *Tarn-et-Garonne*; *Guide du Voy. en France*, p. 62.)

**MONT-BLANC**, in Savoy, at once the highest mountain of the Alps and of Europe. (Vol. I. p. 66.)

**MONTBRISON** (an. *Mons Briso*), an ancient town of France, dep. Loire, of which it is the cap., 237 m. S.E. Paris; lat. 45° 36' 41" N., long. 4° 42' 22" E. Pop., in 1836, *cr. com.*, 6,020. It was formerly fortified; and is irregularly laid out with narrow streets, and low shabby houses. A cathedral, founded in 1205, and still in an unfinished state, a prefecture, hospital, college, with a library of 15,000 vols., theatre, corn-exchange, and infantry barracks are the principal buildings; but the cathedral only has any architectural beauty. Though the cap. of a dep., and the seat of a tribunal of primary jurisdiction and commerce, and of a society of agriculture, Montbrison is very unimportant, having no manufactures, and only a limited retail trade; indeed, it has been proposed to make the large manufacturing town of St. Etienne, 11 m. S. by E. Montbrison, cap. of the dep.

**MONT-DE-MARSAN**, a town of France, cap. dep. Landes, 64 m. S. Bordeaux. Pop., in 1836, *cr. com.*, 3,324. It is situated on the side of a declivity close to the navigable river Midouze (crossed here by a stone bridge of two arches), and is clean, well-paved, and regularly laid out, the principal buildings being the par. church, townhall, court of justice, college, public baths, barracks, a small theatre, and a library with 1,300 vols. The suburbs are planted with trees, and laid out in walks. It has manufactures of coarse woollen cloths, blankets, and sail-cloth; and some trade, with bayonne, in wine and brandy. It is the seat of a tribunal of primary jurisdiction, and of a society of agriculture and commerce.

**MONTETIASCONÉ**, a town of central Italy, Papal States, deleg. Viterbo, on a mountain, 9 m. N.N.W. Viterbo. Pop. about 5,500. It has a fine cathedral, and many other religious edifices, but is celebrated principally for its light, white, unscudal wines; but these, as they do not bear carriage, are seldom met with out of the country where they are produced.

**MONTPELLIER** (an. *Il ponceiro* and *Fibo Valentia*), a town of the Neapolitan dom., prov. Calabria Ultra II., cap. of a distr. on a mountain, 274 m. S.W. Catanzaro. Pop. from 9,000 to 10,000. Its commanding situation, with its fine old castle, gives it a fine appearance from without; but its streets are crooked and ill-paved, and the houses mostly low and of wood. There are several churches, in which are some good pictures; a royal college, &c. The suburbs are principally engaged in the tunny fishery, and in trading in silk and oil. According to Strabo (vi. 236.), Hippionium was founded by the Locri Epizephyrii. After many vicissitudes it became a Roman colony; and Cicero calls it *illustris et nobilis municipium*. It had a fine temple of Proserpine, demolished by Count Roger of Sicily, who applied the materials to the construction of the abbey at Miletto, 6 m. distant. (*Cramer's Anc. Italy*, li. 419—421; *Cramer's Tour*, p. 419—421; *Romney's*, &c.)

**MONTPELLIART** (an. *Accunum*?), a town of France, dep. Drôme, on the Jabron, near its confluence with the Rhone, 70 m. S. Lyon, lat. 44° 32' N., long. 4° 45' E. Pop., in 1836, *cr. com.*, 6,350. It is surrounded with walls, and is generally well-built, the chief street being wide and paved with basalt. It has four handsome gates, and a well-planted public walk along the walls, which adds greatly to its beauty. Near the town is a mineral spring, highly esteemed for its medicinal qualities, and the neighbourhood is remarkable for the abundance and variety of its fruits, &c. The manufacture of figured silks is the only important branch of industry; but it has a considerable retail trade, and is the chief entrepot of an extensive and highly productive district. It was unsuccessfully besieged by Coligni in 1567. (*Ilugo*, *France Pitt.*, li. 6; *Guide du Voy. en France*.)

**MONTETULCIANO**, a town of central Italy, grand duchy of Tuscany, prov. Arezzo, on a lofty hill, 27 m. S.E. Siena. Pop. from 2,000 to 3,000. It is surrounded by a wall with battlements, and has numerous ecclesiastical establishments, a college, an hospital, and manufactures of soap, oil, and wine flasks. It is celebrated for its dessert wine, which, with excusable partiality, is preferred by Redi to all other wines:—

"Montepulciano d'ogni vino è il rò." *Bacco in Toscana.*

**MONTREAU** (an. *Condote*), a town of France, dep. Seine-et-Marne, at the confluence of the Seine and Yonne, each of which is crossed here by a stone bridge, 42 m. S.E. Paris. Pop., in 1836, *ex com.*, 4,379. It has a fine open market-place, and is well built, clean, and respectable: a par. church, town-hall, hospital, and three hotels, are the only public edifices of any importance. It is the seat of a tribunal of commerce, and has an extensive manufacture of earthenware, with some tan-

yards, and a considerable trade with Paris, chiefly in corn, flour, and wood for fuel.

**MONTEVIDEO**, a fortified sea-port city of S. America, cap. of the repub. of Uruguay, on a peninsula extending into the estuary of the Plata on its N. side, 125 m. E. by S. Buenos Ayres; lat. 34° 54' 11" S., long. 56° 13' 18" W. Pop. variously estimated, but may probably be about 12,000. It is well fortified, and has a citadel. The houses, which are of stone or brick, are seldom above one story in height; they are flat-roofed; and timber is so scarce, that their floors consist, for the most part, of brick or bare earth. The streets being unpaved, are either clouded with dust, or loaded with mud, as the weather happens to be dry or wet. The city is ill-supplied with water, which has to be brought from a well 2 m. distant, or from pits dug near the sea side; or is else merely rain-water, collected in cisterns. There are but few public buildings, and those of no great importance; the cathedral is said to be a handsome edifice, but it is badly situated.

The port of Montevideo is the best on the Plata. It is a large circular basin, open to the S.W.; generally the water is shallow, not exceeding from 14 to 19 ft.; but the bottom being soft mud, vessels are seldom damaged by grounding. It should, however, be observed, that the depth of water in the harbour, as well as throughout the whole of the Rio de la Plata, depends very much on the direction and strength of the winds. The harbour is exposed to the pamperos, or S.W. winds, which sometimes blow with so much force and continuance as to cause the rise of a fathom or more in the depth of water; but they rarely do any damage to vessels properly moored with anchors to the S.W. and S.E., and one to the N. On the opposite side of the bay is a mountain called Montevideo, whence the city has derived its name; on its summit is a light-house, having the lantern 475 ft. above the sea.

Montevideo has considerable commerce; the imports principally consist of British cottons, woolsens, and hardware, flour, wine and spirits, linens, sugar, tobacco, hoots and shoes, salt, &c. The great articles of export consist of animal products, which, in 1836, were estimated as follows:—Hides, dry, No. 372,019, do. salted, 141,882; horns, No. 593,425; jerked beef, 306,254 cwts.; horse-hair, 18,692 arrobas of 25 lbs.; horse-hides, No. 37,401; wool, 33,500 arrobas; tallow, 43,182 arrobas, &c. In the same year the total value of the exports was estimated at 3,413,557 Sp. dollars; and that of the imports at 3,597,437 dollars. The trade is principally with Brazil, Great Britain, America, France, Sardinia, Spain, and Portugal.

This town was founded by a colony from Buenos Ayres, and its possession was long a matter of dispute between the Spaniards and Portuguese. It was taken by the Brazilians in 1821; and became, in 1828, the cap. of the new republic of Uruguay. (*Matre, Henderson, &c.*, in *Mod. Trav.*, xvix.; *Parish's Buenos Ayres, Appendix*; *Supp. to Conn. Dict.*, &c.)

**MONTGOMERY**, an inland co. of N. Wales, having N. Merioneth and Denbigh, E. Salop, and S. and W. Radnor and Cardigan. It is oval-shaped, and contains 526,950 acres. The Berwyn Mountains divide this co. from Merioneth; and, with the exception of some considerable valleys, of which that of the Severn is the most extensive, and that of Llangollen, partly in this co., the surface is, for the most part, rugged and mountainous. The soil is very various; but in the vales it is generally clayey, and in parts very fertile; on the whole, however, the land under tillage is not supposed to exceed from 70,000 to 80,000 acres. The Severn has its source at the extreme W. confines of this co., on the skirts of "huge Plynimmon," and runs in a N. E. direction, parallel to, and not very distant from, its S. boundary, till it unites with its important affluent the Yrnywy, which also belongs to this co., on the borders of Salop. The agriculture of this co., especially in the vales and along the border of Salop, has been a good deal improved; but withal it is extremely similar to, and quite as backward as, that of Denbigh and Merioneth (which see). The climate, though moist, is mild and salubrious. The vales of this co. have been long celebrated for a superior breed of horses. Montgomery has, also, long been, and still continues to be, the best wooded co. in Wales. It was formerly regarded as one of the principal sources of the supply of oak timber for the navy; but many of its finest oak woods have been cut down; and though a good deal of new wood has been planted, it is doubtful whether it be sufficient to supply the place of that which formerly existed. Average rent of land, in 1810, 6s. 5½d. an acre. There are a number of fine and commodious farm-houses and offices; but, in general, they are very defective, and the cottages are quite as bad as in Merioneth. Slate is generally diffused over the co., and forms, indeed, the basis of the mountains. Slates are quarried at Llangynog and other places; coal is raised on the borders of Salop; and there are some lead-mines, but none that are very productive. Montgomery is the principal seat of the Welsh hannel manufacture,

which is extensively carried on at Newton, Llanidloes, Machynlleth, and Welshpool (which see). The co. is divided into 9 hundreds, and 47 pars. It sends 2 mems. to the H. of C., viz. 1 for the co. and 1 for the town of Montgomery and its contributory bors. Registered electors for the co., in 1839-40, 2,842. In 1831, Montgomery had 12,169 inhab. houses, 13,407 families, and 56,482 inhab., of whom 33,948 were males, and 33,434 females. Sum expended for the relief of the poor, in 1838-39, 28,241.

MONTGOMERY, a parl. bor., market-town, and par. of N. Wales, cap. co. of its own name, 20 m. S.W. Shrewsbury, and 146 m. W.N.W. London. Pop., in 1831, 1,188. Though small, it is a clean well-built town, in a hollow at the foot of a high hill. The guildhall stands on an eminence near the ruins of an ancient castle, close to which is the co. gaol, a modern stone building, well adapted for its purpose. The church, a cruciform structure, in the early English style, has a handsome tower, erected in 1816, and an exquisitely carved screen, and some curious monuments: the living is a rectory in the gift of the crown. The Calvinists and Wesleyan Methodists have also their respective places of worship; and there are 2 Sunday schools, and a small endowed school. No trade or manufacture is carried on in the town; and it deserves notice merely from its being the cap. of a co., and a parl. bor. It was incorporated by Henry III. under a steward and 12 burgesses; who enjoyed, till the passing of the Reform Act, the privilege of sending 1 mem. to the H. of C. This act, however, made Llanfylline, Llanidloes, Machynlleth, Newtown, and Pool, contributory bors. with Montgomery in the election of the mem. Registered electors for the entire district, in 1839-40, 1,021, of whom only 116 belonged to Montgomery. The election for the co. takes place here; and sessions are held alternately with Newtown. Markets on Tuesday: fairs, March 26. First Tuesday in May, June 7, Sept. 4, and Nov. 14.

Montgomery is very ancient: its castle was built prior to the Norman conquest, and, from its size and strength, was frequently an object of contention during the wars between the English and Welsh. In 1354, it was in the possession of Roger Mortimer, from whom it passed to the crown. In the 15th century, the stewardship of the town and castle was granted to the Herberts of Cherbury. The famous Lord Herbert, celebrated alike for his chivalry, wit, and learning, was born here in 1581. It is the birth place, also, of the late Dr. Abraham Rees, the learned editor of the voluminous and valuable Cyclopædia which bears his name. (*Nicholson's Camb. Guide; Part. Papers.*)

MONTILLA (an. *Montulia*), a town of Spain, in Andalusia, prov. Cordova, 19 m. S. by E. Cordova. Pop., acc. to Mifano, 12,800. It is well built, and has two par. churches, an orphan asylum, three hospitals, a royal school of Latin and rhetoric, and a bonding warehouse for wine. Its trade is considerable, chiefly with Cordova, both in manufactured goods and farm produce, particularly wine, horses, mules, and horned cattle, which, though small and ungainly in appearance, are very hardy and serviceable. An annual fair is held in Sept., and well attended.

MONTLUCON, a town of France, dép. Allier, cap. arrond. on the Cher, close to the canal Du Berry, in a valley bordered by vine-clad hills, 38 m. W. S.W. Moulins, and 171 m. S. by E. Paris; lat. 46° 20' N., long. 2° 40' E. Pop., in 1836, ex com., 4,280. It was formerly fortified, and is well built and situated. A par. church and hospital are the only public buildings. It produces some coarse woollen and linen fabrics; and has a considerable trade in corn, wine, cheese, and cattle.

MONTMARTRE, a town of France, dép. Seine, only a few furlongs N. of Paris, on a conical hill of the same name, commanding an extensive view of the French metropolis and its suburbs. Pop., in 1836, 6,234. It is the favourite resort of the Parisians on Sundays and holidays, and comprises several inns and other houses of entertainment, with some neat-looking villas and private residences. An asylum for 60 old men, a private lunatic establishment, and two schools, have been founded here, and it has oil-cloth manufactories, scagliola-works, and woollen mills, with mines of gypsum, which supply the whole of Paris with plaster. In 1814, the hill was fortified by the Parisians, who defended it for a day against the allies.

MONTPELLIER (Lat. *Mons Pessulanus*), a city of France, dép. Hérault, of which it is the cap., on the Léz, about 5 m. from the Mediterranean, and 77 m. W. by N. Marseilles; lat. 43° 36' 66" N., long. 3° 52' 45" E. Pop., in 1836 (ex. com.), 33,864. It is beautifully situated on the declivities of a low hill, commanding views of the Alps, the Pyrenees, the Cevennes, and the sea. It was formerly walled, and a place of considerable strength; but of its ancient fortifications, there are now only a few gates, a tower, and some portions of the wall on the N.E. side of the city. It still, however,

has, at one extremity, a citadel built by Louis XIII., while, at its other extremity, is the *Place or Promenade de Peyrou*, one of the noblest public walks in Europe. This place is entered by a Doric arch, and ornamented with long lines of ballustrades, covered ways, various sculptures, a bronze equestrian statue of Louis XIV., and numerous fountains, including a magnificent hexagonal *château d'eau* of Corinthian architecture. This, like the other public fountains of Montpellier, is supplied by an aqueduct about 84 m. in length, constructed in the middle of the last century, and which, for a distance of 880 metres, or more than 1/2 m., is raised on a double row of stone arches, and, in point of elegance, rivals the boasted *Pont du Gard*. Between the town and the ramparts of the citadel is the Esplanade, a fine open space planted with trees and ornamented with reservoirs, &c.; the boulevards surrounding the town also afford good public walks; and in the outskirts are many newly-built and handsome terraces. The city itself is very ill laid out; its streets are narrow, steep, and winding, and its squares small and irregular; but its houses are generally good, and, according to Hugo and others, it is kept remarkably clean. The public buildings are quite unworthy so considerable a city. Of eight churches, none demand any particular notice: the cathedral is distinguished from the rest only by being larger and uglier; a singular-looking porch, and a tower at three of the angles of the nave, are the principal external ornaments of this edifice. Adjacent to it is the School of Medicine, occupying what was formerly the bishop's palace, a large building with several fine apartments. This school, founded by the Arabs driven from Spain in 1180, enjoys a high and well-deserved celebrity, as one of the best conducted establishments of its kind in France; and is all that now remains of the once famous university of Montpellier. It has a new and fine amphitheatre; an examination-hall, in which is an antique bronze bust of Hippocrates; a council-hall, with portraits of professors from the period of the 13th century, including also a portrait of Rabelais; a library, with 35,000 vols., including many editions of the 16th century, and 600 valuable MSS. in different European and Asiatic languages; a pretty extensive anatomical museum, several spacious laboratories, &c. The general hospital has accommodation for upwards of 600 patients; and there are large and well-conducted lunatic and lying-in hospitals. The botanic garden of Montpellier, which dates from the reign of Henri IV., was the first established in France, and, though small, comprises 8,000 species of plants: it is one of the four principal and best arranged botanic gardens in the kingdom, which distinction it owes to its having been the scene of the labours of the late celebrated M. de Caudolle. But its greatest interest to Englishmen is derived from its possessing, in one of its most sequestered parts, the tomb of Narcissa, the daughter-in-law of Young, whose funeral the poet has vividly described in "Night the Third."\* One of the principal attractions in Montpellier, is the museum, founded, in 1825, by the Baron Fabre, a native of the town. It occupies four spacious and well-lighted halls, and comprises collections of paintings, engravings, statues, medals, and other objects of *art*, a library of 15,000 volumes, &c., the whole estimated to be worth 2,600,000 fr. The theatre, built in 1796, is well planned, and capable of accommodating 2,000 persons; it is, however, little frequented, and the pit, which is without seats, usually serves as an exchange. The palace of justice, the town-hall, exchange, prefecture, admiralty, barracks, several prisons, including a central prison, with workshops, the Calvinist chapel, synagogue, &c. are the remaining principal buildings, but none deserves especial notice. There are several very good hotels; one of which is said by Inglis to be the best in the S. of France.

Montpellier is a bishop's see, the cap. of the ninth military division of the kingdom, and the seat of a royal court for the déps. Aude, Aveyron, Hérault, and Rhône; and a court of original jurisdiction, a tribunal, and a chamber of commerce, boards of taxation, customs, artillery, and engineering, an university, academy, and a royal college. It has schools of veterinary medicine, engineering, drawing, architecture, geometry, and music; societies of agriculture, arts and sciences, medicine, and archaeology, a government loan-bank; Protestant Bible societies, a prison society; and numerous other charitable associations; several asylums, &c. It has manufactures of woollen cloths, cotton handkerchiefs, muslins, table and other linens, hats, silk, cotton, and woollen hosiery; with cotton-thread factories, distilleries, sugar refineries, breweries, chemical works, &c. It is connected with its port Cette, 17 m. S.W., by a railway, and has a brisk trade with it, and with other towns and villages, exporting large quantities of fresh and dried fruits, wool, and other kinds of rural pro-

\* It is stated in Johnson's (Croft's) Life of Young that Narcissa, or Mrs. Temple, died at Lyons, in her way to Nice; but she, in fact, died at Montpellier.

duce, in addition to its manufactured products. It was formerly a place of great resort for English invalids, on account of the alleged salubrity of its climate.

"About twenty-five years ago," says Inglis, "200 English families were sometimes resident here; but since fashion, caprice, or experiment, have sent consumptive patients to die in Madeira or Naples, instead of Montpellier, that number has been reduced to 40 or 50 families, who indeed, resort thither less for the sake of health than economy. It is undeniable, however, that the air of Montpellier (however little that bustling city may resemble the retired spot pictured by the imagination) is dry and salubrious, possessing the mildness of a southern climate, and yet having its heat tempered by the sea-breeze. It is also a cheap residence, the more so from the diminished influx of strangers. Two well furnished rooms may be obtained for about 10s. a week; and living is not expensive. Beef and mutton fetch from 5d. to 6d. per lb., fish, of about 20 different sorts, may be had at prices varying from 6 to 20 sous; fruit and vegetables are both cheap and good; wine ranges between 1 and 2 francs the bottle."

Montpellier has given birth to many distinguished persons, among whom may be specified Chaptal the chemist, Cambaceres, Daru the historian, &c. It appears to have been founded in the 8th century, and was for a while dependent on the kings of Majorca. It was acquired by Philip of Valois in 1349, but was not finally annexed to France till the reign of Charles VI. The Calvinists got possession of it under Henry III., and held it till 1622, when it was taken after a long siege by Louis XIII. (*Inglis's Swiss, and France*, p. 207; *Frossard, Tableau Pitt. de Nismes et des Environs*, ii. 54—63; *Tugo*, art. *Hérault*; *Guide du Voyageur en France*.)

MONTREAL, a town and river port of British America, and the second city and chief seat of the commerce of Lower Canada; on the S. side of the island of Montreal, in the St. Lawrence river, 14.2 m. in a direct line S. W. Quebec; lat. 45° 30' N. long. 73° 25' W. Pop., with its suburbs, in 1840, 27,297. Its site is not so commanding as that of Quebec, but it is in every other respect superior to that city. It is not so crowded; and some even of its older streets are of tolerable breadth. Montreal is divided into the Upper and the Lower Town; the difference in their elevation is but slight, but the former being the more modern is the handsomer division. It has several suburbs, including which it stretches along the river for 2 m. from N. to S., and has, for some distance, a nearly equal breadth inland. The battlemented wall, with which it was formerly surrounded, has long fallen into decay, and it is now entirely open, the wooded heights around being covered with villas and pleasure grounds. In the Lower Town, Paul Street, the chief commercial thoroughfare, extends parallel with the river the whole length of the city; and in the Upper Town several streets proceed in the same direction, communicating with Paul Street by cross streets. In the Upper Town and suburbs, which are mostly inhabited by the principal merchants, many of the houses are handsomely and solidly built in the modern style; but in the Lower Town they are principally of a gloomy looking grey stone, with dark iron window-shutters and tinued roofs. Along the bank of the river is an extensive line of quays and warehouses. Many of the houses in the suburbs are built of wood, but there are no wooden buildings within the space once encompassed by the walls; and this city and Quebec have more of the aspect of old European towns than any other towns in America.

The most remarkable public edifice is the Rom. Cath. cathedral, opened in 1829, and superior to any other church in British America. It is of Gothic architecture, 254 ft. in length by 134 ft. in breadth. It is faced with stone, and roofed with tin, and has 6 towers, of which the three belonging to the main front are 220 ft. in height. On the roof is a promenade, 76 ft. in length by 20 in breadth, elevated 120 ft. The principal window is 64 ft. in height, and 32 in breadth. The interior is capable of accommodating from 10,000 to 12,000 persons, who may disperse by numerous outlets in 5 or 6 minutes. It comprises 7 chapels, and 9 spacious aisles. There are several other Rom. Cath. churches, mostly belonging to the order of St. Sulpice; to the members of which Montreal chiefly owed its foundation, and who still hold the seignory of the island upon which it stands.

The seminary of St. Sulpice, a large and commodious building adjoining the cathedral, occupies three sides of an oblong area, 182 ft. in length by 29 deep, and is surrounded by spacious gardens. A handsome additional building, 210 ft. by 45 ft., has been lately erected, at an expense of 10,000*l*. In these establishments, students in most of the higher branches of learning are taught at very moderate charges. The principal English church is a handsome building, in the Grecian style, surmounted by a high and beautiful spire. It has also a Scotch kirk, an American

Protestant church, and chapels belonging to the Methodists and Scotch dissenters. The Montreal General Hospital, erected in 1821-2 by voluntary subscription, a large and well-built edifice, is said to be one of the best regulated institutions of the kind in America. A large conventual structure, the *Hôtel-Dieu*, occupied by a superior-matron and thirty-six nuns, is appropriated to the reception of the sick and indigent; and the convent of the Grey Sisters partly serves as an asylum for the aged and infirm, the insane, foundlings, &c.

The *Sœurs Noires* have an extensive convent, founded in 1650; its inmates consist of a superior and 60 nuns, whose duties are directed to the education of young girls. The court-house and prison are substantial buildings, occupying the site of the former college of the Jesuits. The government-house, bank, barracks, ordnance-office, and 4 market-houses, are among the remaining principal buildings. In one of the squares is a colossal statue of Nelson, placed on a Doric column, the pedestal of which has bas-reliefs representing his principal actions. Besides the educational establishments noticed above, Montreal has a college, with a principal and 4 professors, a royal grammar-school, parochial, union, national, Sunday, and other public schools; and many good private French and English seminaries. The university of McGill college, endowed by a citizen of Montreal, in 1814, with a valuable estate, and 10,000*l*. in money, and chartered in 1821, is, we believe, not yet opened; but is to be conducted on a liberal and enlarged scale. Montreal has a mercantile, a house of industry, a savings' bank, a natural history society, a mechanics' institution, a central auxiliary society for promoting education and industry, Bible and tract, agricultural and horticultural societies; several public libraries, an excellent news-room, &c. Several newspapers and other periodical publications issue from the presses of the town. According to Mr. McGregor, there is a greater spirit of improvement in this city than in Quebec. There is much activity observable among all classes connected with trade. The position of Montreal at the head of the ship navigation of the St. Lawrence, and near the confluence of that river with the Ottawa, as well as its situation with respect to the U. States, necessarily make it one of the greatest emporiums of America. (*Brit. America*, ii. 309.)

The harbour, though not large, is secure, and vessels drawing 15 ft. water may lie close to the shore. Its general depth of water is from 3 to 4 fathoms. Its chief disadvantage consists in the rapid of St. Mary's, about 1 m. below, which vessels often find it difficult to stem. To obviate the obstructions in the navigation above Montreal, the Lachine canal, 9 m. long, 20 ft. wide, and 5 ft. in depth, was undertaken in 1821, and completed at an expense of 130,000*l*. The communication with the opposite sides of the river is carried on by several steam and other vessels; and, during the summer, a regular steam-boat communication is kept up with Quebec. At this season, vast rafts of timber come down, and pass the city for Quebec; and scows, bateaux of about 6 tons, and Durham boats, bring to Montreal the produce of Upper Canada. Neither is the trade of Montreal suspended in winter, like that of Quebec. Thousands of sledges may then be seen coming in from all directions with agricultural produce, frozen carcasses of beef and pork, firewood, and other articles. Montreal is the centre of the commerce between Canada and the U. States, carried on by Lake Champlain and the Hudson; and not only is the depot of all the adjacent country, but most of the business done in Quebec, is carried on by branches from the Montreal houses. In 1838, 98 ships, of the aggregate burden of 22,289 tons, entered, and 99 ships, burden 21,901 tons, left the port. Formerly this city was the head quarters of the fur trade, but its interest in it has greatly declined. It has, however, cast-iron foundries; distilleries; breweries; soap, candle, and tobacco manufactories; several ship-building establishments; and machinery for steam-engines. Various articles of hardware, linseed oil, floor-cloth, &c. are made in the town. The markets are abundantly supplied with good butchers' meat, fish, poultry, fruit, vegetables, &c. Mr. M'Gregor says that better accommodations are to be found here than in Quebec; and the society is as good. About 3-4ths of the pop. are of French descent; the remainder, consisting principally of emigrants from the U. Kingdom, Americans, and Iroquois Indians. Montreal, originally called Villemarie, was taken from the French, in 1760. (*M'Gregor's British America*, p. 300—317; *Encyc. of Geog.*, Amer. ed.; *Parl. Reports*.)

MONTROSE, a royal and parl. bur. and sea-port town of Scotland, co. Forfar, at the mouth of the S. Esk, on the N. side of the river, on a projecting tongue of land, between the German Ocean, on the E., and the basin of Montrose, on the W., 60 m. N. N. E. Edinburgh; lat. 56° 42' 10" N., long. 2° 27' 15" W. Pop., in 1801, 7,974; in 1831, 12,055; but including the suburbs of Inch (a small island formed by the river) and Ferryden, 12,853, exclusive of sailors, who amount to between 600

and 700. At present (1841), however, the pop. is supposed to exceed 16,000.

The town consists of one wide and regular street, extending from N. to S. upwards of  $\frac{1}{2}$  m., with numerous closes and subsidiary streets. Many of the houses present their gables to the street, as in the Netherlands. It is a handsome town, well paved, lighted with gas, and supplied with water, conveyed in pipes, from a distance of  $\frac{1}{2}$  m. The public buildings are the town-hall, gaol, lunatic asylum, academy, trades' school, infirmary, house of refuge, parish church, with a handsome steeple 200 ft. high, St. John's, a newly erected *quoad sacra* church, 2 episcopal chapels, and 6 dissenting chapels, of which 2 belong to the Associate Synod, and the others to the Methodists, Baptists, Glasites, and Independents. The parish church is collegiate; and one of the two ministers is paid by a tax of 2½ per cent. on the rental of the bor. The narrow downs, provincially *links*, between the town and the sea, are much resorted to by the inhab. for golf-playing; a game which is in great favour here and in many other places in Scotland.

The most important public structure connected with Montrose is the suspension-bridge, completed in 1829, over the principal branch of the South Esk, and uniting the town with the Inch. The distance between the towers at the extremities of the bridge is 432 ft.; the height of each tower is 71 ft.; the width of the bridge is 26 ft. within the suspending-rods. The whole cost has been above 25,000l.; the postage levied amounts to about 1,500l. a year. The extent of the Inch is less than  $\frac{1}{2}$  m., and the branch of the river on the opposite side is crossed by a drawbridge; so that the communication across the two channels of the South Esk is as perfect as possible.

Montrose has been long celebrated for its schools. It was the first place, in Scotland, in which Greek was taught (*McCrue's Life of Knox*, vol. i. App. n. C.); and it has preserved the character which it so early (1534) attained. It has at present about 20 schools, and above 1,600 pupils, being about a *tenth* part of the entire pop. Of the schools, two are entirely free; one, founded in 1816, by a Mr. White, educates 100 poor children; and another, founded in 1829, by Miss Stratton, educates 42 boys and as many girls. Five schools are partially endowed; the others are voluntary and unendowed seminaries. The Montrose academy, established in 1815, is an excellent seminary. Andrew Melville, who was born in the neighbourhood, was educated at the grammar-school of Montrose. George Wishart, who afterwards suffered martyrdom, was also educated here, and subsequently held the office of teacher in the same school. The celebrated Marquis of Montrose, who made so distinguished a figure in the civil wars in the 17th century, was a native of the town. Archbishop Leighton was descended of a family whose seat was within 2 m. of the bor. There are various subscription libraries, one of which, founded in 1785, has above 8,000 vols.; a mechanics' institute, which has occasional lectures on different branches of science; a Natural History and Antiquarian Society, to which Lord Pamure has been a liberal benefactor; a Horticultural Society; a library of literary and philosophical societies, and three weekly newspapers.

In addition to the funds bequeathed for the support of schools, there are no fewer than 12 different bequests, amounting in the aggregate to about 11,000l., left for the support of the poor, or for particular classes among them. Poor's rates, however, were introduced in 1836; the average amount of which is about 2,800l. a year. There is, also, an hospital fund, consisting of certain lands and tithes granted to the town by James VI., in 1587, amounting to about 170l. yearly. The lunatic asylum, a splendid building, in an airy and healthy situation, was founded in 1779; but having been greatly enlarged and improved, it was incorporated by royal charter in 1811. It has, at present (1841), 77 inmates. The infirmary, a handsome new building, has attached to it a fever hospital, and a dispensary. Average number of patients in the infirmary and fever hospital about 21; do. of out-door or dispensary patients, who receive advice and medicines, about 500. A house of refuge was established and endowed in 1838, by a benevolent citizen, William Dorward, Esq., at an expense of 10,000l. It is intended to shelter and provide for old and destitute persons of both sexes, and for destitute children. The building is handsome and commodious, and the institution, which is said to be admirably conducted, has, at present, about 70 inmates: the children are educated at the different charity schools. There is, also, a society for the relief of the destitute sick.

The principal business in Montrose is flax-spinning and weaving. The town and its immediate vicinity has at present (1841) 6 flax-spinning mills; besides 1 at Logie, and 1 at Craigo, both connected with the town: it has, also, a power-loom factory, and about 500 hand-loom, three fourths of which are in factories, employed on the finer and heavier linen fabrics, including sheetings,

dowls, sail-cloth, and bagging. There is also a bleach-field at Craigo, and another at Logie.

The hands employed may be estimated as under: viz. employed in spinning, 1,650; in heckling, 250; in bleaching, 200; in weaving and manufacturing, 1,400; total, 3,500. Of the above, 300 spinners and 200 bleachers are employed at the Craigo and Logie works, and the remaining 3,000 in Montrose.

In 1840, about 53,000 pieces of cloth were woven in Montrose, and 26,000 in the vicinity, making together 79,000; the quantity produced in 1835 did not exceed 47,000 pieces.

Montrose has also a small soap factory, one of starch, two rope and sail works, and a machine factory. Ship-building is carried on to a considerable extent, and at present 5 ships are on the stocks. There is a patent slip for repairing ships. There are 5 breweries, 2 tanneries, 2 candle-works, and a foundry; and a meal and flour-mill, driven by steam.

The harbour is one of the best on the E. coast of Scotland. The channel of the river is narrow; but, as it has 15 or 18 ft. water over the bar at low ebb, middle-sized merchantmen may run in at any time of the tide; and, at high water, it is accessible to the largest ships. A dock is now in the course of being excavated below the present harbour, which will, it is supposed, cost about 50,000l.; but it may be doubted whether the benefit it will confer on the shipping of the port will be sufficient to countervail the injury arising from the increase of the harbour dues it has occasioned. The basin, immediately W. from the town, has a fine appearance on the map, but is of little use. It is nearly circular, being about 3 m. in diameter; it is shallow, and, excepting the channel of the river, dries at low water. Vessels of 50 or 60 tons, however, reach Old Montrose, at the other end of the basin. The entrance to the harbour has, on its N. side, two light-houses, with fixed lights.

Montrose is a custom-house station; the amount of shipping within the district being 187 ships, of the aggregate burden of 18,200 tons, of which 115 ships, measuring 14,500 tons, belong to the town. Customs revenue, in 1840, 33,441l. The trade of the port has more than doubled within the last 15 years; the shore dues, which were under 1,000l. in 1825, having produced 2,076l. in 1838; they are now still greater, but the rates have been augmented. The chief imports from foreign countries are flax, hemp, and timber. In 1840, there were imported at Montrose 4,480 tons flax and hemp, 33,604 tons coals, 7,400 loads timber, and 11,674 barrels raw hides; 5-6ths of the latter being for exportation to London after being cured. During the same year, there were exported, exclusive of manufactures, sent almost wholly to London, 25,252 qrs. of wheat, barley, &c., 1,400 boxes salmon, 4,647 barrels smoked haddocks, 2,275 barrels pork, and 9,660 bolls potatoes (5 cwt. each). Previously to 1839, 3 or 4 ships sailed annually to the Greenland whale fishery, but this branch of trade has been abandoned. The majority of the ships belonging to the port are now engaged in the Baltic trade, in which it is believed that about 35 vessels, of the average burden of about 175 tons, are at present employed; whereas, in 1820, only about 10 vessels, of 50 tons each, belonging to this port, were engaged in the trade! The steamers that ply between Leith and the N. of Scotland regularly call at Usan, 2 m. S. of Montrose; and a steamer, belonging to the town, plies twice a week to Leith. There are four banks in the town, a savings' bank, and an insurance society.

Montrose was created a royal bor. by David I. in the 12th century. It was here that John Balliol, in 1296, surrendered the Scottish crown to Edward I. Montrose was the first port made by the French fleet, in 1715, with the Pretender on board; and the same personage sailed from it in February, 1716, for France.

The corp. consists of a provost, 3 ballies, and 15 councillors. Municipal revenue, about 3,000l. a year. Montrose unites with Arbroath, Brechin, Forfar, and Perth, in sending a mem. to the H. of C. Registered electors, in 1840-41, 373. (*Boundary Returns; Factory Reports*, 1839; *New Statistical Account of Scotland, & Forfarshire*, pp. 271-290.; and *valuable Private Information*.)

MONTERRAT, one of the British W. Indian Islands, a dependency on Antigua, from which it is distant S.W. 27 m.; in lat. 16° 45' N., long. 61° 0' W. It is about 12 m. in length, and 5 m. in its greatest breadth. Area, estimated at about 30,000 acres. Pop., in 1834, about 7,600, of whom nearly 6-7ths were blacks. Montserrat consists of a range of steep abrupt mountains, or rather, perhaps, of one lofty mountain, 2,600 ft. the summit of which has been broken into a variety of deep crevices and chasms. The upper parts are altogether barren; but the base of the mountain slopes off to the sea by a succession of gentle ridges, admitting of cultivation; and the lower parts are well watered, and very productive. With the exception of the town of Plymouth, unfavourably situated near the S.W. beach, with an amphitheatre of hills in its rear,

intercepting the sea breeze, the island enjoys a comparatively high character for salubrity. (*Tulloch's Report on the Sickness, &c. in the W. Indies*, p. 35.) In 1839, 13,443 cwts. sugar, 29,460 gall. rum, and 18,626 gall. molasses, were imported from Montserrat into the U. Kingdom. The total value of the exports and imports amount to about 5,500*l.* each. Amount awarded to the colonial proprietors for the manumission of the slaves, 103,558*l.* 1*rs.*; the average value of a slave from 1822 to 1830, having been about 37*l.* This island was discovered in 1493, by Columbus, who gave it its present name. It was colonized by the English in 1632. The French took it in 1668, but restored it at the peace of Utrecht. (*Part. Papers*, &c.)

MONZA (an. *Modetia*), a town of Austrian Italy, deleg. Milan, on the Lambro, here crossed by 3 stone bridges, 9 m. N.N.E. Milan. Pop. in 1837, 8,378. It is regularly laid out, paved with round stones, and tolerably well built. It is interesting from having been the seat of government during the time of the Lombard kingdom; and the iron crown of Lombardy is kept, with other relics, in its cathedral, an edifice supposed to date from the 7th century. The former residence of the Lombard kings is said to have been the building now occupied by the court of justice. Monza has a royal palace, with fine grounds, prettily embellished by Prince Eugene Beauharnois, and which is the usual summer residence of the Austrian viceroy; a gymnasium; 2 hospitals; a theatre; and manufactures of silk and cotton stuffs, shawls, hats, and leather. (*Dict. Géog.; Conder's Italy*, i. 347-8.)

MOOLTAN, or MOULTAN, a city of the Punjab, probably the *Malli* of Alexander's historians, cap. prov. of same name, on the Chinab or Acesines, 190 m. S.W. Lahore. Lat. 30° 9' N.; long. 71° 7' E. Pop. about 60,000, one-third of whom may be Hindus; the rest are Mohammedans, the Sikhs being confined to the garrison, which does not exceed 500 men. (*Burnes's Bokhara*, &c. i. 95.) The city is upwards of 3 m. in circ., surrounded by a dilapidated wall, and overlooked on the N. by a fortress of some strength. A considerable portion of the town evidently stands on the *débris* of more ancient buildings. The houses are of burnt brick, with flat roofs; they sometimes rise to the height of 6 stories, so that the narrow streets are dark and gloomy. The fortress of Mooltan is an irregular hexagon, with a wall of burnt brick, 40 ft. high on the outside, and flanked with about 30 towers. In its interior are numerous houses, now uninhabited and falling into ruin, several mosques, and a Hindoo temple of high antiquity. Mooltan has several elegant and highly venerated tombs. Its inhabs. are principally engaged in weaving and dyeing cotton cloths, and silks of a somewhat coarser texture than those of Bahawalpur, but which are largely exported into the adjacent countries. Many of the fabrics of Mooltan are, as of old, of a purple colour, and interwoven with gold. This city was formerly frequented by a great number of pilgrims, and afforded immense plunder to the Mohammedans in 712. It was captured by Mahmood, of Ghiznee, in 1010; by Mahmud Ghori, in 1176; by Timour, in 1398; and by Runjeet Singh, in 1818, since which it has belonged to the doab, of Lahore. (*Burnes's Bokhara*, i. 95-100; *Hamilton's E. I. Voy.*)

MOORSHEADBAD, a large city of British India, presid. and prov. Bengal, on the Bhagirathi, or most sacred branch of the Ganges, 115 m. N. Calcutta. Lat. 24° 11' N.; long. 88° 15' E. Pop. estimated by Hamilton at 165,000. In point of appearance Moorsheadbad cannot compare with either of the other great cities of Bengal, but it is not so mean as has been sometimes represented. The houses are principally of mud and straw; the city extends for 8 m. along both banks of the river, and a number of brick or chunamed houses are interspersed among the rest, with terraces, small verandahs, flat roofs, &c., "on which you may see the owners, in their Moorish dresses, smoking their hookahs, playing chess, or walking sedately in small parties." A great many small mosques are scattered throughout the city, but a large and fine looking European residence, erected by the British government for the residence of the Bengal nabob, is the only public building worth notice. On the *moatie jheel*, a pool left by a former winding of the river, are the remains of the palace, &c., built by Aliserd Khan, in the last century, partly with materials from the ruins of Gour. Within the gateway by which the grounds are entered, is a handsome mosque of fine stone, which the zealous frequenters have concealed with thick layers of whitewash. Only one fragment of the palace exists, but this is an elegant ruin, consisting of 4 arches supported by 5 columns, the whole of beautifully polished black marble.

Moorsheadbad is considered unhealthy from the neglected state of the sewers, the closeness and filthiness of the streets, and the rank jungle intermingled with the huts and houses; and pestilential diseases have often

raged here with much violence. It is also exposed to the attacks of dacoits and other plunderers, never having been fortified except by an occasional rampart during the Mahratta invasion in the last century. It is the head quarters of one of the 6 courts of circuit under the Bengal presid.; the seat of a zillah court; the residence of the district collector and other British functionaries, and of the nabob of Bengal; and has a British College, founded in 1826, and endowed with an income of 16,500 rupees a year.

Moorsheadbad became the cap. of Bengal in 1704, and continued to be the seat of government till the conquest of Bengal by the British in 1756. It was then virtually superseded by Calcutta, to which the revenue-board, collector-general, &c. were transferred in 1751. (*Hamilton's E. I. Gazetteer; Mod. Trav.*, ix. 145-151.)

MORADABAD, a town and distr. of British India, prov. Delhi. The town, on the Rangunga, 105 m. E. by N. Delhi, is one of the most populous and flourishing seats of commerce in the upper provs. It has some good streets, but no public edifice of any importance. The district, or collectorate, is included between the 28th and 30th degs. of N. lat., and 77° 40' and 79° 10' long. Area, 5,400 sq. m. Pop. probably 1,500,000. It is well watered, and extensive tracts are very fertile, though a good deal of it be waste. Sugar, cotton, and wheat are the chief products; the latter is almost wholly exported, the food of the pop. consisting principally of jowaree, bajree, &c. At least one-sixth part of the land is held rent-free. Total land revenue, (1829-30), 465,110 rupees. (*Part. Revenue Report*, 1832; *Hamilton, E. I. Gazetteer*.)

MORAT (Germ. *Murten*), a small town of Switzerland, cant. Freiburg, on the S.E. bank of the lake of the same name, and on the high road between Bern and Lausanne, 14 m. W. by S. the former city, and 7 m. from its suburbs, 1,586. It is partially walled round, and has an ancient castle, now the residence of the *Obcrantmann*, an hospital, and an orphan asylum, a Protestant college, a public library, superior, inferior, and commercial schools, and a brisk transit and general trade. The circumstance of several Roman antiquities having been discovered here, has led to the supposition that Morat was anciently one of the suburbs of *Aventicum* (now Avenche). This otherwise insignificant town, owes its celebrity to the great battle fought under its walls on the 23d of June, 1776, in which the Swiss totally defeated the invading army of Charles the Bold, Duke of Burgundy.

"Morat! the proud, the patriot field! where man  
May gaze on ghastly trophies of the slain,  
Scar'd blush for those who combat'd on that plain.  
Here Burgundy bequeath'd his traitor's host,  
A bonny heap through ages to remain;  
Themselves their monuments!" *Childe Harold*.

The loss of the Burgundians was immense; as many as 15,000 soldiers having, it is said, been left on the field, exclusive of those drowned in the lake. The bones of the slain were afterwards collected, in memory of the battle, in a square building, called an ossuary. This singular monument, after standing for more than 300 years, was destroyed in 1798, by the soldiers from Burgundy, in the French army, who thought it would surpass the gallantry and devotion displayed by the Swiss on this occasion, it is pretty certain that the defeat of Charles at Morat, as well as his previous defeat at Granson, was owing quite as much to his rashness and folly, as to the bravery of his enemies. The principal strength of the duke's army consisted in its cavalry; and yet, on both occasions, he engaged in defiles where they could not act. (*L'Art de vérifier les Dates*, part ii. tom. ii. p. 96.)

MORAVIA (Germ. *Mähren*), an important prov. of the Austrian empire, which, including Austrian Silesia, incorporated with it since 1783, extends between lat. 48° 40' and 50° 25' N., and the 15th and 19th degs. of E. long., having N. Russian Silesia, E. and S.E. Galicia, and Hungary, S. the latter country and Austria, and W. and N.W. Bohemia. It is of a rhomboidal shape; greatest length about 185 m.; average breadth, 55 m. Area, about 10,240 sq. m. Pop. in 1838, 2,143,052. In the N. part of the prov. is a mountainous ridge of no great elevation, stretching W.N.W. and E.S.E., between the Sudeten Band on the W. and the Jablanka mountains, a branch of the Carpathians on the E., dividing the waters that flow N. into the Oder and the Baltic, on the one hand, from those that flow S. into the Mediterranean on the other. The E. and W. frontiers of the prov. are also defended by mountain ridges. Excepting in the N., the country is mostly level, or merely undulating, with a gentle slope to the S.; nearly all its great rivers, including the Morawa, by which it is intersected from N. to S., and whence, also, it derives its name, the Iglawa, Thayer, &c., flowing in that direction. The Oder has its sources in the N. ridge. Being sheltered on the N., E., and W., by mountain ranges, and lying in general only from 500 to 1,000 ft. above the level of

the sea, Moravia enjoys a milder climate than most countries in the same lat. The mean temperature of the year at Olmutz is about 48° Fah. The wind is mostly from the S., and the atmosphere clear. A large proportion of the soil is very fertile, and if advantageous markets could be found, large quantities of corn might be raised for exportation; but, in consequence of the want of the latter, the attention of the inhabs. has been of late devoted more to manufactures than to agriculture, and Moravia is no longer a country whence supplies of corn might be drawn, at a short notice, on a very large scale.

An estate of mean size comprises from 850 to 1,400 acres of arable land, from 140 to 420 acres of meadow land, and 1,000 to 2,500 or more of wood, according to the situation. The estates conferring the right of representation in the assembly, and which are only held by knights or nobles, are of all sizes from a few acres to many sq. miles in extent. These estates can, strictly speaking, be also held by a commoner, but only on his paying a portion of the taxes twice over, and on his renouncing the right to all kinds of patronage and judicial authority. The estates of mean size may be estimated at 2-3ds of the whole; but about 30 estates exceed 32 English sq. m. in extent. In purchasing land, a profit of from 4 to 4½ per cent. per annum is generally looked for. The size of the peasant's holdings is very various: in the plains it may be about 28 English acres; but in the hilly parts, where the soil is thinner and the soil less productive, it is 30, 40, and in some parts 70 acres. Half holdings, quarter holdings, as well as cottiers with small gardens, are also frequent. It is supposed that of the peasant families, 2-3ds hold land, and about 1-3d may be considered as mere labourers. The mode of cultivation adopted by the peasants in the low lands consists in a rotation of three crops, viz. wheat, rye, summer corn, fallow; the fallow being only partial. In the hilly parts, the fallows are used for potatoes, turnips, flax, &c.; in the mountains tillage is more irregular. On most of the small estates of the nobles, a better rotation of crops, with clover, green food, and meadows, prevails, according as the soil, or the local advantages of common grazing (which is very extensive) render it necessary. The following rotations, among others, are pursued:—1. Potatoes, with manure; 2. Barley, or oats, with clover; 3. Clover hay; 4. Clover as pasture; 5. Rye; 6. Oats. In heavy soils:—1. Winter corn with dung; 2. Barley, with clover; 3. Clover; 4. Wheat; 5. Green fodder, with manure; 6. Wheat; 7. Pease and beans; 8. Rye. In the low lands millet is a good deal cultivated; in the mountains flax. On the estate of a Moravian nobleman, which is cultivated in a superior manner, but is by no means of a superior quality of soil, as compared with other estates in the same prov., the following is the average produce of corn per acre:—

	Maximum.	Minimum.	Mean.
	<i>Bushels.</i>	<i>Bushels.</i>	<i>Bushels.</i>
Wheat	42	14	21½
Rye	35	10½	21
Barley	49	16	28
Oats	46.2.3	17½	28
Potatoes	408	175	280

Distilleries, and even breweries, are commonly established on the low farms; and, within a few years, beet-root sugar manufactures have become frequent.

It is not usual to let lands on lease in this part of the Austrian empire. The few cases in which this mode of tenure occurs, must rather be considered as exceptions than as a rule. From the peasant's holdings the lord usually derives,—1st. All that was stipulated on the original cession of the land, whether in the shape of a rent charge in money or otherwise. 2dly. The *Landemum*, or fine on transfer, whether by sale or inheritance (usually 5 per cent.). 3dly. The *Robot*, or personal service, the maximum of which has been fixed by law. This consists generally in 3 days' work, with a waggon and horses, weekly, for the peasant's whole holding; the half-holding gives 1½ day's work, and the quarter-holding 2 or 3 days' labour, weekly; cottagers give from 10 to 13 days per annum. 4thly. The right of grazing on uncultivated fallows and stubble; which, however, the peasant may exercise upon the land of his lord. 5thly. The great and small tithes, which are often ceded to the church, or have been otherwise transferred. Dominical property (allodial estates) pays in general no tithe. The peasant may cede, or leave by will, his holding to whichever of his sons he pleases; but it is then usually charged with a sum for each of his brothers and sisters. The custom prevails of leaving it to the eldest son; but it is often ceded during the life of the father, who retains a certain proportion of the produce for his own use: this generally happens when the father wishes to free his son from liability to the conscription.

Flax is cultivated in considerable quantities by the descendants of German and Bohemian settlers, in the

circles of Brunn and Olmutz: It is celebrated for its fineness and length, and is second only to that of Silesia. In certain favourable situations, the soil and climate of Moravia are well adapted to the grape; and for some time after this was ascertained, the appropriations of land to this kind of culture were so considerable that government supposed it necessary to interfere, and to issue, in 1803, an order prohibiting the laying out of new vineyards. Wine is mostly grown in the S. circles of Znaym, Brünn, and Hradisch: the average yearly produce is estimated at 436,600 *cimers*; a good deal of which is exported to the adjacent provs. Large quantities of brandy and beer are also made. Fruits of many kinds are so plentiful, that Moravia is usually styled the orchard of Austria. The forests, formerly much diminished by imprudent waste, are now better attended to. The pasture grounds are extensive in the mountains, and a large proportion of the Austrian heavy cavalry horses is furnished by this prov. Cattle are not very extensively bred; considerable numbers are sent thither from Poland to the markets of Olmutz, and from Hungary to those of Ausvitz. In 1837, of 90,007 head of oxen sold in Olmutz, 74,184 were from Galicia. Large flocks of sheep are depastured in the mountainous districts; their numbers having increased with the increase of the woollen manufacture. The breeds have been materially improved by crossing with merinos, &c.; though, from want of proper care, the wool of Moravia is still inferior, and most part of the raw material required is imported from contiguous provs. Hogs and geese are bred in great numbers for exportation, and game is very abundant. There are valuable mines of iron, copper, lead, and coal; gold and silver mines were wrought previously to the troubles of the 15th and 16th centuries, when they were abandoned, and the works have not since been resumed. Albm, marble, and excellent building stone are found: among other minerals is a species of stone, which, when first dug up, is so soft that it may be moulded with the hand, but which hardens on exposure to the air: a great many pipe-bowls are made from it.

*Manufactures and Trade.*—Notwithstanding its inland position, this prov. has made a very considerable progress in manufactures, and has become, since the close of last century, one of the most thriving portions of the Austrian empire. Woollens, linens, and cottons are all made on a large scale; the first two consuming not only all the wool and flax raised in the country, but requiring a large importation from other parts. Wool is brought from Hungary; flax from Silesia and Austrian Poland. The oldest woollen manufactures are in the neighbourhood of Iglau, in the W.; but those of Brunn are now the most extensive and important. Woollens are also extensively manufactured in other towns; and, exclusive of the goods produced in manufacturing establishments, large quantities are made by the peasants and others for domestic use. Linen and thread are also largely produced; and cotton factories, some of which are on a very extensive scale, have been established, though with but indifferent success, in many parts of the prov. Dyeing, especially fine Turkey red colours, is successfully and extensively carried on at Brunn, almost all the cloth made in Moravia being sent thither for that purpose. The other manufactures, such as those of silk, leather, paper, pot-ash, glass, beet-root sugar, &c., are also of considerable importance; and their products are exported to the contiguous countries, and to Hungary, Austria, Italy, and the Levant. The imports consist chiefly of wool, oil, flax, raw cotton, silk, cattle, wine, and hardware. The only navigable river is the Morawa; and hitherto goods have been almost always conveyed in waggons. For these there are two great commercial roads, both leading from Vienna; the one passing by Prague, Znaym, and Iglau, in the west; the other by Brunn and Olmutz in the centre of the prov. But the facilities for trade are now in the course of being vastly augmented by the formation of the railway from Vienna to Bochnia, in Galicia, which passes through the valley of the Morawa in this prov. as far as Maggell, having branch railways to Brunn and Olmutz. The completion of this great undertaking will be of signal advantage to the prov.

The government of Moravia, which is entitled a marquisate, is administered by a governor with direct authority from Vienna. Like the other provs. of the empire, it has its States, or assembly of the clergy, nobility, knights, and citizens; but the power or influence of this assembly is very limited. It meets annually, not to determine the amount of the taxes, but their distribution and mode of collection. The prov. is subdivided into 8 districts or circles, each of which has one or two tribunals of original jurisdiction, and a high court of appeal sits in Brunn.

*Education* is very generally diffused in this prov., and the bulk of the people are comparatively civilised. In 1838, it had 1,886 elementary schools, which were attended by no fewer than 272,638 children, being about

1-5th part of the pop.: there is also a great number of superior schools, and the prov. is well provided with the higher class of seminaries. Among others, it has a university at Olmütz, which, in 1838, was attended by 526 students; it has also faculties of science at Brünn and Nicholasburg; an academy of the provincial states at Olmütz; schools of rural economy at Brünn and Olmütz, attended, in 1838, by 192 pupils; and 11 gymnasia, which, in the same year, had 87 teachers, and 2,766 pupils. But, how creditable soever to the government, still it must be borne in mind, that the useful sciences, or those, rather, that are directly subservient to the progress of the arts, and in some degree, also, to the business of administration, are those only that meet with any encouragement, either here or in any other part of the Austrian dominions. All speculative studies, and especially those connected with the principles of politics and political economy, are not merely discouraged but proscribed:—"Ce que veut avant tout la politique Autrichienne," says M. Saint-Marc Girardin, "c'est le calme et le repos; elle veut que le peuple soit tranquille, et pour cela elle veut qu'il soit heureux. Elle veut aussi qu'il ait de l'instruction, mais cette instruction qu'il apprend à l'homme à mieux se servir de ses forces et de celles de la nature, qui fait les bons ouvriers, les bons laboureurs, et non cette instruction qui aggrave l'intelligence, qui lui apprend à douter, à raisonner, à examiner. Voulez-vous être mécanicien, manufacturier, agriculteur, architecte? Vous trouverez à cet égard, en Autriche, tout ce qu'il vous faut: écoles, collèges, professeurs, laboratoires, collections. Voulez-vous être avocat, publiciste, homme de lettres, c'est-à-dire raisonner, discuter, douter? Allez ailleurs, allez bien loin; ce n'est point en Autriche que vous trouverez de bonnes écoles pour de pareilles fantaisies. L'utilité plutôt que le beau, la pratique plutôt que la théorie, le soin du corps plutôt que le soin de l'intelligence, voilà la maxime fondamentale de l'Autriche. De là suit la mesquinerie des études classiques, et la prosopée des études usuelles, l'absence et l'obscurité profonde de l'université de Vienne, et la juste renommée de son institut polytechnique." (*De l'Instruction Publique en Autriche, par un Diplômé Etranger*, 1841, p. 94.)

For a lengthened period after their conversion to Christianity, the Moravians were divided between the Latin and Greek churches; but the doctrines of the Reformation spread widely in this prov. in the 16th century. The intolerant proceedings of the Austrian gov. obliged, however, many Protestant families to emigrate into other countries, and many others to embrace the religion of the House of Hapsburg; so that at present the Rom. Cath. faith greatly predominates over every other. There is now, however, the most perfect toleration for all sorts of creeds. The archbishopric of Olmütz is, next to the primacy of Hungary, the richest see in the empire; and the chapter of Olmütz enjoy the valuable privilege of choosing this high functionary from among their own members. The Calvinists have their superintendant at Brünn, and the Lutherans theirs at Ingrowitz. The inhab. are mostly of the Slavonian stock, divided into many different tribes; but among the pop. there are estimated to be about 470,000 Germans, residing mostly in the towns, 30,000 Jews, and a few Bohemians, Hungarians, &c. This territory was anciently inhabited by the Quadi and Marcomanni. These, or cognate tribes are said, after the dissolution of the empire of Attila, to have founded a republic here, which maintained a precarious independence for some centuries, and was afterwards erected into a kingdom, extending, in the 9th century, over Bohemia, Brandenburg, Silesia, and part of Hungary, &c. Moravia subsequently belonged alternately to the Bohemians and Hungarians: it was finally annexed to Austria, together with Bohemia, in 1527. It was the great theatre of war between the French and Austro-Russian armies, in 1805. (*Oesterr. Nat. Encycl.; Berchman; Allg. Lander, &c. iv.*)

MORAY, or Elgin, a marit. co. of Scotland, on the S. side of the Moray Frith, being the middle district of the old prov. Moray, having N. the Moray Frith, E. the co. Banff, S. Inverness, and W. Inverness and Nairn. It consists of a N. and principal portion, and of a smaller portion on the S., detached from the main body by the intervention of a part of Inverness; and comprises in all 307,200 acres. With the exception of a considerable tract of low, light, arable land along the shore, the rest of the surface is rugged and mountainous. The climate on the coast district is comparatively mild for its latitude; and for a lengthened period wheat has been successfully raised in this district, which occasionally supplies some of the best samples to the London market. This district is also well suited for the turnip husbandry, which has been extensively introduced, and agriculture has been in other respects materially ameliorated; though, on the whole, the progress of improvement has been less rapid in this than in most districts of Scotland. Sheep-farming is not carried on upon a large scale; but the stock of cattle has been improved by crossing with the breeds of Skye and Argyle. Property mostly in large estates.

Farms of all sizes; the farm buildings were formerly wretched, but those on the principal farms have been mostly rebuilt, and are now substantial and commodious. Average rent of land, in 1810, 4s. 14d. an acre. Manufactures unimportant. Lead, iron, lime, freestone, and slate are met with; but the first two are not wrought, and of the others only the freestone to any extent. It is partly intersected and partly bounded on the E. by the Spey, and on the W. by the Findhorn, and has the Loxie in its centre. The salmon-fisheries, especially those on the Spey, are important and valuable. This co. is united with Nairn under one sheriff and in returning 1 m. to the H. of C. Registered electors for the co., in 1839-40, 630. The bors. of Elgin and Forres unite with other bors. in sending 2 mems. to the H. of C. It is divided into 20 pars., and in 1831 had 6,519 inhab. houses, 7,768 families, and 34,231 persons, of whom 15,779 were males, and 18,452 females. Valued rent of the co. 65,600*l.* Scotch. Annual value of real property, in 1815, 73,288*l.*

MORBIHAN, a marit. dep. of France, formerly a part of the prov. Brittany; between lat. 47° 15' and 48° 15' N., and long. 2° and 3° 45' W.; having N. Côtes du Nord, E. Ille-et-Vilaine, and Loire Inférieure, W. Finistère, and S. the Atlantic. Length, E. to W., about 70 m.; breadth varying from 30 to 45 m. Area, 699,641 hectares. Pop., in 1836, 433,522. The coast-line is very irregular, presenting many inlets of the sea; from one of which a capacious bay, called by the Bretons *Morbihan*, or the "Little Sea," the dep. derives its name. Several islands, including Belleisle and Groix, belong to this dep. The N. and centre parts of Morbihan are hilly; but towards the S. are some tolerably extensive plains. The principal rivers are the Vilaine, with the Oust in the E., and the Blavet, Scorff, &c. in the W. Some of them are navigable for some distance, but none of any considerable size. The canal of the Blavet from Hennebont to Pontivy, is wholly included in this dep., and a great part of the canal from Nantes to Brest is within its limits. The climate is mild, but damp, W. winds are most prevalent. The atmosphere is cloudy, and violent storms are frequent in winter. A large proportion of the soil is stony; the vegetable mould is every where scanty, but towards the coast it is tolerably fertile. In 1834, it was estimated that 260,971 hectares were arable, 69,052 do. in pasture, 34,462 do. in woods, and 16,880 do. in orchards and gardens; while no fewer than 291,530 do. were occupied by heaths, wastes, &c. Agriculture is extremely backward; but more corn, principally rye, oats, and wheat, is grown than is required for home consumption; and a good deal of rye bread is made for exportation. The cultivation of the potato is on the increase. Turnips, hemp, flax, &c. are grown; and about 700,000 hectol. of cider are produced annually. Near Guer is the model farm of Coëtbo, where 300 pupils are instructed in the details of agriculture and the auxiliary sciences, at the expense of government. The rearing of cattle is an important business, and the breeds of both oxen and sheep are in the course of being improved. Butter, both fresh and salted, is an important article of commerce. The annual produce of wool is estimated at 220,000 kilogr. The horses, though small, are strong and good. Bees are very extensively reared; and Hugo states that 450,000 kilogr. of honey, and 30,000 kilogr. of wax, are annually exported, worth together about 375,000 fr.

In 1835, of 96,602 properties, subject to the contribution *fiscière*, 45,234 were assessed at less than 5 fr., and 13,288 at from 5 to 10 fr.: 36 only were assessed at 1,000 fr. or upwards. The conger, oyster, and other fisheries are important; but especially that of pilchards, which employs in the season about 560 boats, manned by 2,500 fishermen. About 5-7ths of the fish taken are sold fresh, and the remainder being salted, make up about 15,000 barrels. The nett produce of the pilchard fishery is estimated by Hugo at 1,400,000 fr. a year. Manufactures are of considerable importance. The iron works are said to employ directly and indirectly, from 1,600 to 2,000 workmen. The woollen cloth factories at Josselin and Malestroit employ together about 900 hands; and the tanneries are supposed to furnish products worth 800,000 fr. a year. Paper, glass wares, linen stuffs, cotton yarn, lace, hats, beer, chemical products, &c. are also produced; there are building docks at L'Orient, Vannes, Quiberon, Port Louis, &c.; and salt is made on the coast and islands of the estimated value of 1,000,000 fr. a year. Morbihan is divided into 4 arrondis.; chief towns, Vannes, the cap., L'Orient, Ploermel, and Pontivy. It sends 6 mems. to the Cham. of Dep. No. of electors (1838-39), 1,452. Total public revenue (1831) 8,830,117 fr.; expenditure in the same year, 11,933,084 fr.; the greater portion of which was, however, for the maintenance of the naval and military estab. of the dep. (*Hugo, art. Morbihan; French Official Tables.*)

MOREA (or *Proponessus*), a principal div. of Greece, and the most S. portion of continental Europe, consisting of a peninsula attached to N. Greece by the

isthmus of Corinth, between lat.  $36^{\circ} 15'$  and  $38^{\circ} 20' N.$  and long.  $21^{\circ} 9'$  and  $23^{\circ} 30' E.$ ; area estimated by Thiersch at 8,800 sq. m. Pop., in 1835, about 380,000. It is said to derive its modern name from the resemblance that it bears to a mulberry leaf; and its coast, which is deeply indented with gulphs and inlets, has numerous headlands, the chief of which are Cape Skyllio, eastward; Capes Matapan, Gallo, and St. Angelo, southward, and Cape Tornese westward. Its surface is extremely diversified, but may be generally described as a lofty table-land, traversed by a main ridge connected northward with the chain of N. Greece, and running southward to Cape Matapan, its culminating point (Mount Taygetus) rising 5,115 ft. above the sea. Three branches detach themselves from the main range; one running eastward into the peninsula of Argolis, and another, Mount Malero (an. *Parnon*), running S. S. E., skirting the shore of the Ægean Sea; while a third, known in different parts by the different names of Cyllene, Erymanthus, and Olenus, takes a westerly course to Cape Tornese. Many of these mountains attain a height of 4,000 ft.: their geological constitution is of limestone lying on clay-slate, interspersed in a few places by primitive rocks; and their sides are, with a few exceptions, plentifully clothed with pines, firs, oaks, and other verdant trees. The plains are, by no means, of great extent: the largest are those of Tripolizza in Arcadia, of Nisi in Messenia, and of Gastuni in Elis. Numerous rivers and streams run from the mountain-regions in all directions; the Roupia (Alpheus) is by far the largest, having a general N. W. course of more than 70 m., and, with its tributaries, the Ladon and Erymanthus, draining nearly  $\frac{1}{3}$  of the entire peninsula. Next in size is the Gastuni (an. *Peneios*), rising on Mount Erymanthus, and flowing, as well as the last-mentioned, into the Gulph of Arkhadia: the Iri (an. *Eurotas*), which is the principal river of Laconia, falls into the Gulph of Kolokythia: the other streams are mere mountain torrents, rapid in winter, but dried up in summer. Embosomed in the mountains are several lakes; but none deserves any particular mention except Zaraka (the ancient *Stymphalos*), which has two remarkable *kutavothra*, or subterraneous caverns, to which its waters are almost confined during summer, and by which it was formerly supposed to connect itself with the little river Erasinos, falling into the Gulph of Nauplia near the Lernean Lake, now little more than a reedy marsh. (See *Horod.* vi. 76.) The atmosphere of the Morea is generally pure, and the climate mild, especially in spring and autumn. The heat of summer is very oppressive in the lower districts; and in winter the country is exposed to hurricanes, and liable to be inundated by heavy rains: fogs, also, are common at that season, and the mountains are covered with snow from December to the end of February. Epidemics, originating in malaria, are common diseases in summer, especially in the neighbourhood of Argos, Corinth, and the whole of the W. coast from Patras to the mouth of the Roupia, which are the most unhealthy parts of the peninsula. The coldest, and, at the same time, the healthiest region, is the central table-land of Arcadia: the severity of its climate is noticed by many authors, and it probably gave to its inhabs. that robust habit of body which fitted them not only for the pastoral life but for the fatigues of war, and occasioned the old proverb recorded by Athenæus, that "a man should choose his slaves from Phrygia, but his allies from Arcadia." (*Dicp.* i. 27.)

The more elevated regions are devoted to the feeding of sheep and goats, the latter being to the former as about 1 to 4. The wool is coarse; but the ewes afford good milk, butter, and cheese. These flocks suffer much from jackals and wolves, as well as from a disease called the *cutloghiá*, or plague. Colonel Leake states the number of sheep and goats in Elis alone to have been, in his time, about 450,000. The unutilivated land serves, also, for the pasture of cattle, which, however, are used only for draught, goat's flesh or mutton being universally preferred for food. The best breeds are said to be found in Corinth; and bulls from this district are often sent to improve the breeds in other parts of the Morea. The valleys and plains are, generally speaking, very fertile, and, with the most imperfect tillage, yield large crops. The produce of Elis comprises wheat, two kinds of *holcus*, called *kalamhokki*, maize, and flax. Wheat, on secondary land, is sown in Oct.; but on the richest, in Nov., Dec., and even so late as Jan.: harvest, on the plains, begins early in June, and is not entirely over till the middle of Aug. The *kalamhokki* is sown in April, and gathered in Sept. Along the N. coast large quantities of the currant grape are raised, and the average yearly production of currants, in the neighbourhood of Patras, is stated by Colonel Leake to amount to 5,000,000 lbs., or about one half the amount of that raised in Zante. Argolis produces extensive crops of rice and cotton, the former being a considerable article of trade between Nauplia and Constantinople. Cotton is likewise raised in Messenia and Laconia, and olive oil,

highly esteemed all over Greece. Corn is raised in the irrigated parts of Arcadia; but the greater part of that central district is employed for pasturage. Agriculture, owing to the long-continued insecurity of property, the oppressions under which the peasantry have laboured, and to the obstinate adherence of the farmers to old and imperfect methods of husbandry, is in a most degraded state. Thiersch and Burgess, however, report a marked improvement in the condition of the rural pop. within the last few years. Land used formerly to be let on the *métayer* system; the proprietor being at all expenses, and receiving two thirds of the crop, clear of tax; but since Greece has been separated from Turkey, nearly nine tenths of the land has fallen into the hands of government, which offers it for tillage to any one who will agree to pay a quarter part of the produce for rent: the remaining tenth part of the land belongs to individuals, chiefly small proprietors, and is charged with a tax of one tenth of its produce, and the additional burden of obliging the labouring peasant to bring his tithe in kind from a great distance to the town in which it is collected. (*Burgess's Greece and Levant*, i. 131.) The annual produce of corn was, a few years back, estimated by Col. Leake at 300,000 kilos of 22 oaks (each oak = 54½ lbs.). The flora and fauna of the peninsula differ in few respects from those of N. Greece.

The manufactures of the Morea are unimportant in amount, but comprise coarse cotton and woollen goods, silk fabrics, leather, and salt. The export trade consists chiefly of wine, oil, currants, rice, fruit, and wool; its chief ports being Nauplia, Patras, Corinth, and Navarin. The Morea, which under the Turks was divided into the 2 *saujaks* of Tripolizza and Mistra, is now distributed into the 5 nomes of Argolis and Corinth, Archaia and Elis, Arcadia, Messenia, and Laconia, these being again subdivided into 35 *eparchies*. Tripolizza was the cap. under the Turks, but recently it has greatly decayed; Nauplia, the modern cap., has about 10,000 inhabitants. The other principal towns are Patras (7,500), Modon (6,000), Corinth (5,000), and Korum (4,000).

The most interesting features, however, to the classical traveller are the remains of many ancient cities, existing in the pulpy days of Grecian glory. Among the principal are three mentioned by Homer (*Il.* iv. 51.) Sparta is to be traced only in its ruins; but the beauty of its position, on five hills close to the Eurotas, still recalls the "pleasant Lacedæmon." Various remains of ancient architecture, in the form of dilapidated walls, temples, and forts, exist in different parts of the country, and are described by the general name of *Palaio-Castro*. Of the Cyclopean, or primitive mode of building with uncutted blocks of stone, the chief relics are at Mycenæ and Tiryns. At Mantinea the circuit of the walls is still visible, and the outlines of the celebrated field of battle may be traced. The scene of the Olympic games, though not ascertained with complete certainty, was near the influx of the small river Cladæus into the Alpheus. These interesting ruins are described at some length under their respective heads, to which the curious are referred for further information. The reader will find also some notice of the present inhabitants of the Morea, &c., in the general article GREECE (i. 923—929.).

The Peloponnesus, which, before it received that name, was called successively Apia and Argos, received its appellation from the Phrygian Pelops, whose descendants were afterwards expelled by the Heraclids. Its ancient history forms a part of that of Greece generally. After the destruction of the Achaean league by the Romans, anno 146 B.C., it was formed, with the rest of Greece, into the Roman prov. of Achaia; and continued, either really or nominally, a portion of that empire during 1,350 years. It was taken from the Byzantine emperors by the Franks at the beginning of the 13th century; and in the division of the conquered lands the larger part of the Peloponnesus fell to the Venetians, from whom it received its modern name, either from its supposed resemblance in shape to the leaf of the mulberry (*lt. more*), or from the abundance of that fruit in the peninsula. It was repeatedly invaded by the Turks in the 15th, 16th, and 17th centuries, and was finally confirmed to them in 1718, by the treaty of Passarowitz. With the exception of Malua, the Morea, with the rest of Greece, remained under their despotic sway till 1821, when its inhabitants joined in the general struggle for that independence, which, at length, after eight years of anarchy and bloodshed, was established by the treaty of Adrianople in 1829. (*Leake's Morea*, 3 vols. *passim*; *Hughes's Greece and Albania*, i. 167—235; *Burgess's Greece and Levant*, i. 199—265; *Diet. Geog.* &c.)

MORLAIX, an ancient town and sea-port of France, dép. Finistère, 33 m. E. N. E. Brest, and 283 m. W. by S. Paris; lat.  $47^{\circ} 35' N.$ , long.  $3^{\circ} 52' W.$  Pop., in 1836, ex. com., 7,800. It is situated at the foot of 2 hills, and at the confluence of 2 small rivers, forming a considerable estuary and commodious harbour for vessels of 400 tons burden. At the bottom of the harbour stands a

well-fortified castle; and hills covered with gardens, formed into terraces, rise immediately above the town, the principal street of which runs parallel with the quays. The principal square (built on arches over the river) comprises many good modern houses, with a very large town-hall, partitioned out into government-offices, and a public library. There are 2 large churches, one an elegant Gothic structure, with a fine tower. A large tobacco manufactory of modern construction, employing between 300 and 400 workmen, a hospital, school of navigation, theatre, and 2 hotels, are the other chief buildings. Morlaix is the seat of a subprefect, of a tribunal of primary jurisdiction on commerce, and of a society of agriculture; its principal manufactures are those of tobacco and linen cloth; and it enjoys a considerable trade in butter, corn, tallow, honey, and wax.

Morlaix lays claim to considerable antiquity, and was already an important town when taken by the English, near the close of the 14th century. During the two succeeding centuries it suffered greatly from the ravages of civil war.

**MOROCCO (EMPIRE OF).** (Arab. *Maghrib-ul-Aksa*, "the extreme West,") a tract of country in the N.W. of Africa, between the 28th and 36th degs. of N. lat., and the 2d and 12th degs. of W. long., comprising the *Maghrib* (Latin *Tangier*) of the ancients. It is bounded N. by the Mediterranean Sea and the straits of Gibraltar, E. by the Atlas range, which separates it from the Algerine territory and Biled-el-Jerd, S. by the river Akassa, and Sahara desert, and W. by the Atlantic Ocean. Length of coast-line along the Mediterranean, 250 m.; ditto, along the Atlantic Ocean, 600 m.; estimated area, 219,300 sq. m., distributed into 4 kingdoms, the area and pop. of which are estimated as under:—

Kingdom.	Provinces.	Area in sq. m.	Population.	Chief Towns.
Fez	7	88,657	3,200,000	Fez, Tangier.
Morocco	7	51,580	3,500,000	Mekinez.
Sagha	2	28,656	700,000	Agadir.
Taflet	-	50,697	1,000,000	
Total of empire		219,300	8,500,000	

Of the above population Gräberg von Hemsö states that 3,550,000 are Moors, 3,750,000 Berbers, and Sheloehs (chiefly devoted to agricultural and pastoral pursuits), 740,000 Bedouin Arabs, 339,500 Jews, 120,000 negroes, and 500 Christians and renegades.

**Surface, &c.**—Morocco is mostly bounded on the E. by the stupendous chain of the high Atlas, which commences with Mount Benal-Ammer, S. of the desert of Angad, on the Algerine frontier, and extends S. as far as Capes Geer and Nun. The most elevated parts of the range occur between 30° and 33° lat.; the highest point, Mount Hentet, was estimated by Mr. Jackson at about 29,000 ft., but this is no doubt a gross exaggeration. Captain Washington measured a point called Miltzin, in lat. 31° 12' N., and long. 7° 20' W., which he found to be 11,109 ft. above the sea, and this was the highest in the S. portion of the chain. It is probable, however, that the highest summits will be found more to the N. in the prov. of Tena; but their height, which has never been ascertained by measurement, cannot much exceed 13,000 ft. (See *Geog. Journ.* i. p. 140.) A subordinate range, sometimes called the little Atlas, branches N.N.W. and N.W. towards Ceuta, C. Sparte, &c.; and other chains, either continuous or detached, are thinly sprinkled over the country S. of Fez and Mekinez. The geological constitution of these mountains is granitic in the central ridges, on which are superimposed secondary and even tertiary formations in the less elevated parts of the chain. Silver, iron, and lead mines are wrought to some little extent. Mineral salt is found in great abundance throughout Morocco, and is a considerable article of export to Soudan. But notwithstanding the gigantic mountains by which it is in part bounded, and in part overgrown, Morocco has a large extent of comparatively level land. Some of the plains and valleys are of great extent, and extraordinary fertility, especially those of Shawiya, Tensena, Tacilla, and Tarara between Fez and Morocco. The principal rivers are, 1. the Sebti, rising by several sources on the W. side of the Atlas range, falling into the Atlantic, close to Mehedja, having a probable length of 200 m.; 2. the Wad-Oum-el-Beg, rising by 2 principal branches in the high Atlas, and flowing W. and N.W. to its mouth at Azamor, after a course of about 300 m.; and 3. the Wad-Tensift, rising about 40 m. E. of Morocco, takes a general course W. by N. to lat. 32° 7' N., and long. 9° 19' W., where it falls into the Atlantic ocean. The climate of the country is healthy and genial; the heat is less intense than might be expected from its geographical position, and epidemics are of rare occurrence. The thermometer, even in the hottest season, except during the occasional prevalence of hot winds from the desert, seldom exceeds 28° Reaum. (94° Fahr.); the barometer averages throughout the year 28.30 inches;

and the annual fall of rain (chiefly confined to October and November), as calculated on a series of years, amounts to 29 inches. (*G. von Hemsö*, p. 28.) These observations, however, apply chiefly to the N. and W. portions of the empire, or E. of the Atlas range, the heat is intense, and rain seldom falls. The soil is now, as in antiquity, proverbial for its fertility. Mela says of it, *Ceterum solo etiam ditior et adeo fertilis est, ut frugum genera non cum serantur modo benignissime procreet; sed quadam profundam etiam non sata*. (Lib. iii. cap. 10.) In some favoured spots three crops of corn are reaped in the same year; the soil in many parts is purely alluvial, and in others of clay, sand, and loam, mingled in the most advantageous proportions. (*G. von Hemsö*, 29, 30.)

Agriculture, however, owing, perhaps, to the extreme fertility of the land, which produces luxuriant crops, with little care or attention, is in the most backward state: fallows and rotations of crops are wholly unknown; indeed, the system of culture has remained almost unchanged since the invasion of the Arabs in the 11th century; and it consists of little more, generally speaking, than grubbing up and burning the weeds before the autumnal rains, and afterwards ploughing the land about 6 inches deep, with a machine of the most simple description, drawn by a heifer or ass, and in the S. provinces by a camel. Except in the gardens, the Moors never think of using manure or other means of assisting the soil, and consequently, the land near the towns is more impoverished than in less populous districts, where, from the abundance of unemployed land, it is allowed to remain in fallow 2 or 3 years, and in the mean time other parts are brought under the plough. The wheat is white, transparent, almost without husk, having a large and exceedingly hard grain, producing a flour superior in fineness and colour to that of the northern countries. A second crop is rarely obtained; but in the S. provs., when the harvest commences very early, a spontaneous crop springs up. According to Major Beauclerk, "The plains of Danquella alone are capable of producing in one year as much corn as the united kingdoms of Great Britain. Immense crops of corn yearly overstock the market of Mogador: a bushel of corn may be procured for a partridge, or a coin worth in English shilling; and such is the profusion of grain, that, in many instances, it does not repay the labour of harvesting." (*Journey to Morocco*, p. 286.) Yet, with all this productiveness, so little industry and providence are exercised, that the inhabs. are sometimes, in bad seasons, reduced to the greatest privations, and hundreds of Berbers often die of famine.

Barley is used chiefly for horses and cattle, oats not being raised in any part of the country. Maize and Turkish millet are raised near the towns and along the coast in the S. provs., and potatoes near Tangiers. On the whole, however, not more than a third part of the arable land is cultivated, and this in so superficial a manner, that the produce might be trebled, or even quadrupled, by a better system of tillage. Holme-oaks, cork and juniper trees are found on the mountains; and immense quantities of date-palms, vines, olive trees, sugar-canes, cotton, tobacco, and the fruits of S. Europe, are raised in the low country. Throughout Morocco, however, there is a general scarcity of building timber: the white cedar grows to a tolerable size in the prov. of Refé; but when large timber is wanted, it is usually imported from Gibraltar. Land is usually rented by the number of oxen required for its cultivation, at the rate of about 7 dollars for the yoke of oxen; but in lands belonging to the sultan and allotted out to his soldiery, the same portion of land would be rented at about 4 dollars a year, and, if sold by auction, would fetch at Tetuan about 200 dollars. (*Sir A. C. Brooke, Spain and Morocco*, l. 400.) The pasture-grounds, also, are extremely rich, the grass often attaining a height unequalled except in the prairies of America. The horses in the country are estimated at 400,000; but the breed once so esteemed under the name of Barbis is greatly deteriorated. A few milk-white, small, and finely proportioned horses, with black manes and tails, are occasionally to be met with, belonging to the Arab chiefs; but the mass, though active, hardy, and with good action, are poor and meagre-looking: their exportation is entirely forbidden. Mules (of which there are upwards of 1,000,000) are equally well adapted for riding and draught: they are almost universally employed in long journeys, and a good mule, especially if of a bright chestnut colour with a black cross, is valued higher than a horse. Neither the asses nor mules, however, are at all comparable to those of Andalusia. It is said, though we suspect the statement is exaggerated, that about 40,000,000 sheep and 12,000,000 goats are reared; the wool of the former being of the best quality, and the hides of the latter furnishing the celebrated Morocco leather. Oxen and camels also are bred in great quantities. A duty of about 16 dollars a head is imposed on the exportation of cattle, which being tantamount to a prohibition, the farmer is

discouraged from taking any pains further than to supply his own or his neighbour's wants. The wild animals comprise dogs, hyenas, lions, ounces, panthers, lynxes, gazelles, boars, and different varieties of game; the principal birds being ostriches, storks, quails, snipes, ducks, &c. Fish of many varieties are found in most of the rivers; bees, wasps, and mosquitoes swarm throughout the country, and locusts of large size commit fearful ravages, occasionally devouring every green leaf, and leaving the ground over which they have passed absolutely barren.

*Manufactures and Trade* are confined within very narrow limits. Except in the principal towns, where the houses are large and square, with a central court and flat roof similar to those of Algiers, the people live almost universally in huts or moveable tents; comparatively destitute of furniture and accommodation. Every woman understands the art of spinning wool or cotton, and the men weave it into cloth. Domestic labour, in short, which is almost wholly performed by women, supplies the principal wants of the inhabs. Tanning appears to be almost the only exception: leather is made in great quantities all over the empire, but especially in the large towns, that of Fez being red, while that of Tafielt and Morocco is respectively green and yellow. About 250,000 dozens of goat-skins are annually exported. The red caps, silk fabrics and girdles of Fez are highly esteemed; carpets, chip-baskets, and earthenware are manufactured in different parts, and in the principal towns may be found skilful sadlers, carpenters, locksmiths, and farriers.

The *Commerce* of Morocco is carried on, 1. with Europe; 2. with the Levant; and 3. with the interior of Africa. The exports of Europe comprise about 2,500 cwt. of wax (chiefly to Marseilles, Leghorn, Cadiz, and Lisbon), 1,500 cwt. cow-hides, 160,000 dozens goat-skins, 2,500 cwt. olive-oil, and 4,300 cwt. gums, with smaller quantities of wool, dates, honey, indigo, shawls, carpets, &c., to the amount of about 1,000,000 piastres a year; while the imports, chiefly of manufactured and colonial goods, amount only to 750,000 piastres a year. The tariff is regulated by the whim of the sultan, and prohibitions and duties vary at every port. European vessels pay 6 piastres for harbour dues, and a tax of 10 per cent. is levied on all imported articles. In 1831, the imports were valued at 158,400*l.*, the exports at 121,360*l.*; and in the same year 64 European ships, of 3,870 tons, arrived at, and 98 ships, of 5,820 tons, departed from, the different ports of the empire. (*Gräberg von Hemsö*, p. 157.)

The trade with the Levant is carried on partly by pedlars, accompanying the pilgrim caravan to Mecca, and partly, also, by feluccas coasting the shores of Africa as far as Alexandria. The communication with the interior of Africa is effected by caravans proceeding from Tafielt and crossing the Sahara desert to Timbuctoo, in the manner described in the art. *AFRICA* (I. 31.), where the traders exchange salt, tobacco, cloth, caps, girdles, Turkish daggers, &c., for gold-dust, ivory, rhinoceros horns, assafetida, ostrich feathers, and slaves. Their profits would seem to be immense; since, for 1,000,000 piastres, the value of goods exported, the returns amount at least to 10,000,000 piastres (*G. von H.* p. 146.); but a great part of this excess is swallowed up by the expense of the conveyance of the goods across the desert and back again. Interest on money is forbidden by law; but, notwithstanding, the Jews and others exact sums varying from 7 to 12 per cent. a month, on the security of merchandise. Paper money and bills of exchange are wholly unknown; nor is there any communication by post, for the purpose of facilitating commercial intercourse.

*Government, Revenue, &c.*—The government of Morocco is a pure despotism, the sultan being the head both of church and state, and the arbiter over the property and lives of his subjects; his chief title is *Emir-al-Mumenin*, "absolute ruler of the true believers." There are not here, as in Turkey, an ulema, the depositary of the national religion, or a mufti, the head of the law, who possess privileges independent of the sovereign, and may interfere to check his determinations. There is not even a council or divan which he is expected to consult. He has no regular ministers; all his orders are his single command, and no subject is supposed to have either life or property but at his disposal. The sultans would appear to consider an adherence to their engagements as an unconstitutional check on their power. "Takest thou me for an infidel," said one of them to a foreigner, "that I must be the slave of my word? Is it not in my power to say and unsay whenever I shall please?" (*Chénier's Morocco*, l. 208. Eng. trans.) But, after all, there are here, as in all countries, certain rights which the monarchs dare not touch, and certain duties they must discharge. The sultan cannot safely invade the domestic privacy of his subjects, nor shock any of those customs to which long establishment has given the force of law. He is expected also to give

public audience four times a week, when he administers justice to all, even the poorest. Yet prudent persons usually think it more eligible to acquiesce in the sentence of the cadi, than to afford to the sultan any insight into their private affairs, of which he might afterwards make a not very agreeable use. On these occasions the sovereign appears on horseback, with an umbrella held over his head.

The crown is hereditary, descending to males only, but without the right of primogeniture; and hence it is not unusual for strife and civil war to arise among the children of a deceased sultan. The government has frequently, also, been overthrown by private or public treason. And hence, probably, has arisen the jealous and ferocious character by which the rulers of Morocco have been especially distinguished. Muley Ishmael, who ascended the throne in 1672, a bloodthirsty monster, though not without ability, introduced the system, since kept up, of employing a guard of negro mercenaries, on whose fidelity more reliance may be placed than on that of the Moors.

The most important state officers are the *Mula et-tei*, or tea-taster, usually the sultan's favourite, and the *Mula-et-tesserdd*, or steward of the sultan's household. The sultan sits in public, as already stated, four times a week, to administer justice. The koran is here, as elsewhere in the Mohammedan world, the text-book of justice, and decrees are usually executed immediately after they have been pronounced. For the purposes of civil and military government, Morocco is divided into twenty-eight prefectures, some of which extend over large tracts of country, though others are confined to a single town. The chief provincial officers are the *knaids* or prefects, who, although removable by the sultan, are despotic governors and commanders of the military forces within their districts. The agricultural tribes have also their respective sheiks; but these are commonly subject to the Moorish governors. The revenue of Morocco in 1822 amounted to 2,600,000 piastres; of which, nearly a half is derived from duties on land, houses, shops, mills, &c., and about a fifth from imported goods. The expenditure of the same year, chiefly for the maintenance of the army and the sultan's household, was only 990,000 piastres; and the yearly surplus goes to enrich the sultan's treasury at Mequinez, which is supposed to contain at least 50,000,000 piastres. (*G. von H.* p. 222.) The regular army does not exceed 16,000 men; of whom, as already stated, fully a half are negroes. The sultan's body-guard comprises about 3,000 infantry, and 2,000 cavalry. The Moors are good horsemen, and endure hunger, thirst, fatigue, and every inconvenience. They might therefore make excellent soldiers if they were properly manœuvred and exercised; but they are ignorant of every part of discipline except submission to their superiors. Their standard is the emblematic upon the Koran, by Sid Baccari, the favourite imperial saint, whose book is deposited under a tent in the centre of the army, and is the signal by which they rally. Morocco has 24 fortified and garrisoned towns, the principal of which are Suira, Tangier, Azamer, Salee, and Mazagan. The navy of the empire is quite inconsiderable, comprising only 3 brigs, mounting 40 cannons, and 3 shallops.

*Population.*—The inhabs. may be divided into the classes of Moors, Arabs, Berbers or Berebers, Shellochs, Jews, and Negroes. The Moors are a mixed race, the descendants of the ancient Mauritians, intermixed with their Arab conquerors, and with the remains of the Vandals, who once ruled over the country; and, with the Moors, expelled from Spain, in the 15th century; but these varieties have been long since obliterated, and the Moors are now moulded into a distinct, peculiar people. They principally inhabit the villages and cities. Their language, called the Occidental Arabic, contains, as might be expected, many words borrowed from the language of the Berebers and Shellochs, and imported from Spain. The Arabs, as distinguished from the Moors, principally inhabit the plains, where, like their ancestors, they mostly lead a wandering life, and follow pastoral pursuits. They occupy *durwars*, or moveable villages, composed of tents; and whenever the pastures in the vicinity are exhausted, or the increase of flocks and vermin render the tents inhabitable, they are struck up, packing their effects and children, on panniers on the backs of camels, they set out in search of some other quarter in which to settle. Their women are not confined; but being subjected to hard labour, tanned by the sun, and sometimes even yoked in the plough with domestic animals, these habits of hardihood, with the loss of all traces of beauty, prove more effectual securities against intrigues than the bolts and bars used in the cities. The mountainous portion of the country is occupied by the Berebers and Shellochs, probably the aboriginal inhabitants of the country. The Berebers, who principally inhabit the country of the lesser Atlas, adjoining the Mediterranean, are nearly white, well formed, of middle size, and athletic; they live mostly in huts of stone and mud, but sometimes, like

the Arabs, in tents, and sometimes in caves; they are principally engaged in hunting and pastoral occupations. The Shellocks, who inhabit both sides of the greater Atlas, are less robust than the Berbers, but they are more advanced in civilisation, being principally agriculturists and artisans, and occupying comparatively good houses. A great discrepancy of opinion has been entertained as to whether the languages of these people be radically different, or merely different dialects of the same language; the latter opinion, though accompanied by several difficulties, seems to be, on the whole, the most probable.

The Berbers and Shellocks are sometimes called *amazighis*, or freemen, a designation to which they have a not ill-founded claim. They have never, in fact, been fully subjected to the Moorish government; they often break out into rebellion; and have carried their arms to the gates of Morocco. Their internal government has even somewhat of a republican form, and they are well trained to the use of arms. The Jews, who are numerous, particularly in the cities, carry on all the mercantile and money transactions; they also act as interpreters, and perform, in the cities, the functions of servants, porters, scavengers, &c. Every species of oppression and contempt, however, is heaped upon them. They are not allowed to mount on horseback, nor to sit before a Moor with their legs crossed. The meanest Moors may insult or maltreat them in the streets, or enter their synagogues for the purpose. They must not read or write Arabic, which being the language of the Koran, is too holy for them! A worse evil is, that when the emperor, or men in power, happen to be in want of money, they hesitate not to relieve themselves by stripping the Jews of large portions of their wealth, however carefully it may be concealed.

The negroes, who are not very numerous, are imported from Soudan. Sometimes, however, they obtain their liberty; and, as already stated, the emperor has thought fit to select them for his body guard. (The learned and excellent observations of Shaw, as to the different classes of people in Algiers, may be applied, with little modification, to Morocco. See his *Travels*, passim.)

**Religion and Education.**—The prevailing religion is Mohammedanism, and nowhere are its tenets and observances more rigidly enforced. The Jews are universally despised, nor are Christians allowed to reside any where except in Tangiers, Mogador, El-Araich, and Tetuan. There is a Franciscan convent in Tangiers, being the only Christian establishment throughout Morocco.

The education of the Moors is, at present, greatly inferior to that of their forefathers in the Middle Ages, and is almost exclusively confined to learning the Koran by rote, reading, and writing. At the high school of Fez, however, more aspiring students may receive a sort of instruction in grammar, geometry, and the mixed sciences, logic, rhetoric, metaphysics, and theology. The art of printing is unknown, so that great numbers of persons are employed, in all parts of the empire, copying the Koran, &c. Arts and sciences are in the most barbarous state; the literature, and history of foreign countries are wholly unknown; and their only musical instruments are a rude pipe, and more barbarous drum.

**Manners and Customs.**—The Moors are generally a fine-looking race of men, of middle stature, and somewhat inclining to corpulence, owing, probably, to their inactive life. The women are pretty when young. Blacken their eye-lashes and eye brows, and stain the tips of their fingers with *henna*. The dress of the country is picturesque and graceful, comprising a shirt with large sleeves, ample drawers of white linen, a *kuffan*, or waistcoat, of a yellow or blue cloth, a silk sash, *haik*, or mantle, and slippers, or boots, of yellow leather. Women, however, wear red shoes. The Jews are not allowed to wear colours, and a black cap, with slippers of the same colour, marks their degradation. The usual food throughout the country is a dish, called *kuscusi*, composed of mutton or fowls, stewed with vegetables, and served up in large earthenware pans, accompanied with a savory kind of sauce. Coffee is not used; but tea is a general beverage, always presented to visitors, and highly esteemed by all classes. The Moors do not smoke tobacco, but take large quantities of snuff, and occasionally smoke the hemp-plant, which seems to partake of the intoxicating quality of opium: a confection is also made from the hemp-seed, possessed of the same qualities, and to the use of this the natives are much addicted. The distinguishing features of the Moorish character are, a love of idleness, apathy, pride, ignorance, bigotry, and the grossest sensuality. The cities present the same gloomy aspect as in other Moorish states—that of strict seclusion, particularly of the female sex, while habits of gravity and silence prevail among the men, who meet only in the public coffee-houses. Unluckily, their high national pride, and contempt for all other people, is not combined with any sentiments of individual honour. They are not, however, wholly destitute

of good qualities, among which may be mentioned their hospitality, and fortitude under misfortune: *Allah-tré*, "God willed it," is their consolation in trouble. They are, also, healthy and long-lived, which could hardly have been expected, considering their habits. The climate is unquestionably good; but leprosy, ophthalmia, hydrocele, and syphilis, originating, most probably, in filthy habits, are not uncommon. Their medicines consist only of a few herbs, and their surgery is such as might be expected among a people without science or arts. The plague visits them about once in 20 years, and carries off thousands of the population. (*Geog. Journ.*, i. 146.)

**History.**—Morocco, anciently called Mauritania, was inhabited, under the Romans, by a hardy nomadic race, who were never thoroughly subdued by that nation. Early in the 7th century, the country yielded to the Saracens, whose different dynasties disputed for its possession nearly 300 years. At length, in the 11th century, a chief of Leptima, having acquired so high a reputation for sanctity as to cause all the neighbouring tribes to flock to his standard, overturned the existing government, and extended his dominion all over N. Africa. His son, Joseph Ben-Tessin, extended the empire by the addition of Fez and the S. provs. of Spain. In 1148, however, another revolution took place, and the Morabites were succeeded by the Almohades, who, in their turn, yielded the empire to more successful adventurers. In this state of anarchy the country remained till the middle of the 16th century, when Mohammed-Ben-Achmet, a scherrif and descendant of the Prophet, ascended the throne, which his posterity has ever since continued to occupy. (*Jackson's Travels in Africa; Beaulieu's Journey to Morocco; Sir A. C. Broke's Spain and Morocco, &c.; Count Gräberg von Hemsö, Storia di Morocco; Geog. Journ.*.)

Morocco (Arab. *Murak'sh*), a large city of N.W. Africa, and the cap. of the above empire, 105 m. E. by N. Mogador, lat. 31° 37' 20" N. long. 7° 36' W. Pop., acc. to Captain Washington, about 80,000, of whom 4,000 are Shellocks, and 5,000 Jews. We doubt however whether the population really exceeds 50,000, or at most 60,000. It is beautifully situated about 4 m. S. from the river Tensift, on a plain elevated 1,450 feet above the sea, and is surrounded by a strong wall of lime and mud 30 ft. high and 6 m. in circuit, with square turrets at intervals of 50 paces; but the enclosed area, as in many African and Asiatic cities, comprises, besides houses and streets, many large gardens and open spaces from 20 to 30 acres in extent. The whole town, with slight exceptions, is in bad repair, many parts are in ruins, and it is everywhere filthy in the extreme. It is entered by 11 strong double gates; but the only worth notice is the *Bab-el-Rom*, a Moorish horse-shoe arch, richly sculptured with Arabesque work. Extensive under-ground aqueducts, 10 or 12 feet deep, surround the walls, and reach across the plain to the foot of Atlas; at the lower end, they are mostly in ruins. The houses in the habitable part of the town, a few of which are of stone, but the greater number of mud and lime, are, generally speaking, small, and only one story high, with central courts and flat roofs, the sides fronting the streets being plain and whitewashed, with here and there a narrow opening, unglazed, and scarcely deserving the name of a window. Their interior disposition greatly resembles that of Spanish houses,—the doors are of carved cypress-wood, the rooms long and narrow, with scarcely any furniture except a few mats, carpets, and cushions. Most of them, however, being old and in decay, swarm with vermin, especially bugs, scorpions, and snakes. The streets, which are unpaved, are frequently so narrow and crooked, that a horse can with difficulty pass through them; and they are in parts so heaved up with accumulations of filth, that the floors of the houses are some feet below the pathway. (*Beaulieu's Morocco*, p. 140.) These inconveniences are further increased by numerous low cross arches and gateways that connect the opposite houses. The city contains several public squares; but like the streets, they are unpaved, and consequently very dirty when it rains, and covered with dust in dry weather. The sultan's palace stands on the S. side of the city, outside the main wall, but is itself enclosed within walls of equal strength. Its precincts consist of a large oblong space about 1,500 yds. in length and 600 in width, divided into squares and laid out in gardens, round which are several detached pavilions about 40 ft. square, forming the imperial residence. These have pyramidal roofs covered with glazed tiles, and lighted from 4 lofty and spacious doors, which are opened according to the position of the sun, the floors being tessellated with variously coloured tiles, and the interior painted in the Arabesque style, and ornamented with square compartments containing passages from the Koran, written in a sort of Arabic short-hand. The luxury and convenience of tables, chairs, and curtains are unknown, and even the rooms occupied by the sultan are furnished

\* All but estimated the pop. at only 20,000, while Jackson, by an absurd exaggeration, carried it up to 270,000!

only with a few mats, carpets, cushions, some china and tea equipage, a clock, and arms hung round the walls. The grand pavilion in the middle of the gardens is appropriated to the women: it is a spacious building fitted up in the same simple style as the rest. Near the palace, on the E. side of the enclosure, is the *m'shoar*, or Place of Audience, an extensive quadrangle, walled in, but open to the sky, in which the sultan gives audience to his subjects, hears their complaints, and administers justice. Attached to the palace, also, are 3 gardens, each about 15 acres in extent. In two of these the foreign merchants are allowed to pitch their tents when they visit the sultan, and the third, called *Jouan el Afla*, "the Garden of Prosperity," is destined for the use of the sultanas. The city has many sanctuaries and mosques; one of these, called El Kontabi, is conspicuous above all by a square tower, 221 ft. high, divided into seven stories, and surmounted by a small lantern. The mosque, Beni-Yusef, next in height and age, has an attached college and a saint's tomb, with a cupola delicately wrought in Saracenic tracery. El Moazin, also, said to be the most ancient mosque in the city, is of great size, comprising several courts opening into each other, and intersected in various directions by highly sculptured horse-shoe arches. Its gates are said to be those of Seville, brought thence by the triumphant Al-Moor. The chapel of Idris el Agha, the patron saint of Morocco, is built in the shape of a pavilion, surmounted by a cupola covered with green varnished tiles. Attached to it is an immense hospital, said to have accommodation for 1,500 patients. Near the S. wall of the city is the *Madrese del Enshia*, a college and mosque, in which are the sepulchres of the sultans of the Molite Saïdia dynasty, once adorned with statues and busts, now defaced.

Morocco, like most other Moorish towns, comprises numerous fountains, several of which have traces of delicate sculpture; and one close to the mosque El-Moazin has a cornice of white marble, still exhibiting the remains of former beauty. Outside the walls are several large cemeteries, one of which, on the E. side is upwards of 100 acres in extent; war, plague and famine, to which the town owes its present decay, have caused them to be thickly tenanted. In the N. part of the town is the *Kaissaria*, or bazaar, a long range of shops, or rather stalls, covered in from the weather, divided into compartments, and serving as a general lounge for all classes of the inhabs. Here are exposed for sale silk scarfs, shawls, and handkerchiefs from Fez; carpets and various articles of dress from Duquella; cloth, linen, hardware, tea and sugar from England; almonds and raisins, henna and pure spirit from Suse; corn, beans, &c., from Shragna; dates from Taflet; and an abundance of boots, slippers, saddles, earthenware, mats and cord, with gold and silver embroidery, in making which the inhabs. particularly excel. A large market is held every Thursday, near the N. gate of the city, and is well supplied with home-manufactures; outside the gate, also, is the market for camels, horses, mules, horned-cattle, sheep, &c.; but the display is very indifferent. The tanning of leather is the most important branch of industry in Morocco; and Captain Washington visited one tannery, which alone employed 1,500 persons. The establishment was extremely defective in order and arrangement; but, in spite of dirt and slovenliness, a bright yellow colour is produced, that has not been successfully imitated in Europe. (*Geog. Journ.*, i. 139.)

The *Millah*, or Jews' quarter, is a walled inclosure about 1½ m. in circuit, at the S.E. angle of the city, very densely peopled, and dirtier even than the parts inhabited by the Moors. The Jews pay a capitation-tax to the sultan, and are treated with the utmost contempt; but they are a serviceable body, and are the only goldsmiths, tinnmen, and tailors in Morocco. Shoemaking, carpentry, masonry, smith's-work, and the weaving of haiks, are exclusively the occupation of the Moors. Provisions are cheaper even than at Tangiers; but there is very little trade, that which exists being, with the exception of the commerce in leather and salt, confined to the supply of the town. The air about Morocco is generally calm: the neighbouring mountains defend it from the scorching winds that blow from Taflet and Sahara, while the snow with which the chain is covered nearly all the year, imparts an agreeable coolness to the surrounding atmosphere. In summer, however, the heat during the day is intense, though the nights are cool, and in winter the cold is pretty severe. On the whole, however, the climate is extremely healthy.

Morocco, which is supposed to be situated on or near the spot occupied by the ancient *Bocanum Hemerum*, was founded in 1052 by Abu Tessim, the first Moorish sultan of the Marabout dynasty, and in the following century, during the reign of Ali Ben Yusef, it is said, but no doubt the statement is grossly exaggerated, to have contained 1,000,000 of inhabs. In later times its population has greatly fallen off; and, owing to the devastations of successive conquerors, it retains little of its ancient magnificence. At present it is in many parts little

else than a desert; the ruins of houses heaped one upon another serve to harbour thieves and desperadoes of all sorts. Nothing but the wretched government of Morocco could have made so great a city so miserable and so deserted. (*Geog. Journ.*, vol. i.; *Beaulecker's Journey to Morocco*; *Chenier's Hist. of Morocco*, i. 56—63.; *Jackson's Morocco*, p. 121—124.)

MORON, a town of Spain, in Andalusia, prov. Seville, on a plain near the foot of a lofty hill, 33 m. S.E. Seville, and 60 m. W.S.W. Cordova. Pop., according to Miliano, 7,894. It has some well-built houses, a par. church, and 2 hospitals. Its inhabs. are almost wholly agricultural, and nearly all the oil used in Seville is raised in the neighbourhood. The existence of Roman inscriptions and other antiquities has induced some authors to identify Moron with the ancient *Arunci*.

MORPETH, a mun. and parl. bor., market-town and par. of England, co. Northumberland, ward of its own name, on the N. bank of the Wansbeck, crossed here by 2 bridges, 14½ m. N. by W. Newcastle. Pop. of parl. bor. (which includes the par. of Morpeth, except one detached township, together with the par. of Bedlington), in 1831, 6,678. The town, which is pretty well built, though badly paved, and not lighted, consists principally of 2 streets, at the junction of which is the market-place, with a high square clock-tower, containing a chime of bells. A town-house, a stone structure fronted by a colonnade, and decorated with turrets at the angles, was erected in 1714, at the expense of Lord Carlisle, for the manorial courts, quarter sessions, local business, &c. The co. gaol, and house of correction, is an extensive and commodious pile erected in 1829 on the S. side of the river. The par. church, a plain brick building, is on Kirkhill, ¼ m. S. the town; the living being a rectory in the gift of Earl Carlisle. There is also a chapel of ease. The Rom. Catholics, Presbyterians, and Wesleyan Methodists, have their respective places of worship, to which, and the church, are attached Sunday-schools. A slenderly endowed grammar-school was founded here by Edward VI. An English free-school, and infant schools, are supported by the corporation, and there are 2 subscription schools for boys and girls. The other establishments of the town comprise a Provident club, dispensary, mechanics' institute, subscription library, and some minor charities. Morpeth has undergone little change in its condition during the last 50 years: no buildings are in course of erection, and in 1836 there were 115 uninhabited houses. A small woollen manufactory, iron-foundry, and 2 or 3 steam corn-mills, are established here, but its chief dependence is on its cattle market, which is one of the largest in the N. of England. Freestone is quarried, and there are 4 collieries within the par.; but the railway connecting them with the town has been an unprofitable undertaking.

Morpeth is a bor. by prescription, and recognised as such by the charter of 15 Charles II.; its municipal officers, since the Mun. Reform Act, being a mayor, 3 other aldermen, and 12 councillors. Corp. rev., in 1839, 216*l*, leaving a debt of 903*l*. It has sent 2 mems. to the H. of C. since the reign of Mary; the right of election, down to the Reform Act, having been nominally vested in the bailiff and free burgesses, but substantially in Earl Carlisle, lord of the manor. This Act deprived it of one of its members, and the limits of the bor. were then also enlarged as stated above. Reg. electors, in 1839-40, 363. Petty sessions are held weekly, and quarter sessions alternately, with three other townships, Markets on Wednesday. Large cattle fairs, the Wed., Thurs. and Frid. but one before Whit-Sunday. Races are held N. of the town on Cottingham Common, early in Sept. (*Mun. and Bound. Rep.*, &c.)

It appears from Camden that Morpeth was "burned down by its inhabitants in 1215, out of hatred to King John," that is, with the view of distressing him when on his march to punish the revolt of his barons; and it suffered again from fire in 1689. Its castle, built in 1358, and Cistercian monastery, both more ruins, and several churches and baronial residences in the immediate vicinity, are well worth the notice of the antiquary.

MOSCOW (Russ. *Moskva*), a large city of European Russia, long the residence of the sovereigns, and still one of the capitals of the empire, on the navigable river Moskva, 400 m. S.E. Petersburg, lat. 55° 45' 13" N., long. 37° 33' E. Pop., in 1838, 384,562.

This city, which was founded in 1147, is one of the most singular in the world. It is of a circular form, and covers a large extent of ground. The central part, on an eminence on the N. side of the river, is occupied by the kremlin, or citadel, containing the palace of the czars, with cathedrals, monasteries, squares, &c., built at different epochs, and in the most incongruous styles of architecture. The other quarters of the city lie round this central nucleus, increasing in magnitude according as they diverge from it. On the outside of all are the *slobodes*, or suburbs. The Moskva, which has a very tortuous course through the city, is crossed by various bridges, some of stone, but the greater number of wood.

Previously to the conflagration of 1812, which destroyed two thirds of the city, Moscow presented the most extraordinary contrasts—palaces alternating with huts, Asiatic with European buildings, and open fields and gardens with crowded streets. "If I was struck with the irregularity of Smolensk," says Mr. Cox, "I was all astonishment at the immensity and variety of Moscow; a city so irregular, so uncommon, so extraordinary, and so contrasted, never before claimed my attention. The streets are in general exceedingly long and broad; some are paved; others, particularly those in the suburbs, formed with trunks of trees, or boarded with planks like the floor of a room; wretched hovels are blended with large palaces; cottages of one story stand next to the most stately mansions. Many brick structures are covered with wooden tops; some of the timber houses are painted, others have iron doors and roofs. Numerous churches present themselves in every quarter, built in the Oriental style of architecture; some with domes of copper, others of tin, gilt or painted green, and many roofed with wood. In a word, some parts of this vast city have the appearance of a sequestered desert, other quarters of a populous town; some of a contemptible village, others of a great capital." (*Travels in the North*, l. 283; see also *Clarke*, l. 60. 8vo. edit.)

There is no longer any question that the conflagration of 1812 was the act of the Russian government, in the view of rendering it impossible for the French to winter in the city. With the exception of the Kremlin, and the quarter (Biogorod) immediately surrounding it, on the N., the rest of the city was mostly destroyed; and in some quarters the destruction was so complete that the lines of streets could with difficulty be recognised. The Kremlin, too, though it escaped the conflagration, suffered severely from the mines sprung under its walls, by order of Napoleon, on its evacuation by the French. But this wide-spread desolation was repaired in a very few years. Like a phoenix, Moscow has risen from her ashes larger and more beautiful than ever. The streets have been widened, and the buildings are less singular and discordant; still, however, the old and distinctive character of the city is preserved, being at once "beautiful and rich, grotesque and absurd, magnificent and mean." According to M. Androsoff, there were in all 9,182 houses in the city in 1831; of which, 3,127 were of brick and stone, and the residue timber. The erection of a wooden house is an easy matter. A market, held in a large open space in one of the suburbs, exhibits a variety of materials for house building, consisting of trunks of trees cut, shaped, and morticed into each other. The purchaser who wants a dwelling repairs to the spot, explains the number of rooms he requires, examines the different timbers, which are regularly numbered, and bargains for what suits him. The whole is either paid for on the spot, and taken away by the purchaser, or the seller may agree to transport and erect it at the place where it is wanted. A dwelling may thus be bought, transported, raised, and inhabited, within a week!

The Kremlin, which has been completely repaired since 1812, comprises the Imperial palace, the archbishop's palace, the cathedral of the Assumption, in which the Russian sovereigns are crowned, with the cathedrals of St. Michael, the Annunciation, &c. It also contains the belfry of Ivan Veliki, a tower 263½ ft. in height, having within it, at different stories, 32 bells, some of them of an immense size: on festivals they are tolled without interruption, the Russians being passionately fond of bell-ringing. The great bell of Moscow, weighing 10,000 pounds, or 360,000 lbs. (1,600 tons Eng.), is now lying on the ground, at a short distance from the tower of Ivan Veliki. It is said to have been once suspended in a wooden building; but this taking fire, the water thrown upon it, to extinguish the flames, occasioned the large rent seen in the bell. But the fact of its ever having been suspended is doubtful, and the rent was probably occasioned by some defect in the casting. On festivals, the peasants resort to this bell as they would to a sanctuary. Among the other public buildings, may be mentioned the Palace of Arms, in the Kremlin; the founding hospital; the bazaar, an immense building, containing a great number of shops; the Imperial theatre; the hall, for exercising the troops in bad weather, built by the emperor Alexander (of vast dimensions, being 560 ft. in length, 180 in breadth, and 50 in height; the roof not being supported on pillars); the arsenal; the palace of the senate; the university; the post-office; the Pashkoff palace; the great military hospital. The number of churches, though lessened by the fire, is still immense. In 1831 they amounted, in all, to 288, of which 7 were for Catholics.

The University, founded in 1755, is the most ancient in Russia. It had, in 1835, 120 professors and sub-professors, and 419 pupils. Among the other educational establishments, may be mentioned the gymnasium, dependent on the university; the theological academy, one of the principal in the empire; the medico-chirurgical

academy; the military school, or *corps de cadets*, with 600 pupils; the commercial school, founded in 1804; the establishments of St. Catherine and Alexander, for the education of young ladies; the veterinary school; the institute of Lazarus, so called from its founder, with 80 pupils, and a library particularly rich in Armenian literature, &c. There is, however, a great want of elementary schools for the lower classes; Moscow being, in this respect, far below Petersburg, defective as is the latter.

There are a number of literary societies, libraries, &c. The best library belongs to Count Tolstoi. The university library was partly destroyed in 1812; but it has since been enriched by fresh purchases and donations, and contained, in 1835, about 45,000 volumes. Several nobles have extensive collections of books, pictures, medals, &c.

The Foundling Hospital is a vast establishment, and is managed in the best possible manner. During the 10 years ending with 1831, the admissions were 52,549, and the deaths 34,713. In point of fact, however, a large proportion of the children brought to this, and to all similar establishments, are all but dead before they arrive; and the real objection to such institutions consists not so much in their great mortality, as in the encouragement they hold out to licentiousness, and the desertion of children. The great military hospital has above 1,500 beds; and an undoubted judge, Baron Larrey, has declared that its organisation is excellent. There is also the hospital of St. Catherine, the hospital of Gallitzin, &c. The pop. of the hospitals attached to the city in 1830 amounted to 22,227 individuals.

Moscow is the favourite residence of many of the Russian nobles, who pass the winter in the greatest splendour; not being overshadowed, as at Petersburg, by the court. According to M. Levolante de Laveau (*Guide de l'étranger à Moscou*), there were reckoned in the city, in 1830, 8,396 shops, 476 inns and hotels, 244 *restaurants*, 131 kabinks, or places for the sale of spirits, 58 kabuks for the sale of beer, 133 cellars for the sale of wine, 115 bake-houses, and 25 apothecaries' shops.

Manufactures are prosecuted here on a much larger scale than in Petersburg; but a large proportion of the works on account of the manufacturers and capitalists of Moscow are not in the city, but in the adjoining towns and villages, sometimes at a considerable distance from the capital. The principal establishments are those for the manufacture of cotton, woollen, and silk fabrics, many of which are upon a very large scale, and are fitted up with steam-engines and other improved machinery. Hats, also, are extensively produced; and there are numerous tanneries, breweries, distilleries, &c.

Moscow is the grand entrepôt of the internal commerce of the empire. It has a water communication with Petersburg and Riga, on the Baltic, Astrakhan, on the Caspian, and Odessa, on the Black Sea. In spring, or after the breaking up of the ice, the Moskva is navigable for barks, but during the rest of the season it is navigable for rafts only. A great deal of the commercial intercourse between the city and the adjacent and distant provinces is carried on in winter by the sledges-roads.

The same causes which occasion a very great preponderance of males over females at Petersburg (which see), exist in Moscow, though to a less extent, and have a similar result. The total pop. of the city, in 1830, amounting to 305,631, was, according to M. Androsoff, classified as follows:—

	Males.	Females.	Total.
Clergy	1,759	3,267	4,016
Notables and superior officers	10,490	11,904	22,394
Raznochints	10,167	9,579	19,746
Russian merchants	8,722	7,488	16,210
Dea. lesser traders	24,631	25,636	47,267
Artisans and workmen	8,035	4,126	12,461
Foreigners	1,466	1,225	2,691
Peasants, &c.			
1. Of the crown	20,595	6,621	26,619
2. <i>Des appauvres</i>	2,098	749	2,847
3. Of private individuals	37,794	5,789	43,583
4. Domestic servants	42,206	28,714	70,920
Inferior grades of the army—			
1. On active service	12,300	1,462	13,762
2. On leave of absence	5,385	10,729	13,714
Students, inmates of convents, &c.	4,411	4,240	8,651
Total	184,999	120,632	305,631

(*Schnitzler, La Russie*, p. 88.)

MOSELLE, a frontier dep. of France, reg. N.E., formerly a part of Lorraine, chiefly between lat. 49° and 49° 30' N., and long. 5° 30' and 7° 40' E., having N. and E. Luxembourg, Rhenish Prussia, and Rhenish Bavaria; S. the depts. Bas-Rhin and Meurthe, and W. that of the Meuse. Area, 532,796 hectares. Pop., in 1836, 417,003. The E. part of the dep. is covered with ramifications of the Vosges, and the W. with those of the Ardennes mountains; but neither rise to any considerable height. The general slope of the dep. is towards the N., which is

the direction followed by its principal rivers, the Moselle in the W., the Sarre in the E., and their affluents, the Ornes and Nied. Some portions of the surface are very marshy. Near the Vosges, where primary formations prevail, the soil is stony; elsewhere it is chalky or clayey, and, in general, of indifferent quality, only about 10,000 hectares being said to be rich land. In 1834, the arable lands were estimated to comprise 303,913 hectares; pastures, 45,597; woods, 92,228; and orchards, gardens, &c. 11,920 hectares. According to Hugo and the *Dict. Géog.*, agriculture has of late made considerable progress in this dep.; and certainly it would seem, from the statements of Mr. Jacob, by whom it was visited in 1819, that, both in this respect and in the condition of the pop., there was ample room for improvement. "Through the whole distance," says he, "of 50 m. from the Prussian frontier to Metz, there is not a single good house to be seen, except the convent, and the house of the iron master at Forbach. There is nothing in any of the villages, large and populous as they are, nor within sight of the road, though it is an open country, that looks like a decent farmer's or clergyman's house. All seemed of the same standard; each filthy, dilapidated, and small, with barn and stables adjoining, of corresponding appearance. The horses and waggons looked miserable; the cows, few and poor; and I did not see more than fifty sheep, which were of a bad race, and nearly half of them black. The rubats were ill clothed, and at every stoppage we were assailed by numerous beggars. The cultivators (near Metz) are all proprietors. They or their parents generally bought the land, at the revolution, for paper money; before which they were bound to their lords in certain feudal services and payments, and were supplied by them with the capital requisite for cultivation. In the worst parts of Germany, where the soil is poorest, and where the feudal power is still in force, the peasantry are better clothed, have more furniture in their houses, and display more new and repaired houses, than are seen in the district from Metz to Verdun. Between those cities, the towns and villages are miserable receptacles of filth and poverty." (*Jacob's View of Agriculture in Germany*, &c. pp. 435, 436.)

Besides wheat, oats, and barley, the other principal articles of culture are turnips, flax, hemp, and oleaginous plants.

Moselle furnishes about 180,000 hectolitres a year of second-rate wine, the best of which is the red wine produced in the arrond. of Metz. The white wines are mostly light, and *de peu de durée*. (*Jullien*, 42.) Though the pastures are good, all kinds of live stock, except hogs, are said to be inferior. Quills and honey are important articles of rural produce; cantanides are collected in summer near Metz. In 1834, of 153,968 properties subject to the *contribution foncière*, 84,651 were assessed at less than 5 fr., and 22,318 at between 5 and 10 fr.; only 95 were assessed at 1,000 fr. or upwards. From which is every where abundant, and usually of good quality, is extensively produced and wrought, especially in the arrond. of Thionville. There are many potteries and some glass factories in the dep. Lorraine is famous for its linens; but the value of those produced in this dep. does not exceed 1,800,000 fr. a year. Woollen cloths, lace, paper, glue, and leather are the other principal products. Manufacturing industry may, in fact, be said to have originated and grown up in this dep. since the revolution; but in the interval since that event, has made considerable progress. Moselle is divided into 4 arronds.; chief towns Metz, the cap., Briey, Thionville, and Sarre-union. It sends 6 mems. to the Ch. of Dep. Number of electors, in 1834, 39, 1741. Total public revenue, 11,311, 14,577,481 fr. (*Hugo*, art. *Moselle*, & French *Official Tables*.)

MOSELLE (an. *Mokella*), a river of W. Europe, flowing through the E. part of France, and the S. part of Rhenish Prussia; its basin being situated between that of the Nahe to the E., and the Meuse to the W. It rises in the Vosges dep. and mountains, about lat. 49° N., long. 7° E., and runs generally in a N.N.E. direction, with a very tortuous course, to Coblenz, in lat. 50° 22', and long. 7° 33', where it joins the Rhine. Before entering the Prussian dom., it traverses the French depts. Vosges, Meurthe, and Moselle; and separates Dutch Luxemburg from Rhenish Prussia. Its entire course is estimated at nearly 300 m., for about half of which it is navigable. Its average breadth is about 170 yards; its mean depth 6 ft., and its ordinary rate of current about 1½ m. an hour. Its principal affluents are the Madon, Meurthe, Sille, Sarre, and Sure; Epinal, Toul, Metz, Thionville, Treves, Traubach, and Coblenz are on its banks. The surrounding country is subject to its inundations, which do much damage; but it is of immense utility as a channel of internal communication, large quantities of timber, slates, coal, charcoal, brandy, salt, potash, oak bark, glass and earthenware, and wine being sent by it to the Rhine. (*Dict. Géog.*; *Schreiber's Guide du Rhin*, &c.)

MOSTAH, a town of European Turkey, pach. Bosnia,

and sandjak Herzegovina, of which it is the cap., on the Narenta, crossed here by a Roman bridge, 48 m. S.W. Bosna Seral; lat. 43° 20' N., long. 17° 52' E. Pop. probably under 10,000. It is surrounded by crenellated walls, and its principal streets are on the right bank of the river, about ½ of the town being on the other side. It has a celebrated manufacture of swords and fire-arms, besides an extensive traffic in cattle, corn, and wine, brought thither from a great distance. (*Stein, Dict. Géog.*)

MOSUL, a city of Asiatic Turkey, pach. of Bagdad, chiefly interesting as being near the site of Nineveh, the celebrated cap. of the first Assyrian empire. It stands on the W. bank of the Tigris (here very rapid, 300 ft. broad, and crossed by a bridge of boats, as well as an older one of stone), 153 m. N.N.W. Bagdad, lat. 36° 21' N., long. 43° 11' E. Pop. according to Kinnel, 35,000; of whom, about 9,000 are Christians, 1,500 Jews, and the rest Arabs, Turks, and Kurds. The city is so near the level of the river, that its streets are often flooded; and, like almost every other town in Turkey and Persia, it is in a declining state, its walls being broken down, and its best buildings crumbling into ruins. It has seven gates, and the castle, now in ruins, occupies a small artificial island in the Tigris. Streets narrow and irregular. Houses built partly of stone, partly of plastered brick, with vaulted roofs and ceilings, surrounded by flat terraces. The mosques of which there are several that possess considerable beauty, the coffee-houses, khans, hammams, and bazars, are handsomer than in most Turkish towns, and the market is well supplied with provisions from Kurdistan. The Greek Christians have nine churches, and there is a Dominican convent. The principal ornaments of the city are, a college, the tomb of Sheikh Addul Cassim, and the remains of a fine mosque, the minaret of which was built by Noureddin, sultan of Damascus. West of the Tigris, the environs are wholly uncultivated; and this circumstance, combined with the great extent of the cemetery close under the walls, gives it a gloomy and melancholy aspect.

Mosul is under the separate jurisdiction of such of two taiks; it formerly had a large caravan trade with all parts of Asia, but has lost much of its commercial importance; it still, however, carries on a trifling trade with Bagdad and Asia-Minor; to the former of which it sends, on rafts down the Tigris, gall-nuts and copper, from Kurdistan and Armenia, receiving in return Indian commodities, afterwards forwarded to Diarbekr, Orfa, Tokat, Aleppo, &c. Its only manufacture is that of coarse blue cotton cloths, used by the lower orders of the pop.

The climate is proverbially healthy, the average temp. of summer not exceeding 66° Fahr.; but in spring, during the floods of the Tigris, epidemics are common, though not often fatal. Several malarial fevers are found within a short distance of the town, and are much resorted to for cutaneous diseases. The geological formation of its immediate vicinity consists, according to Ainsworth, of solid beds of massive, compact, and granular calcareous gypsum, arranged in horizontal strata, not fossiliferous, of a bluish white colour, and extensively quarried as marble. Superimposed on the gypsum is a thin formation of a friable limestone, abounding in shells, and forming the common building stone of Mosul, as it probably also formed that of the ancient Nineveh. (*Kinnel*; see also *NINEVEH*.)

MOULINS, a town of France, cap. dep. Allier, on the river of that name, which is here crossed by a handsome stone bridge of 13 arches, in a fertile plain, 159 m. S.S.E. Paris; lat. 46° 34' 49" N., long. 3° 20' 14" E. Pop., in 1836, 14,502. Streets narrow and irregular, but clean and well-paved; houses chiefly of brick, but a few also of stone, especially in the principal avenue, the *rue de Paris*. It has 3 public squares, that of the Allier being by far the largest and best built. It is well supplied with water from numerous fountains. The chief public edifices are the churches of Notre-Dame and the Visitation, the royal college, established in the suppressed convent of the latter, the town-hall, hotel of St. Cyr, and a recently erected hall of justice. It has also 2 large hospitals, barracks, a public library with 20,000 vols., a museum of natural history, and a small theatre. Several fine walks run in different directions out of the town; and in the neighbourhood are extensive vineyards, and mulberry-plantations for breeding silk-worms. Coal and limestone are wrought at a short distance from the town, and are articles of considerable trade. Moulins is the seat of a tribunal of primary jurisdiction and commerce, a chamber of manufactures, and a society of agriculture, sciences, and arts; it has a large manufacture of cutlery, especially scissors, which are highly esteemed, and smaller establishments for making coarse cotton and woollen fabrics, haberdashery, and hats, with steen corn-mills, glass-houses, and tanneries. It has a considerable trade in corn, wine, silk, timber, coal, and cattle, chiefly with Orleans, by the Loire navigation; but also with Bourges, Maçon, &c.

Moulins, which existed as a town so early as the 11th century, became the residence of the Dukes of Bourbon, in 1368. A famous assembly convoked here in 1565, by Catherine de Medici, was followed by the long and sanguinary war of the league. (*Hugo*, art. *Alfort*, &c.)

**MOUNT-SORREL**, (properly, *Mount Soar-hill*), a market-town of England, in E. Goscote hund., co. Leicester, pars. of Rothley and Barrow-upon-Soar. Pop. of township, in 1831, 1,602. It derives its name from being situated close to a steep craggy hill of red granite, which rises immediately from the Soar. On its highest point there formerly stood a fortress, which, being taken by Henry III., was soon after entirely demolished. The town, built along the great road between London and Nottingham, consists chiefly of houses constructed of granite: the principal buildings are, the town-hall (in which the petty sessions for the hund. are held), a church, subordinate to that of Barrow, and three places of worship for dissenters.

Mount-Sorrel has some share in the hosiery trade of Leicester; and it has derived much benefit from its position on the Great-North-road; but this advantage it is likely to lose, from the recent opening of the Midland Counties Railway. Markets on Monday.

**MOUZOUK**. See **FEZZAN**, I. 836.

**MOZAMBIQUE**, a city and sea-port of E. Africa, cap. of a colony belonging to the Portuguese, lat. 14° 49' S., long. 40° 45' E. Pop. 3,000? It stands on a crescent-shaped island of coral, very low and narrow, and scarcely 1½ m. in length, near the entrance of a deep inlet of the sea, which forms its harbour. The fort, which has six bastions and eighty cannon, is in bad repair: the city comprises a large square and several narrow, dirty streets lined with lofty houses fast falling to decay. The governor's palace is an extensive stone building, with a flat lead roof, and a square court in its centre. Three churches, an old town hall, and hospital, are the only other public edifices. Black-town, at its S. extremity, is wholly inhabited by negroes, and consists of bamboo and osier huts.

The administration of the colony is vested in the governor, aided by a council comprising the bishop, the commander of the troops, and the chief civil minister; but it is extremely corrupt, and nearly all the functionaries, both civil and military, are criminals exiled from Portugal. Exclusive of about 500 Portuguese and Creoles, the pop. consists of free blacks and slaves, with about 800 Arabs and Banyans, chiefly engaged in petty trade and handicraft. The irregular life led by the Europeans, and the general insubricity of the climate, prevent any increase in the white pop.; and, at an average, of 100 soldiers 7 only survive a residence of five years. The rural population is in the most degraded state; and, although the soil be naturally rich and productive, the culture of cotton, indigo, sugar, and other articles of commerce is wholly neglected. Rice, millet, and manioc, are raised almost without labour; furnishing, with cocoa nuts, almost the entire food of the slaves. The commerce of Mozambique has greatly decreased, in consequence of our exertions to suppress the traffic in slaves; but, though much diminished, the trade is still carried on to a considerable extent both with Brazil and Arabia. These slaves, who are chiefly of the tribe of Monjores, and brought from the centre of the continent, a distance of 40 or 45 days from the colony, are procured from the native merchants in exchange for salt, shells, tobacco, coarse cloths, &c.; goods costing about 2 dollars will bring in, as the case may be, either a slave, or an elephant's tusk, weighing from 60 to 80 lbs. of ivory; hippopotamus' tusks, gold-dust, cinnamon-root, gums, and amber, are the other chief exports: the imports comprise tea, sugar, coffee, cotton and woollen cloths, with other articles from Diu, Dennaun, and Goa. A duty of 164 crusadoes is levied on every slave exported; all other imports and exports are free of duty.

Mozambique was first visited by Vasco da Gama in 1498; and in 1506 Albuquerque made it the centre of the Portuguese possessions in this part of the world, and the seat of the viceroy of the African colonies. When the Portuguese lost their Indian possessions at the commencement of the 17th century, Mozambique began to decline, and has ever since been in a languishing state. The territory, however, still extends from C. Delgado northward to Delagoa Bay southward, having a length of coast exceeding 1,400 m., and comprising, besides the cap., the several settlements of Ibo, Pomba, Conducia, Mokuaba, and Quilimane. The channel between the E. coast of Africa and Madagascar is called the Mozambique Channel. (*British Africa*, I. 202-204, &c.)

**MUHLHAUSEN**, a town of the Prussian dom., prov. Saxony, reg. Erfurt, cap. circ., on the Unstrut, 29 m. N.W. Erfurt. Pop., with its suburbs, in 1836, 12,050. (*Berghaus*.) It is surrounded by a high wall, flanked with towers, and environed by a ditch; has an antiquated appearance, several Lutheran churches, a gymnasium, 3 hospitals, and an orphan asylum; and is the seat of a judicial court for the town and circ. It has manufac-

tures of woollen and linen cloths, carpets, &c.; with dyeing-houses, fulling and oil mills, distilleries, breweries, and tanneries, and an active trade in corn and dyeing drugs. (*Von Zedlitz's Beytraege*.)

**MULHAUSEN**, or **MULHOUSE**, a town of France, dep. Haut-Rhin, cap. cant., on the Ill, 22 m. S. Colmar, and 16 m. N.W. Basle. Pop., in 1836, ex. com., 13,789; or with com., 16,932; exclusive of about 7,000 individuals, who come daily out of the neighbouring communes to work in the various factories. It is divided into the old and the new town. The former, entirely surrounded by the Ill (here crossed by several bridges), though irregularly laid out, has tolerably broad, well-paved, and clean streets, and some good houses. The Protestant and the R. Catholic par. churches, the synagogue, town-hall, college, arsenal, and hospital, are its principal public edifices. In one of its squares is a column erected to the astronomer Lambert, born here in 1728. The new town, which extends S. on the S.E. as far as the canal uniting the Rhine and Rhone, is handsomely laid out, and has numerous handsome residences, with the hall of the Society of Industry, the exchange, the chamber of commerce, &c.; it has also a capacious basin on the canal.

Until about the middle of last century, Mulhausen had only a manufacture of woollen cloths; but in 1745 cotton printing was introduced, and it is now one of the principal seats of the cotton manufacture in France. The cotton prints and muslins of Mulhausen and its neighbourhood are second only, as respects the perfection and variety of their patterns, to the silk goods of Lyons. (*Bourgeois's Rip. on Switzerland*, p. 84.) The manufacturers have, in many instances, branch establishments in other parts of Haut-Rhin and in the neighbouring depts.; but Dr. Bowring states that many of their mills and factories are mortgaged to the inhuabs. of Basle; and, in fact, Switzerland furnishes considerable capital to the manufacturers of Alsace. (See art. **RHIN-HAAR** in this work.) Hugo says that about one fifth part of its cotton goods are sent out of France. The workpeople are badly clothed, dirty, and lodge generally in cellars, or other comfortless dwellings; but of late efforts have been made, by some of the more wealthy manufacturers, to improve the lodgings of the workpeople in their employ. Wages are good: cotton printers of the first class get from 24 fr. to 3 fr. 50 c. a day; inferior workmen, from 1 fr. to 14 fr.; women, an average of 1 fr. 20 c.; and children, from 25 to 43 c. a day. Weavers (men and women) and male cotton spinners get from 14 fr. to 3 fr. a day; females engaged in cotton spinning, from 75 c. to 1 fr. 10 c.

Intemperance is not so prevalent here, as among the cotton weavers of the dep. du Nord; and, according to Villermé, the proportion of illegitimate children is but little above the general average of France.

The spinning mills at Mulhausen are not in a flourishing condition, owing, in part, to their being obliged to use cotton imported by way of Havre or Marseilles. In point of fact, however, they are totally unable to withstand the competition of the English; and since Manchester and Glasgow cotton twos have been admitted at a slight duty, as low as No. 170, they have ceased to spin any high numbers. Woollen cloths, hosiery, straw hats, morocco leather, and beer, are the other principal goods made at Mulhausen, which has also a brisk trade in iron, hardware, and agricultural produce. Before the Revolution, this town was the cap. of a small republic allied to Switzerland. It was annexed to France in 1798, and has rapidly increased since 1820. (*Hugo*, art. *Haut-Rhin*; *Villermé*, *Tableau des Ouvriers*, i. 14-60; *Bourring's and Symons's Reports*, &c.)

**MULLA**. See **HEBRIDES**.

**MULLINGAR**, an inland town of Ireland, prov. Leinster, co. Westmeath, of which it is the cap., on the Droghda, 44 m. W. by N. Dublin. Pop. in 1821, 3,684; Droghda, 4,225. It consists of one principal street, running E. and W. with several diverging streets and lanes. It has a par. church, a very large R. Catholic chapel, a convent, a Presbyterian and a Methodist meeting-house, a large barrack, and the prison, court-house, and infirmary for the co. Though not an incorporated bor., it sent 2 mems. to the Irish H. of C. till the Union, when it was disfranchised. It has two schools, partly supported by the Educational Board, one attended by about 250 boys, and the other by above 400 girls. Courtsleet and baron, for small debts, are held every Thursday; and a court of record, with jurisdiction to the amount of 100l. The assizes for the co. are also held here; with general sessions in Jan., April, July, and Oct.; and petty sessions on Saturdays. It is a com. built on the radiating plan, contains 100 cells and 15 other rooms for prisoners. It is a large market-town for corn, butter, cattle, and other agricultural produce, having an easy communication by the royal canal, which nearly encircles it, with Dublin on the one hand,

and the Shannon on the other. It has two tanneries, and a brewery. Markets on Thursdays; fairs, inferior only to those of Ballinasloe, for the sale of cattle, on April 6, July 4., Aug. 25., and Nov. 11., the last chiefly for horses. Post-office revenue, in 1830, 872*l.*; in 1836, 1,024*l.*

**MUNICH** (Germ. *München*), a city of S. Germany, the cap. of Bavaria, highly interesting on account of its collections of the fine arts, on the Isar, crossed here by 3 bridges, about 220 m. W. Vienna, and 118 m. E. S.E. Stuttgart; lat.  $48^{\circ} 8' 20''$  N., long.  $11^{\circ} 34' 30''$  E. Pop., in 1840, 106,537, incl. military. The city stands in the midst of a plain, which is neither fertile nor picturesque, but is one of the most elevated in Europe, being nearly 1,600 ft. above the sea. In the last century it was only a second-rate fortified town, with castellated gates, and quaint ancient-looking houses; but since the beginning of the present century, new quarters and suburbs have so far extended themselves beyond the walls, that the buildings now occupy nearly double the extent of the old town. "Munich," says the author of Germany and the Germans, "has kept pace even with Vienna in the march of modern improvement. This is every where visible; for we see new and splendid streets extending in all directions, fine palaces and public edifices, many of them magnificent, surrounded by extensive pleasure-grounds with fine walks and drives: in short, every object shows that it is flourishing beneath the sunshine of peace. Indeed, next to Berlin, Munich is the third city in the Germanic empire; for though Dresden, from its beautiful localities, is more captivating, yet this is the more striking: add to which, the one is dull and stationary, while the other is lively, attractive, and continually advancing in prosperity." (H. 319.) It has, however, an unfinished appearance, in consequence of the open spaces that intervene here and there between the numerous edifices, many of which are still incomplete. The old town comprises numerous streets, diverging from a common central square, called the *Haupt-platz*, and running towards the walls, which form round it a species of irregular circle. A large and broad street runs from N.W. to S.E., called in different parts, the *Neuhäuser Strasse*, *Kaufinger Strasse*, and the *Thal*. The *Sendlinger Strasse* is another leading avenue, and two narrow lanes, one of which passes through *Max-Joseph's-platz*, one of the finest squares in Europe, lead to a fine suburban line of streets. The *Ludwig's Strasse*, *Karl's-platz* and *Maximilian's-platz* skirt the town on its W. and N. sides. The different public edifices that form the principal glory of Munich are chiefly on its N. side. Here, also, is the *Caroline-platz*, in the centre of which is an obelisk, 100 ft. high, formed partly out of cannon taken by the Bavarians in the late war. An equestrian statue of the elector Max. I., by Thorwaldsen, decorates the *Wittelsbacher-platz*. The cathedral, a large brick pile, erected at the close of the 15th century, has 2 towers, 333 ft. high, and a fine monument of the emperor Louis of Bavaria. The church of the Theatines (so called from Caraffa, Bishop of Theate, the founder of the order) is a large structure in the Italian style, with a central dome flanked by 2 towers. The Jesuit's church, built at the end of the 16th century, is remarkable for its wide roof unsupported by pillars, as well as for 2 fine porticoes of marble, which form its grand entrance: it is 280 ft. in length, and 14 ft. wide; has 11 altars and a noble organ, with several monuments, one of which, by Thorwaldsen, to the memory of Prince Eugene Beauharnois, son-in-law of Napoleon, is one of the finest works of its kind. The church of St. Louis, in the Ludwig's-strasse, a brick building faced with marble, in the Byzantine Gothic style, has 2 towers, 220 ft. above the basement, and the nave is 250 ft. in length. The church of All Saints, recently finished, has some fine carvings and fresco-paintings; but is much smaller, and with fewer pretensions to architectural beauty than those before mentioned. There are several other churches, and 2 have very lately been opened in the suburbs, both on a large scale, and tastefully ornamented with pictures and painted glass windows. A Protestant church, recently built, has a lofty open tower, and is celebrated for a remarkably fine-toned organ. The public cemetery lies outside the S. gate, and is of vast extent; open alike to Protestants and Catholics. Not far from it is the General Hospital, a large building having accommodation for nearly 800 patients. The Royal Palace, or *Königs-residenz*, consists of an older part, built in the 16th century, and comprising 4 irregular court-yards, as well as a more modern part, called *Neubau*, planned on the model of the Pitti Palace at Florence, and fitted up in the most sumptuous style, though not yet completed. The apartments already finished are in the style of those seen in Pompeii, and comprise numerous fresco and encaustic paintings, bas-reliefs, richly carved cornices, &c. At the back of the palace is the *Hofgarten*, a large square planted space, surrounded by arcades, with cafés, shops, &c., not unlike those of the Palais Royal in Paris, the E. side being occupied by barracks. Connected with the

*Hofgarten* eastward, is a kind of park, called the English Garden. The new buildings of the palace face Max-Joseph's Square, on another side of which is the opera-house, opened about 14 years ago, one of the largest and most elegant theatres in Germany; it is fitted to hold about 2,500 spectators, and is equalled, as respects its performances, only by those of London, Naples, and Milan. Opposite the palace, in the same square, is the new post-office, copied from that of Rome, and in the centre is a statue of the late king, Max. Joseph I., by Rauch of Berlin.

The great glory of Munich, however, consists in its fine galleries of paintings and sculpture, called respectively the *Pinacotheca* (from *πίναξ*, a picture, and *θησαυρος*, a repository), and the *Glyptotheca* (from *γλυπτος*, a carving, and *θησαυρος*, a repository). The first of these, in the Baier Strasse, is in the Palladian style, with 2 wings, and has a front 500 ft. in length: the public entrance is at the E. end, the corridor is adorned with allegorical frescoes in compartments; and the collection, which, for specimens of the Flemish and Dutch schools, is one of the finest in the world, occupies 7 splendid halls, and 23 adjoining cabinets on the first floor, the basement story being devoted to the reception of drawings, enamels, mosaics, &c. The collection of drawings comprises about 9,000, including 5 by Raphael, 30 by Fra Bartolomeo, and several by Rembrandt, Albert Durer, and other Dutch and German artists. The paintings are limited to 1,500, and consist of the *chefs-d'œuvre* from the king's collections, including the galleries of Düsseldorf, Mannheim, Deux-Ponts, Schleisheim, and other galleries. Two of the apartments are devoted to the German school, and include the *élite* of the Boisseree gallery, purchased in 1837 for 375,000 florins, comprising specimens by Albert Durer, J. von Eyck, Schorel, Hans Holbein, &c. Three of the rooms contain pictures of the Flemish and Dutch masters, the principal of which are the "Murder of the Innocents," "Fall of the Damned," and other splendid works of Rubens; the "Village Fête" of Teniers; the "Musical Party," by Netcher; the "Girl with the Pitcher" and "The Mountebank," by Gerard Dow; "The Wise and Foolish Virgins," by Schalken, besides numerous highly-coloured works of Vanderwerf and Rembrandt, with various portraits of Vandeyck. The specimens of the Italian school, comprised in two apartments, bear no comparison with the invaluable pictures just mentioned; but there are a few fine works by Raphael, Giulio, Titian, Domenichino, Annibal Carracci, and Carlo Maratti. Belonging to the Spanish school, also, may be noticed "The Beggars" of Murillo, several works of Espinosa, and some portraits by Velasquez. There are also a few paintings of the English school, and among them is the well known "Heading of the Wall," by Sir D. Wilkie. The Glyptotheca in the Königs-platz is a chaste and elegant structure, in the Ionic style, erected like the last by the Baron von Klenze, and has a noble central portico, the sides being adorned with statues in niches. The collection is distributed in 12 rooms, each of which is devoted to a distinct epoch in the art, and decorated in accordance with its contents. The walls are of scagliola-work, the floors of marble, and the ceilings richly adorned in fresco and stucco work. The marbles from the temple of Jupiter Panhellenius, in Egina, purchased by the present king for 10,000 sequins, occupy an entire room, and are particularly valuable, from their being the only extant specimens of the Egyptian school of statuary. The *Iliadens*, however, is said to be "the gem of the collection," and one of the finest existing specimens of ancient art. The Roman hall far surpasses the rest in the splendour of its decorations; but the works that it contains are said to belong rather to the declining stage of the arts. The hall of modern sculpture has, among other works, the Paris and Venus of Canova, copied from that at Florence; the Adonis of Thorwaldsen, and a bust of the king by the same artist.

The Leuchtenberg gallery, formed by the late Prince Eugene Beauharnois, comprises a choice, though not very extensive collection, including, among other *chefs d'œuvre*, Murillo's famous Virgin and Child, with several cabinet pictures, by Raphael, Vandeyck, Rembrandt, and Velasquez, with numerous works of modern French artists, and a few sculptures by Canova. The present king of Bavaria is certainly a liberal and perhaps, also, a judicious patron of art; and nowhere is the modern German school of painting to be seen to greater advantage than in Munich. Several artists are kept in the king's employ, and an Academy of Arts has a triennial exhibition, supported by government, with salaried professors and pensioned students. This exhibition is encouraged and, in part, supported by a society which devotes annually about 8,000 fl. to the purchase of modern pictures. Munich was the birth-place of Semmelfelder, the inventor of lithography; and it has many eminent professors of that art, who have transferred to stone some of the most celebrated works of the Pinacotheca and Glyptotheca.

The University of Munich, originally founded at In-

goldstadt in 1472, and removed thither in 1826, is the principal school of learning in Bavaria. It comprises 20 professors of four different faculties, with 1,300 students, almost exclusively Bavarians, besides a library of about 160,000 vols. Philological and theological seminaries, as well as two gymnasia, are attached to the university; and the town has polytechnic, central, and subscription schools. But however high the celebrity of Munich as respects music and the fine arts, the censorship of the press is fatal to the progress of literature, and to all the higher branches of philosophy. The royal library, lately removed to a noble building of great length, and 3 stories in height, is equalled only by that of Paris, the best authorities estimating its contents at 540,000 printed books and 16,000 MSS. The reading-room is open for five hours during three days of the week; but the books may not be withdrawn from the building. The collection of engravings amounts to 36,000; and there are about 10,000 Greek and Roman coins. The museum of natural history is small and poor, containing but few specimens of foreign plants or animals; and the Brazilian collection, made by Spix and Martius during their travels in S. America, though originally good and well selected, has been so much neglected as to be unworthy of notice. Munich has no very important manufactures, but comprises establishments for bronze-casting, iron-works, sugar-refineries, silk-throwing mills, and tobacco manufactories. Its telescopes are highly celebrated, and its porcelain is exported, like that of Dresden, to different parts of Europe. The last branch of industry is under royal patronage, and is carried on in a large establishment at Nymphenburg, about 3 m. distant, where also is a handsome palace of the king, with parks, menageries, &c., completed at the end of the 17th century.

Munich owes its present distinguished position, as the Athens of S. Germany, principally to the patronage and encouragement of the reigning monarch. It is very doubtful, however, whether he deserves any considerable portion of the praise that has been lavished upon him on this account. On the contrary, those who are best acquainted with Bavaria affirm that the embellishment of the capital has been effected at the expense and injury of the rest of the kingdom; and that the vast sums lavished on buildings and pictures would have been far better expended on the improvement of roads, and such like public works.

The immediate environs of Munich abound in taverns and gaudes, which are the favorite resort of the middle classes. Beer is the favourite beverage, and waltzes are danced for 6 or 8 hours, without intermission. The beer-houses are exceedingly numerous, and beer is drunk in immense quantities. Some of the breweries are upon a very large scale. (See *BAVARIA*, I. 309.)

The inhabs. are likewise fond of good cheer in other respects, eating and drinking constituting with them the chief business of life. The morals of the inhabs. are alleged to be at a very low ebb; and, according to the government returns of 1834, there were in that year 1,291 natural, and 1,330 legitimate children. These returns, however, are probably but little to be depended on; and the probability is that Munich is nearly, in this respect, on a level with the other caps. of Germany, where large garrisons are kept. Seven newspapers and magazines are published in Munich, some daily, one or two weekly, and the rest at longer intervals; besides which several literary clubs and reading-rooms are established in the city. It has also a yearly festival (*Folk's-fest*) in the early part of October, established by the present king for the purpose of encouraging agriculture, frequented by farmers and peasants, who bring with them the finest specimens of cattle in competition for prizes offered by government. Poney races and shooting matches take place at this fair; and a high sloping bank, running along the meadow in which it is held is cut, into steps, like a Roman amphitheatre, commanding an excellent view of the whole scene.

Munich was founded by Henry, Duke of Saxony and Bavaria, in 962, on a site belonging to the monks of Schafflar, from whom it takes its name. Otto IV. encircled it with walls in 1157, and in 1632 it surrendered to the Swedes and German Protestants, under Gustavus Adolphus. In the war of 1704, between the Austrians and Bavarians, it fell into the hands of the former, after the battle of Blenheim; and it shared also the vicissitudes of the war of 1740, when the elector made his unsuccessful attempt to attain the imperial crown. In 1796 the French army, under Moreau, approached Munich, and obliged the elector to make a separate treaty. The French again occupied Bavaria in 1800, and from the battle of Hohenlinden till 1813 the country remained in alliance with France. (*Murray's Handbook for South Germany*, pp. 27—49; *Strang's Germany*, II. 359—383.; *Germany and the Germans*, II. 315—326.; *Berghaus; Schaden, Wegweiser durch München*.)

MUNNEEPOOR, an Indep. state of India beyond the-Brahmaputra. (See *CASSAY*.) The small town of

the same name, cap. Cassay, is in a fertile valley, about 400 m. N.E. Calcutta; lat. 24° 20' N. long. 94° 30' E.

MUNSTER, a city of the Prussian states, cap. prov. Westphalia, and of a reg. and circ. of the same name on the Aa, a tributary of the Ems. Pop., 1838, 15,763. It is pretty well built, is the seat of a R. C. archbishop, of the government, and of the tribunal of appeal for the prov. It has a seminary or college for the instruction of Catholics in theology, a gymnasium, a veterinary school, a botanical garden, and a public library. Principal public buildings, the cathedral, the church of St. Lambert, and the episcopal palace, now occupied by the governor. Münster has manufactures of woollen stuffs, and starch, with tanneries and breweries; and a considerable commerce in the products of these, and linen fabrics, hams, and other Westphalian produce. It is united by canals with the Ems, and also with the Verbe, flowing into the Zuider Zee. The treaty of Westphalia was signed in the town-house, in 1648. The famous fanatic Bocold, surnamed John of Leyden, the leader of the Anabaptists, made himself master of this place in 1534; but the town being subsequently taken by the bishop, John of Leyden and two of his accomplices were put to death, after being confined for a while in iron cages, still preserved in the church of St. Lambert. (*Bergaus, &c.*)

MUNSTER, one of the 4 great provinces into which Ireland is divided, comprising the S.W. portion of the island, and the cos. of Clare, Kerry, Limerick, Cork, Tipperary, and Waterford. (See *IRELAND*.)

MURCIA, a prov., and formerly a kingdom, in the S.E. of Spain, between lat. 37° 45' and 39° 25' N., and long. 0° 40' and 3° 45' W., bounded N. and N.W. by Castile, E. by Valencia, S. by the Mediterranean, and W. by Andalusia. Greatest length, 140 m.; do. breadth, 120 m. Area, about 8,000 sq. m. Pop., in 1833, 474,315. It is intersected by numerous ranges of mountains separated by extensive valleys formed by the Segura and its tributaries. The Sierras Segura and Pinos skirt the country westward, and a chain of mountains runs northward from Carthage, the highest point in the province being the Sierra España, which rises 5,800 ft. above the sea. The mountains are chiefly of limestone, interspersed here and there with other formations. Lead and copper abound; but no mines are wrought. The climate on the sea-coast, and among the mountains, is temperate and delightful, but oppressively hot in the plains. The heat in summer occasionally rises above 100° Fahr. in the shade; and the winters are so mild, that frost is almost unknown. Rain seldom falls, and the sky is usually so clear and blue as to have caused Murcia to be called *el reino serenissimo*. The soil, except on the banks of the Segura, is sandy, dry, and unproductive; above two thirds of the surface is incapable of cultivation, and only about one half is fit even for pasture: indeed Murcia is one of the most barren districts in Spain. The *huerta*, however, which lies close to the Segura, is extremely fertile, producing rich crops of wheat, barley, rye, rice, maize, vegetables and fruit, particularly oranges, lemons, pomegranates, and melons; mulberry and olive trees are also raised in great quantities, and the evergreen oaks, as well as pines, clothe the sides of the mountains. Silk and oil are extensively produced, with smaller quantities of saffron and wine. The *esparto* rush grows luxuriantly in the neighbourhood of Carthage, and with *barilla*, forms a considerable article of trade. The cattle of Murcia are not numerous, consisting principally of sheep and goats, with only a few horned cattle: the pigs, owing to the abundance of oaks, are almost equal to those of Valencia. Game is abundant, and the coast swarms with a variety of fishes. Wolves, foxes, and wild boar, inhabit the mountains. The manufactures are unimportant, being principally limited to the production of coarse linens, silk-stuffs, and earthenware and soap. Carthage is the only port, has a considerable export trade in cutlery, henn, ribbons, wine, soda, barilla, and saffron; but the roads of the interior are so bad as almost to prevent intercourse. Three large fairs are held in Sept. at Murcia, Lorca, and Albacete. The inhabs. are proverbial, even in Spain, for pride, apathy, and indolence. Except at Carthage, the principal inhabs. of which are of French, English, or Italian descent, all classes lead a dull monotonous life, spending their time either in eating and smoking, or else in total inactivity. Agriculture is pursued only from necessity, commerce languishes, and education and science are at the lowest ebb.

Murcia was the part of Spain first conquered by the Carthaginians, who founded *Nova Carthago*, anno 202 B.C. The country possessed, with the rest of the peninsula, into the hands successively of the Romans, Goths, and Moors, the last of whom invaded it in the beginning of the 8th century. It formed a part of the caliphate of Cordova till 1144, when it was annexed to the kingdom of Granada, to which it belonged down to 1266, when it was taken by Alonso X. of Castile, and has since formed one of the provs. of Christian Spain. (*Mifano; Mod. Trav.; Inglis*, II. 208—211.)

MURCIA, a city of Spain, cap. of the above prov., on the N. bank of the Segura (crossed here by a "magnificent" stone bridge of 2 arches), 31 m. N.-N.W. Cartagena, and 260 m. S.E. Madrid, lat. 38° N. and long. 1° 14' W.; pop., acc. to Miñano, 35,390. It is situated in a vale which for beauty and fertility equals any part of Spain. It was formerly fortified, but is now open on every side, and has narrow though clean streets, lined with mean houses, sometimes ornamented with grotesque carved-work. Gardens often skirt the streets, as at Seville, and the walls in many parts are overtopped by the heavily laden orange trees and branching palms. There are 4 considerable squares, the largest of which is used for a bull-ring; the principal public buildings are the cathedral, 11 par. churches, the bishop's palace, 5 colleges, a town-hall, custom-house, and hospital. The cathedral is of mixed architecture, with a Corinthian portico and Gothic dome. It formerly possessed great riches in plate and jewellery; but these were abstracted during the late war, and it has now only a few pictures. The chief object of attraction at present is its tower, 260 ft. high, which, like that of Seville, may be ascended by a spiral walk or inclined plane, accessible even to horsemen. In the *Plaza real* is a fine marble column, formerly surmounted by a statue of Ferdinand V.; and there are four public walks, one of which is formed by a mole or quay skirting the river. The botanic garden is small and ill-arranged. The silk manufacture of Murcia, which once employed some 10,000 hands, now requires only 400. The silk is prepared by hand labour, and cannot therefore come into competition with that of Valencia, which is for the most part produced by machinery. Considerable quantities of coarse cloth are made for the supply of the poor; and there is a manufactory of saltpetre farmed by government to a company, which makes about 1,200 arrobas yearly—only one-tenth of the quantity produced at the close of the last century. About 3 m. from the city is a gunpowder mill, bound to furnish government with 60,000 arrobas a year; but the quantity produced seldom exceeds 32,000 arrobas a year. Most of the inhabs. are supported by agriculture: the land in the vale of Murcia produces two crops a year—wheat and lentils, wheat and maize, or wheat and beans—and may be estimated to return about 5 per cent. to a purchaser (*Jochib. ii.* 214.). Provisions, owing to a heavy market-duty, are somewhat dearer than at Malaga and Seville. The price of labour is from 4 to 5 reals a day; female servants receive a dollar per month, and men from 1½ to 2 dollars.

Murcia is very ill provided with accommodation for travellers. Miñano mentions sixteen *posadas* or inns; but they are little better than wretched pot-houses, kept by *gitanos* or gypsies, a race very thickly scattered over all the S. provs. of Spain, and following the trade of a butcher, tinker, or low innkeeper. The inhabs. of the cap. are equally sluggish, gloomy, and reserved, with those in the rest of the province. The African character is more strongly marked in them than in other Spaniards; and the cast of countenance is, in general, very different from that of the Andalusian Moors. (*Townsend, lib. 152—159.; Cook's Sketches in Spain, i.* 35.)

Murcia was little known before the invasion of the Moors, when it was besieged and taken, A. D. 714. It was subject to the caliphate of Cordova from 756 to 1144, when it was annexed to the new Moorish kingdom of Granada. In 1221 it again became subject to Cordova; and, on the dismemberment of that caliphate, was made the cap. of a separate kingdom by Habiél, from whom it was taken in 1266 by Alonso X. of Castile; since which time it has remained in the hands of the Christians.

MURVIEDRO (*Muri veteres*, but more an *Saguntum*), a town of Spain, highly interesting on account of its Roman antiquities, prov. Valencia, on the Canales, about 3½ m. from the Mediterranean, and 15 m. N.-N.E. Valencia. Pop., acc. to Miñano, 6,275. It stands at the foot of a mountain of black marble, and at the S.E. extremity of a large and well irrigated plain; has long, tortuous, narrow streets, and is surrounded by walls flanked with small round towers. The houses in the interior have a mean and gloomy appearance; but the suburbs are more airy and agreeable, and perfectly level. Two churches, three old convents, and a governor's palace are its only public buildings. Murviedro formerly exported considerable quantities of brandy; but its chief dependence, at present, is on the export of the oil, wine, wheat, barley, carobs, and fruit, grown in the adjacent district, sent coastwise to Valencia, and other ports of the Mediterranean.

"Murviedro," says Mr. Swinburne, "seems to occupy the same ground as the ancient Roman city; but, in all probability, the Saguntum of Hannibal was built on the summit of the hills. That the Romans, also, had a fortress on the top is clear, from the large stones and regular masonry on which the Saracens afterwards erected their castle. Half way up the rock are the ruins of the theatre, forming an exact semicircle, about 82 yards in diameter,

from outside to outside: the length of the orchestra, or inner diameter, is 24 ft. The seats for the audience, the staircases, and passages of communication, the vomitoria, and the arched porticoes, are still easily traced. The back part rests against the hill, and some of the galleries are cut out of the rock. Two walls, going off at an angle, serve to turn off the rain water that washes down from the cliff behind. As the spectators faced the N. and E., and were sheltered from the W. and S., nothing could be more agreeable in this climate than such a place of entertainment, open to every pleasant and salubrious breeze, and defended from all winds that might bring them heat or noxious vapours. It is computed that 9,000 persons might be present, without inconvenience, at the exhibitions in this theatre." An attempt was made, at the close of the last century, to repair this noble structure; and, in 1796, a Spanish comedy was represented within its walls; but the plan was never carried into execution. The remains of a circus, also, are still discoverable in the orchards outside the town. It extended to a small river, the bed of which only remains, and which was the chord of the segment formed by the circus. When the Saguntines exhibited their mock sea-fights, called *naumachia*, this bed was undoubtedly filled from the neighbouring canals which still exist. A mosaic pavement, 24 ft. in length and 14 ft. wide, in a very perfect state of preservation, was discovered in 1755, at the entrance of the town; and Ferdinand V. ordered it to be inclosed, but his orders were not carried into effect, and it was, consequently, soon despoiled. Its fragments may still be seen in several houses of Murviedro. "Indeed," says M. Bourgoing, "the city is full of the remains of its antiquity: the walls of the houses, the city gates, and the doors of the churches and inns, are covered with Roman inscriptions."

The ground occupied by the convent of the Trinitarians was formerly the site of a temple dedicated to Diana. A part of the materials served to build the church, and the rest were sold to build *San Miguel de los Reyes*, near Valencia. The castle on the top of the hill presents some interesting remains of Moorish architecture; the fortifications divide the hill into several courts, with double and triple walls, erected on huge masses of rock, laid in regular courses by the Romans. (*Swinburne; Fischer's Valencia, p.* 114.; *Mod. Trav. i.* 288.)

The prevalent opinion seems to be that Saguntum was originally founded by colonists from Zacynthus, who were afterwards joined by Rutuli from Ardea. (*Strabo, lib. iii.; Silius Italicus, lib.* 603.) It appears to have early attained to great wealth and distinction; and being zealously attached to the Romans, it became an object of hostility to the Carthaginians. It was besieged by Hannibal previously to his invasion of Italy; but the strength of the city, and the determined bravery of the inhabs., baffled for nearly 8 months all the efforts of this great general to effect its subjugation. At length, however, it fell into his hands, and 219,000 of the inhabs. being in part put to the sword and in part sold as slaves. They had previously thrown a great part of their wealth into the flames; but the booty was still ample enough to enable Hannibal to reward the valour and devotion of his soldiers, and to facilitate his designs against Italy. (*Polyb. lib. iii.; Livy, lib. xxxi. cap. 9.*) Having been rebuilt by the Romans, it was afterwards famed for its porcelain, mentioned by Martial (*siv. epig.* 108.).

"Sunt Saguntum popula ficta luto."

MUSCAT, a city and sea-port on the E. side of Arabia, prov. Oman, of which it is the cap., about 96 m. N.W. Cape Ras-el-had, lat. 33° 38' N., long. 58° 37' 30" E. Pop., estimated by Fraser at from 10,000 to 12,000, of whom 1,000 are Hindoos, from Sind, &c.; and the rest a mixed race, the descendants of Arabs, Persians, Kurds, Afghans, Belooches, settled here for the purposes of commerce. The town is situated at the S. extremity of a small cove, shaped like a horse-shoe; and on either side hills, lined with forts, rise almost perpendicularly 300 ft. from the sea. It is built on a slope, rising gradually from the water, which nearly washes the bases of the houses. On this side it has no defence; but the other sides are protected by a wall 14 ft. high, with a dry ditch. Its mosques, minarets, and white terraced houses give it an imposing aspect when seen from a distance; but, on entering, narrow crowded streets, and filthy bazaars, wretched huts, paltry houses, and other tenements more than half fallen to decay, meet the eye in every direction. It has, however, some substantial, and even handsome houses; the palace of the Imam, those belonging to his mother, the governor's, and several others being of the latter description: their form differs considerably from what is usually seen in the towns of Yemen and the Hedjaz, partaking more of the Persian than Arabian style of architecture. Muscat is supplied with water by means of a deep and strongly guarded well, from which a newly constructed aqueduct conveys it to tanks in the different quarters. During July and August it is excessively hot; and the fevers

then prevalent are especially fatal to Europeans. The country in its immediate vicinity is extremely barren; but it improves as it recedes inwards. Dates and wheat are the principal articles of produce; the former being held in high estimation, and largely exported, chiefly to India. A date tree is valued at from 7 to 10 dollars, and its annual produce from 1 to 1½ dollars. The value of estates is measured by the number of date trees comprised within the property.

Muscat is a place of considerable importance, being at once the key to, and commanding the trade of, the Persian Gulph. The dominions of the imam are very extensive, and his government is more liberal and intelligent than any other in Arabia or Persia. He has some large ships of war; and his subjects have some of the finest trading vessels to be met with in the Indian seas. The part of Arabia near Muscat is too poor to have any very considerable direct trade; but, owing to its favourable position, and the superiority of its ships and seamen, it has become an important entrepôt, and has an extensive transit and carrying trade. Most European ships bound for Bussorah and Bushire touch here; and more than half the trade of the Persian Gulph is carried on in ships belonging to its merchants. But exclusive of the ports on the gulph and the coast of Arabia, ships under the imam's flag trade to all the posts of British India, to Singapore, Java, the Mauritius, E. Africa, &c. The pearl-trade of the Persian Gulph is now, also, wholly centered at Muscat. All merchandise passing up the gulph on Arab bottoms pays a duty of ½ per cent. to the imam. He also rents the islands of Ormuz and Kishmee, the port of Gombroon, and some sulphur mines from the Persian government.

In the magazines at Muscat may be found every species of produce imported into, or exported from, the Persian Gulph. Various articles are also imported for the use of the surrounding country, and for the internal consumption of Arabia. Among these, the principal are rice, sugar, coffee from Mocha, cotton and cotton cloth, cocoanuts, wood for building, slaves from Zanguebar, dates from Bushire and Bussorah, &c. Payment for these is chiefly made in specie and pearls; but they also export drugs of various descriptions, ivory, gums, hides, ostrich leathers, horses, a sort of earthen jars, called *marbaban*, to Tranquebar, dried fish, an esteemed sweetmeat called *hutebah*, and a few other articles.

The markets of Muscat are abundantly supplied with all sorts of provision. Beef, mutton, and vegetables of good quality may be had at all times, and reasonably cheap. The bay literally swarms with the greatest variety of most excellent fish. Water is excellent, and is conveyed to the beach in such a manner that the casks of a vessel may be filled in her boats while afloat. Firewood is also abundant, and is cheaper than at Bombay.

Mohammedans pay a duty of 2½ per cent. on imports and exports; and all other nations pay 5 per cent.

Nublar thinks, that Muscat occupies the site of the Mosca of Arrian and other Greek writers (*Voyage en Arabie*, ii. 71. ed. Amst. 1780); a conjecture which seems to be confirmed, not merely by the resemblance of the name, but also by the terms applied by Arrian to Mosca being sufficiently descriptive of Muscat; and as the port is bounded on all sides by rocks, it must now present almost the same appearance as in antiquity. Dr. Vincent, however, though he speaks doubtfully on the subject, is inclined to place Mosca to the west of Cape Rassegate. (*Commerce and Navigation of the Ancients*, ii. 344—347. For further particulars, besides the authorities above referred to, see *Hamilton's New Account of the East Indies*, i. 63; *Frazer's Journey to Khorasan*, pp. 5—19; *Milburn's Orient. Com.*, &c. The longitude given above is that of *Arrowsmith's Chart of the Persian Gulph*.)

MUSSELBURGH, a parl. bor. and market and seaport town of Scotland, co. Mid Lothian, on level ground, at the mouth of the Esk, in the Frith of Forth, 5 m. E. Edinburgh. Pop. in 1831, including Fisher-row, and other environs, 5,361. It is well built; the main street runs nearly E. and W., with a slight curvature, parallel to the bay; and it has a great many subsidiary streets. It has numerous villas; which is accounted for by its vicinity to Edinburgh, and its salubrity. Fisher-row, which contains many modern buildings, and new streets, is separated from Musselburgh, properly so called, by the Esk, the communication between them being kept up by means of 1 wooden and 2 stone bridges, one of the latter being old and little used. The other stone bridge is a modern and handsome structure, after a design by Ronnie. The only public buildings are a gaol, an ancient edifice surmounted by a spire, and the parish church of Inveresk (in which parish the town is situated). The latter, on an abrupt eminence ½ m. from the town, is a conspicuous object in every direction. On the shore immediately adjoining the town on the E., are extensive downs or links, used since 1817 for the Edinburgh races, and for the game of golf, which is much practised here.

Musselburgh has two flax-mills, which employ about 120 hands; and about 200 weavers of sail-cloth and other

fabrics. The manufacture of hats is; also, carried on to a limited extent; and there are brick-works, a pottery, extensive breweries and distilleries, tanneries, and flour-mills. Fisher-row, along with Newhaven, in the parish of North Leith, virtually monopolises the supply of Edinburgh with haddocks and other white fish. A branch of the Edinburgh and Dalkeith railroad has its depot at Fisher-row. The country all round the bay abounds with coal, which, by means of the railroad, is conveyed to Edinburgh, and by another branch of the same railway is taken to Leith, for consumption and export. There are two banks in the town. The harbour dries at low water. The exports are coal, spirits, ale, and farm produce.

The schools are numerous and efficient. Gilbert Stuart, author of a history of Scotland and other works, resided at Musselburgh; and New Hailes, the residence of Lord Hailes, the abolitionist and antiquary, is within ½ m. of the town. Poor-rates have been introduced; average annual assessment, 1,100*l*. In addition to the parish church, it has a *quoad sacra* church, and chapels belonging to the Episcopalian, Associate Synod, Relief, and Independents.

The chapel of Loretto, to the E. of the town, was, before the reformation, a place of great importance; pilgrimages were often made to it; and, in 1530, James V. performed a pilgrimage thither on foot. About ½ m. S. of Pinkie House was fought on the 10th Sept. 1547, the battle of Pinkie, in which the English, under the Duke of Somerset, totally defeated the Scotch. The battle of Preston Pans, on 21st Sept., 1745, between the forces of Charles Edward and the royal army, took place in this neighbourhood, when the latter were completely defeated.

Musselburgh had no parl. bor. till the passing of the Reform Act. It now unites with Leith and Portobello in sending 1 m. to the H. of C. Registered voters in 1840-41, 297. Municipal income, 2,022*l*. Number of councillors, 12. (*Statistics of Scotland, Edinburghshire; Boundary Reports; Chalmers's Calc'd.; Private Information, &c.*)

MYSORE (*Maheshastura*), a prov. of S. Hindostan, forming a state subsidiary to the British, between lat. 11° 30' and 15° N., and long. 74° 45' and 78° 40' E., almost entirely surrounded by the territory of the Madras presidency. Its shape is nearly rhomboidal; greatest length, N. to S., 240 m. by an extreme breadth of about the same. Area, estimated at 28,750 sq. m. and pop. at about 2,500,000. The whole country consists of a table land enclosed on the E., W., and S. by the Ghauts; and varying from 1,300 to 4,600 ft. in elevation above the sea, with a gentle slope towards the N. The Zoonagubdra, Penar, Colair, Coleroon, &c., all rise within this prov., which has, however, no river of much size. The climate is one of the most salubrious within the tropics; the air is temperate and bracing, and the deluging rains, which prevail on either side beneath the Ghauts, are here unknown. The soil, which is mostly of the red and black varieties common in the Deccan, is continually watered by refreshing showers; and produces not only most of the grains and vegetables of other parts of India, but also many of the fruits of Europe. Extensive tracts are overgrown with jungles, especially of the date palm, and from the remains of hedges, &c., the prov. appears at a remote period to have been in a much higher state of cultivation than at present, though it has recovered to a great extent, from its previous devastations, since the period of peace, commencing with the present century. Rice, sesamum, sugar, coffee, betel leaf, castor oil, and coconuts, are the principal articles of produce. Though an inland country, the cocoa palm is almost everywhere abundant, great quantities of salt and soda efflorescing on the soil. About Colar, the poppy is raised, both for making opium and for its seed. Potatoes are grown, and exported to Madras and elsewhere. Tobacco is of inferior quality, and is not much cultivated. The great imperfection of agricultural implements, and the inferiority of the cattle, the fields are very imperfectly ploughed; but the soil is, in many parts, extremely productive, with the aid of little labour. The cottages of the peasantry are, on the whole, neater and more commodious than in most parts of India. They are almost universally constructed of the red soil of the country, and roofed with tiles; nor are the best habitations of different materials, or otherwise distinguished from the rest than by their size, and from being whitewashed. The inhabitants are nearly all Hindoos.

The Mysore dominions are subdivided into three great districts; chief towns, Mysore, the cap., Bevoor, and Chittdroog. The government is nominally in the hands of a native prince, but actually vested in the British resident at Mysore, appointed under the Madras presidency. The subsidiary armed force furnished by Mysore to the British government is undefined, but may be estimated at 4,000 men. The present dynasty of the Mysore sovereigns are supposed to have originally emigrated to this province from Gujrat; but no authentic

records of them exist previously to the 16th century. From 1760 to 1799, Mysore was governed by Hyder Ali and Tippoo Sultan. After a protracted contest with the English, Tippoo lost his crown and life at the taking of Seringapatam. (*Parl. Reports; Hamilton; &c.*)

MYSORE, a town of S. Hindostan, the cap. of the above state, on a lofty hill, 9 m. S. by W. Seringapatam, lat. 12° 19' N., long. 76° 42' E. It was suffered to fall into decay by Hyder Ali and Tippoo, but, under the present dynasty, it has been rebuilt, and restored to its ancient importance. It is enclosed by an earthen wall, and consists of the town (pettah) and fort. The latter, which is an extensive work in imitation of a European fortress, is separated from the pettah by an esplanade, and comprises, besides the rajah's palace, the dwellings of the principal merchants and bankers. The architecture of the town is similar to that of Seringapatam, but the houses are larger and better; they are ranged in regular streets, whitened, and intermingled with trees and temples. S. of the fort is a large and good suburb; and on rising ground, near the town, is the British residency. Mysore is well supplied with provisions, and is considered much more healthy than Seringapatam. (*Hamilton; E. I. Gazetteer.*)

MYTILENE, the ancient Lesbos (*insula nobilis et amena*, Tacit. Hist., lib. vi. cap. 3.), an island of Turkey in Asia, in the Ægean Sea, opposite the coast of Asia Minor, to the north of the entrance to the gulph of Smyrna. It is about 33 m. in length from E. to W., by about 26 in breadth. The strait by which it is separated from the main land varies in breadth from 7 to 10 m. Though in part hilly and mountainous, it has the appearance of a considerable extent of level and very fertile land; and, except in a few places infested with malaria, it is extremely salubrious. The principal products are oil, corn, wine, figs, and other fruits; cotton, timber and pitch, silk, honey, &c. The wines of Lesbos were amongst the most celebrated of the ancient world. They are said by Athenæus (i. 22.) to have deserved the name of ambrosia, rather than of wine, and to have been like nectar when old!

"Hic innocentiæ pecula Lesbii  
Ducet sub umbrâ."—Hor. Od. i. 17.

The wine of the island still continues to preserve some, though but a slender portion of its ancient reputation; very little, however, is exported. The figs are excellent, and large quantities of oil of medium quality are annually shipped for Constantinople and other places. The produce of corn is insufficient for the supply of the island. The timber and pitch are derived from the pine forests, with which the mountains are covered. The town of Castro, on the site of the ancient Mytilene, stands on the E. coast of the island, on the strait separating it from Anatolia. It contains many fragments of pillars, capitals, friezes, &c., but no considerable ancient ruin. It may have from 5,000 to 6,000 inhabitants, and has two harbours, but neither is good. The island can, however, boast of two of the finest harbours in the world, Port Jero, or Olivier, and Port Calmi. The former, in its S.E. angle, has a narrow entrance, but the water is deep, and within it expands into a noble basin, capable of containing the largest fleets. Port Caloni, on the S. side of the island, is a basin, similar to the last mentioned, but of more ample dimensions, nearly, in fact, intersecting the island. It has deep water throughout; but the entrance to it being very narrow, it is but little frequented.

Olivier estimated the entire pop. of the island at about 40,000, half Greeks and half Turks, with a few Jews; but later estimates considerably reduce the number of Turks. There can be no doubt that under an enlightened government Mytilene would speedily recover some portion of her ancient prosperity. Olivier mentions that the singular usage obtains in this island of the eldest daughter succeeding to the paternal property, to the exclusion of her brothers and younger sisters! (*Voyage dans l'Empire Ottoman*, ii. 90.) Most probably the custom has descended from a remote era; but some modifications have, however, been introduced in modern times in favour of the younger sisters.

Lesbos was one of the most celebrated of the Greek islands. It had several cities, of which Methymna and Mytilene were the most celebrated. The latter was distinguished alike by the magnificence of its buildings, the amenity of its climate, its proficiency in the *belles lettres* and philosophy, the number of its great men, and the luxury and refinement of the inhabitants. Epicurus is said to have read lectures in Mytilene; and Aristotle resided in it for two years to profit by the society and conversation of its learned men. At a later period it became, like Rhodes, a favourite resort of those Romans who preferred quiet enjoyment to the turmoil and bustle of Rome.

Laudent alii claram Rhodon auf Mytilenem. Hor. Od. i. 17.

Among the illustrious persons who were natives of the city of Mytilene, or of other parts of the island, may

## NAGPOOR.

be specified—Pittacus, one of the seven sages of Greece; Theophrastus, the scholar and successor of Aristotle; Alcaeus, so famous for his odes; Sappho, celebrated alike for her beauty, her poetical talents, her loves and her death; Terpander, who added a seventh string to the lyre; Diophanes, a famous rhetorician, tutor to Tiberius Gracchus, &c. At the same time, however, it must be admitted that the morals of the bulk of the inhabitants were exceedingly corrupt, so much so, that it was common in antiquity to say of a debauchee, that he lived like a Lesbian. (*Celtarum Orbis Antiqui*, ii. 15; Tournefort, i. 38; Ancient Universal History, vii. 290, 8vo ed.)

Mytilene was taken and sacked by Julius Cæsar; but Pompey restored it to the full enjoyment of its privileges; and Trajan, who enriched it with several costly buildings, gave it the name of *Trajanopolis*, which, however, it did not retain. Movio, on the N. coast of the island, is the modern representative of the ancient Methymna.

## N.

NAAS, an inland town of Ireland, prov. Leinster, co. Kildare, 18 m. S.W. Dublin. Pop., in 1831, 3,808. "The town possesses considerable local advantages. Situated in a rich agricultural district, 18 m. from the metropolis, its communication with that city is facilitated by good roads and by means of a branch of the grand canal that enters the town. Its main street, also, presents some appearance of activity, owing to its forming the place of junction of the leading roads from Cork, Limerick, Kilkenny, Waterford, &c., to Dublin. However, far from keeping pace in improvement with the market towns in its vicinity possessed of none of these advantages, its prosperity has been on the decline for the last 15 years. The appearance of the cabins on the outskirts of the town is poor and miserable, many being ruinous." (*Municipal Board Report*.) The public edifices are the parish church, a Rom. Cath. chapel, a meeting-house for Independents, military and police barracks, a market-house, a fever hospital and dispensary, a court house, and a prison. The spring assizes for the co. are held here, and the summer assizes at Athy. Its trade in grain, flour, and provisions, is not so considerable, as might have been expected. Markets, especially for poultry, on Mondays and Thursdays. Post-office revenue in 1830, 452*l.*; in 1836, 647*l.*

NAKHICHEVAN, a town of European Russia, on the Don, about 25 m. above where it falls into the sea of Azoff. Pop. above 10,000, principally Armenians. This and the contiguous town of Rostoff are, as it were, the entrepôts of the Don. Except timber, most part of the produce brought down that great river is landed at one or other of these towns, and is thence forwarded by coasters for Tanguor. Nakhichevan is built in the oriental style, and its inhab. are distinguished by their commercial enterprise. "The connections they have formed with Astrakhan, Mordok, and Kishlar, also colonies of Armenia, almost annihilates the distance that is between them. They draw from these countries rice, silk, a vast quantity of wine, and about 500 casks of Kishlar brandy, in great esteem in Russia. They receive, moreover, from the Caucasus, all the rough produce of the country. By constantly frequenting the fairs which, in the adjacent towns and villages are very numerous, even to the distance of some hundred versts, the Armenians have formed the means of making themselves masters of the trade of the interior of the S. part of Russia." (*Hagemeister on the Trade of the Black Sea*, p. 36. Eng. trans.)

NAGPOOR (*nagapura*, "the town of serpents"), a large city of Hindostan, prov. Gundwannah, cap. of the dom. of the Rajah of Berar, between the Wyneungna and Wurdah rivers; lat. 21° 9' N., long. 75° 11' E. Pop. of the city and suburbs in 1825 estimated at 115,000. Its site is low and swampy in the rains; and the principal streets, with one exception, are narrow, mean, dirty, and intersected by watercourses. The great number of trees intermixed with the huts and houses give it, at a distance, the appearance of a large wood. It presents few good specimens of architecture; the rajah's palace, though an extensive building, has no pretensions to beauty, and has crowded round it a multitude of mean huts of mud and thatch. Some of the principal chiefs and bankers have large houses of brick and mortar, with flat roofs; but these, for the greater part, are old and dilapidated. In 1825, of 27,000 houses in Nagpoor, about 1,300 were of mason-work, the rest being principally of mud, thatched or roofed with tiles.

The dom. of which Nagpoor is the cap., extends between the 18th and 23d degs. of N. lat., and long. 78° 30' and 83° E., having N. the Bengal presid., E. Bengal and the presid. Madras, and S.W. and W. the dom. of the Nizam. Area estimated, in round numbers, at 64,000 sq. m.; and pop. at somewhat less than 8,000,000. The general slope of this country is towards the S.E.; the

surface is generally mountainous and woody, interspersed with occasional tracts of cultivated land. Principal rivers, the Wurdah, Wyneunga, and other tributaries of the Godavery, and the Muhamuddy. The land is assessed on the village system. Wheat, jawaree, and rice; teak and sal timber; cotton, sugar, hemp, tobacco, arrow-root, betel nut, wild silk, iron, and limestone, are the principal products; some of which are sent in considerable quantities to Bombay, in exchange for European manufactures. Nagpoor had always a large trade with Poona, though this has very much diminished since the breaking up of the Marhatta empire; and some trade with Benares and Mirzapore, in muslins, broadcloths, &c. The pop. of the country is nearly all Hindoo, or composed of wild Gond, and other tribes; and very ignorant, the children of only Brahmins and the mercantile classes being educated. The government is better administered than that of the Nizam dom. The revenue, which is estimated at between 46 and 47 lacs rups. a year, is collected under the superintendence of British officers. The rajah furnishes a contingent of at least 1,000 men to the Anglo-Indian army. (*Hamilton's E. I. Gaz.*; *Evid. of Mr. Jenkins in Parl. Rep.*, 1832; *Report*, 1840, &c.)

NAIRN, a small marit. co. of Scotland, on the S. side of the Moray Frith, having N. the sea, E. Moray, and S. and W. Inverness; it also includes the detached district of Ferintosh, in the centre of Inverness. Area, 124,800 acres, of which about a third is supposed to be arable. It is in all respects similar to Moray, with which it is united, under one sheriff. Along the shore it has a belt of low, flat, sandy soil, mostly suitable for the turnip culture, but in parts barren, owing to the sand being dry and movable. The valley watered by the Nairn is generally fertile and well cultivated; but the rest of the co. is mostly rugged and mountainous. The statements as to the size of estates and farms, houses, tillage, stock &c., in the article MORAY, apply equally to this co. Average rent of land, in 1810, is 10s. 6d. an acre. Exclusive of the Nairn, it is watered by the Findhorn (*see* Vol. I. p. 837.), and some smaller streams. Except Nairn it has no town of any importance; and it has neither mines nor manufactures. The co., which unites with Moray in sending 1 mem. to the H. of C., had 120 registered voters in 1839-40: the bor. of Nairn unites with Inverness, &c., in sending another mem. to the H. of C. Nairn is divided into six parishes, and had, in 1831, 2,074 inhab., houses, 2,246 families, and 9,354 inhab. of whom 4,307 were males and 5,047 females. Valued rent, 15,162l. Scotch: annual value of real property, in 1815, 14,902l.

NAIRN, a royal bor., sea-port, and market-town of Scotland, cap. of the above co., near the mouth of the river of the same name, on the public road between Aberdeen and Inverness, 15½ m. N.E. the latter, and 72 m. N.W. by W. the former. Pop., in 1833, inc. par., 3,266. The river is here crossed by a substantial bridge, which, however, was greatly injured by the floods of Aug. 1829. "The principal street is tolerably spacious, but all the others are narrow and confined." (*Boundary Report*.) The only public buildings are the court-house, jail, establishment church, two dissenting chapels, and a large inn, built by subscription. The harbour is accessible only for small vessels; and grain, cattle, timber, salmon, herring, and other white fish are exported to London and other markets. Indeed, the fisheries may be said to be the staple branch of industry of the town. The means of education are ample. The town has no fewer than three banks.

Nairn was created a royal bor., by William I., in the 12th century. In the vicinity is Cawdor Castle, once a fortress of great strength, but now a ruin. It gave the title of "Thane" to Macbeth, and Shakespeare has made it the scene of the murder of the "gracious Duncan." It now gives the title of earl to a branch of the Campbells of Argyll. Lord Lovat found refuge in a corner of this fortress, after the battle of Culloden, in 1746. (*Edinburgh Philo. Trans.* ii.; *Beauties of Scotland*, § Nairn.)

NAMUR, (Flem. *Namen*, Lat. *Namurcum*.) a strongly fortified town of Belgium, cap. prov. of same name, on the Meuse and Sambre at their junction, 3½ m. S.W. Liege, and the same distance S.E. Brussels; lat. 50° 28' 30" N., long. 5° 0' 7" E. Pop., in 1836, 21,176. It is surrounded with good walls, and has been considerably strengthened since the last war: it has strong outworks on both sides the Meuse and Sambre, and is further defended by a citadel, erected in 1817, on the elevated site of a former citadel, demolished by Joseph II. It is well built; many of the streets are broad and clean, and the houses are mostly of bluish stone, roofed with tiles. The cathedral, a modern edifice, with a handsome Corinthian portico, and a dome, is principally remarkable for its containing the tomb of Don John of Austria, the conqueror of the Turks, at the famous battle of Lepanto. The church of St. Loup, a richly ornamented building, and that of Notre Dame, with some good sculptures; the new town-hall, several

hospitals, and a theatre are the other principal public edifices. A bridge crosses each river, that over the Meuse having nine arches; a dam has here also been thrown across the Sambre in the view of raising its waters so as to render it navigable; but this design appears to have only partially succeeded. Namur is a bishop's see; the seat of tribunals of primary jurisdiction and commerce, with appeal to the superior courts at Liege, and the residence of the civil governor of the prov., a military commandant, a provincial receiver of taxes, &c. It has an episcopal seminary; an atheneum with a library and cabinets of mineralogy, chemistry, &c.; various public and superior private schools, a society for the benefit of the poorer classes, a deaf and dumb and many other asylums, a *mont de piété*, founded in 1619, &c. The situation of Namur is favourable for commerce. Its cutlery is much esteemed on the continent, and it has tanneries, potteries, and brass and iron works; but its manufactures are less flourishing than formerly. The coal and iron mines, and marble quarries of its neighbourhood, are, at present, the principal sources of employment and wealth to its inhabs. It has four annual fairs, one of which, beginning on July 2, lasts 15 days.

Namur is supposed to occupy the site of the *Oppidum Admaticorum*, mentioned by Caesar. Like other cities in the low countries, it has frequently suffered from the ravages of war. In modern times it has sustained two memorable sieges, one in 1692, when it was taken by Louis XIV.; and the second in 1695, when it was retaken by the Anglo-Dutch under William III. The first is the subject of Boileau's famous ode *Sur la Prise de Namur*. (*Vandermaelen, Dict. de Namur*; *Dict. Géog. et Voyag. de la France*, &c.)

NANCY, a town of France, dep. Meurthe, of which it is the cap., in a fine plain, near the Meurthe, 30 m. S. Metz, and 175 m. E. by S. Paris; lat. 48° 41' 55" N., long. 6° 10' 31" E. Pop., in 1836, ex. comm., 29,290. This is one of the handsomest towns of France. It was formerly surrounded with walls, but these were demolished under Louis XIII. and Louis XIV.; and the citadel is its only existing fortification. It is, however, still entered by several gates, some of which have much beauty. Nancy is divided into the Old and New Town. The first is, in general, irregularly laid out, though it comprises several good streets and squares, many superior private residences, and most of the principal public edifices. Among the latter, are the remains of the palace of the dukes Lorraine, now converted into a barracks for the gendarmerie; the church of the Cordeliers, a structure of the 15th century, in which are various interesting monuments; the church of St. Epre, and the ducal chapel. The royal court, the tribunal of commerce, and prefecture are in the *Place Carrière*, a square communicating with the *Place Royale*, in the new town, by a noble triumphal arch. The new town, which, however, is as old as 1663, is remarkable for the elegance and regularity of its streets, which mostly intersect each other at right angles. The *Place Royale*, or *Stanislas*, is a square surrounded by edifices, all built on the same plan, comprising the town-hall, the bishop's palace, theatre, &c. Its angles are ornamented with iron gateways and fountains; and in its centre is a statue of Stanislas, king of Poland and duke of Lorraine, erected by voluntary subscriptions throughout the duchy, in 1823. Stanislas, to whom numerous establishments in the town, both scientific and charitable, owe their foundation, is buried, as well as his consort, in the church of *Bon Secours*, which has two marble monuments to their memory. The cathedral is a modern edifice of Corinthian and composite architecture. The remaining principal buildings are the university, with a library of 23,000 vols., the royal college, seminary, civil and military hospitals, a workhouse for the depts. Meurthe, and Vosges, and a house of correction. Nancy is a bishop's see, and the seat of a royal court for the dep. Meurthe, tribunals of original jurisdiction and commerce, a board of taxation, a chamber of manufactures, &c. It has an *académie universitaire*, a royal society of science and literature, a royal school of forest economy, a communal college, Protestant, Jewish, and other schools; manufactures of woollen cloth, hosiery, lace muslins, cotton yarn, liquors, chemical products, &c.; with tanneries, dyeing-houses, and refineries of saltpetre for the gunpowder factory at Metz. Nancy is famous for its shot (*boules vulnérables d'acier*). No record exists of this town previously to the 11th century, but in the 13th, it became the cap. of Lorraine. It was twice besieged by Charles the Bold, of Burgundy, who was killed under its walls in 1477. (*Hugo, art. Meurthe*; *Guide du Voyageur en France*, &c.)

NANGASAKI, a large town and sea-port of Japan, on the S.W. side the island of Kiu-siu, and the only place in that empire accessible to Europeans, 600 m. W.S.W. Yedo; lat. 32° 43' 4" N., long. 130° 11' 47" E. Pop. from 60,000 to 70,000. It is situated on the slope of a hill, and, like every other Japanese town, is regularly built, with wide and clean streets. The houses, however, are

low, none containing more than one good story, to which is added in some a sort of cockloft; in others, a low cellar; all are constructed of wood and a mixture of clay and chopped straw; but the walls are coated with a cement that gives them the appearance of stone. The height of the street-front, and even the number of the windows are determined by sumptuary laws. Oil-paper supplies the place of glass, and the windows are further protected from the weather by external wooden shutters and Venetian blinds; a verandah, into which the different rooms open, runs round the outside of the houses, to which are invariably attached curiously laid out gardens. Large detached fire-proof store-rooms belong to each dwelling, and are so constructed as fully to answer their purpose of preserving the valuables of the inhabs. from the conflagrations so common here and elsewhere in Japan. The chief public buildings are the palaces of the governor and grandees of the empire, some of which cover a considerable extent of ground; there are also in the town and neighbourhood 61 temples, or *gasuros*, usually on commanding eminences, and enclosed in large gardens, the favourite resort of pleasure parties. These buildings are as plain and little ornamented as the private dwellings, and comprise, also, apartments, which are let out to travellers, or used for banqueting rooms, and other purposes. The temples, houses or bagnes are another favourite resort of the natives; and of these, according to Siebold, there are 700 in Nangasacki. The artificial island of Dezima, to which the Dutch merchants are rigorously confined, is about 600 ft. in length by 240 ft. in breadth, a few yards from the shore, close to which stands the town, connected with it by a stone bridge, closed by a gate and guard-house, constantly occupied by soldiery. Neither Dutch nor Japanese may pass the gate without being searched; the number of European residents is limited to eleven; and the menial service is performed exclusively by Japanese; all of whom, except courtisans, are compelled to leave the island at sunset. From this imprisonment the Dutch are allowed to escape twice or thrice a year, rather to be exhibited to the great as a curiosity than out of indulgence. A corps of constables and interpreters (the latter of whom form a regular guild, receiving salaries from the *shogun*), are appointed to watch over their minutest actions; and the most degrading servilities are exacted even from the *opperhoofd*, or president of the mission, by the meanest officers of the Japanese government. As respects trade, the Dutch are placed under restrictions elsewhere unparalleled; but these and other particulars have already been detailed in the general article JAPAN, to which the reader is referred. The harbour of Nangasacki extends N.E. and S.W. about 7 m., being in most places less than a mile in width. Ships lie in 3 or 6 fathoms water within gunshot of the town, and protected from all winds (*Siebold*, i. ch. 1, 2.; *Crawford's Hist. of the Indian Archipelago*, iii. 365-308.; *Manners and Customs of the Japanese*, 24-57.).

**NANKIN**, a city of China, in the district of Kiang-nan-foo, and prov. Keang-soo, near the S. bank of the Yang-tse-kiang, and about 110 m. from its mouth, lat. 32° 4' N., long. 118° 24' E. Pop. (acc. to Ellis) about 400,000. The walls, which are of limestone, cemented with sun-baked clay, enclose a very irregular triangular area of about 3½ sq. m., and this circuit, as measured by the Jesuits, amounts to 57 li, or nearly 20 m., a fact fully proving the absurdity of the Chinese statement that "if two horsemen should go out in the morning at the same gate and ride round in opposite directions, they would not meet before night!" This enclosure, moreover, comprises groves, fields, and even hills, of considerable extent; less than three-fourths of it being covered by the town, which is sit. at the S. extremity, and about 6 m. from the river bank. The city has declined much both in size and splendour since the end of the 13th century, when Kublai-Khan removed the imperial residence to Peking. It now consists of four rather wide and parallel avenues, intersected by 6 or 8 others of less width. The streets are not so broad as those of Peking, but are, on the whole, handsome, clean, well-paved, and bordered with well-furnished shops. A palace of the emperor which once existed, and many other monuments of grandeur, have now almost disappeared. Nor are the palaces of the mandarins in any respect distinguished from those found in the caps. of other provs. of China; indeed, Nankin possesses no public edifices corresponding to its rank as the second city of the empire, except its famous porcelain tower, belonging to one of the pagodas, several temples, and its gates, some of which are of extreme beauty. The Porcelain tower (called *Pao-an-gan-sze*) "pagoda of gratitude," which is unquestionably finer than any similar structure throughout China, is an octagonal building, each side 15 ft. wide. It consists of 9 equal stories, communicating by a spiral staircase running up the centre of the building, and each comprising one saloon finely painted, gilt, and adorned with idols. The outside wall is white, made of the white

bricks commonly used in China; a kind of carved gallery or verandah, ornamented with lightly-tinkling bells, runs round each story, and the whole is surmounted by a gilt conical roof, the height of which from the base somewhat exceeds 200 ft. It was completed in 1432, at a cost of 400,000 taels. An observatory stands about a league N. ward of the pagoda, but though formerly well provided with instruments, &c., it is now almost in ruins. Nankin has extensive manufactures of satin and crape, the quality of the former, both plain and figured, not being equalled by that of any other city in China. The cotton fabric called Nankin receives its name from this city; but in fact it is made in every part of the prov., and scarcely a cottage can be found where the thrifty housewife has not a loom for weaving Nankin. (*China opened*, i. 79.) The paper of Nankin is highly esteemed; and Indian-ink (as it is called in Europe) is manufactured in large quantities both in the town and neighbourhood, forming an important article of commerce. Nankin is celebrated also for its manufacture of artificial flowers from the pith of a shrub, and so extensive is this branch of industry as to give rise to a large trade. The commerce of the city is very considerable, owing to its position in the centre of the empire, and on the Yang-tse-kiang, which is navigable for small boats to the ports of Soo-cheo-fou and Shang-hai, its great entrepôts for corn, manufactured goods, and other articles. Its communication with Peking is effected by the imperial canal, which leaves the river about 40 m. below Nankin; the principal traffic with the cap. is during April and May, when fast boats, which accomplish the distance in about 9 days, are constantly employed in exporting to the imperial court the produce of the Nankin fishery packed in ice. Nankin, according to Du Halde, is not less celebrated for literature than commerce: the arts and sciences are studied there with great diligence, and it furnishes more doctors and mandarins than many towns together; its libraries are also extensive and valuable. The booksellers' shops are well provided with the best native publications, and the editions published here are the most esteemed in the empire.

Nankin, which began, to decrease in the time of Kublai-Khan, was further diminished by the removal of the 6 great tribunals to Peking, which caused its name Nankin ("Court of the South") to be changed to Kian-niu in all the public acts: in common usage, however, it retains its old appellation. It is still the residence of one of the great viceroys called *Tsang-tuh*, to whose jurisdiction are committed all the judicial affairs, not only of this prov. but of that also of *Kiang-si* and *Gan-hway*. The Manchoo-Tartars have here an extensive military depot under a general of their own nation, and their quarters are separated from the rest of the town by a lofty wall. (*Du Halde*, i. 149-151.; *Ellis's Journal of a Miss. to China*, 283-306.; *Ritter's Erdkunde von Asien*, iii. 681-685.; *Geddes's China opened*, i. 70-75.; *Private Information*.)

**NANTES** (an. *Nannetes*, or *Civitas Nannetonum*), a large and celebrated commercial city and port of France, dep. Loire-Inférieure, of which it is the cap., on the Loire, where it is joined by the Erdre and Sèvre-Nantaise, about 31 m. from its mouth, and 210 m. S.W. Paris; lat. 47° 13' 6" N., long. 1° 32' 44" W. Pop. in 1836 (ex. comm.), 75,150. "Nantes is a noble city, and its situation can scarcely be excelled. It stands upon the slopes and summit of a gentle hill, half encircled by the Loire, which is broad, clear, and tolerably rapid; and its beauty is greatly increased by several islets which dot the river exactly opposite to the town, and which are covered with pretty country-houses and gardens." (*Ingles*, p. 338.) The banks of the Erdre too are very agreeable, abounding with chestnut woods, gardens, and country houses. The declivities of the neighbouring hills are in great part covered with vineyards, which add much to the beauty of the scene, though their produce be very inferior. Nantes is built mostly on the N. bank of the Loire, but partly, also, on the islands *Feydeau* and *Gloriette*, in which are some of the handsomest quarters. Both the N. bank and the islands are bordered by fine quays, one of which, *Quai de la Fosse*, full half a league in length, is broad, and shaded by fine elms, and bordered with balconied terraces and warehouses. The Quays of *Brace* and *Port Maillard* are also planted with trees, being at once well frequented promenades, and the principal seats of commercial activity.

Nantes was formerly fortified, but its ramparts have been mostly demolished, and it is now an open town communicating with 4 considerable suburbs. Towards the E. end of the city are the *Cours de St. Pierre* and *St. André*, two public walks planted with trees and separated by the square of Louis XVI., in which is a statue of that monarch surmounting a Doric column about 80 ft. in height. These *Cours*, with the *Boulevard*, W. of the Erdre, another fine promenade of the same kind, are on a portion of the site formerly occupied by the fortifications. There are, however, some remains existing of various fortresses erected in the middle ages.

In the E. part of the city, skirting the river, is the large and imposing castle of the ancient dukes of Brittany, a mass of irregular buildings, surrounded by thick walls flanked with solid round towers. It was founded in the 10th, but it was not till the 15th, century, that it became a place of any great strength. It is now chiefly dismantled, and is the residence of the military governor, and a powder-magazine. Between the Erdre and Loire are some remains of the Chateau de Bouffay, a structure also dating from the 10th century, consisting of some lofty walls surrounding a polygonal tower; and on the bank of the Loire are the ruins of the Tour de Pirmil, erected in 1365. The city is, in general, regularly laid out, and well built and paved. Most of its houses are of stone roofed with slate. There are between 30 and 40 squares, or rather open spaces; the principal of which, the *Place Royale*, is surrounded by handsome shops, and, together with the *quartiers Graslin* and *Feytaud*, may be compared with the best parts of the capital.

The different parts of the city communicate by numerous bridges, several of which are handsome, and one, the *Pont de Pirmil*, 277 yards in length, has 16 arches. The cathedral, though not imposing either without or within, has a front ornamented with good though mutilated sculptures, and flanked with two towers, 170 ft. high: in its interior is a magnificent marble tomb, erected by Anne of Brittany, in memory of her father Francis II., the last duke of that name. No other church demands particular notice. The finest building in Nantes is the Prefecture. It was erected between 1750 and 1777, and was formerly appropriated to the *Cour des Comptes*. It has two noble fronts of the Ionic order, a fine staircase, and several large halls and other good apartments: it is partly used as the depository of the departmental archives. The exchange is a large and convenient building, constructed chiefly within the present century; the theatre, in the *Place Graslin*, built in 1810, is, perhaps, the handsomest provincial theatre in France, after those of Bordeaux and Dijon. The town-hall was commenced in 1607, since which it has received several additions: it has three façades, ornamented with Corinthian pilasters, and over its principal front are sculptured figures, emblematical of the Loire and Sèvre. The remaining public buildings include the mint, corn exchange, and linen hall; the *Hôtel-Dieu*, on the Isle Gloriette, erected in 1655, with 670 beds; the *Hospice du Sautille*, or general infirmary and asylum, with 800 beds; the Hospital of Incamables; the Protestant church, formerly that of the Carmelites; mansion-house, chapter-house, the large prison, public slaughter-house, barracks, college; the museum, with an excellent mineralogical collection; the *Salorges*, a general depot for merchandise, &c.

Nantes is a bishop's see, the cap. of the 12th military division of the kingdom, the seat of a Lutheran consistory, of tribunals of primary jurisdiction and commerce, a chamber of commerce, &c., and is the residence of the consuls of many foreign powers. It has a royal college, an academical society, 2 episcopal seminaries, a public library with 30,000 printed vols., and many valuable MSS. collections of engravings, paintings, and an observatory, and botanic garden, schools of navigation, medicine, drawing, singing, &c., maternity and Protestant Bible societies, a savings' bank, a *mont de piété*, and a maritime insurance office. The bank of Nantes has a capital of 9,000 fr. in 900 shares.

Ships of 200 tons, in the ordinary state of the river, reach the city quays without difficulty; but vessels of a larger burden have to load and unload in the roads of Painbeuf, about 24 m. lower down the river. But notwithstanding this disadvantage, the Loire, opposite the city, is crowded with inland craft, and vessels of all nations, but principally from N. Germany, Sweden, Denmark, and Russia. Nantes, Brest, Pontivy, Redon, and other towns in Brittany, will directly communicate with each other on the completion of the canal from Nantes to Brest, now in progress, and which, when finished, will have an entire length of about 230 m.

The manufactures of this city are various, and on the increase. Coarse woollen-cloths and flannels, cambrics, printed cotton goods, handkerchiefs, tickings, and hosiery, are made on a large scale, besides which there are extensive blast-furnaces, chemical works, potteries, rope-walks, copper foundries, manufactories of iron-cables, cannon, and other stores with breweries, distilleries, sugar-houses, tanneries, vinegar establishments, and ship-yards for the construction of merchant-ships, corvettes, and smaller vessels.

Nantes was formerly famous for her quick sailing vessels; but this is not the case at present, and more ships are now built at Bordeaux. At Indret, near Nantes, on an island towards the mouth of the Loire, the French government has lately founded an establishment for building steam-boats. In 1840, there were here 5 ships, on some of which, steam-boats of from 160 to 220 tons each were in course of being built; the establishment employed altogether 900 workmen, and 4 marine engineers; and a sum of 2,000,000 fr. was

voted by the legislature for its maintenance. (*Ports, &c. of France*, p. 152.) Large naval storehouses are established at Nantes, from which Brest, L'Orient, and Rochfort receive supplies both of provisions and ammunition. Previously to the revolution, the foreign trade of Nantes was much larger than at present; and during the time that the slave-trade was carried on, Nantes was more extensively engaged in it than any other French port. Now Marseilles and Havre both rank above her as commercial cities; but she is still the emporium of all the rich and extensive country traversed by the Loire, and has a considerable import and export trade, particularly with the French W. Indies, S. America, and the different ports of Europe. The exports comprise all sorts of French produce, but principally brandy, wine, and vinegar, silk, woollen, and linen goods, refined sugar, wheat, rye, ship-biscuits, &c. The chief imports are sugar, coffee, and other colonial products; cotton, indigo, timber, hemp, &c. Nantes is likewise a considerable entrepôt for the commerce of the salt made in the dep., chiefly at Noirmoutiers and Croisic. (See *LOIRE INFERIEURE*.) The customs' duties amount to about 15,000,000 fr. a year.

Subjoined is a statement of the French and foreign ships that entered and cleared from the port in 1838, specifying the departments in which the French ships were engaged, and the number in each.

Branch of Trade.	Entered.		Cleared.	
	Ships.	Tons.	Ships.	Tons.
French ships in foreign trade -	201	21,519	155	18,517
colonial do. -	60	12,255	81	13,291
coasting do. -	4,003	153,180	4,503	90,187
fisheries -	15	2,175	-	-
Foreign ships -	176	26,585	159	22,708
Steam vessels, chiefly to and from Bordeaux -	10	736	13	1,010
	4,163	201,580	4,672	151,513

\* Of these 40 vessels of 1,615 tons left in ballast.

Of the vessels engaged in the fisheries 10 came from the banks of Newfoundland, laden with 15,665 cwt. of cod-fish and 250 cwt. of oil; 3 whalers brought in, during the same year, 13,433 cwt. of whale-oil, and 396 cwt. of whalebone. The pilchard fishery is also carried on with great activity; and employs, in the season, 700 boats, manned by about 3,000 seamen. Nantes has 2 weekly markets, and 12 yearly fairs, one of which, beginning May 25th, lasts 15 days. Living is cheap; and fish of many varieties, as well as the fine fruits of the S. of France, are abundant in the markets. According to Hugo, there are annually killed in Nantes 2,700 bullocks, 20,600 calves, 24,300 sheep, and 9,000 hogs.

The era of the foundation of Nantes is unknown; but before the conquest of Gaul by the Romans, it was already a considerable city, and the cap. of the *Nannetes*, who distinguished themselves by their opposition to Julius Cæsar. In 415, it was unsuccessfully besieged by the Huns, and, in the middle of the 9th century, was sacked by the Normans. In 992, it was added to the possessions of the dukes of Brittany, with whom it remained down to the union of that kingdom with France, by the marriage of Anne of Brittany to Louis XII. But Nantes is chiefly distinguished in history from the famous edict issued here in 1389 by Henry IV., and hence called the Edict of Nantes, which secured to the Protestants the free exercise of their religion, and an equal claim with the Catholics to all offices and dignities. The revocation of this edict by Louis XIV., in 1685, is the grand blot in his reign; and by occasioning the emigration of great numbers of his most industrious subjects, was even more injurious to the kingdom than the victories of Marlborough and Eugene.

During the revolutionary phrenzy, Nantes was the scene of the atrocities of Carrier, the most sanguinary of the republican agents in the reign of terror. Nantes has produced numerous distinguished individuals, including Anne, Duchess of Brittany; the Egyptian traveller, Cailland; the physiologist, Laennec; Ronche, minister of police, &c. Near it is the Chateau de Baro, celebrated as having been long occupied by Mad. de Sevigné. (*Hugo, art. Loire-Inferieure; Guide du Voyageur en France; Parl. Reports; Commercial Dict., &c.*)

NANTUCKET, an island of the U. S. of America, state Massachusetts, in the Atlantic, 26 m. S.E. the peninsula of Cape Cod, the port of Nantucket, being in lat. 41° 16' N., long. 70° 8' W. Pop. in 1830, 7,020. It is of triangular shape, about 15 m. in length, and from 4 to 10 m. broad, with an area of 23,280 acres. The land, which was originally conveyed, in 1630, by the Earl of Stirling to joint proprietors, and by them divided into 27 shares, is a joint stock property to the present day; but the number of shares has increased to 3,000, held among the inhab., most of whom belong to the Society of

**Friends.** Little attention, however, is paid to agriculture, and both sheep and cows are fed on common pastures. The pop. is chiefly employed in the whale or other fisheries, and the seamen have acquired great celebrity for their enterprise, skill, and success. In 1838, 13 ships and 3 schooners arrived in port, from the whale-fishery, laden with 21,730 barrels of sperm oil, and 6,200 of whale oil. The town of Nantucket is situated on the arm of a small bay on the N.W. side of the island; it comprises about 750 houses, chiefly of wood, several places of worship, 2 banks, 2 insurance companies, a woollen-cloth manufactory, and 30 spermaceti establishments, employing a capital of 600,000 dollars. Its harbour is nearly landlocked, tolerably deep, and well protected from all winds: a light-house stands at its S. extremity. In 1839, the aggregate burden of the vessels, belonging to this port, amounted, according to the official returns, to 31,343 tons, that of the ships engaged in the fishery being estimated at 25,495 tons. (*Official Reports; Davisport's Gaz.; &c. Amer. &c.*)

**NANTWICH**, a market-town and par. of England, co. Chester, and hund. of its own name, on the Weaver, crossed here by a stone bridge, 17½ m. S.W. Chester, and 146 m. W.N.W. London. Area of par. (comprising 5 townships), 3,490 acres. Pop. in 1831, 5,357; do. of township, 4,886. It is situated in a luxuriant vale near the borders of Staffordshire and Shropshire, is irregularly laid out, and comprises 3 principal streets, badly paved and lined with mean-looking houses, uniting near the church, a very beautiful cruciform building of red sandstone, built in the early English style, and highly ornamental, with an octagonal tower rising from the intersection of the nave and transepts. There are likewise several places of worship for Dissenters, with attached Sunday schools, which, in 1835, furnished instruction to 840 children of both sexes. Two endowed day-schools are attended by about 130 children; and there are several almshouses, besides minor charities. A market-house and town-hall were built in the last century. Nantwich formerly owed its prosperity to the abundance of its salt springs; but only one spring is now worked, and nearly the whole trade has been removed to other places. Large quantities of excellent cheese are made in the town and its fertile neighbourhood; besides which, the manufacture of shoes for the London market forms an important branch of industry. Cotton goods, also, are made here in considerable quantities; and in 1839 there was a cotton mill, employing 111 hands. The glove trade is carried on to some extent. Great facilities of intercourse are furnished by the Birmingham and Liverpool, as well as by the Chester and Ellesmere, canals; and the Grand Junction Canal passes at only a few miles' distance. Petty sessions for the hundred are held here; and the Marquis Cholmondeley, as lord of the manor, holds a baronial court for the recovery of debts under 10*l.* Markets on Saturday; and fairs, May 15, June 13, Sept. 4, and Dec. 4, 18, 19.

Nantwich, mentioned in Domesday simply as "Wich," was the scene, in 1069, of an unsuccessful attempt by the Cheshiremen to resist the advance of the Normans. In 1438 and 1583, the town suffered considerably from fire; and during the parliamentary wars, it was besieged by the royalists under Lord Byron, but soon afterwards relieved by Sir Thomas Fairfax. It also deserves notice, from having been the birthplace of General Harrison, one of the regicides, and of Milton's widow, who died here in 1726.

**NAPLES (KINGDOM OF)**, otherwise called the **KINGDOM OF THE TWO SICILIES**, a European state of the second class, nearly identical with the *Magna Græcia* of antiquity, comprising the S. portion of Italy, with Sicily and the adjacent islands, included between the 36th and 43d degs. of N. lat., and the 12th and 19th of E. long. It has N. the Papal States, E. the Adriatic, and elsewhere the Mediterranean. Its total area may be estimated at about 42,000 sq. m., and its pop. at nearly 8 millions.

The Neapolitan territory is divided into two principal portions, the continental and the insular, the first being called the *Dominij al di qua del Faro* (the country on this side the Faro, or straits of Messina) and the latter, the *Dominij al di la del Faro* (or the country beyond the Faro). The latter portion will be fully treated of under the head **SICILY**; we have now only to deal with the continental portion, the area, population, subdivisions, &c. of which are as follow:—[See top of next col.]

**Physical Geography.** The continental part of the kingdom of Naples, the limits of which have scarcely varied for the last 8 centuries, is about 400 m. in length, N.N.W. to S.S.E., and 130 m. in its greatest breadth, from Cape Campanella to the Gargantuan promontory. Its shape is very irregular; at its S.E. extremity are the two peninsulas of Calabria and Otranto, forming one the foot and the other the heel of the boot, which Italy is supposed to resemble, while to the N.W. of the latter is the conspicuous promontory of Gargano, extending into the Adriatic, representing the spur. On the W.

coast also are many promontories and headlands, as those of Sorrento, Gaeta, Bala, Cape Vaticano, and others, which respectively bound the Bay of Naples, the Gulphs of Gaeta, Salerno, Policastro, St. Eufemia, &c. The peninsulas of Calabria and Otranto inclose the extensive Gulph of Taranto, N. and S. of which are the less spacious Gulphs of Manfredonia and Squillace. The coasts are for the most part bold and abrupt, but the W. and S.W. are much more so than the E. and N.E. On either side however the kingdom has several good ports.

The surface of Naples, like that of the greater part of Italy, is mountainous, but it contains extensive and beautiful plains and valleys, which under the influence of an invariably mild climate present a luxuriance of vegetation, and a beauty of scenery, hardly to be met with in any other part of Europe. The Apennines traverse the kingdom nearly in its centre from end to end. In the Abruzzi, where they reach their greatest altitude, they consist of three lateral ranges, but these unite near Isernia, and the main chain thence proceeds undivided to Monte Carnio, about 14 m. N. Potenza, where it finally bifurcates, the principal range running through Calabria to its farthest extremity, and a less elevated range through the S. part of Apulia. Many important ramifications are given off by the Apennines both before and after their bifurcation, as that forming the lofty promontory of Sorrento, that of Gargano, the mountain knot of La Sila in Calabria, &c. The Apennines rise to a much greater elevation in S. than in Central Italy. The *Gran Sasso d'Italia* (M. Corvo) in the Abruzzi, reaches the height of 10,185 Eng. ft., and M. Majella, in the same prov., that of 9,325 ft. There are some separate or detached groups of mountains, of which Vesuvius, though not the largest, is by far the most celebrated. It owes this distinction to its situation close to the city of Naples, and still more to its having long been an active and sometimes a most destructive volcano, *Ætna ignis insularum*.

The largest of the Neapolitan plains is that of Capitanata, having Foggia in its centre. It is mostly appropriated to pasture, and is in part sandy and arid. (See *anti*, p. 57.) But the most celebrated plain is that of the Terra di Lavoro round Naples, anciently the *Campania Felix*, an epithet to which it is still well entitled. The choicest gifts of nature have been lavished upon this noble plain. It is above 40 m. in length by from 15 m. to 20 m. in breadth, and, excepting Vesuvius and a ridge between Naples and Misenum, it is everywhere a dead level. The soil, which is deep and loamy, is of the most extraordinary fertility, frequently producing two crops in a season. It is carefully, if not skillfully, cultivated; the vegetation is most luxuriant; and being free from malaria, the air mild and genial, and the sky usually clear, it goes far to realise the poetical descriptions of the Elysian fields—*Omnium non modo Italia, sed toto orbe terrarum, pulcherrima Campanie plaça est. Nihil uberius cælo: denique his floribus vernal. Nihil uberius solo: idco Liberi Cæveri certamen dicitur.* (*Florus*, lib. 1. cap. 16; see also *anti*, p. 57.)

The rivers are numerous, but mostly inconsiderable. The principal are the Garigliano (an. *Liris*), and the Volturno flowing through Campania to the Mediterranean, the Pescara, Biferno, Candelaro, Cervaro, Ofanto (an. *Aufidus*), &c. falling into the Adriatic; and the Bradano, Basiento, Crati, &c. which carry their waters to the Gulph of Taranto.

The only lake of any size is that of Celano or Fucino (an. *Fucinus*), in the Abruzzo Ultra, 11 m. in length by 7 m. in its greatest breadth, in a basin surrounded by high mountains. This lake receives the waters of several considerable streams, and having no outlet, is apt, occasionally, to overspread the surrounding country. To obviate this effect, the Emperor Claudius, in imitation of a similar undertaking at the Alban Lake (see Vol. I. 48. of this work), carried an *emissario*, or aqueduct, 3 m. in length, partly by tunnelling and partly by

\* In 1838, the pop. had diminished to 6,021,284, a diminution principally owing to the cholera and febrile diseases, which had been particularly prevalent in the city and prov. of Naples during the previous year. (*Secretaria, Statistica d'Italia, Almanach de Gênes*, &c.)

excavating, from the Liris, through Monte Salviano, to the lake, by which its waters were at once reduced and prevented from again rising to a higher level. (See *Suoncio in Claud.* cap. 20.; *Tacit. Annal.* lib. xii. cap. 56, 57.) This great and useful work was, however, in later ages, suffered to fall up and become useless. Latterly, however, it has been renovated under the direction of Affan de Rivera, in whose work (*Considerazioni sul Mezz.* &c. i. 305.) the reader will find an account of the undertaking.

In respect of climate, S. Italy is artificially divided into three regions, according to the elevation of the surface. In the lower parts of the country, the winter is so mild that vegetation is never interrupted; and at the S. extremity of the kingdom, the aloe, palm, and other tropical plants flourish in the open air. In the plains and valleys, near the foot of the mountains, snow seldom falls, and remains only a short time on the ground: but in the higher portions of the Abruzzi, &c., the cold of winter is piercing and long continued. There is a marked difference in the climate on the E. and W. sides of the Apennines. In the plains of Apulia and Bari, for example, rain seldom falls; the ground is, in parts, arid, and almost desert, and, during summer, vegetation is parched up, and the heats are oppressive; but, on the W. coast of the kingdom, and especially in Campania, showers are frequent in summer, and in winter the ground is saturated with moisture. At an average of the kingdom, the annual fall of rain may be estimated at about 29 inches. Except in some marshy tracts on the coast, the climate is in general as healthy as it is genial. The heats of July, Aug., and Sept. are sometimes, however, rather luxurious, and, in the *sciocco*, from the Syrian and Arabian deserts, exerts its pernicious influence. Its enervating and suffocating blast, notwithstanding the cooling it has sustained in passing over the Mediterranean, becomes positively dangerous when it lasts more than 20 or 30 hours, and is not followed by a breeze from the N. In Naples and other large cities, the streets are deserted during the prevalence of the *sciocco*, the inhabs. shutting themselves up in their houses, and closing all the doors and windows to exclude the air as much as possible.

*Geology, Natural Products, &c.*—Granite and gneiss, which are absent from the Apennines of Central Italy, again appear in the S., and are the predominant rocks in the main chain from the Abruzzi to the end of Calabria. They are intermixed with mica, talc, clay slate, serpentine, &c., and accompanied on either side by the calcareous formations, of which the Italian peninsula is mainly composed. Calcareous or sandy formations constitute the principal portion of the upper soil; but in some parts, especially in the neighbourhood of the capital, the ground consists of volcanic tufa, lava, ashes, &c., which contribute to its prodigious fertility. Vesuvius is at present the only active volcano of continental Naples; but there are numerous extinct volcanoes, the craters of some of which supply salt ammoniac, sulphur, vitriol, alum, and other volcanic products. These, with pumice stone from the Lipari islands, salt, lime, and crystals of several kinds, form the chief mineral wealth of the kingdom. Iron is dug up at Stilo in Calabria, and at Vesuvius; but in no great quantity. In Calabria Citra, veins of gold and silver have been detected, but not such as to pay for the expense of working. Salt is procured from salt lakes near Taranto.

The *negligible products* have been already noticed with those of the rest of Italy (*ante*, p. 59.); but, in addition to the ordinary forest trees, shrubs, and fruits of Italy, the pistachio, date, sugar cane, &c., flourish, and in some places cotton is rather extensively cultivated. Immediately on entering the Terra di Lavoro from the Papal States, an increasing luxuriance of vegetation is perceptible, and many a new product common to tropical climates are added to the *flora* of other parts of Italy. Bears, wild boars, and an abundance of game, inhabit the forests; and the crested porcupine is an animal said to be peculiar to this part of Italy. The shores abound with fish, and the Gulph of Taranto is celebrated now, as of old, for the number and excellence of its shell fish. Among these are the *Pinna marina*, the silky fibres of which are woven into stockings, gloves, &c.; and the *Maratula*, still used, as in antiquity, in dyeing wool. The tarantula and cantharides are met with in the S., which is also occasionally devastated by swarms of locusts.

*State of Property, Agriculture.*—Notwithstanding the backward state of Naples at the present day, in respect of agriculture and other branches of the industry, it has made a very considerable progress during the last century, and especially during the last 30 years. When the Austrian dominion ceased, in 1733, the industry of Naples was at its lowest ebb. The abuses inherent in the feudal system had then attained to a maximum. The entire property of the country belonged to the crown, the church, the nobility, many of whom had vast entailed estates, and the corporations. The bulk of the people were in a state of predial slavery. Every feudal right

and service, however onerous and absurd, was rigidly insisted upon. The game laws existed in their utmost extent: justice, if we may so abuse the word, was administered in baronial courts; the services which the peasantry had to render to their lords were not defined, and they could hardly do any thing except with their consent. The roads were neglected, commerce despised; the country, notwithstanding its fertility, frequently suffered from famine; and the people, oppressed, fleeced, and without the means of improving their condition, mostly sank into a state of indolence and apathy, while the more adventurous spirits became bandits and robbers. (See the *Saggio Politico sul Regno delle Due Sicilie*, by Del Rê, p. 16. and passim.)

The Bourbon government laudably exerted itself to suppress some of the worst of these disorders; and it so far succeeded as to introduce a better system of administration, to improve the roads and towns, and to provide, in some degree, for the growth of manufactures and commerce. But the abuses with which the whole frame of society were infected, were too deeply seated to be eradicated by its feeble and timid hands. The wants of the country were set forth by Filangieri, and other able writers, but things continued nearly on their old footing until after the French had established their ascendancy in the countries on this side the Faro. We have already seen that Napoleon has an unquestionable title to be regarded as the best friend and benefactor of Italy (*see ante*, p. 62.); and this, perhaps, is more especially true of Naples than of any other part of the peninsula. In 1806, Joseph Bonaparte, then king of Naples, promulgated, not doubt with the approval of his brother, a law, which overturned the feudal system, some of its foundations, and produced an extraordinary and most beneficial change in the constitution of property and of society. "The feudal system," says this law, "and all feudal jurisdiction, are abolished; all towns, villages, hamlets, are subjected to the general laws of the country. All feudal dues to the exchequer cease, and feudal estates are subject to the same taxes as others. All feudal burdens, services, and dues of a personal nature, levied from communes or individuals, are abolished without compensation; as are all prohibitive rights or monopolies, wherever they did not originate in purchase. Rivers are public property. The feudality of offices and *judicemmisses* shall cease."

This law was followed by others of an equally decisive and stringent character; and at the same time, convents were secularised, the prodigiate drosses by which they were occupied were turned out, with only a small stipend, and their estates sold at very low prices. Happily, the changes that these laws had introduced into the distribution of property and the state of society, previously to the revolution that restored the Bourbons to the throne, were such as to render a return to the old state of things impossible. The nobility have, however, recovered some of their old privileges, and have been permitted to establish majorats. The attempts to restore the property and influence of the clergy have been prosecuted with greater zeal, and have been, perhaps, more successful. But, the monastic property of monks and nuns have been again established, a comparatively small amount of property is now in their hands; and it is to be hoped that the growing intelligence of the people may at length put a final stop to this most wasteful and vicious mode of employing the public wealth.

The measures now noticed, coupled with the introduction of the law of equal succession in cases of intestacy, have had a much greater influence over the distribution of property than might, *a priori*, have been anticipated. It appears from the returns under the land-tax (*Contribuzione Fondaria*), that in 1832 there were in continental Naples no fewer than 1,419,121 properties rated to the tax, and that these were held by 1,062,172 individuals, showing that there is, in fact, a very large proportion of every family in this part of the kingdom. (*Del Rê Saggio Politico*, p. 53.) As houses as well as land are rated to the land-tax, and as there are no means by which to classify the contributors according to the sums paid by each, we are unable to hazard any estimate of the size and value of the different classes of properties. There can, however, be no doubt that the number of small and middle-sized properties has been prodigiously augmented since 1806. Indeed, the danger now is that the tendency to divide and subdivide estates should be carried too far. When all feudal privileges are abolished, and land is placed on the same footing as other property, the interests of society will be best promoted by adopting a system of impropriety, and preventing, in as far as practicable, by indirect methods, the division of the land into minute portions.

The method of holding land by tenants differs in different parts of Naples. In some of the richest and most populous districts round the capital and elsewhere, the land, when not occupied by the proprietor, is mostly let in small lots of 4 or 5 acres, on the *metayer* system; but in general this system is but little followed, and in most parts of the country the land is either occupied

by proprietors, or by tenants holding under a lease of some years' duration at a fixed rent. The size of farms varies in different districts; and in those where pasture predominates, they are sometimes very large. But notwithstanding the impetus given to industry of late years, agriculture is still extremely backward. The nobility, who are usually involved in debt, care little for agriculture, and their tenants are mostly without either adequate capital or skill. Drainage in some quarters, and irrigation in others, though of essential importance, are generally neglected; and the sowing of artificial grasses, and even the application of manure, are comparatively unknown. "Farming implements, carts, ploughs, and tools of every kind are of the most wretched description." (*Macgregor*.) The more common kinds of grain are wheat, maize, or Indian corn, and, in the colder situations, rye. In Calabria, and the more distant provinces, grain is thrashed out by driving cars over it, or by trampling it with the feet of horses and oxen. In many parts few or no ploughs are used in tillage. In the *Campania*, for example, the soil is so very friable, that it is easily turned up, even by children; and such is its fertility that no fallows are required in its culture, and but little manure, the gathering in of one crop being followed by immediate preparations for another. According to Châteauneux 6 crops are obtained round Naples in 5 years, exclusive of the produce of vines, fruits, and beans, which grow in the same land without prejudice to the corn crops. Most parts, indeed, of the kingdom, except where there is a deficiency of water, are extraordinarily fertile; the crops of wheat and maize are especially most abundant; and there can be no doubt that, with a skilful and careful system of agriculture, the kingdom might afford ample subsistence for 4 or 5 times its present population. But here, as elsewhere, the fertility of the soil, and the mildness of the climate, contribute, with bad government, to enfeeble the cultivators; and by lessening their wants, and enabling them to supply them with little labour, generate that indolence and apathy that are so universal. In the finest districts numerous families live in the meanest hovels, and in a state that in Great Britain would be reckoned to approach closely to absolute indigence. But under such a climate, and occupying such a soil, they do not often suffer the extreme of want. They rarely, however, partake of any of the enjoyments and luxuries of life, other than those which they share in common with the lower animals. Without ambition, or the desire of rising in the world, and without any knowledge of the liberal, and but little of the mechanical arts, they pass their days in a state of British apathy and indigence.

The plain of Sorrento, according to Châteauneux, is almost the only part of the kingdom of Naples where agriculture may be said to be skilfully and actively carried on. The rotation of crops is there, 1st year, maize; 2d, wheat, succeeded by beans; 3d, cotton; 4th, wheat, followed by clover; 5th, melons, followed by pease or beans; making 8 crops in 5 years. Next to the above, rice, barley, rye, onions, and other kitchen vegetables, oil, wine, hemp, flax, tobacco, saffron, and fruits of various kinds, form the principal products; and each might be produced in quantities at least equal to twice the consumption of the inhab. The olive is found in all the low and temperate parts of the country, and its culture is widely extended. In Apulia, especially, a great extent of land is covered with olive-trees, which frequently reach the ordinary size of oaks; and throughout the prov. of Bari, and a part of that of Otranto, a broad belt of olives lines the coast for 100 m. In 1827, a good oil year, the produce of these provs. was estimated at 340,000 *salme* (3,314,000 galls.). In Calabria, also, from Rossano to Gioia, olives grow in great abundance; and the W. shore of the kingdom, from the last-named town to Gaeta, produces large quantities of oil. The average annual produce of Calabria is estimated at 100,000 *salme*. The culture of the olive, and the preparation of the oil, have of late years attracted a great deal more attention than formerly, and have been materially improved; and were it not for the anti-commercial policy of the government, would become of vast importance. At an average of the three years ending with 1821, the exports of olive oil amounted to 2,300,123 stags a-year; whereas, at an average of the three years ending with 1832, the exports were 3,008,887 stags a-year, or above 6,000,000 imperial gallons. (*Serritore*, p. 61.) Gallipoli is one of the greatest marts in Italy for oil; and that shipped from it is considered equal to that of Genoa or Legua; a superiority for which it is mainly indebted to the influence of the tufa cisterns, in which the oil is purified before being shipped. (See Vol. I. p. 878.)

The Neapolitan wines are mostly full bodied, and some are of a good flavour; but the principle of the division of labour is very imperfectly understood, and, instead of being pursued as a separate branch, requiring the undivided attention of the husbandman, the culture of the

vine is commonly carried on upon the same farm with that of corn, olives, &c. In the Terra de Lavoro and other parts of the country, elms and poplars are seen, planted in rows for the support of the vines, the intermediate spaces being sown with corn, pulse, and other crops. In parts of the Abruzzi, however, the vines are cut low, and tied to canes, as in France; and in the prov. of Otranto, they are cut off to about 2 feet above the ground, which is hoed around them with a degree of care by no means general in S. Italy. The wines of Taranto, Gerace, and other parts of Apulia and Calabria, might become very superior by proper treatment. Round Vesuvius some fine growths are obtained, among which is the celebrated *lucerna Christi*; this, which is a red luscious wine, is little known except to visitors at the royal table at Naples, the quantity grown being small, and principally purchased for the court. On the whole, though the wines of Naples be probably superior to those of the rest of Italy, they are very inferior to those of France or Spain; and are seldom met with out of Italy; and, except the sweet wines, are mostly converted into brandy.

Oranges and lemons are grown in large quantities in Capriata and about Salerno and Reggio, from which latter town a good many are sent to France and Genoa; tobacco is pretty largely cultivated in Bari and Otranto, and saffron in Calabria Ultra, the Abruzzi, and Basilicata. But, excepting flax and hemp, which are extensively cultivated, few crops furnish materials for manufactures; these, generally speaking, being imported from abroad. Lignocice is grown in Calabria and the Abruzzi, and about 15,000 *cantari* a-year of juice are exported. Manna is a product of some importance in Calabria; it exudes from gashes cut in the bark of the *manna-sh* (*Fraxinus ornus*). The product is farmed by the crown; and the labourers who cut the bark and collect the manna are debauched, while so employed, from attending to any other occupation, though they receive only a small pittance, amounting to 3 *carlini*, or about 1s. for every *rotolo* of manna they collect. Manna is also produced near Salerno, where, however, about 5 *carlini* per *rotolo* are paid for its collection.

The forests might become an important source of national wealth; but, in consequence of the suppression of the feudal system, the sale of monastic and other domains, and the division of the communal property under the French, numerous woods were felled, and the ground they occupied was subjected to tillage; but, after a few favourable harvests, the soil was exhausted; and it was further exposed to the redoubled violence of inundations, which, by washing away the mould and stones from the mountain declivities, caused great injury to the lands below. For these reasons, in 1819, a special board of superintendence over forests, &c. was appointed; and it was forbidden to appropriate the ground occupied by woods to tillage, except where the site is level and fertile, or under certain other circumstances; neither is any proprietor allowed to fell timber without express permission. These regulations have checked the diminution of the woods; but their preservation has been next to useless; for, although in many parts of the interior there is abundance of timber admirably adapted for ship-building, the roads and means of conveyance are so bad that its carriage to the coast would more than cover the cost of importing it into Naples from other countries. And, moreover, government discourages the efforts of individuals to improve the roads by prohibiting the export of timber, at the same time that it obliges it to be cut down by laying a heavy duty on the importation of coal.

If we except sheep, the rearing of live stock is not much attended to. There are estimated to be 4,000,000 head of sheep in the kingdom, a great number of which are migratory, being kept on the mountains in summer, and driven, in winter, into the valleys, and the *tavoliere* of Apulia. The last-named region is a tract of about 95 sq. m. belonging to the crown, and which, a few short intervals excepted, has been wholly devoted to pasturage from the time of the Romans, its tillage having, indeed, been prohibited. Under the French, however, a law was passed in 1806, which, for a time, completely changed the state of the *tavoliere*. Instead of the ground being farmed exclusively as pasture, a fixed rent was substituted; and every one was allowed to apply the land, as he pleased, to pasturage or tillage. But in 1817, this judicious law was repealed, and a new act passed, by the provisions of which (in order to keep up, as it was alleged, the due proportion between pasture and arable land,) no one was to till more than 1-5th part of his land, on penalty of paying a tenfold rent, &c. Latterly, however, we believe that this absurd enactment has been materially modified, it having fortunately been found impossible to enforce its provisions. The horned cattle are estimated at about 300,000 head, exclusive of about 50,000 buffaloes, which wander in large herds over the marshy plains in the N.W. The oxen are of different breeds, and excellent quality, being

used both for the plough and for carts. They are mostly stall-fed, on vine leaves, maize, stubble, &c., except in Apulia, or districts where the pasture lands are very extensive. The horses are but indifferent; but a fine small active breed, with dark frizzled hair, is peculiar to Calabria. Mules and asses are the most common beasts of burden. Hogs and goats are very numerous; the former, which are of a large, dark, hairless breed, wander wild in the forest; the milk of the latter is converted into cheese. The herdsmen throughout the kingdom are principally from the Abruzzi.

Except in the S., where the cottages are sometimes built of stone, it is rare that the agricultural labourers inhabit any thing but wooden huts, roofed with straw or tiles, in which three or four generations often live together. They live almost wholly on vegetable food; and into this, fruits and pulse enter more largely than corn. Their clothes are coarse, and the dress of the shepherds and poorer peasantry consists almost solely of sheep or goat skins, with the hair outside. The wages of an ordinary field labourer may average about 16 grani (or 6d.) a day.

The culture of silk is widely diffused, and it now forms a valuable article of export from the kingdom. The greatest quantity of silk is produced in the provs. of *Lavoro*, *Principato*, and *Calabria*, but especially the last. At *Reggio*, in particular, many families furnish houses expressly for rearing silkworms. The total produce of Naples was estimated, in 1833, at 800,000 lbs., of which 536,000 lbs., worth 2,005,000 ducats, were exported raw and wrought. (*Serristori*, p. 61.) The remainder is consumed in the country. The silk of Calabria is stronger and more compact than that of other parts of the kingdom; a consequence, it is supposed, of the worms being fed with the leaf of the red mulberry peculiar to that prov. Much less attention is, however, paid to the culture of the mulberry, both there and throughout the Neapolitan dom., than in N. Italy. In the vicinity of Naples, where two crops of cocoons are annually collected, the breeders of silkworms are accustomed to buy mulberry leaves at a dear rate, at the same time that they use the poplar as a support for the vines in their farms.

The fisheries rank next to the foregoing branches of industry. The tunny (*Scomber thyssus*) frequents the W. coast in large shoals in the early part of the year, and the taking of the fish employs a large number of hands. Large meshed nets, perhaps 1,500 ft. in length, and divided into several compartments, are laid across the track of the shoals at a considerable distance from the shore, with which they are connected by strong lines and nets of still larger meshes. The fish, having got into the nets, are prevented finding their way out again by the number of compartments; and after the lapse of a day or two, men in flat-bottomed boats surround the nets with harpoons, and kill the larger fish, which are sometimes 8 ft. in length. The whole draught is afterwards hauled on shore. Anchovies are caught in abundance in the spring; and many mullets are taken, the roes of which are made into *botarga*. A great many of the inhabs. of Taranto employ themselves in taking the shell-fish of the gulph, leaving the adjacent lands to be cultivated by natives of Calabria and Abruzzo. But the quantity of fish taken for food is by no means equal to the home demand, and salted fish is a principal article of import. Coral is raised on different parts of the coast.

*Manufactures* are, for the most part, domestic; and the majority of the goods made scarcely ever find their way out of the country. Of late years, however, manufactures have been considerably improved, and several considerable manufacturing establishments are now to be met with in different parts of the kingdom. Those of silk are the most extensive; and next to them are those of woollens, principally established in the capital and at *Sora* and *Isola*. Linen stuffs are made in several of the provincial towns, and there are numerous paper-mills.

Naples has manufactures of gloves and straw hats, in imitation of those of Tuscany; and the princes of Butora and Gerace, with other partners, have established a considerable glass manufactory at *Pausillipo*. *Reggio* has manufactures of gloves, waistcoats, and hosiery; and *Avellino*, of woollen cloth, satinettes, and maccaroni. *Campobasso* is famed throughout the kingdom for its cutlery. The establishments in which it is made are on a very small scale. "Great was my surprise," says Mr. Craven, "at finding that the various articles of this nature are all fabricated in detached small workshops, containing little more than a common blacksmith's apparatus, and possessing so contracted an assortment of articles that I could with difficulty obtain a selection of a dozen knives and scissors. They all work by commission for dealers in the metropolis and other large towns, with such limited means and capital, that they are entirely incapacitated from executing and maintaining in their laboratories a collection exhibiting any thing like variety or choice." (*Excursions in the Abruzzi*, &c. ii. 142.) A miserable cotton factory, a sort of government monopoly established at *Salerno*, some time ago, and the iron mine

and forge at *Stilo*, comprise nearly all the remaining branches of manufacturing industry. (*Part. Report*, 1840; *Châteaueux*, *Italy*, &c. pp. 187-298.; *Vogel's Ravenna's Italy*, li. 248-264.; *Rampoldi*, *Simona*, *Craven*, *Swinburne*, &c. *passim*.)

*Commerce*.—The extraordinary fertility of her soil, the variety and superior quality of her raw products, and her admirable situation, give Naples the means of carrying on a very advantageous and extensive commerce. But her natural advantages have been, in this respect, all but nullified by the perverse policy of her government. Her oils, silks, sulphur, corn, wines, &c., would all meet with a ready and advantageous sale abroad, provided the manufactured goods and other products which foreigners have to give in exchange for them, were admitted on any thing like reasonable terms into the Neapolitan dominions. Such, however, is not the case. The importation of a great variety of foreign articles is prohibited; and most of those that are admitted are loaded with oppressive duties, varying from 50 to 100 and 150 per cent. *ad valorem*. But this is not all. Not satisfied with attempting to shut out foreign products, the Neapolitan government lays heavy duties on many of the most important articles produced in the kingdom, when exported; and thus by raising their price to the foreigner, and lessening the demand for them, does all in its power to limit and hinder their production! Olive oil, for example, is charged on its exportation with a heavy duty; and as oil is largely produced in *Lucca*, *Tuscany*, *Genoa*, and elsewhere, the effect of this *felo de se* tax is to depress that branch of industry which is most suitable for the country, and to encourage the culture of olives and the oil trade in other parts of the peninsula! After this specimen of the commercial policy of Naples, the reader will not be surprised to hear that the *bonding* of goods is not permitted in any part of the kingdom; in other words, all foreign goods must pay duty on being imported, and no part of this duty is remitted, or drawn back, on their being again re-exported.

Under such multiplied difficulties the wonder is, not that the commerce of the country is confined within comparatively narrow limits, but that it exists, and is so extensive as we find it to be. The great superiority enjoyed by Naples in the production of certain articles, and the wants of the people originating in the low state of manufactures, and the demand for colonial products, spices, dye-stuffs, and other indispensable articles, have however proved too strong for the anti-commercial policy of the government, and occasion a considerable intercourse with foreigners. No accurate accounts have, however, been published of the quantities and values of the principal articles imported into, and exported from, the Neapolitan dominions; but, according to the information obtained by Mr. Macgregor and others, the value of the exports from the continental portion of the country may, perhaps, be estimated at about 2,000,000*l.*, and that of the imports at about as much. The latter consist of cottons, woollens, linens, and other manufactured goods; sugar, coffee, and other colonial products; spices, dye-stuffs, salted fish, iron and hardware, &c. The exports consist principally of olive oil, silk, flax and hemp, wool, wine, corn, linseed, cream of tartar, rags, maccaroni, lamb and kid skins, liquorice, coral, bones, &c. The trade of continental Naples principally centres in the capital; and the reader will find in the following article an account of the principal articles exported from it in 1838.

Subjoined is an ACCOUNT of the Vessels belonging to the different Neapolitan Ports in 1834:—

Provinces.	Employed in Foreign Trade.	Employed in Fisheries and Coasting Trade.	Total Vessels.	Burden in Tons.	Men.
Naples	2,639	621	3,260	125,040	22,220
Terra di Lavoro	94	73	167	9,896	1,846
Principato Citra	253	22	275	8,565	2,474
Sannio	15	13	28	1,028	258
Capitanata	43	14	57	14,288	3,123
Bari	509	129	638	1,167	791
Otranto	224	7	231	1,167	791
Abruzzo Citra	78	14	92	1,389	305
Ultra I.	24	6	30	414	198
Basilicata	23	—	23	114	98
Calabria Citra	182	8	190	1,304	1,238
Ultra I.	351	46	397	4,680	1,630
Ultra II.	120	18	138	1,118	1,586
Total	4,556	938	5,493	169,330	36,263

The principal weights in use are, the lb of 12 *once* = 11 oz. avoird.; the *rotolo* = about 31 oz.; and the *cantaro* of 100 *rotoli*, = 1164 lbs. avoird. The *tomolo* of corn = 145 Winchester bushels; the *barile* of wine, &c. = 94 imp. galls.; the *salica* of oil = 354 imp. galls. nearly. The *canna* of 8 palmi = 6 ft. 11 in. Eng. the *valmo*, di

visited in 12 *once* = 10.38 Eng. in. The Neapolitan mile of 7,000 palmi = about 1½ Eng. m.; the *mezza* = ½ Eng. acre. Accounts are kept in ducats (36. 54d. each), divided into 10 carlini and 100 grani. (*Balbo's Serristori*, &c.)

The Government is a monarchy, hereditary in both the male and female line; and at present in the hands of a branch of the house of Bourbon. The monarchy in respect to the continental portion of the kingdom, was formerly quite unlimited, while Sicily had a parliament of its own. But in 1821 a *consulta* was established for each separate division of the Neapolitan dom.; that for the continental portion consisting of 16 mems., and that for Sicily of 8 mems., appointed by the government from lists of candidates named by the inhabs. of the different provs. Each *consulta* was presided over by a vice-president nominated by the king; and both assemblies frequently meet in one, termed the *consulta generale*, in which a state minister, also appointed by the king, sat as president. In 1837, these *consulti particolari* were permanently amalgamated into one parliament, which sits at Naples. But the functions of this body are of the most restricted description; and, as is truly observed in the "Quadro del Governo," non v'ha altra suprema autorità legislativa che quella del monarca; essa è assoluta, ed in qualunque modo faccia egli conoscere la sua volontà debbono i sudditi obbedirvi. The king is, however, assisted by a cabinet of 9 ministers, and a privy council composed principally of noblemen.

Every province is governed by an *intendente* appointed by the king, to whom all the internal administration of the prov. is confided; at the head of every district (*circondario*) is a sub-intendant; and in every commune a syndic or mayor. Each commune has also a body of decurions elected from the heads of families paying taxes of from 12 to 24 ducats a year, according to circumstances, and who consult, under the presidency of the syndic, on the affairs of the commune, fixing the rates, and appointing municipal officers; but their resolutions do not acquire the force of law till they have received the sanction of the *intendente*. Every district has a council of 10 mems.; and in every prov. is a council of from 15 to 20 mems., nominated by the communes, and chosen by the minister of the interior; which council assembles once a year to examine the proposals of the district councils, to draw up, under the direction of the intendant, the projects proposed for the prov., and to examine the provincial accounts, &c. The provincial council must not, however, consult upon any matters but such as are submitted to it; and the entire authority in the prov. remains with the intendant and his council, which consist of from 3 to 5 mems., and is formed after the model of the French *council de préfecture*.

Justice is administered in a supreme court of cassation in the capital; high civil courts at Naples, Aquila, Trani, and Catanzaro; civil and criminal courts in the capital of each province, by a judge *d'intruzione* in each district, with authority from the provincial criminal court; and by a *conciliatore* in each commune, who decide in cases to the amount of 6 ducats. In 1834, tribunals of commerce were in operation at Naples, Foggia, and Monteleone. Judges, as well as most other functionaries, usually hold their appointments for 3 years. Trials are public, and the code of laws, as well as the judicial forms, established by the French, have been generally adopted, except that trials by jury are unknown. Some late statistics and details show that the average of persons accused is as 1 to 1,020, and of those convicted as 1 to 1.438 of the pop. Of 5,813 convictions, in a given period, 104 were for offences against religion; 206 for homicide, intentional or otherwise, and 1,703 for violations of property. In Capitanata, 1 in 607 of the pop. was convicted; in Abruzzo Ultra, 1 in 2,611. The proportion of the accused was 1 in 559 of the rural pop., 1 in 199 of artisans and servants, 1 in 508 of persons occupied in liberal arts, and 1 in 2,819 of landed proprietors. (*Von Raumer's Italy*, &c. ii. 229—230.) According to these reports, Capitanata is a province distinguished for crime; and both it and Sannio have been, in fact, noted for brigandage on a large scale. Mr. Claver states, that even the favourite amusements of the children in some districts in these provinces, consist in mock representations of attacks by brigands on travellers, &c., in which the former invariably gain the advantage. The country bordering on the Papal territories is also infamous for robberies. Under the French, the police was well organised, but it is now extremely corrupt and bad. Popular feeling, in the capital at least, is also generally in favour of an offender.

The established religion is the Rom. Catholic; but the S. provinces have about 75,000 Greeks, chiefly the descendants of Greek colonists, who settled in S. Italy after the destruction of the Greek empire by the Turks. Jews are few; and there are only about 800 Protestants in the kingdom. In the continental dominions of Naples, there are 20 archbishops and 66 bishops, each of whom receives an income of not less than 3,000 ducats. Ac-

cording to Serristori there were altogether, in 1837, 26,304 secular, and 20,006 regular clergy. Under the French, in 1807, about 250 convents were dissolved, their conventual property sold to pay the creditors of the state, and the monks, &c. allowed only a small stipend annually, which sum was afterwards considerably diminished. But, as already stated, since 1820, every thing has been moving in the contrary direction. Many convents and religious foundations have been restored; many new ecclesiastical fraternities founded; and the Jesuits have been re-established and endowed. According to the concordat concluded with the Papal court in 1818, the pope has the sole privilege of confirming the archbishops and bishops of the Neapolitan dominions in their sees, with other important privileges. Still, however, "the Neapolitan government does not allow the publication and application of any Papal rescripts without its own consent, and displays its firmness, nay, sometimes severity, in matters concerning the bishops and clergy, as the court of Rome would scarcely suffer a Protestant sovereign to exercise without reprimand." (*Raumer's Italy*, &c. ii. 212.)

Public instruction is in the most miserable state. Popular or elementary instruction is confined to the clergy. The Jesuits have, since their re-establishment in 1822, opened day-schools for the gratis instruction of youth, though they have not yet been allowed to re-open their former colleges for lay-boarders. There are grammar schools, as in other parts of Italy; and some attempts have been made to establish Lancasterian schools in Naples, but they seem to have failed. (*Journal of Educ.* v. 25.) There is, or ought to be, a primary school for boys in every commune; but there are, few, if any, primary schools for girls, and seminaries for teachers have only just begun to be established. In some of the provs., scarcely one in 150 or 160 persons learns to read and write.

Naples has a university, with faculties of theology, physics and mathematics, literature, jurisprudence, and medicine, which is attended by about 1,500 students; royal lycées in Naples, Salerno, Bari, Catanzaro, and Aquila; royal colleges in all the other provincial caps.; and 42 secondary schools; in which, however, little is taught beyond reading and writing, and the mere elements of Latin and Greek. But, with the exception of mathematics, antiquities, and perhaps physics, all the higher branches of science and philosophy are in the most degraded state; and even the fine arts have not escaped the general paralysis.

In 1811, a royal society of science was established in Naples, which has been replaced by the Royal Borbonic Society, with 60 mems. in 3 divisions: many other institutions which were founded by the French have disappeared. In 1834, as many as 30 periodical publications appeared in the kingdom; of these, some that were scientific journals had a high character, but the others were mostly indifferent or worthless. The censorship of the press prevents native talent, if it exist, from distinguishing itself; and the oppressive duties on foreign books hinders the people from acquiring that information from abroad which they cannot obtain at home. *Manti frumentarii* are established in the chief towns for the relief of the poor, in which contributions of corn are received and distributed to the indigent. The hospitals and other charitable foundations were formerly very rich; but they suffered a good deal from the encroachments on their funds by the French government. Their revenue, however, amounts at present (1840) to about 1,500,000 ducats a year: they are generally managed by the clergy. Prisoners in public gaols are allowed, but not compelled, to work.

But the provision for the poor is certainly inadequate; and owing partly to this, and partly to the defective state of the police, mendicancy is excessively prevalent. Mr. Maclaren says, that in "all the towns and villages near Naples, strangers are beset with crowds of mendicants, whose importunities know no bounds. To give any thing to the first who merely excites them to follow you, it is nothing less than a persecution, and is really one of the greatest nuisances a traveller has to endure."

The military force in 1838 amounted to nearly 45,000 men, of whom 20,000 were infantry of the line, 4,500 cavalry, 2,800 artillery and engineers, and 8,000 *gendarmes*. In time of war, the effective force amounts to 64,237 men. (*Serristori, Statist. delle Due Sicilie*.)

From the completion of the 18th to that of the 25th year every one (with certain exceptions) is liable to the conscription. A law of 1834 fixes the time of service at 5 years in the army and 5 years in the reserve; but *gendarmes*, artillerymen, and volunteers, serve 8 years without reserve. A provincial militia was instituted in 1818; but it was suppressed 3 years afterwards. The soldiers have, at different times, been employed in useful public works, such as paving the streets, &c.; but it must be added, that the troops are ill paid, and deficient in courage, morale, and most of the qualities that constitute good soldiers. In fact, 25,000 English, French,

**NAPLES.**

or Austrian troops, would suffice to conquer and retain the kingdom. The principal fortresses are Civitella del Tronto, Pescara, Aquila, Gaeta and Capua, all in the N. provs. : Manfredonia, Brindisi, and Taranto, are only partially fortified.

The *naval force* consists of 2 ships of the line, 5 frigates, 2 corvettes, and a number of smaller vessels, mounting altogether 496 guns. There are 3 battalions of marines, 2 of 1,000 men each, and 1 of 600 men. The principal dockyard is at Castellamare, in the bay of Naples. (*Serrisforti, Oudinot, &c.*)

The revenues are derived partly from direct and partly from indirect taxes. Of the former the *contribuzione fondiaria*, or land-tax, is by far the most important. Previously to the French régime, the estates of the church and the nobility were exempted from direct taxation; but the French made an end of this unjust distinction, and imposed the *contribuzione fondiaria* equally on all descriptions of land, without reference to its proprietors or occupants. The tax was originally fixed at 25 per cent. of the rent, and has not since been changed. The other principal sources of revenue are the customs' duties, the tolls on articles consumed in the different towns, the salt and tobacco monopolies, lottery, &c. The indirect taxes paid by the different districts are incurred by companies of the inhab., who collect them at a certain per centage. We are not sufficiently informed as to the working of this plan to be able to say whether it be as advantageous as it is ingenious. We subjoin an

of the Income and Expenditure of the Kingdom of Naples in 1835.

Revenue.	Ducats.	Expenditure.	Ducats.
Land and direct taxes	7,142,000	President of the Council of Ministers	54,000
Customs and consumption duties	5,801,000	Ministry of Foreign Affairs	250,000
Salt	3,075,000	Justice	40,000
Tobacco	902,000	Finance (including the credit list, interest on debt, &c.)	14,553,000
Gunpowder, and playing cards	277,000	War	7,200,000
Registrations, &c.	1,187,000	Naming	1,580,000

Sinking fund, &c.	704,000	the Interior	1,879,000
Deductions from salaries, &c.	1,131,000		
Grants furnished by Sicily	2,977,000		
Various sources	1,411,000		
Total	26,089,000	Total	26,100,000

(*Scrivatori, Statist. delle Due Sicilie.*)

*History.*—At a very early period, most part of the coasts of Naples and Sicily were occupied by Greek colonists, the founders of some of the greatest and most flourishing cities of the ancient world. They received from this circumstance the name of *Magna Græcia*. Continental Naples was wholly subjugated by the Romans soon after their war with Pyrrhus; and formed a most valuable portion of their empire. In modern times it has undergone many vicissitudes. It was united to Spain in the early part of the 16th century; and continued, as an appanage of that kingdom, to be governed by the kings of Spain, till the treaty of Utrecht, when it was ceded to Austria. It was then governed by an independent monarchy, under the Infanta Don Carlos of Spain, who took the name of Charles III. It continued under the Bourbon dynasty till 1798, when it was overrun by the French, who held it from 1803 till 1815.

These circumstances account in part, at least, for the degraded character of the Neapolitans. Down to the invasion of the French they had grown under an accession of tyrannical or imbecile rulers: and with such a government, and with the feudal system in full vigour, a servile and ignorant nobility, a priesthood always ready to protect and absolve every scoundrel who had money and power, it would have been a miracle had the people not become as worthless, as corrupt, and as degraded as their rulers. Had the government of the French been continued for half a century, the regeneration of the country might have been effected. But Naples has again become the prey of dotage and imbecility. And till a new order of things shall be introduced; a vigorous government established; and the oppressive restrictions on foreign trade and on the circulation of books and papers have been abolished; it would be idle to expect any material improvement in the condition or character of the people.

NAPLES (ad. *Parthenope*), the capital of the kingdom of Italy and sea-port of Italy, cap. of the above kingdom, and the residence of the sovereign, on its W. coast, at the N. side of the bay or gulph of Naples, 118 m. from Rome, in the immediate vicinity of Vesuvius, the lower elements of which approach to within a little distance of the city, on the S.E.; lat. (Port St. Elmo), 40° 50' N., long. 14° 15' E. (Port St. Elmo). In January, 1837, 351,719; but, owing to the ravage of cholera in the course of that year, the pop. was reduced, on the 1st of January, 1838, to 336,302. It may

be taken at present (1841) at 350,000. The situation of Naples is one of the finest that can be imagined. Scarcely partly by the declivity of a hill, and partly by the margin of a spacious bay, it spreads its buildings along the shore, and covers the shelving coasts and adjacent eminences with its villas and gardens. Its suburban stretch in a magnificent and lengthened sweep, from Portici on the E., to the promontory of Misenum on the W. The bay is extensive, and presents an almost unrivalled assemblage of picturesque and beautiful scenery. On its N.W. side, the shores of Pozzuoli rise in a gentle swell from the surface of the water; while on the E., Vesuvius, with its verdant sides and black smoking summit, bounds the prospect: the centre contains the city, with its palaces, churches, and gardens, rising one above the other, backed by the heights on which are the royal palace of Capo di Monte, the observatory, and the Castle of St. Elmo. The view from the city seawards commands the whole sweep of the bay, bounded on the S. by the promontory of Sorrentum, and having near its mouth the Islands of Capri Ischia, &c. The clearness of the atmosphere, and the mildness of the climate, command the gratification inspired by the scene, and justify the epithet *paradisus* given to the city by the ancients. The city has an oblong form: but, when viewed from an elevated position, such as the Carthusian monastery, the castle of St. Elmo, or the church of Santa Maria del Partu, it appears irregular, the surrounding country being so studded with houses and villages, that it is impracticable to mark the line of separation between the town and the environs.

But it is principally in respect of its situation that Naples is superior to most other cities. The streets, indeed, are generally straight and well paved, though without foot-paths, but they are universally narrow, and being bordered by lofty houses, have a dark gloomy appearance that contrasts singularly with the splendour of the surrounding country. The Strada di Toledo, the principal street, having at the one end the Piazza di Mercato, and on the other the royal palace, runs N. and S. for about a mile; and being only 40 to 50 ft. in width, it is the only house on either side, from 5 to 7 stories in height. Few of the other streets are more than 30 ft. in width, and many not more than from 15 to 20 ft., and some not so much. The houses are flat-roofed, and covered with a kind of stucco made of Pozzolana sand, which becomes indurated on exposure to the atmosphere. Most of them have balconies in front; and these, and the booths and stalls, with which the streets are constantly occupied, make them look narrower than they really are. There are several open spaces or *targhi*; for they cannot be called squares; but they are very irregular in shape and plan. The principal of these is the Largo di Castello, or the Largo del Palazzo, and the Piazza di Mercato. Some of the *targhi* are decorated with fountains and obelisks; and the city is, on the whole, pretty well supplied with water.

The houses in Naples bear no analogy to those in London, but correspond pretty closely to those of Paris, except that they are generally on a larger scale. "You see," says Mr. Maclaren, "a vast tenement, with a front as long as that of Edinburgh College, but two stories higher — a grande porte, as large as the college gate, and decorated, too, with columns. This porte opens into a court as long as the building, but perhaps only 30 or 40 ft. wide. The tenement, in fact, forms a parallelogram, built all round the court, with wide spacious stairs in each of its interior fronts. The whole of the ground story externally consists of a series of arched cells, probably 10 ft. wide, 12 ft. high, and 15 or 20 ft. deep. These are occupied as sale shops, cafés, and work-shops. The door is always in three high and narrow divisions; in the middle of the middle division is a small window, in the other all the windows are doubled back, and the instance is carried on in the open air. In cell No. 1, for instance, you have an oil-shop; in No. 2, tripe, sausage, &c.; in No. 3, cloth of some kind; in No. 4, sacks of flour; in No. 5, a coppersmith hammering away; in No. 6, you see half a dozen tailors stitching; in No. 7, you find a confectioner, who is kneading the dough on his counter; in No. 8, a modiste, or dealer in women's dresses; in No. 9, a carpenter; in No. 11, a bookseller; in No. 12, a watchmaker. The cells are all of the same shape and size, and not one front only, but often all the four external fronts of the building are thus arranged and occupied. Such a building is called a *palazzo*, which does not mean a palace, but simply a house, or, rather, a tenement, in the ground story, the upper story of which is a street, and arranged for their business, and in the upper part a crowd of other persons live. Naples is almost entirely composed of *palazzos*, great or small, such as I have described, and they are crowded together amazingly. The ground may be said to be a crop of houses, as a field bears a crop of corn; for gardens, or open plots of ground for drying clothes, or securing the advantages of light and air, are never dreamed of here, except as appendages to villas in the suburbs. In one

thing Naples is magnificent — its street pavement, which invariably consists of squared blocks of lava, joined as closely and correctly as the flags of our foot pavement. They are said to be laid in mortar, as the old Roman roads were, and hence may be considered as built roads. So firm is the work, that you never see one block an inch higher or lower than another." (*Notes*, p. 51.) There is not, however, a single shop in Naples, that would be reckoned handsome in London or Paris. Neither has it any good coffee-house or restaurant.

Notwithstanding his disposition to eulogise, Eustace admits that Naples has but little architectural magnificence. The prevailing taste, if a series of absurd fashions deserve that name, has always been bad. Moresco, Spanish, and Roman, corrupted and intermingled together, destroy all appearance of unity and symmetry, and form a monstrous jumble of discordance. Hence, the magnificence of the churches and palaces consists principally in their magnitude, and their paintings, marbles, and other decorations.

The cathedral, built on or near the site of a temple of Apollo, a large Gothic edifice, is overcharged with ornaments in the most discordant style. It is supported by more than 100 granite columns, which originally belonged to the edifice it has replaced. In the subterranean chapel, under the choir, is the body of St. Gennaro, the tutelary saint of Naples, whose blood, carefully preserved in a crystal vase, and miraculously liquefied three times a year, is regarded by the orthodox Neapolitans as the boast of the cathedral, and the great glory and honour of the city. The Santi Apostoli, erected on the ruins of a temple of Mercury, is perhaps the most ancient church in the city, having, it is alleged, been originally erected by Constantine, but subsequently rebuilt with greater magnificence. The churches of St. Paul, St. Filippo Neri, Spirito Santo, and S. Martino, are all well deserving of attention; the latter, indeed, is said to be the most splendid and beautiful church in the city. The church del Partu, though inferior to most others in size and decorations, deserves notice from the fact of its having been erected and dedicated to the *Virgin parienti*, by Sannazarus, author of the famous Latin poem *De Partu Virginis*. It contains the remains of its illustrious founder, a native of the city where he died in 1530, inclosed in a magnificent tomb, with the following distich by Bembo: —

"Da sacre cineri flores hic ille Maroni  
Succosus & munda proximus, ut timui."

In all there are said to be about 200 churches in the city; and the priests compose a large, though, certainly not the most valuable, part of the pop.

The Neapolitans appear to entertain the most perfect indifference as to the manner in which their mortal remains are disposed of. The great burying place of the city lies alongside the splendid road leading to the *Campo Marzio*. It consists of 365 deep cells, dug into the Pozzolana, of which the hill is composed. One of these cells is opened in rotation every morning, and receives all the dead bodies of the day, brought in carts, and tumbled into it, like as much rubbish; this done, it is shut up again for a year, and is then opened to receive a fresh supply of carcases! But, exclusive of this vast gothoia, a considerable number of funerals take place in churches.

The palaces and mansions of the nobility, like the churches, have little pretensions to purity of architecture; and though in many the apartments are on a grand scale, they are in general too much loaded with ornaments. The kings of Naples have been distinguished by their rage for building. The royal palace (*Palazzo reale*) in the city, near the quay, at the S. extremity of the Strada di Toledo, though a part only of the original design, is a vast building, 3 stories in height, with 4 interior courts; the first story is of the Doric, the second the Ionic, and the third the Corinthian order of architecture. Its interior is splendidly fitted up, and it has some good paintings. Another royal residence, the Capo di Monte, finely situated on an eminence outside the town, on the N., commands a magnificent view. It has attached to it some fine gardens; and it possessed, a few years ago, some remains of the famous Parma gallery, including portraits by Raphael, Andrea del Sarto, and Parmegiano, and some fine sculptures; these, however, have been mostly removed to the museum. This palace is now united to the city by a magnificent road, constructed by the French, and called, during their ascendancy, the Strada di Napoleone. The old palace of the Neapolitan monarchs is now occupied by the courts of justice, and by the archives of the kingdom.

The *Palazzo degli Studi Publici*, erected in the early part of the 17th century, from designs by Fontana, is, by far, the most interesting building in Naples. It was intended for the university, and was used as such from 1616, when it was completed, down to 1790, when the university was removed to the convent of Gesù-Vecchio,

\* A Latin name given to Sannazarus.

and the Palazzo degli Studi was converted into a great national museum, the *Museo Borbonico*. In addition to a noble library, comprising about 150,000 vols., and many MSS., this museum contains a matchless collection of bronzes, gems, paintings, household furniture, papyri, and Etruscan vases, from Herculeaneum, Pompeii, Stabia, Nola, Capua, and other ancient cities; and, in addition to these treasures, which are, in all respects, unique and unrivalled, it contains, exclusive of others, most of the statues and pictures formerly comprised in the Farnese palace at Rome, brought thither when the King of Naples succeeded to the rich inheritance of that family. The collection of statues is, in fact, inferior only to those of the capital and Vatican, and the gallery at Florence, while in paintings it yields only to Rome, Florence, and Bologna. But, despite all the treasures of the studi, Naples is not at present either a school or a cradle of art, which is at a lower ebb here than in any other considerable city of Italy.

The university of Naples, founded in 1224, has above 1,500 students. It is presided over by a rector, and divided into faculties, under deans, who, with the professors, receive very inadequate salaries from the crown. The professors are frequently chosen with little regard to merit, and the instruction they afford is, in all the higher branches of science and philosophy is most inefficient and worthless. Public law, moral and political philosophy, and even theology, can hardly be said to be taught at all; or, if taught, the instruction is not intended to expand or enlighten the mind, but to imbue it with the grossest prejudices. There are, besides the university, many superior, as well as inferior, schools; but, speaking generally, they are all miserably bad; and, Turkey excepted, education is nowhere at a lower ebb than in Naples. The censorship is extremely strict; and such foreign works as are admitted, are burdened with an extremely high duty. Under such circumstances, one ceases to be surprised at the gross ignorance prevalent among the mass of the pop.: the wonder, in fact, is, that there should be so much intelligence amongst them as is found ready to exist.

Naples has a *Società Reale Borbonica*, or Royal Society, divided into the three sections of the fine arts, science, and archaeology; and other literary and scientific associations; a military and naval college; a royal medical college; a veterinary do., a royal college of music; a fine botanical garden, constructed by the French; an observatory, in an elevated situation to the N. of the city, &c. One of the most curious institutions in Naples is a school where natives of China are instructed in the principles of Christianity, and qualified to act as missionaries. The number of pupils is small, seldom exceeding 6.

Naples has numerous and some very extensive establishments for the support and relief of the poor, including a school for the deaf and dumb, and an asylum for the blind. The two principal hospitals are those, *Degli Incurabili*, and *Della Annunziata*; the former notwithstanding its name, is open to the sick of all descriptions, and has a revenue of about 300,000 duc. a year. The latter is destined to receive foundlings and destitute females. Here, however, as everywhere else, the opening of hospitals for the reception of foundlings is productive of a vast amount of mortality and immorality. Their influence in the latter respect is too obvious to require illustration; and they are really the most efficient means that could be devised for occasioning the destruction of the children they are intended to preserve. In Naples, for example, in 1837, 2,319 children were taken to the different receiving houses attached to the Foundling Hospital, of which 1,694 died in the course of the year! the greater number being, in fact, in a dead or dying state when they were received! The truth is that instead of discouraging, foundling hospitals are as a powerful incentive to infanticide. The *Reclusorio*, or *Albergo de Poveri*, is an immense workhouse, or rather asylum for the destitute poor who are able to work, and for orphans and poor children of both sexes, who are lodged and educated. The hospital of San Gennaro, near the hill of Capo di Monte, is intended for the reception of infirm and aged poor, or poor unable to work. But, despite its hospitals, such is the want of industry, and the defects of the police, that there probably is no other city whose streets are infested by so large a proportion of poor, miserable, wretched mendicants.

Naples has 6 or 7 theatres. That of San Carlo, the largest and finest in Italy, was nearly burnt down in 1815; but it was soon after repaired, and re-opened with more than its original splendour. Among the minor theatres, 2 or 3 are wholly devoted to the exhibition of Pulcinella, or Punch, who is here seen in his glory. "What," asks Forsyth, "is a drama in Naples without Punch? or what is Punch out of Naples? Here, in his native tongue, and among his own countrymen, Punch is a person of real power; he dresses up and retails all the drolleries of the day; he is the channel, and sometimes the source, of the passing opinions; he can inflict

ridicule, he could gain a mob, or keep the whole kingdom in good humour. Such was De Flori, the Aristophanes of his nation, immortal in buffonery." (P. 268.)

The finest promenade is that called the Chiaja, extending along the shore from the Castello dell' Ovo, B. to Virgil's tomb and the hill of Pausilippo: it is in part planted and ornamented with statues and fountains, and is, altogether, one of the finest public walks that is anywhere to be met with. The mole also is a favourite promenade, and the quays that stretch E. from it towards Portici.

Though Naples could offer no effectual resistance to an invading armament, it is not altogether unprovided with the means of defence, having the castle of St. Elmo on a hill on its N.W. side, the Castello Nuovo adjoining the royal palace and the bay, and the Castello dell' Ovo on a rock projecting into the sea. The Castello Nuovo is so situated as to afford a safe retreat to the royal family and court in the event of any disturbance in the capital. The castle of St. Elmo has extensive subterranean bomb-proof works. The arsenal and cannon foundry are situated between the *Palazzo Reale* and the sea.

A vast number of employments must necessarily be carried on in so great a city; but there are few manufacturing establishments on any thing like a large scale. Some woollen, silk, and linen stuffs are, however, produced; as are hats, gloves, earthenware, jewellery, &c.; fondries, wrought on account of government, furnish cannon, fire-arms, iron cables, &c. The preparation of macaroni may, however, be said to be the distinguishing business of Naples. It forms the principal food of the bulk of the population, and is, therefore, largely produced. The best macaroni is made of the flour of the hard wheat (*Grano duro*) brought from the Black Sea. Being mixed with water, it is kneaded by means of heavy wooden blocks wrought by levers, till it acquires a sufficient degree of tenacity; it is then forced, by simple pressure, through a number of holes, so contrived that it is formed into hollow cylinders. The name given to the tubes depends on their diameter; those of the largest size being macaroni, the next to them vermicelli, and the smallest fedelini. When properly prepared and boiled to a nicety, Neapolitan macaroni tastefully greenish tinge. It is then taken out of the caldron, drained of the water, and being saturated with concentrated meat gravy, and sprinkled with finely grated cheese, forms a dish of which all classes, from the prince to the beggar, are passionately fond. But the macaroni used by the poor is merely boiled in plain water, and it is rarely eaten with any condiment whatever. When properly prepared it is nutritious and easy of digestion. The Lazzaroni pique themselves on the dexterity with which they swallow long strings of macaroni and vermicelli without breaking them.

*Commerce.*—The harbour of Naples is formed by a mole projecting from the centre of the city, nearly in the form of the letter L, leaving a light-house on its elbow. Immediately within the mole there are from 3 to 4 fathoms water, the ground being soft, but only small vessels can approach the town. The water in the bay is deep, and there is no bar, but it is a good deal exposed to the S. w. stery winds; and to guard against their influence, vessels in the bay moor with open bawse in that direction. For remarks on the system under which the trade of Naples and the kingdom generally is conducted, we beg to refer to the previous article. Subjoined is

An Account of the Quantities of the principal Articles exported from Naples in 1838.

During the same year, there cleared out from the harbour 1,227 ships, of which 1,051 were Neapolitans, 80 English, 22 French, 43 Sardinian, 20 Tuscan, &c. Naples and Castellamare have about 2,800 registered vessels of the burden of nearly 100,000 tons. The duties collected at the Neapolitan custom-house amount, at an average, to about 3,500,000 ducats, or about 600,000*l.* a year.

There are 4 or 5 companies for the insurance of ships, and 1 for lives. Their terms are generally higher than those of similar establishments in London. Houses are never insured at Naples, their construction rendering fires very rare. The companies are established by royal authority, the shareholders being only liable for the amount of their shares.

The principal merchants of Naples are all, more or less, bankers, inasmuch as they advance money on letters of credit, and deal in foreign exchange, and other financial operations. But the only banking establishment at present in existence, is the Bank of the Two Sicilies, founded by government, and guaranteed by the possession of landed property. It is not a bank for the issue of notes on credit, like the Bank of England, but for their issue on deposits somewhat on the principle of the Bank of Hamburg. Government makes all its payments by means of notes or orders on the bank; and they are issued to individuals for whatever sums they desire, on their paying an equivalent sum of money to the bank. These notes or orders form a considerable part of the circulating medium of Naples; they are paid in cash on demand. The building occupied by the bank is one of the finest in the city.

Government has also established a discount office, where bills indorsed by 2 persons of good credit, and not at more than 3 months' date, are discounted at 4 per cent. Goods are universally sold at long credits, mostly from 4 to 8 months, and for manufactured goods sometimes longer. Discount for ready money is at the rate of 6 per cent. per annum. Merchants are arranged by the Chamber of Commerce into 5 different classes, and a 6 months' credit is given at the custom-house for duties, to the extent of 50,000, 40,000, 30,000, and 15,000 ducats, to individuals, according to the class in which they happen to be enrolled. But this is of little importance, as the transactions of a merchant must be very limited indeed if the duties he have to pay be not much more than the credit he is allowed. High discriminating duties are charged on all foreign ships entering the port.

*Society in Naples* has undergone many considerable changes during the present century; but its distinguishing features have not materially varied for a lengthened period, and Goldsmith's admirable picture of Italian manners is still more applicable to this than to any other portion of the peninsula:—

But small the bliss that sense alone bestows,  
And sensual bliss is all the nation knows,  
In florid beauty groves and fields appear,  
Man sees the only growth that dwindle here,  
Contented faunts through all his manly reign;  
Though poor, luxurious; though submissive vain;  
Though grave, yet trifling; zealous, yet untrue;  
And even in penance planning sins anew.

The nobility are exceedingly numerous, and are as fond as ever of splendour and parade. Previously to the occupation of the country by the French, the greater number of them were very poor; and the changes introduced in 1806, and the subdivision of property that has taken place in the interval, have considerably reduced the fortunes of those who had formerly large estates. "Titles are here so common that you find at every corner *Prencipi* or *de Prencipi* without a virtue or a ducat." The rage for carriages and equipages is as great at this moment as it was in the days of Dr. Moore: "Women at all above the lower ranks do not walk; those who cannot afford a carriage are doomed by pride to perpetual imprisonment in their own houses, or only go to church with one or two poor devils hired for the occasion, who put on antiquated livery, and carry a book or a cushion. I am told that husbands sometimes perform the office, trusting probably that they shall escape recognition under the disguise of a footman, and choosing to gratify vanity at the expense of price. The roofs of the houses, which are flat, and adorned with flowers and shrubs in boxes, afford air and exercise to the women.

Thus living in idle retirement, their mind is exclusively bent on the means of procuring a lover; and the tales of Boccaccio and Lafontaine convey a likeness of their moral habits and manners." (*Simond's Italy*, 435.)

The numbers and wealth of the clergy were greatly diminished by the measures adopted by the French; and though both have been increased since the Restoration, their wealth has not been increased in proportion to their numbers. They are, speaking generally, poor, ignorant, and servile; and though the outward forms of religion be respected, it has nowhere so little real influence as at Naples. The lawyers, merchants, physicians, artists, and such-like persons, form the most intelligent and most valuable portion of society.

The *lazzaroni*, so prominent in the descriptions of Naples, formerly included most part of the lower classes, comprising street-porters, hawkers, water-carriers, boatmen, hackney-coachmen, mendicants, &c. Their numbers were loosely estimated at from 30,000 to 40,000, and they were said to constitute a distinct race, immersed in poverty, only half-clothed and not half-fed, without lodgings, and sleeping in the open air in the porches of churches and other public buildings. But it is now admitted that the *lazzaroni*, properly so called, or the houseless poor, are merely the dregs of the population, and that they owe their gipsy-like complexion and cast of features to their constant exposure to the sun and air. It is singular that wretches in so destitute a condition, and frequently involved in all but the extremity of want, should, speaking generally, be remarkable for their fine symmetrical and muscular forms, and be distinguished by their vivacity and humour. Great efforts have been made for many years past to lessen the numbers of the *lazzaroni*; and, under Murat, many of them were drafted into the army. But they are still extremely numerous; Mr. Maclaren says he saw numbers of half-clothed wretches (*lazzaroni*) asleep, in sunny days, on the pavement of the Chiaja. "They are the refuse of civilisation, sunk to the condition of savages. It is said there are individuals among them who do not know their own names, and who go to the priest and confess anonymously, owning sins of whose designation in the Decalogue they are ignorant." Unless when pressed by hunger, or under some peculiar and extraordinary excitement, the *lazzaroni* are neither turbulent nor licentious; but on such occasions they evince all the sanguinary ferocity of savages. They seem, however, to be wholly incapable of any vigorous or long-continued exertion for any public purpose, and may, speaking generally, be regarded as submissive, docile slaves. It used to be a common saying at Naples, that, to keep the populace quiet, three things only were necessary—*fede, farine, and forche*; that is, shows, food, and gibbets! And this compendious principle has not yet fallen into disrepute, though certainly they are supplied with but a very scanty portion of *farine*.

Lottery offices are extremely numerous in Naples, and have, as might be expected, a most injurious operation. Tickets are so subdivided, that shares may be purchased for about 2*d.*: the moral pestilence consequently descends to the very lowest ranks, and even the *lazzaroni* are speculators. There are, probably, a greater number of pick-pockets in Naples than in any other city; and deceit and falsehood are so common as hardly to excite attention. The *donne libere* are also extremely numerous.

Owing principally, no doubt, to its mild cli-

mate, a large proportion of the pop. of Naples may be said to inhabit the streets, and to carry on their business out of doors; and the competition arising among parties so situated, has probably given rise to that universal turmoil and effort to attract notice, that is at once so grotesque and so disgusting to a stranger.

"Naples," says Mr. Forsyth, "in its interior, has no parallel on earth. The crowd of London is uniform and unintelligible: it is a double line in quick motion; it is the crowd of business. The crowd of Naples consists in a general tide, rolling up and down; and in the middle of this tide, a hundred eddies of men. Here you are swept on by the current, there you are wheeled round by the vortex.

Quil'vidi 'a gente, più che altrove troppa  
È d'una parte e d'altra con gran' urli,  
Fercotevansi 'ncontro ———

DANTE.

A diversity of trades dispute with you the streets. You are stopped by a carpenter's bench, you are lost among shoemakers' stools, you dash among the pots of a *maccaroni* stall, and you escape behind a *lazzaroni's* night-basket. In this region of caricature, every bargain sounds like a battle: the popular exhibitions are full of the grotesque: some of their church processions would frighten a war-horse.

"The mole seems, on holidays, an epitome of the town, and exhibits most of its humours. Here stands a methodistical friar preaching to one row of *lazzaroni*; there, Punch, the representative of the nation, holds forth to a crowd. Yonder, another orator recounts the miracles performed by a sacred wax-work, on which he rubs his *agnuses*, and sells them, thus impregnated with grace, for a grain a piece. Beyond him are quacks in hussar uniforms, exalting their drugs and brandishing their sabres, as if not content with one mode of killing. The next *professore* is a dog of knowledge, great in his own little circle of admirers. Opposite to him stand two jocund old men, in the centres of an oval group, singing alternately to their crazy guitars. Further on is a motley audience, seated on planks, and listening to a *tragi-comic filosofo*, who reads, sings, and gesticulates old Gothic tales of Orlando and his Paladins.

"If Naples be a paradise inhabited by devils, I am sure it is by merry devils. Even the lowest class enjoy every blessing that can make the animal happy—a delicious climate, high spirits, a facility of satisfying every appetite, a conscience which gives no pain, a convenient ignorance of their duty, and a church which ensures heaven to every ruffian that has faith. Here tatters are not misery, for the climate requires little covering; filth is not misery to them who are born to it; and a few fingerings of *maccaroni* can wind up the rattling machine for the day.

"They are, perhaps, the only people on earth that do not pretend to virtue. On their own stage they suffer the Neapolitan of the drama to be always a rogue. If detected in theft, a *lazzaroni* will ask you, with impudent surprise, how you could possibly expect a poor man to be an angel. Yet what are these wretches? Why, men whose persons might stand as models to a sculptor; whose gestures strike you with the commanding energy of a savage; whose language, gaping and broad as it is, when kindled by passion, bursts into oriental metaphor; whose ideas are cooped, indeed, within a narrow circle—but a circle in which they are invincible. If you attack them there, you are beaten. Their exertion of soul, their humour, their fancy, their quickness of argument, their address at flattery,

their rapidity of utterance, their pantomime and grimace, none can resist but a lazzaroni himself.

"These gifts of nature are left to luxuriate unexpressed by education, by any notions of honesty, or habits of labour. Hence their ingenuity is wasted in crooked little views. Intent on the piddling game of cheating only for their own day, they let the great chance lately go by, and left a few immortal patriots to stake their all for posterity, and lose it." (Pp. 264—267., and 412.)

"The people," says M. Simond, "seem, in general, peaceful and contented, unconscious of want at least; they consume little, and that little is cheap. For three grains a day (three half-pence sterling) a man has his fill of macaroni, and for three grains more he may have his frrittata (very good fish or vegetables fried in oil) at any of the innumerable stands of itinerant cooks about the streets, which is not the only luxury of the gastronomic kind within his reach. A glass of ice-water costs one sixth of a grain (one twelfth part of a penny sterling), and, if properly seasoned with lime-juice and sugar, two grains. The price of these things is kept down by government, ice or hardened snow being abundantly supplied at the public expense from natural ice-houses, in certain cavernous rocks above Stabie and Sorrento, and even on Vesuvius. The ice in baskets is made to slide down the mountain, along light ropes, into boats, which sail across the bay during the night, and land their precarious cargoes before day.

"The lower people have clubs, where they assemble twenty or thirty together, and contribute each one grain for wine of an evening. They elect a president and vice-president. The president calls upon one of the members to drink a glass of wine filled by the vice-president; but when the member challenged is about to take it, the vice-president has the right to say, I take it for myself, and actually drink it to his health; a standing joke, which he may repeat as long as he pleases, or as long as he can, but which the disappointed expectant, who has the laugh of the company against him, does not always relish; and in the end there is sometimes fighting and stabbing." (P. 432.)

The country round Naples is the most beautiful that can well be imagined, and is peculiarly interesting from its classical associations. Virgil was buried in the immediate vicinity of the city; and the ruins of an ancient mausoleum on the left hand side of the road, leading from the promenade of Chiaja to the grotto of Pausilippo, is said to have contained the remains of the prince of Latin poets. There is, however, no really good foundation for this statement.

The grotto of Pausilippo, now alluded to, is a tunnel cut through the hill of that name, being a part of the road from Naples to Pozzuoli. It is about two-thirds of a mile in length, 60 ft. in height, and broad enough to serve for a highway. This work is of great, but unknown, antiquity. Seneca, in his 57th epistle, complains bitterly of its length, darkness, and dust. (*Nihil illo carcere longius, nihil illis faucibus obscurius, etiam si locus haberet lucem, putris auferret.*) Its dimensions were, however, enlarged in 1557; and it is now well paved and lighted with lamps by day as well as by night. (For further information as to the environs of Naples, see the articles BAIE, HERCULANEUM, POMPEII, POZZUOLI, VESUVIUS, &c., in this work.)

**Historical Notice.**—Naples is very ancient. It was founded by the people of Cumæ, a colony from Greece, who gradually spread themselves round the Bay of Naples, and was called from this circumstance Neapolis, or the new city. It was also called Parthenope from its being the burying-place of one of the sirens of that name. (*Ætæus Paterculus*, lib. i. cap. 4.; *Strabo*, lib. x.) It was, therefore, to all intents and purposes, a Greek city; its inhab. spoke the Greek language, and were long distinguished by their attachment to the manners and customs of their ancestors. It was on this account, according to Tacitus, that it was selected by Nero to make his *début* on the stage; such a proceeding being less offensive there, and less repugnant to the prevailing senti-

ments, than in Rome. (*Tacit Hist.* lib. xv. cap. 33.) Naples, in truth, was then, as now, a chosen seat of pleasure. Its hot baths were reckoned equal to those of Baie; and the number and excellence of its theatres and other places of amusement, its matchless scenery, the mildness of the climate, and the luxury and effeminacy of the inhab., made it a favourite retreat of the wealthy and luxurious Romans, and justifies Ovid in calling it *in otia nata Parthenopem*. After the fall of the Roman empire, it underwent many vicissitudes. It, however, early became the cap. of the modern kingdom of Naples; and, notwithstanding the calamities it has suffered from war, earthquakes, &c., it has long been the most populous city of Italy, and one of the most interesting that is anywhere to be met with. (Besides the authorities already referred to, see *Serristori, Statistica d'Italia, parte settima*, passim; *Official Statement of the Population of Naples on the 1st of January, 1838*; *Stark's and Valer's Guides*; *Com. Dict.*; *Macgregor's Report*, &c.)

**NARBONNE** (an. *Narbo Aburius*), an ancient city of France, dep. Aude, about 4 m. S. from the Aude, and 7 or 8 m. from the Mediterranean, on a navigable canal that unites it with the sea, on the one hand, and with the river on the other, and which also unites it with the Canal du Midi, a little to the N. of the Aude, 52 m. S.W. Montpellier, and 34 m. N. by E. Perpignan; lat. 43° 11' 13" N., long. 3° 09' 24" E. Pop., in 1838, ex. com., 10,792. It stands in a fine plain, and is surrounded by a wall flanked with towers, and entered by four gates. Streets narrow and tortuous, and houses mean and ill-built; it is divided by the canal into two nearly equal parts, *la Bourg* and *la Ville*, connected by three bridges; and is plentifully supplied with water by numerous fountains connected with springs outside the walls. The esplanade, or *Place des Bourges*, in the centre of the town, is a fine open space; but its beauty is much impaired by the almost total absence of vegetation. Other promenades are formed near the gates; on the banks of the canal is a fine public walk, planted with trees, and the environs generally are extremely beautiful. Narbonne has few buildings worthy of notice, except the cathedral and archbishop's palace. The former, built in the 13th and 14th centuries, is one of the finest specimens of Gothic architecture in Europe; the choir, however, is the only part complete, the nave, commenced in 1708, being unfinished. Two towers rise from its W. end; but they are deficient in that lightness and elegance observable in similar structures of the same era. The archbishop's palace (celebrated in history, as having been the place where Louis XIII. signed the order for the trial of De Thou and Cinq-Mars), is an ancient castellated building in the Place des Bourges, having attached to it a massive square tower, built in the Middle Ages; in the front court are the remains of a marble altar, erected by the Narbonne Augustus Caesar, and, in the garden, a fine tomb of white marble. The two par. churches are ancient and massive structures, but built in very bad taste, and remarkable only for some curious sculptures. The other chief buildings are three hospitals, the exchange, arsenal, barracks, prison, a museum, theatre, and public baths. Narbonne is the seat of a tribunal of original jurisdiction and commerce; and has some silk manufactures, fabrics of coarse linen cloth, worsted caps, and paper, with numerous distilleries, potteries, chemical works, tanneries, &c. It is the centre of the wine and spirit trade of the dep., and the principal support of its inhabitants is derived from its trade in wine, corn, brandy, silk, oil, salt (obtained from the neighbouring lagoons), wax, and honey, which it exports, partly to Bordeaux, by the Canal du Midi, and partly to Marseilles and other markets on the Mediterranean, by its port of La Nouvelle, at the mouth of the canal on which it is built. The honey of Narbonne is said to be the finest in the world. "Its peculiar excellence is owing to the variety of nourishment for the bees. The hives are moved from one place to another. From the gardens of Narbonne they are carried to the meadows in the neighbourhood; and they are afterwards conveyed 30 or 40 m., as far as the low Pyrenees, so that the treasures of the gardens, meadows, and mountains, are all rilled to produce the honey of Narbonne. In England this system, though doubtless it would be advantageous, could not effect what it accomplishes at Narbonne, because numerous aromatic plants, abounding in the S. of France, are not indigenous to Great Britain. It is of a much higher flavour than any other honey, and so odoriferous that one might fancy himself eating a bouquet." (*Ingis*; *Switzerland, France*, &c., p. 21.) Fruit is extremely abundant and cheap. The wages of labour do not exceed a franc a day, but the necessities of life are obtained at the same easy rate. Meat, however, is not reckoned among them by the lower orders; for "a Narbonne we have got so far south, as to discover something of those indolent habits which produce, in still more southern countries, a distaste

for all exertion beyond that necessary to preserve existence, and which limit the necessities of life to the natural productions of the soil." (P. 212.) It is worthy of remark, also, that the dress of the peasantry in the neighbourhood bears a striking resemblance to that worn by the Catalonians. The neighbourhood is fertile in corn, but is rendered unhealthy in summer by the salt lagoons fringing the shores of the Mediterranean. There are numerous salt-pans, and marble is quarried near the town.

**Narbo**, one of the most ancient towns of Gaul, and the chief city of the Volcae Arecomici, was formed into a Roman colony (ann.) 116 B.C.; Julius Caesar further enlarged it by sending thither the veterans of the tenth legion, and Cicero (*Or. pro M. Fonteio*, c. 1) terms it *colonia nostrorum civium, specula populi Romani ac propugnaculum*. At the distribution of Gaul into provinces by Augustus it gave its name to the S.W. province, called *Narbonensis*: Mela speaks of it as a place *unde olim terris auxilium nunc et nomen et decus est*, and Strabo designates it as the emporium of all Gaul. Its public buildings, and great commercial wealth, are mentioned by other authors; but the present remains of its ancient grandeur are confined to a few fragments and inscriptions, chiefly incorporated in the walls of the town. It fell into the hands of the Visigoths A.D. 462, and was shortly after made the cap. of their kingdom. In 720 it was taken by the Saracens, and by Pepin-le-bref in 759; after many vicissitudes it was finally annexed to the crown of France in the early part of the 16th century. Its ancient walls were demolished by Simon de Montfort during the wars against the Albigenes: those by which it is now surrounded having been constructed, considerably within the limits of the old walls, by Francis I. It has, at different times, suffered severely from the plague. In the wars of the League, Narbonne embraced the cause of the Huguenots; but in 1591 it submitted to Henry IV. (*Ilugo*, art. *Aude*; *Guide du Voy. en France*; *Anglais*.)

**NARDO** (an. *Neritum*), a town of the Neapolitan dom., prov. Otranto, cap. cant., on the road from Lecce to Gallipoli, 16 m. S.S.W. the former, and 10 m. N.N.E. the latter, city. Pop. about 5,000. It is a substantial, flourishing town, neatly built, and well paved. It is a bishop's see; and has numerous churches, an hospital, and manufactures of cotton goods, the raw material of which is grown in its vicinity. It was a place of some note in antiquity, as a city of the Salentines; and was held in esteem as a seminary of learning as late as the middle of the 15th century. (*Craven's Tour*, &c., pp. 138, 139; *Rampoldi*.)

**NARNI** (an. *Nequinum* and *Narnia*), a town of Central Italy, Papal States, deleg. Spoleto, on a lofty eminence, at the foot of which flows the Nera (an. *Nar*), 44 m. N. by E. Rome. Pop. about 3,600. The town has nothing but its antiquity and picturesque appearance to recommend it: it is badly built, with steep and narrow streets, and exhibits every mark of poverty and decay. It has a cathedral, several other churches, numerous convents, a modern aqueduct, which supplies several public fountains, and the ruins of an amphitheatre. But it is principally celebrated for the remains of a noble bridge thrown by Augustus over the Nar, constructed after the Etruscan method, of large blocks of marble without cement: it is supposed to have been originally upwards of 630 ft. in length. Only one of the arches remains perfect, the span of which is above 60 ft.: the piers supporting it are 24 ft. in breadth. Addison styles this bridge "one of the stateliest ruins in Italy;" and few relics of antiquity are better adapted to impress the mind with high ideas of Roman magnificence. Narni was the birth-place of the Emperor Nerva. (*Craven's Ancient Italy*, l. 277, 278; *Rampoldi*; *Conder's Italy*.)

**NARO** (supposed to be the an. *Myrtum*), a town of Sicily, intend. Girgenti, cap. cant., on the Naro (an. *Hypso*), 13 m. E. by S. Girgenti, and 21 m. S.W. Caltanissetta. Pop., in 1831, 10,105. It is situated on an eminence, surrounded by picturesque valleys and glens; has a royal college, and a house of refuge, and some trade in oil, wine, and sulphur, which last is very abundant in its vicinity. Many sepulchres, medals, and other vestiges of antiquity, have been found here. (*Smyth's Sicily*, p. 202; *Dict. Geog.*; *Ortolani, Diz. della Sicilia*.)

**NARRAINGUNGE**, a considerable trading town of British India, prov. Bengal, distr. Dacca-Jelapore, on a branch of the Behmagputra, 8 m. S.E. Dacca. Lat. 23° 37' N.; long. 90° 58' E. Pop. estimated at 15,000. The inhabitants carry on a large trade in salt, grain, tobacco, and lime, and the town exhibits a scene of bustle and activity seldom witnessed in a community of Bengalees. The banks of the river are studded with indigo factories, and the remains of forts erected to repel former invasions of the Arracanese. (*Hamilton's E. I. Gaz.*)

**NARVA**, a town of European Russia, gov. of Petersburg, on the Narova, about 8 m. from its mouth, and 81 m. W. S.W. St. Petersburg, lat. 59° 22' 53" N., and

long. 28° 24' 40" E. Pop. 3,000. It is divided into an old and more recent part; the latter, placed on high ground, is surrounded with fortifications in a good state of repair, and consists of respectable stone houses; the lower and older part comprising only a few wretched wooden tenements, with two churches, one of which belongs to the Greek, the other to the Lutheran, religion. Three other churches, a town-hall, exchange, and the half-ruinous fortress of Ivangorod (built in 1492, by the Czar Ivan III. Vassilievitch), are the only other public edifices.

The place, in fact, would not be worth notice but for the famous battle fought in its vicinity, on the 30th of November, 1700; when Charles XII., king of Sweden, at the head of only 8,000 men, attacked and forced the entrenched camp of the Russian army, consisting of about 80,000 men, which had been besieging Narva. The Swedes gained a complete victory. Above 18,000 Russians were killed in their intrenchments, besides a great number drowned in the river; next day above 30,000 Russian troops surrendered to the Swedes, by whom they were disarmed, and dismissed. This extraordinary success did not cost the Swedes above 600 men! On hearing of this disaster, the czar, Peter the Great, said, "*Je sais bien que les Suédois nous batront long temps; mais à la fin ils nous apprendront eux-mêmes d'les vaincre*;" and the event proved that he was in the right. (*See* *l'histoire de Charles XII.*, liv. II.)

**NASEBY**, a decayed market-town and par. of England, co. Northampton, hund. Guilsborough, 11½ m. N.N.W. Northampton, and 72 m. N.W. London. Area of par. 3,690 acres. Pop., in 1831, 707. This village formerly possessed a market and a worsted manufactory, but they have long ceased to exist; and the market cross, in the centre of the village, is the only extant sign of its past importance.

But, how unimportant soever in other respects, this trifling village will be ever memorable in British history for the battle fought near it on the 14th of June, 1645, between the royalists under Charles I. and the parliamentary army commanded by Cromwell and Fairfax. The action was obstinate and well contested; but in the end the parliamentary leaders achieved a complete and decisive victory. The loss in killed on both sides was nearly equal; but the republicans took 500 officers and 4,000 soldiers, and all the king's artillery and ammunition. This action may be said to have terminated the civil war.

**NASHVILLE**, a town of the U. States of N. America, state Tennessee, of which it is the cap., on the Cumberland, 155 m. S. by W. Louisville. Pop., in 1830, 5,566, but it is now probably little short of 10,000. It is situated on the S. bank of the river, adjacent to fine bluffs, and is well built, with wide and regular streets; comprising, besides some elegant private dwellings, a court-house, lunatic asylum, penitentiary on the Auburn plan, the halls of the university, U. States branch bank, market-house, with hotels, churches, &c. The town has an active and pretty extensive trade; and there are some manufactories, comprising brass and iron foundries, rolling-mills, tanneries, &c. Steam boats ascend as far as the town, the burden of steamers belonging to which, in 1838, amounted to 5,481 tons; but the navigation, so far as respects the Ohio and Mississippi, only lasts for about eight months of the year, as during the dry season the boats cannot descend from the mouth of the Cumberland to that of the Ohio. The University of Nashville, founded in 1806, has six professors, and is attended by 95 students: the library comprises 8,500 vols. There is also a lyceum, and the town issues 4 or 5 newspapers. (*Plant's Geog.*, p. 338; *Murray's Encycl.*, Amer. ed., liv. 577.)

**NASO** (an. *Agathyrnum*), a town of Sicily, intend. Messina, distr. Patti, cap. cant., on the Naso, near its mouth, in the Mediterranean, 10 m. W. by S. Patti. Pop., in 1831, 6,226. It is situated on a hill, in a finely wooded and healthy neighbourhood; is walled, and has some handsome buildings: several warehouses on the sea shore belong to its inhab. It acquired some notoriety in 1812, by reason of its pop. having refused the constitution then promulgated, and armed themselves on behalf of king Ferdinand. (*Smyth's Sicily*, p. 99, &c.)

**NASSAU (DUCHY OF)**, a state of W. Germany, principally between lat. 50° and 51° N., and long. 7° 32' and 8° 45' E.; having N. and W. Rhenish Prussia, S. Hesse-Darmstadt, and E. the latter, Hesse-Cassel, the territ. of Frankfurt, and the Prussian circle of Wetzlar. Length, N. to S. 55 m.; average breadth, about 33 m. Area, about 1,800 sq. m. Pop., in 1838, 386,221. Almost the whole of the surface is hilly, with a general slope towards the W. The Taunus mountains cover the S. and the Westerwald the N. part of the duchy; the Feldberg, the highest point of the former, rises to nearly 2,700 ft.; and the Salzberg-head (*Salzburger Kopf*), in the Westerwald, reaches the height of 2,600 ft. above the sea. No portion of level surface is sufficiently extensive to be called a plain, and the valleys are gene-

rally narrow and confined, though many are highly picturesque.

The Rhine forms a considerable portion of the S. and W. boundaries. The Mayn limits the duchy to the S.E., and the Lahn intersects it near its centre, baving, for the most part, a S.W. course. The Lahn receives within this duchy the Elz, Eins, Aar, Muhl, &c.; and joins the Rhine at Lahnstein; being navigable as far as Weilburg, 14 leagues from its mouth. There are no lakes; but Nassau has a number of mineral springs, especially in the Taunus, where are Ems, Selter, Schlangenbad, Wiesbaden, &c., among the most frequented spas in Germany. The climate is cold in the mountains, particularly in the Westerwald, but so mild in the sheltered valleys that the vine comes to very considerable perfection. The mean temperature of the year in the Rheingau, S. of Weisbaden is 10° centigr., or 50° Fah. Every part of the duchy is tolerably healthy. The soil is no where remarkably fertile, but only a small portion of it is barren; it is least productive in the N., where, however, there are good natural pastures. A portion of the soil in Westerwald is volcanic, consisting of basalt and lava; and near Weilburg are traces of an extinct volcano. In 1831, of 1,812,541 *maasses* of land, 702,000 were arable, 126,120 in meadows, 121,413 in vineyards, 7,473 in gardens, no fewer than 736,377 in woods, 6,545 occupied with buildings, 105,581 in natural pastures, &c., and 40,247 altogether waste. Agriculture is the principal branch of industry. The land is mostly divided into small parcels, which are not, however, farmed by their actual proprietors. "The whole country, from the Heidelberg to the Rheingau and Homburg mountains, and from the Rhine to the mountains of the Spessart (which tract includes, besides the S. part of Nassau, part of Hesse Darmstadt, Frankfurt, Hesse Cassel, and Bavaria), presents one uniform face. This plain is divided between large forests of the common *Frax sylvatica*, occasionally interspersed with oak and beech woods, and large flat districts of corn and vegetables, unreveted by a single tree or hedge. The open fields are divided into small patches, by the difference of culture, which frequently denotes the boundaries of each peasant's little farm. The farms rarely exceed 50 acres: gentlemen farmers, or speculative agriculturists, are unknown; and the opposite extreme, the class of agricultural day-labourers, is very small. The peasant generally holds his little possession at a fixed rent, due to the lord of the soil, which is never increased. He cannot be dispossessed; and his land descends from father to son subject to this burthen—a tenure much resembling English copyholds. *Leibtenge-schaft* (personal vassalage) is now completely abolished in this, and, indeed, in most parts of Germany." (*Statistik near the Rhine*, 112, 113.) Wheat is grown in the valleys of the larger rivers, but on the uplands, rye, barley, and oats are almost the only grains cultivated, with potatoes; and in the Westerwald, buckwheat. The S. declivities of the Taunus are covered with chestnut woods and orchards. In the district called the *Rheingau*, further S., along the Rhine and Mayn, the culture of the vine occupies a large share of attention. The finest growths of the Rhine, as Hockheim, Steinberger, Rudesheim, and above all Johannisberg (which see), come from this duchy; in which nearly a third part as much land is appropriated to the culture of the vine, as in all the Rhenish Prussia. (*Bergbaus*.) The soil of the Rheingau is thin and sandy; but it is well matured, and very productive. The Hockheim, properly so called, or *hock*, is grown at Hockheim, on a little hill behind the ancient deanery, on a space of about 8 acres, open to the southern sun, and sheltered from N. winds by the town. Each acre has about 4,000 vine plants, valued at a ducat each; and the little hill produces, in good seasons, about 12 large casks (*tonneaux*) of wine, each of which sells, frequently as soon as made, for 1,500 florins (125*l.*) or upwards. A constant supply of water is afforded to the plants by a small rivulet, and they are protected from too much wet by moveable wooden heads. (*Schreiber*, 171.) But there is another vineyard far inferior to the above; and the surrounding lands yield an abundant produce which, as in the case of other vines, often passes for the first growths. The produce of the Steinberger vineyard, which belonged to the suppressed monastery of Eberbach, and is now the property of the Grand Duke, is the strongest of all the Rhenish wines; and, in favourable years, has much sweetness and delicacy of flavour. The quantity made is about 300 hds., of which about 60 is first rate, and has occasionally been sold on the spot at 10*l.* a bottle. (*Henderson on Wine*, 223.) Flax, hemp, fruits, hops, tobacco, turnips, and chicory, are among the other principal kinds of produce. The pastures are well attended to, and a good many crops are grown for fodder; the rearer of live stock being an important branch of husbandry. Bergians estimates that there are 172,000 head of cattle, 126,000 sheep, and 54,000 hogs in the duchy. (*Allg. Länder*, &c., iii. 513.) The various breeds are said to be improving. Bees are numerous, and game

abounds in the woods. Iron, lead, copper and silver are the principal mineral products; heavy coal also is found in the Westerwald, and chalk, marble, roofing slate, and potters' clay elsewhere. Mining, forges &c. are estimated to employ 8,000 workmen. Working in metals is, however, the chief branch of manufacturing industry; the other manufactures are mostly domestic. Linen cloths are woven by the peasantry at their own houses; and some cotton cloths, carpets, woollen yarn and hosiery, Morocco leather, sieves, soap, sealing wax, &c., are made; few, however, of the manufactured articles find their way out of the duchy, the exports consisting principally of mineral waters, wine, cattle, wool, mineral products, and hardware and earthenware. The roads are good; and the Rhine, Mayn, and Lahn, present great facilities for commerce; but the trade of the duchy is by no means so flourishing as it might be. Nassau has of late years joined the Prussian commercial league.

Accounts are kept in florins (*gulden*) of 60 *Kreutzers*, containing 4 *pfennigs* each; the florin = 1*s.* 8*d.* Engl. The Hessian *morgen* (*stuecknormalmorgen*) = about 8-11ths Engl. acre.

The government is a constitutional monarchy, hereditary in the male line; and is among the most liberal of W. Germany. The *Landstände*, or parliament, of the duchy consists of 2 chambers: the first composed of the princes of the ducal house, the heads of 8 noble families, and 6 representatives for the rest of the nobility; the second consisting of 22 members, 15 of whom are representatives of the landed proprietors, and 3 of the clergy. The states are convoked yearly. The press is free, and personal liberty, the right of petitioning, and eligibility to all public offices are privileges belonging to every subject. Civil justice is administered in a primary court in the cap. of each of the 28 districts of the duchy; in secondary courts at Dillenburg and Usingen; and a high court of appeal at Wustaden. The principal criminal courts are at Wiesbaden and Dillenburg. There are elementary, royal, and grammar schools at Diaz, Usingen, Dillenburg, Hadamar, Wiesbaden, &c., and a gymnasium in Weilburg, besides female schools, many special academies, and deaf and dumb and other charitable schools. The government has taken considerable pains to promote popular education, but it does not seem to be yet much diffused, few children attending the public elementary schools. By an agreement with Hanover, the university of Göttingen has been constituted the high school for the duchy; except in Rom. Cath. theology, for which students resort to Marburg, in Hesse Cassel. In respect of religion, about 208,000 are Protestants, 175,000 Rom. Caths., and 6,200 Jews; the Lutherans and Calvinists have united in one communion. The military force consists of about 4,000 men under arms, with a reserve of 1,550 more. Public revenue estimated at 1,800,000 florins a year: public debt about 2,000,000 florins, but this is in process of liquidation. Nassau holds, with Brunswick, the ninth place in the German Confederation; it has two votes in the full council, and, with Brunswick, one in the committee. It furnishes to the army of the Confederation a contingent of 3,028 men.

This country, like Hesse, was anciently inhabited by the *Catti*. The founder of the reigning house of Nassau was Otto of Laurenburg, brother of the emperor Conrad I. In 1255, two collateral lines were formed; and the descendants of the elder have remained in possession of this territory; while those of the younger (Orange-Nassau) have been seated on the throne of Holland. (*Bergbaus*, *Allg. Länder*, &c., iv. 431—440; *Horschemann's Stein*; *Schreiber, Guide du Rhin*, &c.)

NATCHEZ, a city of the U. S. of N. America, state Mississippi, on the E. bank of the river of the same name, 285 m. above New Orleans; lat. 31° 33' 48" N., long. 91° 30' W. Pop., in 1830, 2,780, but estimated by Mr. Stuart to have amounted to 5,000 or 6,000, in 1833 (i. 262.), and now probably 8,000 or 10,000. It is situated partly on high ground, about  $\frac{1}{2}$  m. from the shore, but partly, also, "under the hill," close to the river. The upper town is laid out in broad streets, crossing each other at right angles, and shaded with fine spreading trees, the whole having an appearance of comfort and opulence. The principal buildings are the court-house, the 3 banks, the gael, academy, and its 5 places of worship; besides which there are many handsome private houses, with attached gardens. "Natchez," says Mr. Stuart, "though occasionally very unhealthy, from the prevalence of yellow fever, is one of the most beautiful towns of the U. S. The 'pride of India' tree, shading the streets, was in blossom, having a greater resemblance to the lilac than to any other of the flowering shrubs. Its leaves are long and spiked; and the growth of the trees is so rapid, that in a few years they completely cover a village, and give a delightful freshness to the landscape." A fine esplanade, 100 yds. wide, occupies the edge of the bluff close in front of the upper town, and

commands an extensive and striking view of the river, the rich country eastward, and the wide dismal swamp on the W. side of the Mississippi. The town "under the hill, however, and that part in which the principal river trade is carried on, is a repulsive place, and is the general resort of the vilest characters from the upper and lower country. The houses are tenanted by boatmen, mulattoes, &c.; and on the landing-place are several hotels, in which vice and immorality of every kind are unblushingly displayed. Dancing assemblies for the refuse of both sexes are held in the public rooms of these houses almost every night; and there are other rooms devoted to gambling." The captain of the "Constitution" steamer informed Mr. Stuart, that he considered the neighbourhood of Natchez as the most profligate place in the Mississippi valley. (*Stuart*, ii. 262.) The lower part of the town is also inhabited by some of the wealthiest merchants; and this being one of the principal places above New Orleans for the shipment of cotton, the streets at a certain period of the year are almost barricaded with bales of that article. In 1835, 35,000 bales were shipped from this port; and although nearly 300 m. above New Orleans, it is accessible to large ships, and carries on a very considerable foreign trade. Steamboats, also, constantly pass the town, and furnish the greatest facility for communication with the districts either above or below. The *Natchez*, and two other newspapers, are published here. Considerable attention is paid to literature; and at Washington, a village 5 m. from the city, is Jefferson College, founded in 1802, with 6 professors giving instruction in various branches of science and literature; the library is small, containing only 1,522 vols.

Natchez was formerly the residence of the chief of the Indian tribe, from which the town was afterwards named. In 1716, the French formed a settlement here, and established a port called St. Rosalie. Disputes, however, arose between the natives and the new-comers, which ended in a general massacre of the latter. The French, a few years afterwards, sent an army into the country; and so vigorous were their measures, that the whole nation was either exterminated, or sold as slaves. Indian mounds and other monuments are visible near the town; as are the ruins of the French port. (*Stuart's America*, ii. 262-264; *Flint's Geog. of the U. S.*, p. 231; *Murray's Enquiry*, Amer. ed., iii. 548, &c.)

NATOLIA, ANATOLIA, or ANADOLIA (a corruption from *anadolus*, the East, or *Livani*), a peninsula of W. Asia, anciently called *Asia Minor*, and now constituting a pachalik of Asiatic Turkey: it extends between lat. 36° and 42° N., and between long. 26° and 42° E., being bounded N. by the Black Sea, E. by Armenia and the Euphrates, S. by Syria and the Mediterranean, and W. by the Archipelago. Length, from C. Kara-burnu to the Euphrates, 670 m.; breadth from 300 to 440 m.; estimated area, 250,000 sq. m., or about 1-16th more than that of the Spanish peninsula. Pop. probably about 4,350,000. The coast-line is very irregular, especially on its W. and S. sides, where it is deeply indented by the Gulphs of Adramytti, Smyrna, Kos, Makry, Adalia, and Souderson. Surface very irregular, but may be generally described as a high table-land, dotted with salt lakes, and enclosed by two ranges, detached from the plateau of Armenia, and running nearly parallel to the N. and S. coasts. The latter of these chains, the *Mons Taurus* of the ancients, and Sultan-dagh of the Turks, runs close to the shore in some parts of Karamania, forming a bluff precipitous coast, intersected here and there by narrow gorges, through which numerous torrents run into the sea. One of the heights, close to the Gulph of Adalia, was ascertained by Captain Beaufort to be 7,800 ft. high; but there are several summits in the interior, the snow on which descending one fourth the way down their sides, indicates a height of 10,600 ft., or nearly equal to that of Mount Etna. (*Beaufort's Karamania*, p. 57.) The highest is in fact less clearly defined, the only snow-covered peak being *Mount Olympus*, about 25 m. S. the Sea of Marmara. Connected with *Olympus* westward is the celebrated *Mount Ida*, overlooking the plain of Troy; and the highest summit of which, called *Gargarus* by Homer, and *Kaz-dagh* by the Turks, rises about 5,000 ft. above the sea. About 100 m. S. of *Ida* runs another range, the *Tmolus* of antiquity, mentioned by Ovid, Virgil, and Seneca as being celebrated for its excellent wines and rich metallic veins. The central table-land is partly drained by the rivers flowing into the Black Sea; but a large portion, lying N. and N.W. the range of *Taurus*, about 240 m. in length, by 150 m. in breadth, is covered with numerous salt lakes, marshes, and rivers, having no visible outlet. In rainy seasons these lakes overflow, and, but for the ridges that cross the plain and separate it into basins, would submerge nearly 200 sq. m. of the surface. The largest of these is the lake *Boisheir*, 43 m. W. S.W. *Konieh*; but by far the most curious in the peninsula is the *Tatiss palus* of antiquity (about 50 m. N. *Konieh*, and 2,500 ft. above the sea), the waters of which, acc. to Strabo, were

so impregnated with brine, that any thing immersed in it was soon covered with a saline incrustation: the Turks call it *Tatiss*, and it still furnishes in abundance the article for which it was anciently famous; but it contains neither fish nor conchiferous animals. (*Geog. Journ.*, x. 299.)

The largest rivers of Natolia flow into the Black Sea. The *Halys*, or *Kizil-Ermak* ("Red River"), rises by 2 branches on the S. side of Mount *Erdik* (an. *Argæus*), and flows by a tortuous course of about 500 m. first N.W., and subsequently N.E., into the Black Sea, where it is about as wide as the *Seine* at Paris. It is the largest river of Asia Minor; and, in ancient times, was considered the boundary between the Lydian and Median kingdoms, as well as a natural dividing line of the peninsula. (See *Herod.*, i. 72.) E. of the *Halys* is the *Iris* (now the *Jekil-Ermak*), a much smaller river, rising in the N. range of the table-land, and flowing W. by N. past *Tokat* into the Black Sea, about 20 m. E. *Samsoun* (an. *Anisus*). In the N.W. part of Natolia is the large and celebrated river *Sangarius* (now *Sakaria*), the most distant source of which is in the central plateau, about 60 m. S.S.W. *Angora*; lat. 38° 5' N., long. 32° 3' S. After receiving numerous tributaries, it turns northward, near the modern town of *Eskisheir* (an. *Dorylaeum*), and flows into the Black Sea, about 50 m. W. by S. *Erekli*. The three principal rivers flowing into the Archipelago are the *Cæicus*, the *aurio turbidus Heremus* of Virgil (*Georg.*, ii. 137.), now the *Sarabat*, the marshy *Caystros*, at the mouth of which was the *Ææzus* of Homer (*Il.*, ii. 470.), and the *Meander* (now *Menderes*), by far the largest of the three, and celebrated in antiquity, not only for the sinuities of its course, but for the fertility of its valleys, and the number of flourishing cities on its banks. It rises by numerous sources in long. 30° 8' E., and takes a general course, W. by S., about 220 m. to its mouth, near the ruins of *Miletus*. The rivers on the S. side of the peninsula, are, with one or two exceptions, little more than brooks or mountain-torrents; and the *Cydnes*, the scene of the splendid pageant of *Cleopatra*, is at present only 160 ft. wide, and inaccessible to any but the smallest boats. (*Beaufort's Karamania*, p. 275.)

The geological formation of Natolia partakes in many parts of a volcanic character. The high regions of Phrygia, called *saracastan*, abounds with lava, and other substances, indicating the existence of igneous action at some previous period; earthquakes have frequently visited the W. part of the peninsula, and all but demolished *Laodicea*, *Apamea*, *Cibotus*, *Sayles*, and other cities of antiquity; and it has still numerous thermal and sulphureous springs. The most general formation, however, is of white limestone, bold cliffs of which rise in Karamania, from 600 ft. to 700 ft. perpendicularly from the sea, exhibiting the most curious contortions of strata. (*Beaufort*, p. 212, 213.) On the N. side of the peninsula the same description of strata prevails, covered with gypsum, and in the highest mountains serpentine is found alternating with the blue mountain-limestone. The marble of Asia Minor was extensively used by the wealthy Romans, in building their houses and villas. These mountains abound in mineral riches; copper is wrought to a considerable extent near *Trebizond*, *Samsoun*, and *Siwas*; and the region of the *Chalybes*

sevislima quamquam

Gens Chalybium, duris patiens cut cultus in arvis

Et tonat addicta semper domus ignem missa.

*Vul. Flac. Arg.*, iv. 610.

is still an important mining district of the peninsula. Lead has been found in several places, though not wrought; but rock-alum is procured near *Unich* (an. *Ume*), and exported in considerable quantities.

The climate of Natolia, owing to the varying elevation and different aspects of its surface, will admit of no general description. On the central plateau, the height of which (exclusive of mountains) varies from 2,800 to 3,900 ft. above the sea, it is cold, though salubrious, and snow lies, in many parts, for 2 or 3 months of winter; but, in July and August, the heat is often intense, and rendered more oppressive by the tendency of the sandy surface to absorb heat. On the W. shores the climate is genial, and the soil very productive; but in some parts, as at Smyrna and elsewhere, epidemics are prevalent, and the plague often makes great ravages among the pop. The heat in July is stated by Mr. Addison to range from 84° to 94° Fah. in the shade; rain seldom falls, though the want of it is, in some measure, compensated by heavy dews. (*Damascus and Palmyra*, i. 320, 321.) The climate on the N. side is far more temperate, and rain is frequent. The soil on the coasts is tolerably fertile, producing wheat, olives, rice, millet, and other grains; but tillage is much neglected, irrigation and the manuring of land being little practised. The N. shores are covered with forests of oak, ash, larch, beech trees, &c., furnishing abundant supplies of timber for the Turkish navy. The mountains of Karamania

are covered principally with pines. Large flocks of sheep and goats graze on the lofty plains of the interior; their wool and hair forming an important article of commerce between Angora and Smyrna.

Naotolia is under a pasha or military governor, to whom are subject the respective beglerbegs of Anatoli, Karamania, Marash, Siwas, and Trebizond, the country being further subdivided into 17 sandjaks. The fixed population consists principally of Turks and Greeks, with smaller numbers of Armenians and Jews; besides whom there are nomadic tribes, both Kurds and Turcomans, employed partly in pastoral, but partly also in marauding occupations. (For further particulars see TURKEY.)

Naotolia, which was first called simply Asia, afterwards *ἡ παρὰ Ἀσίαν*, to distinguish it from that more to the E. *ἡ ἐν Ἀσίᾳ*, was called *Asia propria* or *proconnesiaria*, by the Romans, and did not receive its appellation of *Asia Minor* earlier than the time of Orosius, in the beginning of the 5th century. With respect to the original inhabitants of this celebrated peninsula, we have little information on which any reliance can be placed; but there is reason to believe that the Phenicians had settlements, at a very early period, on its S. and W. coasts, and that there were frequent emigrations to it from Thrace, as well as Thessaly, soon after the Trojan war. The great Ionian migration (composed of colonists from Attica and Achaea) took place *anno* 1130 B.C.; and, about 80 years afterwards a colony of Dorians, from Megara, Troezen, and Argos, settled on the S.W. coast, a little S. of those last mentioned. Subsequently to the establishment of these Greek colonies, and during the existence of the Lydian monarchy, (which lasted from a period of obscure antiquity down to the overthrow of Croesus by Cyrus B.C. 546,) Asia Minor was overrun successively by large bodies of Cimmerians and Scythians, who, however, though they penetrated as far as Lydia, and took Sardes, were unable to secure a permanent footing in the country. (Herod., i. 15.) The numerous revolutions, indeed, caused both by conquest and colonisation are sufficiently attested by the statement of Herodotus, that the peninsula, between four and five centuries prior to the Christian era, comprised 30 different nations (*ἔθνη*). At the fall of the Lydian kingdom Asia Minor was formed into 4 satrapies, belonging to the Medo-Persian empire, under which it remained upwards of two centuries, though the interior of the country, inhabited by nomadic tribes, was never fully subdued. Notwithstanding the oppressions of the provincial governors, and their occasional struggles with the "Great King," the Greek colonists continued to flourish, and they gradually spread themselves northward, along the Euxine Sea, as far as *Trapezus* (now Trebizond), and southward, on the shores of the Mediterranean to the Gulph of Issus, everywhere distinguishing themselves by their industry and commercial activity. In refinement, also, and the cultivation of the arts, they were at least equal, if not superior, to their European brethren; at all events, if Asia Minor have not given birth to great warriors and statesmen, she may justly boast of the all but unrivalled excellence of her poets, historians, philosophers, architects, and musicians. In poetry she lays claim to Homer, Hesiod, Sophocles, Aeschylus, and Nicander; in philosophy to Thales, Pythagoras, Anaxagoras, Blas, and Pittacus; and in history to Hecataeus, Hellanicus, Herodotus, Ctesias, and Dionysius of Halicarnassus. The Macedonian succeeded the Persian dominion *anno* 331 B.C.; from which time, during nearly two centuries, Asia Minor was subject to many vicissitudes consequent on the changing fortunes of Alexander's successors and their descendants, as well as the formation of several minor kingdoms (as Pontus, Bithynia, &c.) under native princes. During the century immediately preceding the Christian era the various parts of the peninsula fell, one by one, into the hands of the Romans, under whom it formed a proconsulship; and it attained, during their dominion, not only its most uniform and settled, but also its most prosperous state; a fact sufficiently proved by the number of large cities built or embellished, and the great works undertaken and completed, during the earlier period of the empire. The decline of the Roman power exposed the peninsula to fresh invasions from the E.; and at the commencement of the 8th century the Mohammedans began to settle themselves on its E. borders. At the period of the first crusade they had spread over almost the whole peninsula, and reduced it to a state in many respects similar to that in which we find it at the present day, except that it was more populous. It was ravaged by the crusaders in the 12th and 13th centuries, and was overrun by the Tartar hordes under Taimour after the battle of Angora (1402 A.D.); but neither produced any permanent effect on the condition of the population. (Leake's *Asia Minor*, p. 1—144; Cramer's *Asia Minor*, *passim*; *Geog. Journ.*, vi. x.)

NAUMBURG, a town of Prussian Saxony, distr. of its own name, on the Saale, 25 m. S. Halle, and 28 m. S.W. Leipzig; lat. 51° 3' N., long. 11° 54' E. Pop.

12,000. It is situated in a fertile vale, and is tolerably well built, having several good and wide streets, with 3 suburbs. Its principal public buildings are the citadel, town-hall, and arsenal, a noble Gothic cathedral, 5 Calvinistic churches, 2 orphan asylums, 6 hospitals, a poor-house, gymnasium, and trade-school. It is the seat of a superior and ordinary tribunal for the circle, a council for do., and board of taxation. It has manufactures of woollen cloths, hosiery, and shoes, and large chemical works. The 2 annual fairs of Naumburg were formerly much celebrated, but have recently declined in importance.

Naumburg is celebrated in history as having been besieged in 1482 by the Hussites, under Procopius. This general, irritated by the resistance of the inhab., made a vow to put them all to the sword, but was deterred from his purpose by the earnest supplications of the children of the town, who came out in procession and threw themselves at his feet. The anniversary of this event (called the *Kindersfest*, or "Children's Fete.") is still celebrated on the 28th July, and has furnished Kotzebue with the subject of one of his plays (*Von Zedlitz, Neukirch Pruss. Staat.*, iii. 225; *Berghaus*; *Murray's Handbook of N. Germ.*, p. 352.)

NAUPLIA, or NAPOLI DI ROMANIA, a city and sea-port of independent Greece, on the E. side of the Morea, at the extremity of the bay of its own name, 5 m. S.E. Argos, 58 m. W. S.W. Athens; lat. 37° 33' 50" N., long. 22° 47' 30" E. Pop., acc. to Burgess, 16,000. The town, which stands on the N.E. side of a hill, with a fabulous summit, and is built in the form of an amphitheatre, has been greatly enlarged and improved since the war of independence.

"Nauplia," says Mr. Burgess, the most recent traveller in Greece, "differs in no longer any similarity to its former internal appearance (which was that of a filthy and miserable Turkish town). The features of the Palamidi rock, the heights of Itchkali, the low coast sweeping round by Tyrius and the Lerndan marsh, with citadel of Argos rising out of the plain, the mountainous shores flanking the E. parts, and the headlands jutting beyond the reach of the naked eye, most endure as long as the landscape remains undissolved: but every thing that man and his institutions can change is now changed at Nauplia." (i. 186.) It now comprises several wide streets, regularly laid out, and lined with good houses, in the European style; some of which, for size and elegance, might pass, in Greece, for minor palaces. The principal public buildings, besides the churches (one of which belongs to the R. Catholics), are a royal palace, formerly the residence of Count Capo d'Istria, a new court of justice, called the *Βουλαιεον*, and a garrison, occupied by Bavarian troops. The shops are well stored with provisions, and other articles; and there are numerous cafes about the port, and in the chief thoroughfares. A quay faces the harbour, which is commanded by the ancient Fort Palamendi, one of the strongest castles in Greece; at its foot is a stone aqueduct, from which the town is well supplied with water. Nauplia possesses one of the largest government dockyards in Greece, and extensive storerooms. Its trade is very considerable, the principal exports being oil, wool, gall-nuts, wax, silk, wool, and cotton; while the imports comprise corn, manufactured and colonial goods, with timber, &c. The commerce is principally carried on in Greek bottoms. In 1836 there arrived 86 vessels of 6,026 tons, and 58 vessels of 3,728 tons left the port in the same year. The roadstead of Nauplia is W. of the town, in 8 and 9 fathoms; but within the harbour there are only 2½ fathoms, and in entering it is necessary to keep in mid-channel, to avoid a shoal of 6 ft. water.

Nauplia is, in comparison with the rest of Greece, well provided with literary establishments. They comprise a military academy, school for the middle classes, circulating library, several book societies, two lithographic establishments, and five printing-houses, one of which is the property of the government, and exclusively employed in printing their official paper. The *Σαφει*, or "Saviour," a political and literary newspaper, is published here in Greek and French, and has a wide circulation. The pop. of Nauplia comprises a considerable number of Germans, French, and Italians: house-rent is high, and the rate of living is not much cheaper than at Paris or Naples. The climate is unhealthy, owing to the miasma from the neighbouring marshes in summer, and the cold searching N.E. winds that prevail during winter: the town has likewise been frequently ravaged by the plague.

The ancient Nauplia was the port and arsenal of Argos during the flourishing period of Grecian history; but it was deserted and in ruins when visited by Pausanias, who noticed the vestiges of its walls and docks (*ἡμάρω*), the temple of Neptune, and a fountain called Canathus, still existing. The inhab. had been expelled several centuries before by the Argives, on suspicion of having favoured the Spartans, who in consequence received them into their territory, and established them at Methone in Messenia. The town revived under the Byzantine em-

perors, and was occupied in the 13th century by the Venetians, who made it their chief settlement in the Morea. It was taken by Sultan Solymian in 1537, but was soon afterwards recovered; nor did the Venetians finally lose possession of it till the treaty of Passarowitz in 1718 secured it to the Porte, which retained it down to the close of the war of independence. Nauplia was the seat of the new government from 1829 to 1834, when it was transferred to Athens. (*Russess's Greece and the Levant*, i. 185-188.; *Leake's Morea*, ii. 355-361.; *Gf. Rep.*; *Journal of Educ.*, vol. ix., &c.)

NAVAN, an inland town of Ireland, prov. Leinster, co. Meath, at the confluence of the Blackwater with the Boyne, 26 m. N. by W. Dublin. Pop., in 1831, 4,416, and, including its suburbs, about 6,000. It has a par. church, a Rom. Cath. chapel, a convent, an endowed grammar-school, a national school, a preparatory Rom. Cath. college, with a chapel, court-house, bridewell, fever hospital, the infirmary for the co., and cavalry barracks. At one end of the town is a large rath or mote. Owing to the opening of the Boyne navigation to Drogheda, Navan has become a place of considerable trade, especially for all sorts of agricultural produce, sent principally to Drogheda, but partly also to Dublin. It has also 5 corn or flour mills, 2 paper mills, 2 distilleries, and a tannery. The old corporation sent 2 members to the Irish P. of C. till the Union, when it was disfranchised. Markets on Wednesdays; fairs on Easter and Trinity Monday, the 2d Monday in Sept., and the 1st Monday in Dec. Post office revenue, in 1839, 602*l.*, in 1836, 604*l.* (*Railway Rep.*; *Mun. Boundary Rep.*).

NAVARINO, a town and sea-port of indep. Greece, on the S.W. coast of the Morea, 136 m. S.W. Athens, and 92 m. S. by W. Patras; lat. 36° 52' 15" N., long. 21° 4' E. Pop., 2,000. It stands on the S. side of a fine semicircular bay of the same name, and is surrounded by walls, and defended by a strong citadel, placed on a lofty rock. Streets narrow, steep, and irregular, lined with small, mean-looking houses, chiefly of stone cemented with mud, and encumbered in many places with the fallen ruins of former habitations. At the opposite extremity of the bay are the remains of Navarino Vecchio, consisting of a fort covering the summit of the hilly peninsula of *Coryphasium*, on the S. slope of which once stood the ancient *Pylos*. The long rocky island of Sphacteria (an. *Sphacteria*) stretches about 4 m. from N. to S. across the mouth of the bay, forming a kind of natural breakwater for its protection from the heavy seas that would otherwise be thrown in from the W. The entrance is at the S. side of the island, and the bay is one of the finest asylums for shipping in the Mediterranean. It has water to float the largest ships, and good holding ground. Ships usually moor about  $\frac{1}{2}$  m. from the modern town, or behind the island of Marathonist, near the centre of the harbour. The circular lagoon, on the N. side of the harbour, directly E. of Navarino Vecchio, abounds with fish; but, as it is not mentioned either by Thucydides or Pausanias, it is probably of modern formation.

The ancient *Pylos*, one of those towns that claimed to be the birthplace of Nestor (called by Homer Νέστωρ ἄκρον) was deserted by its inhab. after the Messenian war. When the town was restored, we have no information; but in the time of Pausanias, it was uninhabited, and comprised among other monuments, a temple of Minerva Coryphasia, and a monument of Nestor. (See *Paus. Mess.* 36., quoted by *Leake*, i. 413.) The island of Sphacteria, which Thucydides (iv. 35-38.) has described as "desert, pathless, and covered with wood" (ὄρος ἐν ἡμῶν ἀπείρητον καὶ ὄρεσι λεγόμενον), is celebrated in the history of the Peloponnesian war as having been occupied by the Lacedæmonians after the defeat of their fleet by the Athenians, under Demosthenes. They were detained here during 72 days, and were at length compelled to give themselves up as prisoners, and to surrender their fleet in pledge of their fidelity to their engagement. The battle which preceded this blockade took place in the bay of *Pylos*, or Navarino, which has also obtained celebrity in modern times, during the late war of independence, for the decisive victory gained (Oct. 20. 1827) by the combined fleets of England, France, and Russia, under Sir E. Codrington, over the Turco-Egyptian fleet, commanded by Ibrahim Pacha. Notwithstanding the great preponderance of force and science on the part of the allies, the Turco-Egyptian fleet made an obstinate resistance, but in the end it was almost totally destroyed. A convention was soon after entered into, by which the Turks agreed to evacuate the Morea; and this battle finally led to the acknowledgment by the Porte of the independence of Greece. In the treaty of Adrianople, in 1829. (*Leake's Morea*, i. 400-415.; *Gall's Morea*, pp. 19-23., &c.)

NAVARRE (Sp. *Navarra*), a portion of Spain forming a dependent kingdom, under that monarchy, on the N.E. side of that peninsula, between lat. 41° 57' and 43° 19' N., and long. 0° 41' and 2° 25' W.; being bounded N. by France and the Pyrenees, E. by Aragon, S. by Old Castile, and W. by the Basque provs. Greatest length

from S.W. to N.E., 75 m.; breadth, about 50 m. Estimated area, 2,440 sq. m. Pop., 271,280. The surface consists in a great measure of subordinate mountain ranges, running southward from the main ridge of the Pyrenees; but the S. part of the prov., near the Ebro, has some extensive and fruitful valleys. The principal summits within the limits of the prov. are Altobiscar, 5,380 ft. high; Adi, 5,218 ft.; and 3 others rising above 8,000 ft. from the sea. The highest points of the Pyrenees, however, are considerably to the E. in the kingdom of Aragon. The principal passes over the Pyrenees from Navarre into France are, proceeding eastward, those of Verru, Maya, and Roncesvalles, the last of which is, according to Bory St. Vincent, 5,771 ft. above the sea. The mountains are chiefly of transition and secondary formation, consisting in a great measure of the rock called Pyrenean limestone. Jasper and marbles, also, occur in large beds; and there are several iron-mines, besides one of copper. Rock-salt is quarried at Valtierra, near the Ebro; and the yearly returns, according to Miñano, amount to 12,000 arrobas; the prov., also, comprises numerous thermal springs. Principal rivers, the Aragon, Zidacos, and Arga, uniting their waters in one channel, which falls into the Ebro opposite Alfaro; the only river flowing into the bay of Biscay is the Bidasoa, which rises in the mountains, forming the Val de Hasen, and runs E. and E. of Navarre, falling into the sea near Fuencerrabia. The climate of the mountainous districts is very severe in winter, and not genial even in summer; but in the valleys of the Ebro and Aragon the temperature is much higher, and the climate delightful, as well as healthy. The forest trees of the Pyrenees consist chiefly of the pine, large quantities of which are sent down the Ebro to Zaragoza and other places; but there are also considerable numbers of beeches, deciduous oaks, chestnut-trees, &c.; and no prov. furnishes so good a supply as Navarre of useful building timber. (*Cook's Sketches*, ii. 286.) The wild animals of the mountains are wolves, wild boars, foxes, and wild cats; game is abundant in every part of the prov. Pasturage is extensively followed, especially in the N. districts; and, according to Miñano, the stock at the last general census included 43,636 oxen, 4,616 calves, 25,760 mules, 629,560 sheep, 69,500 goats, and 31,760 hogs; the produce of wool being estimated at 56,490 arrobas (12,669 cwt.). The higher part of the kingdom, on the frontiers of France, is bleak, cold, and unsuitable for tillage; but the plains near the Ebro have a rich productive soil, well watered by numerous streamlets connected with the larger rivers. The principal crops are wheat, maize, barley, and oats. Hemp and flax are also raised, with oil and wine. About the half of the latter, with the greater part of the wool, and about 30,000 bushels of corn are exported chiefly to France in return for silk and cotton fabrics, colonial produce, &c. Cyder is made in the Val de Baztan, and liquorice is raised in the S. districts for exportation. Agriculture, however, is much neglected, and was recently rendered almost futile, in consequence of this part of the peninsula being the scene of the civil war between the adherents of the present queen and Don Carlos. Manufactures are also inconsiderable, including only those that are most indispensable, and some distilleries. The intercourse with the adjoining provs. is maintained partly by the canal of Aragon, running from Tudela to Zaragoza, and partly, also, by roads intersecting the country in various directions: the great road from Pampluna to Madrid is said by Captain Cook, and other recent travellers, to be little inferior to the modern roads of England.

The kingdom of Navarre is still governed by its separate laws, and has, nominally at least, the same constitution which it enjoyed when it was a separate monarchy; but its cortes, or estates, have not met since 1713, and cannot be convoked without the authority of the crown. A council, however, representing the cortes, sits permanently at Pampluna, decides on the method of raising the revenue, fixes the tariff, and exercises other commercial privileges. The supreme power is vested in the viceroys, who presides at the royal council (*Consejo Real*), consisting of 6 judges, an attorney-general, and 4 *alcaldes*: this is the highest tribunal for civil and criminal causes. The inhabs. of Navarre are tall, and strongly built, resembling the Biscayans in independence of spirit, attachment to their religion, and jealousy of their ancient national privileges. Castilian is the general language of Navarre; but the Basque is spoken in the N. and W. districts.

Navarre is divided into 17 *partidos*, which are again subdivided into 74 *merindades*, or districts; and the kingdom comprises 9 cities, the principal of which are Pampluna, the cap. and seat of government (pop. 15,000), Tudela (8,150), the once royal city of Olite (5,000), and Estella, the stronghold of the Carlists during the late war (4,600).

The inhabs. of Navarre, in the time of the Romans,

were called *Fascones*, in common with those in the neighbouring parts of the peninsula, and were faithful subjects of the empire till the close of the 5th century, when they were subdued by the Visigoths, under whose sway they remained between 200 and 300 years. The Arabs overran the country in the 8th century; but were unable to effect its conquest. Inglo, Count of Bigorres, having been elected king in the 9th century, the crown remained upwards of 5 centuries in his family, till in 1590 it became united, through intermarriage, with that of France, the title of whose monarchs, from the time of Henry IV. (with the exception of Napoleon), to that of Charles X. was "King of France and Navarre." In 1512, however, Ferdinand of Aragon united all the country S. of the Pyrenees to the crown of Spain; so that only the small portion N. of that chain remained annexed to the French monarchy: this formed the prov. of Bearn before the Revolution, and is at present included in the dép. of the Lower Pyrenees. (*Cook's Sketches in Spain*, i. 118–122; ii. 286; *Milano; Dict. Géog.*, &c.)

NAXIA (an. *Naxos*), an island of the Grecian Archipelago, the largest of the group called the Cyclades, about 5 m. E. Paros, its cap. of the same name being in lat. 37° 7' N., long. 26° 27' E. Shape, oval; circuit about 48 m. area, 106 sq. m. Pop., according to Burgess, 18,000. The coast is much indented and precipitous, especially on the N.E. side; and the surface is very uneven, comprising several high mountains of primitive formation, on which are superimposed strata of gneiss and mountain limestone: the culminating point of the island, anciently called the hill of Zeus (3,310 ft. high), is still called *Zia*; it attained some celebrity from its containing a cavern or grotto, to which, according to tradition, the Bacchantes came to celebrate their mysteries and festivals. Emery is wrought in one part of the island; and, according to Dr. Clarke, almost all the energy of commerce comes from Naxia. Large flocks of sheep feed on the mountain sides; but both their wool and flesh are of inferior quality.

Naxia has few large trees, but is pretty thickly covered with lemon trees, myrtles, oleanders, thorny brooms, the arbutus and labdanum plant, *atractylis gummifera*, the produce of which is chewed by the natives, and various kinds of leguminous plants, besides the olive, fig, and vine, which are extensively cultivated. The wine, however, though characterised by Athenæus as the "nectar of the gods," is now of very indifferent quality, owing to the want of care in its preparation. The oil, also, is inferior to that produced in most of the other islands. The island was famous in antiquity for its fertility; but agriculture is now so much neglected that the corn raised is sufficient only for six months' consumption of the inhabitants. Vegetables, however, are so abundant, that considerable quantities are sent to Syra. (*Burgess*, ii. 21.) Lime juice also is exported, chiefly to Russia. In the S. of the island is a small salt-pan, from which the cap. is supplied with salt. The island abounds with game; and field-sports constitute a favourite occupation of the inhab.

Naxia, the cap. of the island, occupies an eminence close to the sea on the W. coast (which is the only part accessible to shipping), and has 4,000 inhab. Its narrow streets lined with dilapidated houses, exhibit a profusion of marble; and there is scarcely a dwelling in which there are not ancient inscriptions or other monuments. A castle, built by the Venetians, occupies the summit of a hill above the town. The principal remains of the ancient Naxos are a gate belonging to a temple of Bacchus, on a lofty crag, an aqueduct, and a jetty now under water, but still distinguishable in calm weather. It is the residence of a Greek and Latin archbishop, and there are several churches and convents belonging to both religions. The harbour of Naxia, called the Porto Saline on account of the salt collected there, is exposed to the N. and N.W. winds, and being almost surrounded by hidden rocks, is unfit for the anchorage of large ships. The island comprises 40 villages; and there are numerous country-houses, forming the residences of the nobles and gentry.

Naxos, which, according to Pliny, was called at different times Strongyle, Dia, Dionysias, and Callipolis, was probably first colonised by Carlians. The Naxians were among the most steadfast opponents of Persian aggression, and the failure of the expedition undertaken by the Persians against this island at the suggestion of Aristagoras, led to the revolt of the Ionian states. Soon afterwards, Naxos was conquered by the Persian fleet under Datis and Artaphernes, who destroyed the city and enslaved its inhab. (*Herod.* v. 28. vi. 96.) The Naxians, however, had sufficiently recovered 7 years afterwards to enable them to furnish 4 well-equipped triremes for the fleet at Salamis. The Athenians, even in the time of Pisistratus, claimed them as colonial dependents; and, after the Persian war, they deprived them of their liberty. Naxos was celebrated in ancient mythology for the worship of Bacchus, who is alleged to have been born in the

island. It became tributary to the Romans after the fall of Corinth, 146 B.C., but was ceded by Mark Antony to the Rhodians after the battle of Philippi. The island was afterwards annexed to the possessions of the eastern empire, and subsequently became the possession of the Venetians, and the cap. of a dukedom which embraced most of the other Cyclades. At length, in the reign of Selim II. (A.D. 1570), it was united to the Ottoman empire. The Turks, however, allowed the inhab. to retain their ancient laws and government, contenting themselves with occasionally sending a *waivode* to collect the land-tax and customs. It now forms a part of the new kingdom of Greece. (*Turner's Greece*, i. 208–221; *Burgess*, ii. 21; *Cramer's Greece*, iii. 408; *Clarke's Greece*, &c., vi. 90–113.)

NAZARETH, or NASSARA, a small town of European Turkey, in the pachalik of Acre, celebrated as having been the residence, during his youth, of the founder of Christianity, 17 m. E.S.E. Acre, and 70 m. N. by E. Jerusalem. Pop. 3,000, of whom 500 are Turks, and the rest Christians. It stands on the W. slope of a delightful valley, encompassed by rocky mountains of no great height, which rise round it like the edge of a shell, as if to guard it from intrusion. The houses are mostly wretched stone cottages, with mud floors and roofs; nor does it comprise anything worthy of notice, except a Latin church and convent, with two other churches, belonging respectively to the Maronites and Greek Catholics. The Turks also have a mosque, erected at the beginning of the present century. The Latin convent, belonging to the missionaries of the Terra Santa, at the E. end of the village, is a spacious and commodious building of stone, surrounded by high walls, which enclose a church, cells for the friars, and extensive accommodation for pilgrims and travellers. The church, called that of the Annunciation, is an ill-proportioned and gaudily ornamented building, said to occupy the spot where, according to tradition, the house of Joseph and Mary stood before its miraculous removal to Loreto. "The columns and interior walls being round with silk damask, and there are two tolerably good organs. Beneath the high altar is the descent to a subterranean cave, in which the Virgin is said to have lived, and which is divided into small grottoes, pointed out as her kitchen, parlour, and bed-room! Here also are two granite columns, each 2 ft. 1 in. in diameter, and about 3 ft. apart, which are supposed to occupy the very places where the Angel and the Virgin stood at the precise moment of the Annunciation. The innermost pillar is broken through, above the pedestal, and, although it touches the roof, it is represented to be self-supported in the air. "The fact, however," says Dr. Clarke, "that the capital, and a piece of the shaft of a grey granite pillar, had been fastened on to the roof of the cave; so clumsily, also, is the rest of the *hocus-pocus* contrived, that what is shown for the lower fragment of the same pillar is not of the same substance, but of Cipolino marble." (*Travels in Greece and the Holy Land*, iv. 170.) It was formerly the custom of the sick, during the prevalence of the plague, to resort thither for the purpose of rubbing themselves against the pillars, believing thus to obtain a certain cure; but, within the last few years, a railing has been formed to exclude the patients, who, however, still flock round in hopes of relief from being in its immediate vicinity. Different interesting localities are pointed out to the pilgrims, such as Joseph's workshop, enclosed in a small chapel, the synagogue in which Christ explained the celebrated passage of Isaiah (*Luke*, iv. 16–22), the table on which Jesus ate his last meal previously to his final departure for Jerusalem; and even the precipice, or "brow of the hill," to which they led him, "that they might cast him down headlong." (*Luke*, iv. 29.) Here however, as at Jerusalem, fancy, and the desire of imposing on the credulity of the devotees, have had a far greater share in fixing these localities, than any regard for authenticity. The chamber containing the fictitious *mensa Christi* is the favourite resort of all pilgrims, Turks as well as Christians; and to Rom. Catholics, who say the Pater-noster and Ave Maria in it, the pope grants a plenary indulgence of seven years! The present walls of Nazareth are, with the exception of a few weavers employed in rural pursuits. Corn is raised abundantly in the neighbourhood, especially by the monks of Terra Santa, who are the chief farmers; and a small portion of it is sent to Acre, which is the chief source of supply for the town. The pasturage of cattle and goats, also, is extensively pursued, from the milk of which is made a large quantity of butter and cheese, both of indifferent quality. (*Turner's Levant*, ii. 130.)

Nazareth is not mentioned in the Old Testament: it was a city of the tribe of Zebulun, and afterwards of the N. portion of Palestine, called Galilee, and was held in so little esteem by the Jews of Jerusalem as to give rise to the exclamation, "Can any good thing come out of Nazareth?" (*John*, i. 46.); it owes its entire celebrity to the circumstance of having been the resi-

dence of Jesus Christ almost from his birth to the commencement of his ministrations. Here the angel Gabriel announced to the Virgin the approaching birth of the Saviour; thither the holy family returned 33 days after his birth at Bethlehem; and during his infancy spent in the house of Joseph the carpenter "the child grew and waxed strong in spirit, filled with wisdom, and increasing in favour with God and man." (*Luke*, ii. 40, 52.) Christ preached here "the acceptable year of the Lord," immediately after the temptation; and found from the unfavourable manner in which he was received, that "no prophet is accepted in his own country." His hearers were filled with wrath, rose up, thrust him out of the city, and led him to a precipice to destroy him; but he passing through the midst of them, went his way (*Luke*, iv. 28-30.); and thenceforward Capernaum seems to have been his general residence, though there can be little doubt that he occasionally visited Nazareth to see his mother, and the members of her family. (*Clarke's Travels in Greece and the Holy Land*, iv. 164-183; *Turner's Levant*, ii. 129-132; *Robinson's Palestine*, i. 205-209; *Mod. Trav.*; *Calmet's Dict. ad vocem*.)

NEAGH (LOUGH) a lake of Ireland, the largest in the United Kingdom, in the centre of the prov. of Ulster, having N. and E. the co. of Antrim, S.E. Down, by which it is merely touched, S. Armagh, W. Tyrone, and N.W. Londonderry. It is about 17 m. in length, by about 9 m. in breadth; occupying, inclusive of Lough Beg (2,551 acres) which is joined to it, an area of 61,626 Irish, or 99,823 statute acres, at ordinary high-water-mark. (*Third Report of Commissioners on Irish Bogs*.) It is fed by several rivers of considerable magnitude, while the Lower Bann is the only channel through which its refulgent waters find a passage to the sea. Though by far the largest, it is by no means the most beautiful of the Irish lakes. Its shores consist mostly either of a level strand, or marshy border, liable to frequent floods; and are of course deficient in those varied banks, and bold promontories, without which such extensive sheets of water want picturesque effect, except when their uniformity is broken by islands; and of these there are only two small and uninteresting ones in this lake. Frequent squalls and want of shelter render its navigation rather dangerous for sailing vessels; but these inconveniences will most probably be obviated by the introduction of steam packets. According to Mr. Sampson (*Survey of Londonderry*, p. 118), the mean level of Lough Neagh is about 38 ft. above that of the sea; and it is said that nearly 10,000 acres of land contiguous to its banks, now annually flooded, might be made available for agricultural purposes, by the outlay of a moderate sum on the removal of some obstructions in the channel of the Lower Bann. Its waters are celebrated for their petrifying quality. (*Statistical Account of British Empire*, iii. 337.)

NEATH, or NEDD (the an. *Nidum* of Antonine's Itin.), a parl. and mun. bor., market-town, and par. of S. Wales, co. Glamorgan, and hund. its own name, on the Neath (crossed here by a stone bridge), 7 m. E. N. E. Swansea, and 123 m. W. by N. London. Pop. of par. bor., in 1831, 4,043. The town, situated in a picturesque valley on the E. side of the river, is "indifferent in appearance; the streets are narrow, and badly paved; there are few good houses, and the place is only partially lighted with gas. The cottages of the poor extend irregularly beyond the town, particularly on the Cardiff road." (*Mun. Board Report*.) The town-hall is a handsome modern building, the lower part of which is used for a corn-market; a church, with a lofty square tower, and six places of worship for dissenters, are the only other public edifices. There are two national schools, two Sunday-schools, and two infant schools.

Neath is situated in the immediate vicinity of an extensive copper, iron, and coal district, and it depends in a great measure on the great smelting-houses and foundries that have been established round it, chiefly on the W. bank of the river. "The commerce of Neath is very considerable, and has been steadily increasing for some years; but though vessels of 300 tons can get up to the town, the trade is generally carried on by barge-communication with Britten Ferry, which is about 2½ m. lower down the river, and is connected with Neath by a canal running northward, 12 m. higher up the valley. By Britten Ferry, in fact, Neath acts as the vent of all the mineral districts connected with the vale. Another canal joins the last mentioned at Aber-dulais, and terminates in a sea-lock and basin on the E. side of Swansea harbour. The exports are coal, culm, copper, iron, iron castings, fire-bricks, oak bark and timber; the imports comprising copper and iron ore, corn and flour, foreign timber, black-jack, and general shop-goods." (*Parl. Board Rep.*)

Neath is a bor. by prescription, and has been governed since the Municipal Reform Act by a mayor and 3 other aldermen, with 12 councillors: it has also a commission of the peace under a recorder. Before the Reform Act, Neath was a contributory bor. to Cardiff; that Act an-

## NEGROPONTE.

nexed it, with Aberavon, Kenfig, and Loughor, to Swansea, which sends 1 mem. to the H. of C. At the same time the electoral limits were so enlarged as to include, with the old bor., that portion of the suburbs on the W. side of the river. Registered electors of Neath in 1839—40, 174; ditto, of entire bor., 1247. Neath is also one of the polling-places at elections for the co.; and the petty sessions for the hund. are held here, as well as the quarter sessions alternately with 3 other towns. Markets on Wednesday and Saturday; fairs, July 3, Sept. 12., and the first Thursday after Trinity Sunday.

About 1 m. from the town, on the low ground bordering the river, are the ruins of the Neth Abbey, founded by Richard de Granville in the 12th century; the church is a mere heap of ruins; but the chapter-house, a curious specimen of early English architecture, is still in tolerable preservation; and foundations of buildings may be traced to a considerable distance. (*Parl. Rep.*; *Nicholson's Cambrian Guide*.)

NEGAPATAM, a decayed town of Hindostan, presit Madras, distr. Tanjore, and the residence of the British collector for the district, on the shore of the Bay of Bengal, 162 m. S. by E. Madras. The European town, which was formerly the cap. of the Dutch possessions in the Carnatic, now scarcely exists, Negapatam being seldom resorted to, except by ships, for water and provisions, both of which are plentiful. The native town is tolerably extensive and regular; and on its N. side is a remarkable tower 80 ft. high, the origin of which is unknown, but which is very useful as a land-mark. The anchoring ground here is about 3 m. from shore. Negapatam was taken by the English in 1781. (*Hamilton's E. I. Gaz.*)

NEGOMBO (*Nagambhu* "the land of serpents.") A sea-port town of Ceylon, on the W. coast of that island, 20 m. N. Colombo, and beside the canal, from the latter city to Calpenty. Lat. 7° 11' N.; long. 79° 44'. It has a small fort, and several ranges of European buildings; and is principally inhabited by Dutch families in reduced circumstances, attracted thither by the cheapness of provisions, and the salubrity of the climate.

NEGROPONTE, or EGRIPO (an. *Eubœa*), a long, straggling island of the Grecian Archipelago, lying close to the E. coast of indep. Greece, and forming, with the Sporades, a separate monarchy of its own name. Length, 110 m.; breadth, from 5 to 25 m., the widest part being measured from Chalcis to C. Kill: area, 1,480 sq. m. Pop., in 1836, 60,000. Eubœa is very similar in its mountainous character and geological constitution to the neighbouring continent, from which it seems to have been separated by some sudden convulsion of nature. Grey limestone and clay-slate are the chief stratifications, and there are clear indications both of old and more recent volcanic action. The whole country is bold and rugged, with a bluff coast, especially on its E. side, which is dangerous to navigators; the highest points of the mountain-range, proceeding from N. to S., through the island, are Mount Lithada, 2,837 ft. high; Mount Kandili, 3,967 ft.; Mount Delphi (an. *Ierapontus*), 5,725 ft.; and St. Elias d'Oro (an. *Ochia*). The soil of the slopes near the shore is very fertile, but only imperfectly cultivated. The orange, citron, almond, and other trees peculiar to the climate of Greece, grow abundantly on the lowlands; while the chestnut, oak, and fir, skirt the regions nearer the mountains. The staple produce of the N. part of the island consists of grapes, from which the farmers make large quantities of a thin red wine, very commonly drunk in Greece, and fetching, according to Colonel Leake, about 5 plasters per barrel. Corn and olives are raised chiefly in the S. districts; but the island has lost the character which it anciently held of being the granary of Greece. (*Comp. Thuc.* i. 2, with *Herod.* v. 77.) Excellent herbage for grazing is found in the more elevated lands; but oxen are bred only for farming purposes. Sheep, however, are numerous, and of an excellent breed, furnishing large quantities both of wool and cheese.

The chief town and port of Eubœa is Chalcis, or Egripos (lat. 38° 30' N., long. 23° 54' E.), on the Euripus, or channel of Talant, where it is only 40 yards wide, and crossed by a bridge, supposed to have been erected by Mahmoud Pacha in 1462. Pop. 6,000. The town (which, according to Strabo, was founded by the Athenians before the Trojan war) is walled and strongly fortified, comprising numerous ancient fragments; but few of them are sufficiently large to be intelligible. It has also 2 tolerably good harbours, one of which on the N. side, though small, is deep, secure, and capable of containing many merchant ships. The only other town of Eubœa is *Corythus*, or Castel Rosso, a fortified post near its S. extremity, with 2,000 inhabs. There are, also, numerous villages.

The most ancient name of Eubœa was Macris; but it was also known, at different times, by the various appellations of Ochia, Eliopia, Asopis and Abanti. Its inhabs., called Abantes by Homer, were among the earliest navigators of Greece, and, according to Herodotus,

joined the Ionian colonists on the coast of Asia Minor. (i. 146.) They also founded settlements at a very early period in Illyria, Sicily, and Campania. Soon after the expulsion of the Pisistratidae, the island became a dependency of Athens, but recovered its liberty after a hard struggle, in the 21st year of the Peloponnesian war. It afterwards became attached to the Macedonian interests, and was taken by the Romans from Philip, the son of Demetrius. It then gradually declined in population and importance; and Pausanias alludes to its fallen state under the emperors. At the dismemberment of the Eastern empire by the Franks, the Venetians obtained possession of Euboea; but were expelled from it, in 1470, by the Turks, who held it till the formation of the new kingdom of Greece in 1829. (*Leake's N. Greece*, vol. ii.; *Dodwell*, ii. 149—153.; *Cramer's Greece*, ii. 123—125, &c.).

NEJIN, a town of Russia in Europe, gov. Tchernigoff, cap. district, on the Oster, 400 m. S.W. Moscow, lat. 51° 2' 45" N., long. 31° 49' 45" E. Pop. 16,000. It is surrounded by a rampart, most of its houses are of stone, and it is one of the handsomest, best built towns of Little Russia. It has several churches, 2 convents, an hospital, and a grammar-school founded by Prince Liehorodko. It produces silk, soap, leather, and preserves and liquors that are highly celebrated all over Russia. It is also the entrepôt of a considerable portion of the commerce carried on between the provinces on the Baltic and those on the Black Sea. Its merchants are principally Greeks, who enjoy certain peculiar privileges, but they are partly, also, Armenians and Jews. It has several well frequented fairs. (*Schützler, la Russie*, &c. p. 464.; *Dict. Geog.*)

NEIGHERRY HILLS, or NEIGHERRIES, a collection of mountains of S. Hindostan. (See MADRAS PIERCE, p. 245.)

NEISSE, a fortified town of Prussian Silesia, reg. Oppeln, on the river Neisse, which divides the city into 2 parts, in a marshy district, 48 m. S.E.E. Breslau. Pop. in 1837, 16,787. It is, on the whole, well built, having been greatly enlarged by Frederick I., who also constructed its best fortifications; it is encircled by 3 gates, and comprises among its public buildings a large castle, a commandant's residence, district-hall, 7 Catholic and 2 Calvinist churches, extensive barracks, powder-mills and arsenals, a small theatre, 2 hospitals, 2 high schools, a Catholic gymnasium, a poor-school, and an asylum for poor Catholic clergy (called *domus emendationum*.) Neisse is the seat of a council for the circle, a tribunal for the principality, a board of taxation, and a consistory court; it has some printing establishments, manufactures of linen and woollen cloths, several distilleries, and a few good hotels. Large yearly fairs are also held here. (*Von Zedlitz; Neukirch; Preuss. Stat.*, iii. 132.; *Berghaus*, &c.)

NELLORÉ, a town of British India, presid. Madras, cap. distr. of same name, on the Pennar, 13½ m. from the Bay of Bengal, and 100 m. N. by W. Madras. It was, in the last century, a fortress of considerable strength; and is still a populous and busy town, about 3 m. in length, full of shops well stocked with commodities, though without a single public or private building of note. The suburbs without the walls are large. The residence of the British collector, &c. is on an elevated ridge S. of the town. A curious discovery was made here in 1787, of a number of Roman gold coins and medals, enclosed in a small pot under the ruins of a Hindoo temple. Many had, unfortunately, been sold and melted; but about 30 were preserved, and found to be of the second century, mostly Trajans, Adrians, and Faustinas. (*Hamilton's L. 1. Gazetteer; Madras Almanack*.)

NEMÉE, an ancient town of Greece, famous for the games celebrated in its neighbouring grove, but now marked only by the modern village of Agio-Georgio, 12 m. S.W. Corinth, and 10 m. N. by W. Argos. The extant ruins of the town, or village (for Pausanias terms it merely a *κώμη*), comprise fragments of a temple of Jupiter, a church, and a few blocks and broken Doric pillars, supposed to have formed parts of the tomb of Opheltes. Of the temple three columns only are standing, two of which, belonging to the space between the ante, support their architrave. These columns are 4 ft. 6 in. in diameter, and nearly 32 ft. high, exclusive of their capitals. The temple was hexastyle and peripteral, being supposed by Mr. Wilkins to have had 14 columns on the sides." The lower part of the walls, enclosing the cella, is complete, and the pillars, of which there are numerous fragments, have fallen in such regular order, that the temple appears to have been destroyed by an earthquake, rather than by the lingering and desultory decay of time. Mr. Dodwell says: "I have not seen in Greece any Doric temple, the columns of which are so slender, and the capitals so disproportionately small, as those of Nemée: the whole is of soft calcareous stone, and the columns are coated with a fine stucco." Sir W. Gell mentions, also, "that there are indications of the Nemean theatre at the foot of a neigh-

bouring hill; and probably vestiges of the stadium and hippodrome might be discovered by a search similar to that instituted at Herculaneum and Pompeii." (*Itin. of Morea*, p. 159.)

Nemée was celebrated in mythical history as having been the scene of the first labour of Hercules in destroying the Nemean lion; and the den of this animal was pointed out to travellers even in the time of Pausanias, near the end of the second century of the Christian era. The games are of doubtful origin; but the national mythology ascribes them to the respect entertained for the memory of Opheltes or Archemorus, son of Icygeus, a king of Nemée. They were celebrated in the grove of Molochus, and are thus alluded to by Statius (*Theb.* iv. 159.):—

Dat Nemea comites et quos in prælia viri  
Sæcra Cleonæi cogunt vineta Molochi.

With respect to the periods at which these festivals were celebrated, different accounts are given by the old writers; but the most consistent statement is, that they were celebrated triennially. In the Athenian month *Bædromion*, corresponding with the modern August. The Argives were the judges at these games, which comprised boxing and athletic contests, as well as chariot-races; and the competitors were crowned with olive till the time of the Persian war, when, in consequence of the losses that the Argolic republic had sustained in that struggle for independence, snailage, a funeral plant, was introduced in its stead. It appears from Polybius and Livy (xxvii. 30.), that the games were in a flourishing state in the reign of Philip, son of Demetrius, in the second century preceding the Christian era. It may be inferred, however, from the slight mention that Pausanias makes of the Nemean games, that they had in his time fallen into great neglect. (*Dodwell's Greece*, ii. 208—216.; *Cramer's Ancient Greece*, iii. 285.; *Burgess's Greece*, i. 171—177.)

NEMI, a village and lake of Central Italy, Papal States, in the Comarca di Roma. The village on the N.E. bank of the Lago di Nemi is 2 m. N.E. Albano, and 16 m. S.E. Rome. Nemi, so called from the forest or  *nemus* by which it was anciently surrounded, was famous in antiquity for the worship of the Sestiman Dianæ,  *nemus glæcialis Triviae*—to whom human sacrifices were offered. No remains that can with certainty be ascribed to the temple dedicated to the goddess are now to be met with. The Lago di Nemi is 1,022 ft. above the level of the sea; and is now, as of old, beautifully sequestered, and well entitled to its classical epithet of *Speculum Dianæ*. But its principal celebrity in modern times has been derived from the discovery at its bottom, in 1535, of the remains of a very large ship, 500 ft. in length, constructed by one of the early emperors, most probably for some of the *naumachia*, or sham sea-fights, exhibited on the lake. (*Gell's Rome and its Vicinity*, ii. 112.; *Cramer's Ancient Italy*, ii. 34.)

NEMOURS, a small town of France, dép. Seine-et-Marne, cap. canton, on the Loing, 18 m. S. by E. Melun. Pop. in 1836, 3,635. It is surrounded by the river and the canal du Loing, and inclosed by walls. It is well built, and has a fine old castle, which now serves for several public institutions, including a public library of 10,000 vols.; several suburbs, a hospital, a small theatre, and a handsome bridge over the Loing. It has some large tanneries and leather factories, and a brisk trade in agricultural produce. The seignory of Nemours was given to the house of Orleans, by Louis XIV. (*Hugo, art. Seine-et-Marne*, &c.)

NENAGH, an inn. town of Ireland, prov. Munster, co. Tipperary, near the Nenagh river, an affluent of the Shannon, within 4½ m. of that river, 82 m. W. S.W. Dublin. Pop. in 1831, 8,446. It is situated in a rich and fertile portion of the co., and was once defended by a strong castle, now in ruins. The principal streets are well and regularly built, and it is decidedly the best town between the cities of Dublin and Limerick. It has a church, a M. C. chapel, Methodist and Independent meeting-houses, an endowed and a national school, a fever hospital, a dispensary, and a large infantry barrack. General sessions are held twice a year, and petty sessions weekly. It is a constabulary station. Its proximity to the Shannon, or rather to its enlargement called Lough Dergh, gives it considerable advantages, and has made it a considerable market for corn and cattle. Markets on Thursdays; fairs on 24th April, 29th May, 4th July, 4th Sept., 10th Oct., and 1st Nov. Post-office revenue in 1830, 9582.; in 1836, 1,0261. Branches of the Agricultural and National Banks were opened in 1834-5. (*Railway Rep.* &c.)

NEOT'S (ST.), a market-town and par. of England, hund. Toseland, co. Huntingdon, on the Ouse (crossed here by a handsome stone bridge), 8 m. S.W. Huntingdon, and 49 m. N. by W. London. Area of par. 4,750 acres. Pop. in 1821, 2,617. The town comprises 3 or 4 respectable streets, intersecting each other, with a large market-place. The church is a fine building in the perpendicular English style, with large windows of painted glass and an elegant tower 150 ft. high, at its W. end

There are also 3 places of worship for Dissenters, and, in 1834, 4 Sunday-schools were attended by 520 children. It has also an endowed school for 25 boys, and a large paper-mill; but the principal dependence of the inhabitants on the retail trade with the surrounding district. Markets on Thursday, 3 large horse and cattle fairs; and statute-fair on Aug. 1.

NEPAUL, (Hind. *Nepala*), an indep. kingdom of N Hindostan, extending through 8 degs. of long., and comprising a great portion of the S. declivity of the Himalaya chain. It lies between lat.  $26^{\circ} 30'$  and  $30^{\circ} 50'$  N., and long.  $80^{\circ}$  and  $88^{\circ}$  E., having N. and N.E. the table-land of Thibet, E. the territory of Sikkim, and elsewhere the British territories. Length, E. to W. about 500 m., average breadth, rather more than 100 m. Area may be estimated at 53,000 sq. m.; and pop. : 2,000,000. This country may be divided into four regions, according to its elevation. The lowest, or *terriani*, is a part of the great plain of Hindostan. In a few places, the British districts reach to the base of the mountains, but, in most parts, the Nepaul dominion stretch for about 20 m. into the plain. This region is not wholly level, but undulating, and comprises a good deal of poor land, overgrown with trees and bushes of little value; but there is also a large proportion of rich land and, upon the whole, the soil is much better than in the adjacent parts of the British territory, the produce being, however, nearly the same. The surface here is intersected by numerous small rivers, which not only serve for watering the crops, but, in the rainy season are used for the transit of agricultural produce to the markets of British India, and to float down the valuable timber of the forests. The very name *terriani* (or *teriyani*), implies, indeed, the country's being navigable. Bounding this region on the N. is another nearly the same width, consisting of small hills composed chiefly of clay intermixed, however, with many primary rocks.

The lower portion of this region, with a part of the last named, is the grand site of the sail forests, among which are many sisoo and teak trees. Higher up the hills are covered with great variety of trees; and in the N. are many pines and mimosa, from which catechu is obtained. In this region are many fine valleys, some of which are tolerably cultivated; while others, though possessing a very rich soil, are almost wholly neglected. A few straggling villages are scattered through the woods, the inhabitants of which grow cotton, rice, and other articles with the hoe, having first cleared away the trees. The third region is that of the mountains, which rise so high as to be covered with snow for a great part of the year, and are divided by valleys, rising to from 3,000 to 6,000 ft. above the great plain of Hindostan. Of course, these valleys differ very much as to temperature; some abound with rattans and bamboos, and ripen the sugar-cane and plum-apple; while others produce only barley, millet, and other grains of cold countries; and oaks and pines are their only forest trees. The breadth of this belt or region generally may be from 30 to 40 m. N. to S., though further W. it is probably greater. The fourth, or Alpine region, is probably of nearly equal extent, and consists of immense rocks, rising into sharp peaks and tremendous precipices, which, where not perpendicular, are covered with perpetual snow, and almost constantly involved in clouds. The interior, or most lofty chain of the Himalaya, forms the farthest boundary of Nepaul to the N.; through which, however, are several passes into Thibet, while several tributaries of the Ganges, which intersect this country, are supposed to rise on the N. side of the main chain.

The land in the third or mountain region is considered the most valuable in the country, and is that in which all the officers and servants of the crown are paid, and from whence all endowments are made. From the abundance of rain in the warm season (for the periodical rains extend to Nepaul with nearly the same violence and duration as in Bahar), the land here, considering the inequality of surface, is uncommonly productive of grain. Wherever it can be levelled into terraces, however narrow, it is exceedingly well suited for transplanted rice, which ripens after the rains have ceased, so that the harvest is never injured; and as most of these terraces can be supplied at pleasure with water from springs, the crops are almost certain. In some parts the same land gives a winter crop of wheat and barley, but in most parts this is judiciously avoided. Where the land is too steep for terraces, it is generally cultivated after fallows with the hoe, and produces rice (sown broadcast), maize, cotton, several kinds of pulse, a kind of mustard, Indian madder, wheat, barley, sugar-cane, and a large species of cardamom; and in the country between Nepaul Proper (the valley of Catmandoo) and the Kail, ginger is a valuable product; but transplanted rice may generally be considered as half the entire produce. The sugar-cane is planted in considerable quantities in the valley of Nepaul Proper, and it seems to thrive. Most European kitchen vegetables have been introduced; but they are

only to be found in the gardens of men of distinction, and in very small quantities. From the abundance of rain, the climate is not favourable for many kinds of fruit; the heats of spring not being sufficient to bring them to maturity before the rainy season sets in, as is the case in Bengal. Peaches grow wild by every rill, but the one side of the fruit is rotted by the rain, while the other is still green. The grapes are also bad from the same cause.

The pasture on the mountains, though not so harsh and watery as that of the low country, is by no means good, and is said to be inferior to that even of the heaths of Scotland. The pastures are in general common. Nothing is paid for pasture; but as it is scarce, and as the principal tribes do not employ cattle in agriculture, very few are bred in the country. Buffaloes and goats are imported from the low country; and horses, yaks, (*Bos grunniens*), shawl-goats, common goats, and sheep, are brought from Thibet, and become tolerably fat on the hills. The buffaloes furnish pretty good beef. The shepherds of some tribes are provided with numerous flocks. In winter they retire to the lower mountains and valleys; but in summer they ascend to the Alpine regions, and feed their herds in the vicinity of perpetual snow. The sheep which these people possess are very large, and have fine wool, which is woven into a cloth finer than that of Bootan; they give also an abundance of milk, from which is made a kind of cheese.

The lands in Nepaul Proper have long been divided into *khat*s, or fields, each of which, in ordinary seasons, produces about 234 bushels of paddy, or rice, in the husk, which, on the supposition that each *khat* is equivalent to 84 English acres, would be at the rate of 28 bushels an acre. The arable lands are partly retained as the property of the court, for defraying the rajah's household expenses; but the produce of the land so employed is not sold, but serves for the consumption of the court, and for distribution in charity at the temples and among religious mendicants. But by far the greater portion of these lands are let to tenants, or granted in fee for military service; and the rent of the lands let, as in the former case, forms a principal portion of the rajah's revenue. Landholders who do not cultivate their own estates, in general let them for half the produce. The persons who rent lands from the owners are of two kinds: the *kuriyas*, who occupy free land, and are exempted from any services to government, except the repair of roads, &c.; and the *prajyas*, who occupy the crown land, whether that be held by the prince, or granted for military service. Most great proprietors, however, like the rajah, employ stewards, with their servants and slaves, to cultivate land for the supply of their families. Money-rent for land can seldom be procured, and is very low, only from 4 to 12 annas being paid as a fixed rent in money for land capable of producing a crop, the half of which is worth about 50 annas.

But when the lands are alienated for sale, they fetch from 1,000 to 2,000 *mohurs* a *khat*, which high price is owing to the very small quantity of land that is brought to market. The agricultural implements are very inferior, and almost comprised in an awkward kind of hoe, weeding-iron, and fans for winnowing the corn. In Nepaul, however, they have made a further progress than in India, by the introduction of water-mills for grinding corn.

The mountain region of Nepaul contains a good deal of iron, copper, lead, and some zinc, the first three being found quite on the surface. The copper ore is dug from trenches open above, so that the workmen cannot act in the rainy season, not having sagacity to make a drain. Each mine has attached to it certain families, who seem to be a kind of proprietors, as no one else is allowed to dig. The total quantity of ore dug by each miner may be estimated at 2,000 lbs. a year. This is delivered to another set of workmen, by whom it is smelted and wrought, the rajah, to whom the forests mostly belong, furnishing the materials for the charcoal. The ore yields, at an average, 62 per cent. of metal, 1-3d of which becomes the share of the rajah, 3d that of the miner, and 1-5th the share of the smelter; the remainder is divided among the rajah, the miner, and the keeper of the accounts, who usually advances a subsistence to the whole working party, and often furnishes loans even to the rajah. Iron-ore is found near the surface, and is wrought nearly on the same principle as copper, the miner receiving 1-3d part of the produce. Some of the iron is so excellent that it can without being converted into steel, it is made into knives and swords. Only 2 lead-mines are now wrought; but lead is found in many parts of the country close to the surface, and it contains much silver. There are numerous sulphur mines; but some have been deserted on account of their injurious effects on the workmen. Corundum, here called *Kirran*, is found in great quantities on the hills of Isma and Muskot; but the masses, which always lie close to the surface, are much smaller than those in the British territory, and seldom exceed 4 or 5 lbs. in weight.

The most extensive manufacture of Nepaul is that of coarse cotton cloth, woven by the native women of all ranks, and by the men of the Parbutiya caste. These cloths constitute the dress of the middle and lower classes of people, though woollen would be better suited to the temperature of a Nepaul winter. All those, however, who are not very poor, cover themselves with woollen blankets imported from Bootan. The entire dress of the higher ranks is of foreign manufacture, and comprises Chinese silks and shawls, with muslins and calicoes from the low countries. The military alone wear European broad cloth. There are also at Lalita-Patan and Bhatgong extensive manufactures of copper and brass goods, as well as of bells, made from a mixed metal, called *Phul*: these, with iron vessels and lamps, are exported in large quantities to Thibet. A strong paper is made at Bhatgong, from the bark of the *Daphne papaverifera*, but the supply is insufficient for the home consumption, and paper is imported from Bootan.

The trade of Nepaul was formerly pretty considerable, though the rajah's territories produce few articles for exportation, except metallic wares and drugs; but at present the badness of the police, and total want of credit, owing partly to the weakness of the law, and partly to the falsehood of the people, operate as a great hindrance to commercial intercourse. The merchants of Cashmere carry their goods, by way of Leh, to different parts of Thibet and W. China, exchanging them for goods' hair, tea, and silks; they also send to China other skins, to the value of about 50,000 rupees a year, procured chiefly from the neighbourhood of Dacca, in Bengal. The merchants of Bootan and Thibet bring to Catmandoo paper, coarse woollen cloths, horses, shawl-goats, sheep, boned cattle, *chamru*, musk, salt, sal-ammoniac, gold, silver, borax, gold dust, silver, and preserved fruit; much of which is again exported to Patna, in exchange for buffaloes and goats, broad cloths, entery, glass-ware, and other European articles, Indian cotton cloths, mother of pearl, coral, pepper and other spices, camphor, tobacco, and *phagua*, a red powder thrown about by the Hindus at their festivals. Most of these articles, with metallic utensils and bells, are sold to the merchants of Thibet. The money of Nepaul consists of *chunas*, 4 of which are equal to 1 *paisa*; 3 *paissas* = 1 *anna*; and 8 *annas* = 1 *mohur*. Gold coins are called *ashreffies*; but the half ashruddy, =  $\frac{1}{2}$  *mohurs*, is the highest piece now coined: it weighs 844 grains, and is worth nearly 6s. 3d. at the mint price of Calcutta. The *mohur* is the common silver coin of the country, and is worth about 4-10ths the Calcutta rupee. The *paisah* and half-*paisah* are the principal copper coins. Grain is sold by measure; 1 *muri* being equivalent to 23 Winchester bushels.

The Nepaulese government, which for many years has been monopolised by the tribe called Gorkulis, is essentially despotic, modified, however, by certain observances enjoined by immemorial custom. The *Dewan*, or *chakra* forms the basis of jurisprudence both in civil and criminal cases, the principal punishments being by fines, confiscations of property, banishment, degradation of caste, maiming, and death by hanging as well as by a guillotine. Women are never put to death, but are subject to mutilation and torture. The provinces are governed by *subahs*, who are the supreme officers of revenue, justice, and police: each farms the revenue of his own district, and either collects it on his own account, or underlets it to *choudharies*. The amount paid by the *subahs*, however, forms by no means the whole of the royal revenue; for, besides compulsory presents made by all visitors of the court, a general income-tax is levied on all classes according to the exigencies of the state. Nepaul Proper is governed by a rajah, assisted by the *bazadar*, or council of the 12 great officers of the court; for the support of which Catmandoo pays 18,000 rupees; Lalita Patan, 18,000; Bhatgong, 14,000; and Kirtibpoor, 7,000. Each farm is assessed at a certain quantity of grain, which may be paid either in kind or in money at the market price. A large proportion of the valley, however, has been assigned either in fee or as charity land. A town called Sanchow, worth annually 4,000 rupees, is the jointure of the queen-regent, and Dewapatan, which is still larger, belongs wholly to certain temples. The religion of the Nepauls is Buddhism; but in the distinctions of caste and the nature of the priesthood there are essential differences between the religion of the Nepauls of Ava and that professed by those of Nepaul, both of whom are held in equal abhorrence by the Brahmins of Bengal.

The pop. of Nepaul comprises numerous tribes partly of Mongol and partly of Hindoo descent. The Magars, who occupy the hills in the W. part of the kingdom, form the greater part of the rajah's army, and the Gurungs, who employ themselves either in mining or pasturage. The Newars live in the plain of Catmandoo, and devote themselves to agriculture and the useful arts. They are of middle size, with broad shoulders and chest, flat faces, small eyes, and spreading noses, with a sallow complexion. The grand basis of subsistence in Nepaul is

rice, with which the poorer classes eat raw garlic, radishes, and lentils: those in more easy circumstances add oil or *ghree*; and the rich eat a great deal of animal food. Even the poorest are occasionally able to sacrifice a pigeon, fowl, or duck, which they afterwards eat. The rajpoots of Nepaul, indeed, are so fond of animal food, that, to the astonishment of the Bengalese, they drink the blood of a sacrifice as it flows from the victim. All classes drink spirituous liquors, to which they are excessively addicted. Most of the Nepaulese domestic servants are slaves, the price of which varies between 30 and 40 *mohurs*. Even some of the Brahmins are slaves to the rajpoots; but they are not degraded, and are employed in great families either as cooks or in the service of the private chapels. All other ranks are sold as common slaves, and persons of the best families have often been deprived of their caste; but this is not usual, as the Nepaulese are particular in maintaining the distinction of castes. Most of the slaves have been born free: a few, perhaps, have been degraded on account of crimes; but by far the greater number have been sold by necessitous parents. The female slaves, even those of the queen, are *domestic*, compelled to sell their favours for clothes, no allowance being made to them by their masters except a little rice. Hence they seldom have children, and beggary is the usual lot of the old and infirm. The queen's slaves form her body-guard, and follow her on horseback armed with swords and riding like men. The ordinary language of Nepaul is the Parbutiya, or mountain-Hindoo dialect, which is continually becoming more prevalent, and in some districts has already superseded the language of the native tribes: it is exclusively spoken by the reigning family and the higher castes. The Newars have a language peculiar to themselves, quite different from that of their neighbours, and alleged to possess a copious literature.

Nepaul, which was formerly divided among numerous independent princes, became united by conquest in the middle of the last century under the sovereignty of a chief of the Ghorikas, who in about 40 years subjected all the countries between the Sutledge westward and Bootan on the E. The aggressions of the Ghorikas on the Chinese territory were stopped in 1792 by an army of 70,000 men, who, after a bloody victory, sent a detachment of 25,000 to Catmandoo, and obliged the rajah to make an ignominious peace. The Ghorikas afterwards turned their arms against the British, who, after a war of two years, obliged them, in 1816, to cede all the countries between the Sutledge and Kail, as well as to evacuate the territories of the Sikim-rajah. Active symptoms of hostility to the English were displayed in 1839; but these were checked by the events of Afghanistan. (*Hamilton's Nepaul*, passim.)

NEPI (anc. *Nepete*), a town of Central Italy, Papal States, deleg. Viterbo, 25 m. N.-W. Rome. Pop. about 1,500. It is beautifully situated, and surrounded by a high Gothic wall, partly founded on the original walls erected by the Etruscans. It has numerous churches and convents, and a fine modern aqueduct, but a gloomy and desolate appearance within. Some Roman antiquities exist here. Conjoined with Sutri, NEPI constitutes a bishop's see. (*Gill's Rome*, &c. ii. 118.)

NERAC, a town of France, dep. Lot-et-Garonne, cap. arrond. on the Baize, a tributary of the Garonne, 16 m. S.W. Agen. Pop., in 1836, ex. com., 3,684. It is divided into the old and new town, one on either bank of the river, here crossed by two stone bridges. The old town, on a steep declivity, and partly surrounded with Gothic walls, is ill built and gloomy; but the new town, on a level site, and encircled by promenades, is well laid out, and handsome. NERAC has the remains of an extensive castle, said to have been constructed by the English, a fine par. church, a large hall, and several other good public buildings. One of the promenades has a good statue of Henry IV., who passed most part of his youth in the castle of NERAC. This town has manufactures of coarse woollens, ship biscuit, and corks; and a good deal of trade in linen fabrics, corn, flour, wine, and brandy. Numerous Roman antiquities, including baths and other edifices, medals, inscriptions, &c., have been discovered at NERAC, from which it would appear that it was anciently called *Aque Neræ*, and was either founded or greatly embellished by Tetricus, in the reign of Gallienus. (*Hugb. et Lot-et-Garonne*, &c.)

NERBUDDAH, (*Narvada*), "The bestower of pleasure," called by Ptolemy the *Nanados*, a river of Hindostan, extending through 9 degs. of long. in the N. part of the Deccan. It rises in the table-land of Gundwanah, lat. 22° 40' N., long. 81° 45' E., near the sources of the Sone and Mahanuddy. It has a general W. direction, with fewer windings than most Indian rivers; and, after a course of about 760 m., falls into the Gulph of Cambay, lat. 21° 36', long. 72° 50', 28 m. W. Baroach. It varies considerably in breadth; being 600 yards across, near Julahpoor, in long. 80°; and 1,200 yards at Mundleyssir, 210 m. from its mouth; while above and below Baroach, it sometimes expands to a breadth of 3 m. At

its source, the Nerbuddah may be 2,460 ft. above the level of the sea: its total rate of descent will be therefore nearly  $\frac{3}{4}$  ft. in a mile. During its passage it is greatly obstructed by rocks, islands, shallows, and rapids, which render its navigation in most parts difficult or impracticable through the provs. Guudwanah, Malwah, &c.; but, after entering Gujrat, it becomes navigable for small craft for about 100 m. from the sea. The Nerbuddah is joined by no affluent of any consequence. For so considerable a river its basin is remarkably narrow and restricted; it being inclosed on the N. by the most part, by the Vindhyan mountains, and on the S. by the Santpoora and other parallel ranges, which are seldom more than from 50 to 60 m. from the former. The valley through which it flows, consists of fertile alluvial soil, in which many fossil remains have been found. (See *Journ. of the Asiatic Soc. of Bengal*.) Mundlah, Gurrat Warrah, Hussingabad, Hinda, Mheysur, and Baroach, are the principal towns on this river. By the war of 1817-18, the British obtained an extent of nearly 30,000 sq. m. of the country watered by this river from the rajah of Berar, which, under the term of "Ceded Districts on the Nerbuddah," has been annexed to the Bengal Presidency, and, in 1820, produced a total revenue of 1,876,398 rupees. (*Park. Reports; Asiatic Journals; Hamilton's E. I. Gazetteer*.)

#### NETHERLANDS. See HOLLAND.

**NETTUNO**, a small sea-port of Southern Italy, in the Campagna and Comarca di Roma, 31 $\frac{1}{2}$  m. S.S.E. Rome. Pop. about 3,000. It seems to have derived its name from an ancient temple dedicated to Neptune, and is built round the bastions of a Papal fortress. It has now but little activity or commerce, owing to the unhealthiness and depopulation of its vicinity; but in antiquity, under the name of Ceno, or Cerio, it was the port of Antium, the cap. of the Volsci, some remains of which city exist about 2 m. W. by S. (*Gell's Rome, &c.*, li. 122.)

**NEUBURG**, a town of Bavaria, circle Swabia and Neuburg; on the Danube, here crossed by 2 bridges, 28 $\frac{1}{2}$  m. N.N.E. Augsburg, and 45 m. W.S.W. Ratisbon. Pop. 6,000. It is divided into the upper and lower town; and has some remains of its ancient walls, a royal castle, in which many curiosities are kept, an arsenal, a royal institute, an hospital, a gymnasium, and a teacher's seminary. It is neat and well built; and is the seat of the high court of appeal for the circle. (*Berghaus, &c.*)

**NEUCHÂTEL**, or **NEUFCHÂTEL**, a canton in the W. of Switzerland, forming a principality belonging to Prussia; between lat. 46° 50' and 47° 10', and long. 6° 25' and 7° 5' E.; having N.E. and E. the canton Bern, S.E. the Lake of Neuchâtel, S.W. Vaud, and W. and N.W. the dep. of Doubs, in France. Length N.E. to S.W. 33 m.; average breadth about 9 m.; area, 240 sq. m. Pop., in 1837, 58,616, of whom 17,734 were either citizens of other cantons, or foreigners. The Jura chain runs through the canton in its entire length, dividing it into two parts, one belonging to the basin of the Rhine, and the other to that of the Rhone. This mountain range often rises to 5,000 ft. in elevation; and the Chassirai, its highest point within the canton, rises 5,285 ft. above the sea. The valleys extend generally in a longitudinal direction, parallel to the mountains. The principal lakes are those of Neuchâtel (which see), and a part of that of Bienné; principal rivers, the Doubs, constituting the N.W. boundary; the Reuse, Thielle, Tyon, &c. The climate varies greatly: the vine is cultivated on the banks of the lake of Neuchâtel; but in some of the more elevated valleys the winter is very severe, and on many of the mountains snow remains continuously for 7 or 8 months. The soil is principally calcareous. Of 256,000 *poises* or arpents of land, which the canton is estimated to comprise, 35,000 are arable, 4,600 vineyards, 58,000 in artificial, and 60,000 in natural pastures, and 45,000 in forests. There are very few large proprietors: the savings of the labouring pop., both agricultural and manufacturing, are generally laid out on the purchase of cottages, with a small portion of adjacent land. Excepting wine and vegetables, this canton does not yield enough of agricultural produce for its own consumption; and the principal part of its supply of corn is imported from the neighbouring cants. of Basle and Bern. Considerable quantities of wine grown around Neuchâtel are exported to the neighbouring Swiss cantons. The best wines are those of ortailled, Neuchâtel, and Boudry. The first in five years is said to approach pretty closely to Burgundy. Within the last few years the preparation of sparkling wines, sold as champagne, has become a pretty extensive branch of business, from 120,000 to 140,000 bottles being annually exported. A good many cattle are reared, principally cows; and cheese is one of the principal articles of export. Hay is also extensively exported.

Neuchâtel is one of the principal manufacturing cantons of Switzerland, especially for watches, printed cottons, and lace. Watch-making, which was introduced early in the 17th century, is carried on to a great

extent in the mountainous districts, but particularly in and near Le Locle and Chaux de Fond. It is estimated that from 18,000 to 20,000 hands are employed in this branch of industry, or in manufacturing instruments for the construction of watches. From 100,000 to 120,000 watches are supposed to be annually produced, of which 35,000 are of gold; they are exported to France, Germany, Holland, Italy, Spain, America, Turkey, &c. Mostly all the watches sold in Paris are made in Neuchâtel, and the neighbouring Swiss cantons, whence they are either smuggled into France, or regularly imported, the gold watches paying a duty of 6 and those of silver of 10 per cent. The capital employed in the watch trade has been estimated at 7,000,000 of Swiss fr., or upwards of 386,000*l.* sterling. It is difficult to ascertain the ordinary rate of wages, workmen being generally paid by the job, and not by a stipulated salary. But it is believed that a man's wages may be estimated, at an average, at from 1,000 to 1,500 fr. (55*l.* 10*s.* to 83*l.*) a year. Lace-making was said by Fbel to occupy from 5,000 to 6,000 hands; but it has declined, and many persons formerly engaged in it have embraced some branch of watch-making. The printed cotton manufacture was established early in the last century, towards the latter end of which it was in its most flourishing state. At present most of the cotton cloths printed in Neuchâtel are furnished by Zürich and other Swiss cantons; and only about 1,000 men, women, and children, are employed in this manufacture, who produce annually about 80,000 pieces, each containing about 32 English yards. Of these prints about 30,000 pieces are sent to the Prussian territories, and the remaining 50,000 to Holland, Belgium, and Italy. Hosiery, cutlery, mathematical instruments, and metallic wares of various kinds, are among the other manufactures of the canton. Neuchâtel is not a member of the Prussian Commercial League, but its manufactures are admitted into the Prussian dominions at a diminished duty. Watches, &c., pay one half, wine two fifths, and printed cottons pay 20 *rix-dollars* per cent. of the ordinary tariff duty. The livre or fr. of Neuchâtel (of 20 sols of 12 deniers each) = 10 batzen, or about 1*s.* 8*d.* English.

Neuchâtel recognizes the sovereignty of the king of Prussia, and pays him an annual tribute of 70,000 Neu. fr., or nearly 4,000*l.* All the administrative functionaries are nominated by the king, without a veto on the part of the legislature. The representative body (*audiences générales*) consists of the 10 oldest members of the governor's Council of State; of 14 members not councillors, chosen for life by the king from lists presented by the inhab. of the canton; of the head magistrates of the cantons, whose number must not exceed 24; and of 20 deputies each at least 25 years of age, elected by all the male inhab. of more than 22 years of age, neither condemned criminals, bankrupts, nor receiving pecuniary relief. This body is convoked and prorogued at the command of the governor, but it must assemble once in two years. No law can be passed, changed, or abrogated, without the consent of the *audiences générales*; but no resolution of the latter becomes law till it has received the sanction of the king. The budgets are voted by the *audiences générales*, on whose account the imposts are received, through agents nominated by the king. No custom-houses exist in any part of the canton; and the turnpike duties are much lower than in most of the other Swiss cantons. There is no impediment to the exercise of any profession, no poll-tax or other direct contribution, duty on raw materials, impost on carriage or communication, or taxes on food or drink, direct or indirect. There are neither stamps nor patents; and the complete absence of all restrictions, and of almost all taxation, is a primary cause of the cheapness of most articles, and the general prosperity of the canton. There are few districts of Europe where so large a proportion of the inhab. are interested in savings' banks. In 1834, 1 in 18 of the pop. was a depositor. Paupers are provided for by the communes to which they belong; no general tax can be established for their support. The number of illegitimate children is about 2*l* per cent.

The administration of justice is both prompt and economical. There are 21 courts of primary jurisdiction; and 2 of appeal, at Neuchâtel and Vallangin. The laws are, in many respects, similar to those formerly prevalent in Burgundy. The inhab. speak a French dialect; they are Protestants, except about 3,000 individuals under the authority of the Bishop of Lausanne. Public instruction is pretty generally diffused, a few individuals being ignorant of writing and arithmetic. There are colleges in Neuchâtel, the cap., and Chaux de Fond; and schools of watch making, and other arts in those towns and Le Locle. Many societies for instruction, and benevolent purposes, exist. The militia comprises all males between the ages of 18 and 50. Neuchâtel furnishes a battalion of light infantry to the Prussian service, and a contingent to the Swiss confederacy. The public revenues, derived from rents, a small tithe or land tax, posts, turnpikes, salt and

anction duties, &c., amounted, in 1834, to 302,311 fr., and the expenditure at the same year to 238,153 fr., of which 14,317 fr. formed the contribution to the Swiss confed.

Neuchâtel belonged, in the 11th century, to the German emperors; and was ceded to Burgundy by Rodolph of Hapsburg. In 1466 the town of Neuchâtel entered into a treaty with Bern, and soon after allied itself to the Swiss confed. In 1707, the last direct inheritor of this territory dying, the states chose the king of Prussia for their sovereign. Napoleon created Neuchâtel into a principality, which he conferred on Marshal Berthier; but in 1814 it reverted to Prussia, being constituted, however, at the same time, the 21st among the Swiss cantons. (*Ebel; Manuel de la Suisse; Picot, Statistique; Lutz, Geogr., &c.; Roaring's Rep. on Switzerland; Helvetic Almanack, &c.*)

NEUCHÂTEL (Germ. *Neuenburg*), a town of Switzerland, cap. of the above canton, on the N.W. shore of the Lake of Neuchâtel, 17 m. N.W. Freyburg, and 45 m. E.S.E. Besançon. Pop. from 5,000 to 6,000. It is built upon the steep slope of the Jura mountains, and along a narrow strip of level ground between the hills and the lake. Its objects of curiosity comprise the castle, formerly occupied by the French princes of Neuchâtel, but now by the Prussian governor; the church, a Gothic edifice of the 12th century; the town-hall, in which the *archives générales* are kept; the gymnasium, with a museum of natural history, &c. Its charitable institutions are on a large scale; one hospital and poor-house was founded and endowed with a sum of 166,000*l.* by a townsman; and another, the Hospital Pourtales, is also an extensive establishment, and open to all persons without respect of country. It has also, an orphan asylum, a house of correction, some public granaries, several good hotels, &c. The *cévrat d'absinthe* is produced here, and it has a considerable traffic in the agricultural and manufactured produce of the canton. (*Ebel, &c.*)

NEUCHÂTEL (LAKES), otherwise called the Lake of Yverdon (Germ. *Neuchâberger-See*), a lake of Switzerland, in the W. part of the confed., between the cantons of Neuchâtel, Vaud, Freyburg, and Bern. It is of an elongated shape; length N.E. to S.W. 24 m.; average breadth nearly 4 m.; area probably 90 sq. m. The elevation of its surface above the sea is estimated at 1,320 ft.; its greatest depth is 400 ft. Several considerable rivers empty themselves into this lake, which also receives the surplus waters of the lake of Morat. Its own surplus waters are conveyed by the Thièle to the lake of Bienné; and thence to the Aar and the Rhine. Neuchâtel, Granson, Yverdon, Estavayer, and Condrine, are on its banks. Its scenery is agreeable, but tame in comparison with that of most other Swiss lakes. Its navigation is sometimes dangerous, from its being subject to sudden gusts of wind. A steamer, however, plies on it daily from Neuchâtel to Yverdon. (*Picot's Suisse; Murray's Handbook for Switzerland.*)

NEUILLY, a village of France, dép. Seine, cap. canton, on the Seine, here crossed by a handsome stone bridge, on the road from Paris to St. Germain, 1½ m. W.N.W. the Barrière de l'Étoile. Pop., in 1836, ex. com., 3,753. "The bridge of Neuilly, regarded as a *chef-d'œuvre* of the architect Peromet, has an entire length of 800 ft. (the span across the river being 710 ft.), with five arches, each nearly 128 ft. in breadth, and 32 ft. in height. "The *château* de Neuilly, built in the time of Louis XV., is a favourite summer residence of Louis Philippe, king of the French. The village has manufactures of earthenware and chemical products, and distilleries of ratafia, &c. (*Hugo, art. Seine.*)

NEUSATZ (Hungar. *Új-Fidek*), a royal free town of Hungary, co. Bacs, on the Danube, opposite Peterwardin, with which it is connected by a bridge of boats, 46 m. N.W. Belgrade. Pop. 20,231 (*Berghaus*.) It consists of long straggling streets, but, being of modern origin, some of them are tolerably well built, and they are generally paved. The Greeks have 5 churches, the R. Catholics 1 church, and the Armenians 1; it has also a synagogue, a gymnasium, a R. Catholic high school, Jewish school, &c. Neusatz is a place of considerable traffic, particularly with Turkey, for which it is chiefly indebted to its position on the Danube, near the influx of its 3 largest tributaries, the Theiss, Drave, and Save. Its numerous shops are said to be full of "grocery, and clothes, ironmongery, tin-ware, earthenware, wooden bowls, dishes, and trenchers, all of very rude fashion, and jewellery of an ordinary description." (*Quin's Voyage down the Danube.*) Neusatz is the residence of the remains of a Roman wall stretching from Neusatz to Csurg on the Theiss, 10 m. N.N.E. (*Oesterr. Nat. Encyc.; Berghaus, &c.*)

NEUSOHL, a royal free town of Hungary, beyond the Danube, cap. co. of its own name, on the Gran, at the influx of the Bistrica, 80 m. N. Pesth. Pop. 5,214, nearly half being Protestants. "Neisohl has wide streets, and is a tolerably well built country town, rather

imposing in its appearance, because all the houses appear to be in the Italian style, with flat roofs, though probably it is only a high parapet carried up to hide the roof." (*Pager, i. 355.*) In the par. church (a Gothic structure), is a bell weighing 100 centners. Neisohl has an old castle, an hospital, several superior schools, &c., and is the residence of a bishop, the seat of a mining council and tribunal. Near it are the mines of Herengrund, producing 1,500 cwt. of copper a year, and some silver; and in the town is the largest smelting-house in Hungary. Neisohl has also manufactures of sword-blades, and beet-root sugar. (*Oesterr. Nat. Encyc.; Pager's Hungary, &c.*)

NEUTRA, or NÉUTRA, an episcopal town of Hungary, cap. co. of the Neutra, in a finely wooded country, 45 m. E.N.E. Presburg. Pop. 4,563. It has a castle, a co. hall, a cathedral and bishop's palace, a lyceum, and several high schools; and carries on a considerable traffic in the wine grown in its vicinity.

NEUWIED, a town of Rhenish Prussia, circle Neuwied, of which, and of a mediatised principality, it is the cap., on the Rhine, 7 m. N.N.W. Coletenz. Pop., in 1837, 5,708. It was founded early in the last century by a count of Wied, on the broad principle of perfect toleration for all sects; in consequence of which a neat and flourishing manufacturing town soon sprang up. It is laid out in squares of houses, formed by 9 streets intersecting each other at right angles. At its W. extremity, overlooking the Rhine, is a castle, the residence of the princes of Wied; the town has, also, several churches, and other places of worship, a gymnasium, teacher's seminary, hospital, orphan asylum, house of industry, a prosperous Moravian establishment, &c. Its manufactures are of silk, cotton and linen fabrics, and yarn, stockings, iron goods, tobacco pipes, Prussian blue, chieroy, potash, and soap: it is the seat of the judicial court for the principality, the circle court, and a mining tribunal. The museums of natural history in the castle and in the Moravian establishment, are worth notice; but the principal object of interest at Neuwied is its collection of antiquities; these were found in the buried Roman city of Victoria, about 2 m. N. of the town, supposed to have been destroyed by the Germans towards the end of the 4th century. (A full description of this collection may be found in *Schreiber, Guide du Rhin*, 290-293; *Berghaus; Von Zeditz, Dar Preussische Stadt, &c.*)

NEVERS (an. *Noviodunum*, and *Nivernum*), a city of France, dép. Nièvre, of which it is the cap.; on the Loire, where it is joined by the Nièvre, and a little above the influx of the Allier; 133 m. S.S.E. Paris; lat. 46° 59' 17" N.; long. 39° 31' 17" E. Pop., in 1836, ex. commune, 13,275. It is agreeably situated on the declivity of a hill facing the S., but is in general ill built and ill laid-out, its streets being narrow, steep, and crooked, and its houses old and gloomy. In its centre, however, is a large and regularly constructed square, on one side of which is the ancient residence of the Dukes of Nivernais. Some of the entrances to Nevers are imposing: that from Bourges is ornamented with a triumphal arch, and on the road from Moulins the Loire is crossed by a solid stone bridge of 20 arches. The quays on the river are bordered with good houses, and look clean. The cathedral, on the site of a very ancient church, is an edifice principally constructed between the 12th and 16th centuries. It is large, and has a lofty square tower; in its choir is some fine stained glass. Several other churches, as well as the cathedral, are curious specimens of Gothic architecture. The other public buildings are mostly in a simple but appropriate style: the principal are the barracks, arsenal, public-hall, and public library with 8,500 vols. The park, formerly belonging to the dukes of Nivernais, has now become one of the many public promenades surrounding Nevers. The city preserves but a few remains of its ancient fortifications. It is the see of a bishop, whose diocese extends over the dép. Nièvre; and is the seat of tribunals of primary jurisdiction and commerce, of a chamber of manufactures, a communal college, &c. It has several hospitals, a handsome little theatre, 2 episcopal seminaries, schools of drawing, geometry, &c., a free school of arts, a *commission d'antiquité*, and many other scientific establishments. It is also distinguished by its manufacturing industry. It has a royal cannon foundry, in which from 200 to 250 cannons, weighing in all about 550,000 kilogrs., are cast annually, besides 50,000 kilogr. weight of other kinds of artillery. (*Hugo*.) It also produces chain cables, iron works for suspension bridges, and other heavy iron goods. Nevers has been for many centuries famous for its china-ware, which, for durability and solidity, is said to be the best made in France; it is sent in large quantities to Paris, and throughout the country watered by the Loire and its tributaries. This manufacture employs about 700 workmen, whose wages are said to average 1 fr. 75 c. a day. Glass wares, metal buttons, coarse woollen cloths, violin strings, vinegar, glue, brandy, and leather are among the other principal manufactures. It has also a considerable trade in timber for ship-building, charcoal,

iron and steel, wine, salt, &c., being the great entrepôt for the upper Loire. Its trade is facilitated by a commodious haven at the mouth of the Nièvre. It has 9 annual fairs, one of which lasts 8 days.

This town existed at the conquest of Gaul by Cæsar; it became a bishopric in 506, and the cap. of Nivernais; in 865 it was burned by Hugh Capet; and in the middle ages suffered severely from plague, the inundations of the Loire, the invasions of the English, and religious wars. (*Hugo, art. Nièvre; Dict. Géog.*)

NEVIS, one of the British W. India Islands, belonging to the crown, and situated about lat. 17° 10' N. long. 62° 33' W., separated by a strait 2 m. in breadth, from the S.E. extremity of St. Christopher's. Shape circular; greatest length, N.E. to S.W., 6½ m.; extreme breadth, about the same. Pop. 11,500. It consists of a conical hill, rising from the sea to a height of 2,500 ft. Soil mostly a strong tenacious marl, not readily absorbent of moisture: the climate is similar to that of St. Kitt's and Tortola. It is well watered, and, in general, fertile. The inhabs. are nearly all occupied in the raising of the sugar-cane and provisions, and in the preparation of rum and sugar. In 1839, 36,406 cwt. sugar, 39,252 gallons rum, and 3,501 cwt. molasses, were imported from Nevis into Great Britain. The total value of the exports amounted, during the same year, to 12,263£; that of the imports to 27,183£. It is divided into 5 parishes: Charleston, the cap., is at its S.W. extremity. This colony is placed under a governor and council, and assembly. It has 9 public schools, in which about 400 children are educated. The portion of the compensation for slaves paid to the proprietors of Nevis, amounted to 151,007£; the number of slaves by the last registration having been 8,722, and the average value of a slave, from 1822 to 1830, 39.4s. Columbus discovered Nevis; it was settled by the English in 1628. (*Parl. Papers, &c.*)

NEWARK, a par. and mun. bor., market-town, and par. of England, co. Nottingham, S. div. wap. of its own name, on a lateral stream of the Trent, crossed here by a handsome bridge of 7 arches, 16 m. N.E. Nottingham, and 110 m. N. by W. London. Area of par. bor. 2,000 acres. Pop. in 1831, 9,837. The approach to Newark from the N. is by a long causeway carried over a flat island formed by the Trent and the Newark branch; and under it are numerous bridges, to give free passage to the waters during the floods. The town, consisting of a principal street on the Nottingham and Lincoln road, crossed by several others, and having a large market-place near its centre, is on the whole well built, paved, lighted with gas, and abundantly supplied with water. Among the public buildings, one of the most interesting, though now in ruins, is the castle near the bridge, called the *New Work*, from the circumstance of its having been re-edified by Stephen. It comprises a square of large dimensions, with 2 massive towers, and seems to have had 5 stories; the interior area is used as a bowling green, but several of the lower rooms are still entire. King John died in this castle, 18th Oct. 1216. The town-hall, in the market-place, a handsome building of stone, erected in 1776, comprises several large apartments for the corporate business, assemblies, balls, &c. It has also a court-house for the quarter sessions, with a small gaol, which, however, is "wholly inadequate and unfit for its purpose." (*Pris. Inspec. 5th Rep.*) The church, said by Mr. Rickman to be one of the largest and finest in England, was built in the reign of Henry VI.; it is a cruciform structure, with large aisles, transepts, and chapels, having at its W. end a highly ornamented tower, surmounted by an extremely light steeple, 249 ft. in height, round which are niches containing statues of the twelve apostles. Some of the windows have stained glass, representing the history of Jesus Christ; the choir is separated from the rest of the church by a screen of rich oak-carving, and in the interior are several curious monuments. The fabric is kept in repair by the produce of estates belonging to the bor., so that there is no necessity for a church-rate. The living is a vicarage in crown patronage. It has also 4 places of worship for dissenters, with various Sunday schools, attended by about 100 children. The grammar school was founded in 1529; its endowment, at the time of the Char. Comm. Inquiry, amounted to 2,380£ a year, and in consequence of a suit in Chancery, the corporation, its trustees, have founded two exhibitions of 80£ a year each, tenable for 4 years at Oxford or Cambridge. The master has a salary of 220£ a year with a good house, and 600£ a year are paid to an usher; the school is attended by about 40 boys. Two national schools furnish instruction to about 250 children of both sexes, and there are two or three smaller schools wholly or in part supported by subscription. The endowment in trust by the bor. for charitable purposes, independently of that above mentioned, are very extensive; and there are several almshouses, a workhouse, and dispensary. A library and small theatre are the only other public establishments.

Newark carries on a considerable trade in malt and corn, and in coal, cattle, and wool. It has also two large

brass and iron foundries: bricks and tiles are made here, and large quantities of gypsum and limestone, quarried and prepared in the neighbourhood, are sent by sea to London. Here are two pretty extensive linen manufactories, and two private banks, besides a savings' bank and a branch of the Nottingham banking company. The arm of the Trent on which Newark stands is made navigable by means of a lock close to the town.

Newark was divided by the Mun. Reform Act into 3 wards; the corporation comprising a mayor and 5 other aldermen, with 18 councillors. It has also, a commission of the peace under a recorder, with a court of requests for the recovery of debts under 50£. Corp. rev. in 1839, 1,250£. The quarter sessions for the S.E. div. of the co. are held here. Newark has sent 2 mems. to the H. of C. since the 29th Charles II., the right of election down to the Reform Act being in the mayor, aldermen, and inhabs. paying scot and lot. The electoral limits were not changed by the Boundary Act, reg. electors in 1839-40, 1,130. Newark is also the election-town for the S.E. div. of the co. Large markets, especially for corn, on Wednesday; fairs, Friday in Mid-land, May 14., Aug. 2., Nov. 1., and Monday before Dec. 11.

Newark, which takes its name from the castle, became a place of considerable importance soon after the Norman conquest. But its principal celebrity is owing to the fact of its having been one of the chief garisons of the royalists during the civil wars of Charles I. It was besieged by the parliamentary forces in 1643; but both the town and castle were held by the royal army till 11th May, 1646, when it was surrendered to the Scotch by command of the king, who was then a prisoner. The castle was at the same time demolished by order of parliament. (*Parl. Rep.; Char. Comm. Rep., &c.*)

NEWARK, a town or city of the U. States, the largest and most important in New Jersey, though not its cap.; co. Essex, on the Passaic, 3 m. from Newark Bay, and 9 m. W. New York. Pop., in 1830, 10,953; but, in 1835, estimated at 16,000. It is well built, and has many good houses. The court-house, gaol, 2 banks, an arcade, and the chapels of the Presbyterians, Episcopalians, Baptists, and Methodists, are the principal public buildings. It has extensive manufactures of shoes and boots, saddlery, carriages, furniture, hats, jewellery, &c. The Passaic is navigable up to the town for sloops of 80 tons. About 7,000 tons of shipping belonged to the port in 1838. (*Encyc. Americain; Mitchell, &c.*)

NEW-BEDFORD, a town and port of entry of the U. States, Massachusetts, co. Bristol, on an arm of Buzzard Bay, 50 m. S.S.E. Boston. Pop., in 1830, 7,292. It is regularly laid out upon sloping ground, and has a wealthy and prosperous appearance, chiefly owing to the whale fishery, in which its inhabs. are largely engaged. It has numerous churches, 3 banks, 2 insurance offices, a court-house, a flourishing lyceum, a gaol, academy, theatre, and several printing offices, one of which issues a daily paper. In 1838, 85,383 tons of shipping belonged to the port, 3-4ths of the vessels being whalers. New-Bedford is connected with Taunton by a railway 20 m. in length, opened in 1840. (*Amer. Almanack; Official Reports, &c.*)

NEW BRUNSWICK, a tract of country in British N. America, on the W. side of the Gulf of St. Lawrence, between lat. 45° 5' and 46° 5' N., and long. 63° 47' and 67° 53' W., bounded S. by Nova Scotia and the Bay of Fundy, N. by Lower Canada, and W. by the state of Maine in the U. States. Extreme length, from N. to S., 180 m.; average breadth, 150 m.; estimated area, 25,531 sq. m. Pop., in 1834, 119,567. This colony, which is divided into 11 cos., has much less indented coastline than Canada or Nova Scotia: the surface, however, is broken and undulating, though not mountainous, and considerable rivers intersect it in all directions, the largest being St. John's (which see), Miramichi, and Mistigouche. The principal gulphs are the Bay of Chaleur and Miramichi, on its E. coast, and that of Passamaquoddy on the S., into which runs the river St. Croix, which divides the province from Maine, in the U. States. Its geology is very little known; but limestone seems to be the prevailing feature, though clay-slate, granwacke, and even the primitive formations occasionally occur. Coal is abundant, and is wrought near the Grand lake, by a joint-stock company. Iron and gypsum occur also in considerable quantities. Dense forests cover, by far, the greater part of the surface, and though the soil is generally rich and fertile, except in a few swampy tracts, only one-sixteenth of the whole province has been surveyed and laid open for settlers. The cutting down, and exportation of the fine timber, with which these forests abound, has, however, been extensively pursued for some years, and the quantity of cleared land is progressively increasing. The fauna and flora of the colony nearly resemble those of Nova Scotia, to which, indeed, it formerly belonged. The climate is very similar to that of Canada: winter lasts from Nov. to April, when a sudden change takes place, and vegetation becomes extremely rapid. The temperature in the

S. parts is milder and more equable; but the prevalence of sea-fogs, on the shores of the Bay of Fundy, render the cultivation of wheat near the coast very uncertain, though it does not seem to injure the health of the settlers. Indeed, the climate altogether is uncommonly healthy, and will bear to be compared with that of any part of England. Rheumatism, consumption, and low typhus are the prevalent diseases; but they are in a great measure brought on by exposure to the damp, and the sudden changes of temperature. Agriculture, notwithstanding the rich tracts of alluvial soil skirting the rivers, is considerably less advanced than in Nova Scotia and the Canadas, owing, in part, to its later settlement, but principally to the superior importance attached to its timber trade. Within the last few years, however, great improvements have taken place in these respects; agricultural societies have been formed, new settlers have introduced, in many parts, the more approved systems of husbandry, and emulation has been generally excited by ploughing-matches, cattle-shows, and the distribution of premiums. Wheat, Indian corn, barley, and oats are the principal grain crops; but by far the most important article of produce is the potatoe, the crop of which, in 1835, was estimated at 2,100,000 bush. Red and white clover are the grasses most cultivated, and beans, peas, turnips, mangel-wurzel, and beetroot thrive well, and are raised in pretty considerable quantities. Pasturage is followed to some extent, and it was estimated that the live-stock of the colony, in 1835, comprised 11,000 horses, 91,000 cattle, 143,000 sheep, and 50,000 hogs. The felling and conveyance of timber constitutes, however, as before observed, the great employment of the labouring classes; and most of the *lumberers* are dissolute and depraved, and the occupation prevents them from paying proper attention to agriculture. Many of the trees, especially the yellow pines, attain a great size, and furnish timber of good quality, though inferior to that of Norway and the Baltic. It is principally conveyed to Great Britain in the log, the remainder being manufactured into deals, boards, staves, &c.

The timber exported from New Brunswick to Great Britain in 1837 was valued at 476,670*l.*; that of Lower Canada during the same year having been estimated at 651,788*l.* This trade is wholly forced and artificial, being a consequence of the high discriminating duties imposed in England on Baltic timber. It is contended, however, that the equalisation of the duties, how advantageous soever to England, would be injurious to Canada and New Brunswick, by diminishing their trade in timber. But the truth is that this, so far from being advantageous to either, is distinctly and completely the reverse. The holds which it generates are quite subversive of that sober, steady spirit of industry, so essential to a settler in a rude country: to such a degree, indeed, is this the case, that lumberers have been described as the pests of a colony, "made mad and kept vicious by the very trade by which they live." Ship-building is pretty extensively carried on, chiefly at St. John's, the cap. In 1839, 164 ships were built, of the aggregate burden of 45,864 tons; but they are of the class called "slop built," and do not enjoy a high character for solidity or durability. Though less deeply lauded with fishing bays than Nova Scotia, the coast and rivers of New Brunswick abound with fish, especially cod, herrings, salmon, and mackerel; the entire value of the exports of fish and fish-oil having amounted in 1837 to 68,000*l.* The whale fishery, introduced only within the last few years, has already attained considerable importance; the exports of oil and whalebone, in 1837, having been estimated at 37,422*l.*

Except timber, and the produce of its fisheries, the exports of New Brunswick are quite inconsiderable: the imports consist of corn (chiefly from the U. States), of the value, in 1837, of 150,828*l.* British and Irish manufactured goods, valued at 217,321*l.*, and various minor articles, making a sum total of 730,563*l.* Subjoined is an account of the ships that entered and left the ports of New Brunswick, in 1839.

Countries.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
Great Britain	578	208,712	826	290,925
British Colonies	1,283	118,176	1,369	118,860
United States	94	64,053	798	53,688
Other foreign ports	37	8,181	4	638
Total	5,482	399,122	5,267	444,051

The colony seems, on the whole, to be improving. The Brunswick land company have done much to promote the immigration of industrious British settlers, and several joint stock companies and banks have been recently established. The premium for bills on England varies from 8 per cent. to 1½ per cent.; and the difference between the currency and sterling price of money in the prov. amounts to 1½ per cent. The paper currency, which is very general, consists of the notes of the

different banks, and of those issued by the corporation of the city of St. John's. The sum in circulation amounted, in 1839, to about 350,000*l.*

The constitution of New Brunswick is very similar to that of Nova Scotia, which it resembles in several other particulars, and to which the reader is referred for further information. The representative body, or parliament, comprises 26 mems., and sits at Fredericton, about 90 m. above St. John's. The judiciary courts are the court of chancery, in which the governor presides, the supreme court directed by 4 justices, circuit courts, a court of common pleas, and numerous courts for the recovery of small debts. The revenue is extremely variable, and has been much increased of late years by the sale of unoccupied lands; besides which, a few light taxes are levied for poor rates and other local purposes. After the payment of the local magistracy, &c., the surplus is appropriated to the improvement of the colony, and especially to the formation of roads, that have recently been completed to very considerable extent. The expense of the regular army is defrayed by the British government; but there is likewise a native militia comprising upwards of 20,000 men. The religion of New Brunswick is similar to that of Nova Scotia; and the diocese of the colonial bishop of that peninsula extends over the province. There are, likewise, Rom. Catholics, Presbyterians, Methodists, and Baptists; but the religion of the colonists partakes more of fanaticism than sober rational worship. As respects education, New Brunswick enjoys more than ordinary advantages. King's College, at Fredericton, owes its origin to the exertions of Sir Howard Douglas, and has been in active operation for some years. Its maintenance is chiefly provided for by an annual grant of 2,000*l.* from the local government, and the mode of instruction nearly resembles that pursued in Oxford; subscription to articles is not, however, required, except from students of divinity: a grammar-school, also, is supported out of the college-funds. Nine other grammar-schools, which, in 1839, had 321 pupils, are either wholly or partially supported by legislative grants. English schools, also, are established in all the pars. of the prov.; and, in 1839, there were 477 schools, furnishing elementary instruction to 7,019 boys, and 6,519 girls.

The pop. of New Brunswick consists of a mixed race of English, Irish, Welsh, and Scotch; but the last are far less numerous than in the neighbouring colonies. The French also have three small settlements on the E. side of the prov. The Indian aborigines have been for many years fast declining in numbers, and all attempts to civilise them or improve their condition have failed: they have a few small villages scattered in different parts, and are all R. Catholics. In manners and customs the British settlers nearly resemble those of Canada, Nova Scotia, and Cape Breton. The women are handsome; the men generally tall, well-made, muscular, and scarcely ever corpulent. They are remarkably spirited, adventurous, and attached to their country; nor can there be any doubt that they would, if well disciplined, make excellent soldiers.

The country now called New Brunswick, was, in the early part of last century, comprised by the French under the appellation of New France, and viewed as an appendage to Acadia. At the peace of 1763 it was ceded, with the rest of Canada, to the English, and, from that time to 1785, was considered as part of Nova Scotia. The country, however, was little more than a mere wilderness, till General Sir Guy Carleton procured for it a royal charter, constituting New Brunswick a distinct prov., with himself as governor. To his exertions it chiefly owes the rapid rise of its prosperity; but it also owes many material improvements in its roads, schools, agriculture, judicial arrangements, &c., to Sir Howard Douglas, governor from 1824 to 1831. (*McGregor's America*, li. 3—102; *Murray's B. America*, li. 224—256., &c.)

NEW BRUNSWICK, a town of the U. States, New Jersey, on the Raritan, 17 m. from Maritan Bay, and 28 m. S.W. New York. Pop., in 1830, 7,831. It is partly built on a low site, but is acclimated tolerably healthy. Its principal institutions are Rutgers's College, founded in 1770, and a theological seminary established in 1811. New Brunswick stands at the end of the New Jersey railroad, and of the Delaware and Raritan canal, the terminating basin of which is 14 m. in length, and 200 ft. wide. The Raritan is navigable for sloops of 80 tons up to the town, which has a brisk trade, particularly in grain.

NEWBURGH, a sea-port and market-town of Scotland, co. Fife, on the S. bank of the Tay, 13½ m. S.W. Dundee, and 9 m. S.E. Perth. Pop., in 1831, 2,642. It consists chiefly of one street, running E. and W. along the line of the shore, with another at right angles leading down to the harbour. The town is mostly of modern date, particularly towards its outskirts, though many old buildings remain to mark its ancient state. The public buildings are the town-house, with a spire, the parish

church, and a dissenting chapel. The splendid mansion-house of Muggdrum is close to the bor. on the N.W. The means of education are ample and efficient; from 1-10th to 1-7th part of the pop. are at school. The town is lighted with gas.

The harbour is pretty good; but only 10 vessels from 60 to 150 tons, exclusive of fishing-boats, belong to the bor. It has notwithstanding a considerable trade, being the port for the greater part of Kintore-shire, Strathcarr, and other contiguous districts, both for the export of their agricultural produce, and for importing coals, lime, &c. Most vessels bound for Perth wait here for the flow of the tide; and some of them unload part of their cargo before they can, even at high water, proceed up the river. Newburgh, indeed, is, next to Kirkcaldy, the most important sea-port of Fifeshire. The weaving of coarse linens is largely carried on, employing from 550 to 600 looms.

Newburgh existed in the 12th century, and was subject to the neighbouring monastery of Lindores, whose remains are yet pretty entire. In 1631, it was created a royal burgh, Charles I. sent, like Falkland, being unable to defray the expenses of its parliamentary representative, it petitioned to be relieved from the burden, which was granted. It has otherwise, however, all the marks of a royal burgh, and is governed by 2 bailies and 15 councillors. Municipal revenue, derived from land, about 170*l.* per annum. There are two curious crosses of remote antiquity in the neighbourhood; one called the Muggdrum Cross, the other Macduff's Cross. The former is supposed to commemorate a victory over the Danes in the 10th century; the latter was erected as a sanctuary to any of the kindred of Macduff, thane of Fife, who might commit murder. If they fled thither, and paid a certain fixed solatium to their chief, they obtained protection. (*New Stat. Account of Scotland, & Fifeshire*, p. 56-81.)

NEWBURGH, a town and port of entry of the U. States, New York, Orange co., on the Hudson, 50 m. N. New York. Pop., in 1830, 6,424. It is well built; well paved, and well supplied with excellent water. It has places of worship for various sects, an incorporated academy, and several other schools; 2 banks, some good hotels, and paper, plaster, and gunpowder-mills; a whaling company, with a capital of 115,000 dollars, &c. It is, alternately with Goshen, the seat of the county court, and was the head-quarters of Washington during the publication of the celebrated Newburgh Letters. (*New York Gazetteer*, &c.)

NEWBURY, a mun. bor., market-town, and par. of England, co. Berks, on the Kennett, crossed here by a stone bridge of 3 arches, 244 m. S. Oxford, and 53 m. W. by S. London. Pop. of the mun. bor., which includes, with the par. of Newbury, portions of the pars. of Speen and Greenham, in 1831, 8,460. The town, a considerable portion of which on the N. bank of the Kennett is in the hamlet of Speenhamland, consists of two principal, wide, and well-built streets, arranged in the form of the letter T, with smaller and very irregular streets at its S. extremity. The market-place, opposite the church, is a large open square, in which is the guild-hall. The church, erected in the reign of Henry VII., is a large but plain building, with a square tower; the living is a rectory in the patronage of the crown. A district church, in the Gothic style, has recently been erected on the London road, and is remarkable for its extensive catacombs. There are, likewise, 5 places of worship for dissenters; and the town comprises several Sunday schools, and an endowed free-school, besides numerous and wealthy corporation-charities, which, however, had been greatly neglected previously to the passing of the Municipal Reform Act. (*Mun. Corp. Rep.*) The almshouses have accommodation for 50 aged people; there is a small bor. gaol, and about 4 m. S. the town is a large Union workhouse.

Newbury is situated on the main-road between London and Bath, has a large posting business, which employs a considerable number of hawks, besides occasioning a large importation of horse provender. The Kennett and Avon Canal, connecting the Severn with the Thames, passes through the town, and affords the advantage of water-carriage from London, Bristol, and S. Wales. In the immediate neighbourhood are 2 silk-manufactories and a paper-mill; but they are not considerable. The rapid declivity and copious supply of water in the Kennett, have occasioned the erection of numerous large corn-mills, two of which are within the town. There are also considerable malthouses, and some extensive breweries. The quantity of grain annually exported from Newbury, either as flour, malt, or in its natural state, amounts to upwards of 7,000 tons, in return for which it imports large quantities of building materials, and various articles of general consumption from the ports of London and Bristol. The town has the appearance of being in a prosperous and improving condition; and there has been a great increase of buildings and pop., especially in Speenhamland. High rents are

readily obtained in situations favourable to trade. The poor rates are much higher than in the adjoining parishes, and higher also than they should be with reference to the description of the pop., a circumstance chiefly attributable to the attractions offered to the lower classes by the numerous charitable foundations attached to the corporation. (*Mun. Corp. Rep.*)

Newbury, which is a bor. by prescription, and was afterwards chartered in 38 Eliz., has been governed, since the Reform Act, by a mayor and 3 aldermen, with 12 councillors; it has a commission of the peace under a recorder. Corporation revenue in 1839, 1,027*l.* The spring quarter-sessions for the co., and petty sessions for the hundred, are held here, and is one of the polling places for the co. elections. Large corn-markets on Thursday; horse and cattle fairs, Holy Thursday, July 5, Sept. 4, and Nov. 8.

Newbury returned 2 mems. to parl. in the reign of Edward I.; and it is not known at what period, or for what cause, it lost the franchise. It was formerly also celebrated for its manufacture of serge, shalmons, &c., and in the reign of Henry VII. a soldier, named, known as Jack of Newbury, kept 100 looms, from the produce of which he became so wealthy as to be able to entertain the king and his retinue during their passage through the town. He was a great benefactor to Newbury; and his house, a large brick structure, is still shown in the High Street, his manufactory being now occupied by a large inn, "the Jack of Newbury." The vicinity is remarkable for two battles fought during the civil wars between the royalist and parliamentary forces, Charles I. commanding his army in person on both occasions. The first was fought on a common called the Wash, on 20th Sept. 1643; the second on 27th Oct. in the following year; but neither had the decided result. Donnington Castle, a short distance N.W. of Newbury, was the property of Chaucer, the earliest English classic poet; and in it he spent the last two years of his life, which terminated in 1400. (*Mun. Reports*, &c.)

NEWBURY-PORT, a town and river-port of the U. States, Massachusetts, being the third town of the state in pop. and commercial importance, co. Essex, on the Merrimack, about 3 m. from its mouth, and 32 m. N. by E. Boston: lat. 42° 49' N., long. 70° 52' W. Pop., in 1830, 6,375; but it is now (1841) probably above 10,000. It is built on a gentle acclivity, and has an imposing appearance from the river. It consists of two long streets, running N. and S., parallel with the river, and communicating by other streets, crossing them at right angles. State Street, the principal, is broad, and lined with good houses, which, though of wood, are well built and handsome. The streets are partially paved and flagged, but neither lighted nor watched. It is connected with Salisbury, on the opposite side of the river, by a bridge, about 4 m. long, partly supported on wooden piers, and partly suspended by chains. The harbour is secure, and has usually about 2 fathoms water at low ebb; but it is difficult of entrance, from a bar at the mouth of the river, which is impassable during E. gales. (*Bunt's American Coast-Pilot*.)

A breakwater was a few years since constructed within the river, about 2 m. from its mouth, at an expense of 200,000 dollars, for the double purpose of shutting the Merrimack out from a swampy bay S. of the town, and enabling it to clear away the bar; but in these objects it appears to have signally failed. Newbury-Port has several considerable cotton, cloth, and yarn factories, numerous distilleries, and manufactures of shoes, hats, cordage, Morocco leather, gold and silver plate, &c. In 1838, 18 vessels, of the aggregate burden of 2,744 tons, were built here. This town had formerly a large share of the W. India trade; at present it imports a good deal of raw cotton, for its own manufactures and those of Lowell; and its inhabitants are actively engaged in the trade of and mackerel fisheries and a brisk coastwise trade. The vessels belonging to the port, in 1838, amounted to 30,457 tons shipping. (*Official Reports*, *Murray's Encyc. of Geog. & Anc. Americana*, *Prin. Inform.*)

NEWCASTLE-UPON-TYNE, a parl. and mun. bor., and river-port of England, locally situated in Castleward, co. Northumberland, of which it is the cap., but it is also a co. by itself, and is celebrated as the principal British port for the shipment of coal, on the N. bank of the Tyne, about 94 m. from its mouth, 50 m. E. Carlisle, and 244 m. N. by W. London: lat. 54° 58' 30" N., long. 1° 37' 30" W. Area of parl. bor., which includes, with the town and co., the five townships of Byker, Heaton, Jesmond, Westgate, and Elswick, 9,130 acres. Pop., in 1831, 63,513, but at present (1841) probably 65,000. The town, which was formerly fortified, and still has a square Norman castle, with two ancient gates, and a few remains of the old town wall, occupies the bottom and sides of an acclivity rising somewhat abruptly from the river; and though a few years back it was very irregularly laid out, and consisted, with but few exceptions, of narrow, circuitous, and ill-built lanes, it has been so improved within the last 20 years, (principally

through the exertions of Mr. Grainger, a native of the town,) that it is now one of the handsomest towns of England. These improvements have cost nearly a million sterling; and include a great number of new streets and terraces, a handsome square, a market (the largest in England), a central exchange, theatre, dispensary, music-hall, lecture-room, two chapels, two auction marts, &c.

*General description.*—Grey Street, so called in honour of Earl Grey, the largest of Mr. Grainger's new streets, has now become the principal thoroughfare of the town: it ascends a gentle acclivity, and forms a continuation of Dean Street and the Slide, which last reaches nearly to the river. Grey Street is nearly  $\frac{1}{2}$  m. in length, by 80 ft. in breadth, and is lined with substantial stone houses, which, in point of architectural beauty, may vie with Regent Street, in London: the effect is heightened, also, by the curvilinear direction of the street. At the top of Grey Street, where it joins Blackett Street, one of Grainger's earlier and less ambitious works, stands the column dedicated to Earl Grey, 136 ft. high, and surmounted by a colossal statue of that nobleman, by Bailey. Grainger Street, another fine avenue, 300 yards in length, and 66 ft. wide, is on a similar design with Grey Street; and at their junction with Market Street is a large triangular space, on which has been erected the central exchange, a building having three uniform fronts, in the Corinthian style, with circular columns, facades with columns of the same order, and supporting light domes, after those of the temple of Vesta at Tivoli. The outside is formed into handsome shops and ware-rooms, enclosing the exchange, which has four large entrances, and is altogether lighted from above: the roof is ingeniously constructed, resting on the external walls, and inwardly on a circular entablature, supported by 14 Ionic columns, enclosing a platform, within which is the news-room, the outer space being open, and used for the promenades and rendezvous of the merchants. Adjoining the exchange is a handsome coffee-room. The establishment is supported by 1,000 subscribers, and is managed by a committee; but the property belongs to Mr. Grainger. The proprietor offered it as a free gift to the corporation for a corn-market, but that body thought fit to decline it: the principal commercial business is transacted at the old exchange on the Sandhill. Clayton, Nelson, Nun, and Shakespeare Streets are the other principal thoroughfares in Mr. Grainger's splendid improvements; and besides these, Eldon Square, N. of Blackett Street, Westgate, Percy, and Northumberland Streets, deserve notice. The N. suburbs are open; and, being removed from the bustle of town, are occupied by houses suited to the wealthier inhabitants, who have extended their residences into Jesmond township, forming a succession of terraces; and further north is a group of new buildings, called Broadleaf Place. On the hill, also, W. of Newcastle, terraces and villas are in course of formation; and the same is the case on the road to N. Shields: indeed, it may be said that the town is extending itself in every direction, with marked improvements in architectural taste. In Sandgate, however, and the lower parts of Newcastle, which extend along the banks of the Tyne for nearly 2 m., there are many narrow, inconvenient, and dirty streets, lined with manufactories, ware-houses, &c.; and comprising, also, many lanes and alleys, as filthy, close, and unwholesome as the very worst of those of Liverpool and Manchester: indeed, "the mind cannot picture a state of greater destitution and misery than what appear in many of these houses; and in Sandgate, E. of the town, the condition of the people seems not much better." (*Rep. to British Association, 1838.*) The communication with the bor. of Gateshead (which see), on the S. side of the river, is maintained by means of a handsome stone bridge, of nine elliptical arches; but it has been proposed to supersede this by another so lofty as to admit underneath the free passage of colliers and other masted vessels.

*Corporation and Commercial Buildings, &c.*—The guildhall, which comprises also the exchange and the court belonging to the incorporated society of hostmen or coal-fitters (chartered in 1600), is a large building on Sandhill, much enlarged and altered at different periods, but of the most heterogeneous architecture, though at the same time pretty well adapted for business: the rooms contain some valuable portraits of public characters. On the quay, a fine open space faced with stone, and one of the largest in the kingdom, is the custom-house, lately faced with stone from a design by Smirke. The Moot-hall, or assize court-house for the co. of Northumberland, is within the precinct of the old Norman castle, and consists of a Grecian building, designed from the Temple of Theseus at Athens, and faced on two sides by Doric porticoes: the interior is well arranged for the business both of the civil and criminal courts. The town-hall, in Carloll Square, is a strong and rather unattractive building, erected in 1827, on the napoleon principle, at a cost of 47,000*l.*; but it is reported, that both the site and construction are bad; soli-

tary confinement is impossible, and a better prison might have been built at little more than half the expense. It comprises about 50 cells, and the same number of rooms; the average number of prisoners, not including debtors, amounts to about 80, and the daily cost of each prisoner may average about 1*s.* 2*d.* The Trinity-house, in Trinity-church, Quay-side, is an incorporated institution of great antiquity, intended not only to improve the navigation of the river by the appointment of licensed pilots, but to provide subsistence for poor and decayed brethren, their widows and children: it supports at present about 27 in-pensioners, at 2*s.* per month; 81 masters or their widows, out-pensioners, at 8*l.* a year; and 37 seamen or their widows, at 6*l.* a year. The Arcade, in Pilgrim Street, one of Grainger's erections, though perhaps the least distinguished in point of taste, consists of an oblong pile of building, with a Corinthian frontage 94 ft. long and 75 ft. high. The N. of England joint-stock bank, and the savings' bank, occupy the front rooms; and in other parts are the post, stamp, and excise offices, with auction-rooms, shops, and chambers for lawyers, engineers, &c. It was opened in 1832, and cost 40,000*l.* The barracks, on the N.W. side of the town, comprise an extensive range of building inclosed within a stone wall, and accommodate nearly 1,000 troops.

*Markets.*—The Corn Exchange, recently built, seems to be sufficiently capacious and convenient, as is the Fish Market. A large butcher-market was built in 1808, but it has been removed; and the only great market now existing in Newcastle is that constructed by Grainger, the largest in England, 318 ft. in length, and comprising an area of 9,050 sq. yards, exceeding that of St. John's in Liverpool by 2,650 sq. yards: it has 14 entrances, and is lined with 243 shops, besides stalls.

*Literary, Scientific Institutions, &c.*—The Literary and Philosophical Institution (founded in 1793, chiefly through the exertions of the Rev. W. Turner, a celebrated dissenting minister of Newcastle,) occupies a building of Doric architecture in Westgate Street; and adjoining the library are the meeting-rooms and lecture-rooms of the Natural History and Antiquarian Societies of Newcastle. A literary, scientific, and mechanical institution has an establishment in Blackett Street. A new Music-hall, beneath which is a large public Lecture Room, has been built by Mr. Grainger, in Nelson Street. The old Music Hall is now entered from Grey Street, and is occupied as an auction mart. The Newcastle Institution, for the promotion of the fine arts, in Blackett Street, a handsome building with a Corinthian front, comprises a saloon and octagon gallery well lighted from the top: the establishment is supported by a joint-stock company, and the annual exhibition is in June. Newcastle has 6 public libraries, and 5 weekly newspapers. A club, conducted in the modern style, called the Northern Counties Club, has among its members the most distinguished nobility and gentry of that part of England. The principal places of amusement are the theatre, in Grey Street; the assembly-rooms, in Westgate Street; behind which is the racket court, the riding-school in the public walk called the Fother, and the baths at the N. end of Northumberland Street. The theatre, built by Grainger in 1835, from designs by Mr. Green, an architect of Newcastle, instead of an older one that he had purchased and pulled down, has a front in Grey Street 120 feet in length, with a portico of 6 Corinthian columns, supporting a rich pediment: its interior shape is that of a flattened horse-shoe; and in point of size it is surpassed by few or no English theatres, except the Opera-house, and the patent theatres of the metropolis. Races are held in June on the Moor, about  $\frac{1}{2}$  m. N. the town; and a good stand has been erected for the accommodation of visitors.

*Churches, &c.*—Newcastle has 4 par. churches, the oldest of which is St. Andrew's, a Norman building, at the top of Newgate Street. By far the finest, however, is St. Nicholas (now the parent church) a cruciform structure in the decorated English style, with a choir and nave 220 feet in length, and 74 feet in width, the choir only being enclosed for service: a painted E. window, and a magnificent altar-piece of the Last Supper, decorate the interior; and at the W. end is a tower in the early perpendicular style, surmounted by a crocketed steeple resting on four flying buttresses, the whole being 201 ft. in height. This steeple is said, by Mr. Rickman, "to be as fine a composition as any of its date, and the lightness and boldness of the upper part can hardly be exceeded." St. Giles's in Edinburgh, the College Tower in Aberdeen, and St. Dunstan's in the E. of London, are imitations of this steeple, but they all fall far short of the original. A very good library, though chiefly of old or theological books, is attached to this church: the rules of admission are very liberal; and it is, in fact, open to the public free of charge. All Saints' is a modern Grecian building, with an elegant spire 202 feet in height; the interior is of an elliptical shape, and richly fitted up with solid mahoe-

gany. St. John's, in Westgate, is a cruciform church, built in the 13th century, having a square embattled tower at its W. end. The chapels of ease are, St. Anne's, on the New Road; and another at Barras-bridge, called St. Thomas', in the early English style, and surmounted by a light tower 140 ft. high. An endowed charity school is attached to each of the churches, and a fifth to the chapel of St. Anne. The dissenters here are numerous, and most respectable; out of 30 places of worship, 24 belong to different classes of Methodists, and other dissenters, including R. Catholics, members of the Church of Scotland, and the Society of Friends. Few of these, however, have any claim to notice from their architectural beauty. Within the bor. are numerous Sunday schools, furnishing religious instruction to upwards of 5,000 children of both sexes. Two public cemeteries have been formed of late years in the suburbs.

**Schools and Benevolent Establishments.**—The Royal grammar school of Newcastle was founded by Thomas Horsley, in 1525. Among its pupils have been the late lords Eldon, Stowell, and Collingwood, the poet Aken-side, and several other distinguished characters: Dawes, author of the *Miscellanea Critica*, was one of its masters. A Lancelian school, known as the "Jubilee-school," founded in 1809, has a handsome school-house, with a large library, and is liberally supported by subscription. A second Jubilee school was founded to commemorate the 50th year of the prelate of the late Dr. Shute Barrington; it is on the national plan, and supported chiefly by the clergy and lay members of the Established Church. There are several other endowed and subscription schools, including two infant schools. According to a report made to the British Association, the number of children receiving instruction of some kind or other, in 1838, amounted to 8,239, or to about 51 per cent. of the pop. between the ages of 5 and 15. The principal benevolent institutions are, the infirmary, which has accommodation for 800 in-patients; a dispensary; two blind asylums; a small lying-in hospital; asylum for poor seamen; Jesus's hospital, for decayed freemen; mendicity society; domestic-guardian institution; and several ranges of almshouses; besides which, there are several minor charities and religious associations. Newcastle has also a large union-work-house; the expense of maintaining the poor of the bor. in 1839 amounted to 13,326*l*.

**Coal Trade.**—The importance, if not existence, of Newcastle is owing to its convenient situation as a place of shipment for the coal wrought in its neighbourhood. The pits lie on each side the Tyne, from within 2 m. of its mouth to 16 or 18 m. up the river; and it appears from the evidence before the committee of the H. of Lords on the coal-trade, that, in 1829, there were 23 working collieries on the N. side, and 18 on the S. side of the Tyne. Several more have since been opened, and at present upwards of 50 pits are at work in the neighbourhood of Newcastle, some within 1 mile of the river, but others more than 8 m. distant. The coals are conveyed from the pits to the staiths in wooden or cast-iron waggons, brought along railways generally by means of successive inclined planes or locomotive engines. From such staiths (or coal-shipping wharfs) as are above Newcastle Bridge, the coal is conveyed in keels (each capable of holding 8 chalders or 22 tons) to Wallsend, Jarrow, or Shields, where it is delivered on board the ships; and the strength, as well as activity of the Tyne keelmen, is proverbial in the N. of England. Within the last few years, however, the formation of the Brandling Junction, and other railways, to S. Shields, has caused a diminution of the keel navigation. The coal shipped at Newcastle is sent not only to the port of London, but furnishes a large portion of the supply for the E. and S. coasts of England, and a considerable quantity is exported, chiefly to France, Holland, and Denmark, as will be seen from the following returns of coal, culm, and clinders, shipped at the port of Newcastle in 1835 and 1839:—

	London.	Other Ports of the U. Kingd.	Colonies, or Foreign Ports.	Total.
	<i>Tons.</i>	<i>Tons.</i>	<i>Tons.</i>	<i>Tons.</i>
1838	1,187,532	1,772,196	5,64,175	3,523,903
1839	1,155,856	1,005,165	5,68,092	3,717,313

Owing to the circumstance of most of the vessels engaged in the coal-trade with London and other British ports belonging to Newcastle, her registered tonnage is very nearly equal to that of Liverpool, having amounted, on the 5th of Jan., 1841, to 1,330 ships, of the aggregate burden of 260,000 tons, manned by 13,500 seamen.

The principal exports of Newcastle, besides coal, comprise pig and sheet lead (from 6,000 to 7,000 tons of the former, and above 2,000 tons of the latter) from the mines of Staunhope, glass, and other goods manufactured in the town, hams, grindstones from Gateshead-fell, &c.

The gross customs' revenue of the port amounted, in 1840, to 442,951*l*.

The salmon-fishery of the Tyne (once much celebrated) has greatly declined. About 90 steam-boats belong to Newcastle, chiefly employed in towing ships up and down the river, or plying for passengers to and from Shields. Other and larger steam-packets ply between Newcastle and Stockton, Hull and Leith; and steamers of still greater size ply to and from London weekly, or even more frequently, during the summer months. The Tyne is navigable, from its mouth up to Newcastle Bridge, for vessels of 250 tons, though in some intermediate places the depth, even in the middle of the stream, does not exceed 4 ft. at ebb tide. Dredging machines, however, have been in use within the last few years, and the navigation is said to have been much improved, though the bar at the mouth must always prove a great impediment to the entrance of large ships. It is high water at Newcastle about an hour later than at Tynemouth-bar, the average rise of spring-tides being 11 ft. 7 in., and that of neaps 7 ft. 2 inches.

The principal manufactures are those of bottles and window glass, mostly carried on in the township of Byker, of mill-work, steam-engines, &c., and of leather and soap, of which last article 2,532,257 lbs. were made in 1839. Ship and boat building, rope and sail-making employ considerable number of hands; besides which, there are several malthouses, breweries, iron foundries, lead mills, and chemical works. The gross excise duty collected at Newcastle amounted, in 1839, to 318,331*l*. It has a branch of the Bank of England, with the North of England Joint-stock Banking Company, Newcastle-upon-Tyne Joint-stock Banking Company, Northumberland and the Durham District Banking Company, Newcastle Commercial Banking Company, a private bank, and a Savings' bank. The internal communication is maintained not only by the coal-pit railways already mentioned, but by the Carlisle and Newcastle railroad (61 m. in length, opened in 1839). The Brandling Junction railway connects the last-mentioned railway with the towns of S. Shields and Sunderland on the S. side of the Tyne; on the N. side of which is the Newcastle and North Shields railway. It is probable, also, that Newcastle will soon be connected with the metropolis by the Great N. of England railway, which is already (1841) open as far as Darlington.

Newcastle was constituted a bor. by William the Conqueror, and has received 36 charters from subsequent monarchs. It is divided by the Mun. Reform Act into 7 wards, and is governed by a mayor and 13 other aldermen and 42 councillors, and has a commission of the peace under a recorder. Corp. rev. in 1839, 68,475*l*., chiefly derived from ballast-dues, tolls, and rents. The assizes and Episcopacy quarter-sessions for the co. of Northumberland are held in the Moot-hall, besides which there is a mayor's court and sheriff's court for the recovery of debts to an unlimited amount, a court of conscience for debts under 40*l*., and a court of conservancy for the river. The town is well-paved, lighted, and cleaned by the corporation, and there is an efficient police. Newcastle has sent 2 mems. to the H. of C. since 27 Edward I., the election being vested, down to the Reform Act, in the free burgesses, both resident and non-resident. The electoral limits were enlarged by the Boundary Act, so as to include, with the old borough, the townships of Jesmond, Heaton, Byker, Kilsick and Westgate; and in 1839-40 it had 4,530 reg. electors. It is one of the polling-places at elections for the co. Markets extremely well supplied, especially with corn, on Tuesday and Saturday: fairs for woollen cloth, hardware, leather, horses, and cattle, Aug. 12 and Oct. 29, each lasting 9 days.

The wall of Adrian passes through the town, which is proved, by the numerous antiquities discovered in it, to have been the site of a Roman station; but there is no proof, though a strong presumption, that it was the *Pons Ælii*, mentioned in the "Notitia." Before the Conquest it was called Mouchchester, from its numerous monastic institutions (of which there are still rather extensive remains), and also from being the resort of pilgrims to the holy well of Jesmond mount (now corrupted into Jesmond). A fortress was built here by Robert, eldest son of William the Conqueror; and it received the name of Newcastle, probably, to distinguish it from some more ancient building. In 1229 the walls on the E. side were rebuilt, and in the reign of Edward III. the town was unsuccessfully attacked by David Bruce. Newcastle, at this early period, had become one of the largest commercial ports of the kingdom. It is curious, however, that the first authoritative mention of coal occurs in a charter by Henry III., authorising the burgesses of Newcastle to dig for that mineral. In 1281, the town had a considerable trade in coal, which soon after began to be imported into London; and in 1325 coals were exported to foreign countries. The town furnished, in 1346, 17 ships and 314 mariners for the siege of Calais, a greater force than any port N. of the

Thames, except Yarmouth. It continued steadily to increase in commercial importance and mining industry till 1636, when it was visited by the plague, which carried off 5,000 of its inhabitants. In the parliamentary wars it warmly espoused the cause of Charles I. With respect to the progress of its coal-trade, it may be stated that in 1703 the masters of the Trinity House of Newcastle reported to the H. of C. that 600 ships, each carrying 80 Newcastle chalders, and navigated by 4,500 men and boys, were required for the supply of other ports; and in 1772, 450 keels were employed on the Tyne, the quantity shipped amounting to 351,800 Newcastle chalders. The trade has thence been steadily increasing, and with greater rapidity since the introduction of gas. Lately, however, there has been a slight diminution, owing to the opening of extensive pits in S. Durham, whence large supplies of coal are sent to the ports of Hartlepool and Middlesbrough. (*Parl. Papers*; *Penny Mag.*, art. *Improvements of Newcastle*; *Scott's Railway Companion*, &c.)

NEWCASTLE-UNDER-LYNE, or LYME, a parl. and mun. bor., market-town, and one of England, co. Stafford, N. div. hund. Pirehill, 15 m. N.N.W. Stafford, and 13½ m. N.W. London. Pop. of parl. bor., in 1831, 8,192. The town, which is well paved and lighted, consists of two nearly parallel streets, entered from the London road, and crossed by several others of an inferior description. It is, on the whole, well built, though chiefly consisting of old houses: in the High Street is a large open market-place. The guildhall, a respectable-looking building, has good accommodation for the municipal and magisterial business. There are two churches, one of which, with the exception of its square tower, was rebuilt at the beginning of last century: the other, a dissent church, has recently been erected, the expense being defrayed chiefly by a grant of 4,000*l.* from the parl. commissioners, but partly, also, by private subscription. A handsome Rom. Cath. chapel was built in 1831; and there are places of worship for Wesleyan and other Methodists, Independents, Baptists, and the Society of Friends. Six Sunday-schools are attended by upwards of 1,500 children; besides which, a national, Lancasterian, infant, and four subscription schools furnish daily instruction to about 800 boys and girls. Newcastle-under-Lyne has, also, a free grammar-school, founded in 1602, and in trust of the corporation. The master's salary amounts to 63*l.* a year; but though the sons of freemen may receive gratuitous classical instruction, the school is not much resorted to by the inhabitants of the town, and is seldom attended by more than 12 boys. (*Mun. Corp. Rep.*) Almshouses for 20 aged women were established here in 1637, by the Earl of Albemarle; and the town has several benevolent institutions, besides Bible, tract, and missionary associations, &c. A literary and scientific institution was founded in 1836, a public library has 2,000 vols., and there is a small theatre, little patronised.

"The manufacture of hats is the chief business carried on at Newcastle, though there are three or four silk-mills and one cotton-mill at work." These mills, however, are not mentioned in the Report of the Factory Inspectors for 1838. "The town, a few years ago, was in some measure regarded as the cap. of a pottery district, which includes several towns equal or even superior in pop. and importance to Newcastle itself. Latterly, however, this connection has been broken, and the town has suffered much in consequence. Trade has been very languid till within the last year or two, when it somewhat revived; and at present the labouring classes are in full employment." (*Mun. Board. Rep.*)

Newcastle has more recently sustained a serious diminution of its traffic, from the removal of the great line of communication between London, Manchester, &c., to the Grand Junction Railway, which passes upwards of 6 m. W. of the town. There is good reason, however, to believe that, on the completion of the Birmingham and Manchester, the Chester and Crewe railways, which are intended to run close by it, the losses occasioned by the opening of the former will be more than compensated. Iron-works and collieries are seated in the neighbourhood, and there are considerable tanneries and malt-houses, with a paper-mill employed in making tissue paper for the potteries. The town is connected by a branch canal with the Grand Trunk navigation, and has access by a similar line of communication to the coal-field of N. Stafford. A branch of the Manchester and Liverpool District Banking Company, and a private bank, are established here, and there is a savings bank. Markets on Monday and Saturday: 5 yearly cattle markets.

Newcastle-under-Lyne, which received its first charter in the 19 Henry III., was divided by the Municipal Reform Act into 2 wards, and placed under a mayor and 5 other aldermen, with 18 councillors; it has also a commission of the peace, under a recorder. The bor. has returned 2 mems. to the H. of C. from 27 Edward III., the right of voting down to the Reform Act being in the

resident freemen (by gift, birth, and servitude). The Boundary Act added to the old bor. a small extra-parochial part of the Penkhill-township: reg. electors, in 1839-40, 1,031. It is also one of the polling-places for the N. div. of co. of Stafford.

The distinguishing name of Newcastle (*under Lyme*, or *Lyme*) is of doubtful origin; but the best authorities refer it to the fact of its standing near the woodlands, which formed a *lyme* (thicket) or separating *line* between the co. palatine of Chester, and the rest of England. Ashton-under-Lyne, Wiltmore-under-Lyne, and Audlem, or Old Lyme, admit of similar explanations. It gives the title of duke to the Pelham-Clinton family. (*Parl. Rep.*, &c.)

NEW ENGLAND, the name commonly given to the N.E. portion of the United States, or to the territory including the states of Vermont, New Hampshire, Massachusetts, Maine, Rhode Island, and Connecticut.

NEWFOUNDLAND, a large island of N. America, near the Gulf of St. Lawrence, and off the E. coast of Labrador, from which it is separated by the narrow strait of Belleisle, between lat. 42° 30' and 51° 30' N., and long. 52° 19' and 59° 10' W. Greatest length from N. to S., 350 m.; average breadth, 130 m. Area, 57,000 sq. m. Fixed pop., in 1836, 70,557, exclusive of those who visit the different stations during the fishing season. It may be generally described as of a triangular form, but is broken and indented with broad and deep bays, harbours, coves, rivers, and lagoons, which, besides numerous capes and projecting points of land, form two peninsulas, on one of which, called Avalon, at the S.E. corner of the island, is the town and harbour of Avalon. Its surface is wild and rugged, and its aspect from the sea far from prepossessing. The interior, which, till within the last ten years was almost unknown, is much broken with water; and lakes, marshes, and scrubby trees, form its general character. The only large and navigable streams are the Humber and that called the River of Exploits. Its prevalent geological constitution is of granite, on which are superimposed in some parts porphyry, quartz, gneiss, mica, and clay-slate, with secondary formations: coal and iron also occur in a few places. The E. half of the interior is generally a low, picturesque country, traversed by hills and lakes, the whole being diversified by trees of humble growth. The country westward is more rugged and mountainous, with little wood, except near the shore; but the mountains are not generally in ridges, each apparently having its own particular base. The highest part of the island is the N. peninsula lying above the strait of Belleisle; near its centre are the most considerable extent, swampy, unhealthy, and usually covered with peat or strong wiry grass. Spruce, birch and larch, are the principal forest trees. Pine seldom occurs, and never attains a large size; indeed, there is but little wood of any value, except for fuel and the building of small boats; so that it has scarcely timber enough for its own consumption, much less for exportation. Whortleberry bushes and *misha-capuca* (Indian tea) are the principal plants on the high unwooded grounds. The best soil is along the rivers and at the heads of the bays fringing the island; with the soil and climate generally suited for the raising of grain, though well adapted for pasture and the cultivation of potatoes and other green crops. Vast herds of caribou deer graze in the plains and woods of the interior, and their flesh constitutes nearly the whole food of the Mic-Mac Indians. Beavers are much scarcer than formerly; but foxes are still numerous along the rivers and sea-coast. Among the other wild animals are wolves, and bears, hunted by the Indians from Labrador. Insects are numerous in swampy places, especially in hot weather. The best known and most celebrated of the animals belonging to Newfoundland are its dogs, famed for docility, obedience, and attachment to their masters. They are remarkably voracious, and are usually fed on salted fish, but like the aborigines of the country, they endure hunger for a very lengthened period. The true breed has become very scarce, and there are only a few specimens of it in England, the animal so called in this country, though equally sagacious, hardy, and fond of the water, being a breed crossed with the mastiff, or some other English dog. The E. and S. coasts, where the winds blow from the sea, are very humid; and during winter the cold is intense. The harbours on the Atlantic shore are not so long frozen over as those within the Gulf of St. Lawrence, where the atmosphere is generally clear, and the climate not unlike that of Lower Canada. During the summer months the days and nights are commonly serene and pleasant; the temperature is very hot during summer, and in winter frequently falls as low as 30° below the freezing point. The island, however, is on the whole extremely healthy; and the inhabs. often attain a great age, attended with more than ordinary bodily as well as mental vigour. Agriculture is progressively increasing; but very few give it their exclusive attention, the pop.

being principally employed in the fisheries. Almost every family, however, has a small quantity of land in cultivation, though tillage be very imperfectly understood.

Newfoundland has long been celebrated for its fisheries, on which, indeed, the inhab. principally depend. The Great Bank, on the E. side of the island, is in some places about 200 m. in breadth, and 600 m. in length, the soundings being from 25 to 95 fathoms. There is also an outer bank, lying between lat. 44° 10' and 47° 30' N., and long. 44° 15' and 45° 25' W.; and a continuation of banks extends southward to Nova Scotia. Fogs prevail almost without interruption on these banks, occasioned by the meeting of the waters brought thither by the gulf-stream from the tropics, with the waters carried by the influence of the winds from the Polar regions. A counter-current from the N. sweeps, also, along the shore of Labrador, bringing with it large icebergs, and rendering navigation dangerous, especially during foggy weather. The best fishing-grounds on the Great Bank are between the 42d and 46th parallels; and the principal English settlement, besides St. John's, the cap., are Conception Bay, Carboneau, Grace Harbour, Trinity Harbour, and Placentia, all on the E. side of the island. The islands of St. Pierre and Mequelon, near the mouth of Fortune Bay, on the S. coast, were ceded to France in 1814: the former has a harbour and town of its own name, and is the residence of a governor. The cod-fishery, which commenced a few years after the discovery of the island, attained so high an importance during the late war with France, that the exports of cod and cod-oil were valued, in 1814, at 2,504,000*l.*; but the English fishery has since rapidly declined, so that the average annual value of the fish exported during the years 1837-38-39, amounted only to 507,261*l.* The number of ships employed in the fisheries cannot be ascertained; but, in 1839, there were 6,159 boats. The cod-fishery commences early in June; and as the English have for some years abandoned the bank-shoals to the Americans and French, it is principally carried on close to the shore, in small boats, manned by 2 or 4 persons. Every fisherman is provided with 2 lines, each with 2 hooks, baited with herrings, mackerel, and fish-entrails. In some cases, *jiggers*, or artificial fish, are used, provided with 2 strong hooks, which the cod swallows with the bait. *Scines* are also used, by which multitudes of cod are hauled ashore in coves on the coast of Labrador. So abundant are the fish occasionally, that a couple of cod are hooked on each line before it reaches the bottom; and while one line is running out, the fisherman has only to turn round and pull in the other, with a fish on each hook. As soon as the boat is loaded, which, under favourable circumstances, will be in 3 or 4 hours, they proceeded to the stage on the shore, where the process of cutting up, salting, and drying takes place; and after having delivered their cargo, return immediately to sea. The cod-fishery, however, is truly precarious. Sometimes the fish is not equally abundant on all parts of the coast, and the fishermen are compelled to go far from the stations, and in some cases, to split and salt the cod in the boat. The incessant labour, also, which attends the curing leaves the shoremen scarcely time during the season to eat their meals, and allows them little more than 4 hours' sleep. (*McGregor's Brit. America*, i. 200-207.) The seal-fishery is conducted in vessels varying from 80 to 120 tons, with crews of 20 or 30 men. The season commences early in April: it is principally conducted close to the shore of Labrador, and has become important only within the last 50 years. The cod fishery on the W. coast has been given up to the French; but there is still a small whale-fishery conducted in boats on the S. side of the island. There is likewise a pretty extensive salmon-fishery, the value of which, in 1839, amounted to 11,692*l.*

The trade of Newfoundland consists in the exportation of the products of its fisheries (valued, in 1839, at 844,000*l.*), in exchange for manufactured goods, colonial produce, corn, ship-biscuits, and a variety of articles for the consumption of the inhabs. The following table exhibits the number and tonnage of ships that arrived at, and departed from, Newfoundland in 1839:—

Countries.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
Great Britain	163	19,790	156	15,286
British Colonies	336	28,064	419	40,217
United States	4	5,207	29	1,962
Foreign	21	39,009	255	32,830
Total	561	91,661	854	90,295

The government of Newfoundland was long administered by naval commanders appointed to cruise on the fishing station, who returned to Britain in winter. Within the last century, however, it has been deemed more eligible to have a resident governor. In 1832, in consequence of a petition from the inhabs., a represent-

ative government was granted, the election being by almost universal suffrage. This system has hitherto worked very inharmoniously, the popular body having been in a state of violent collision, both with the executive and the commercial interests. Great complaints have also been made of the influence of the Rom. Cath. clergy in the elections; and the principal merchants have made representations to the government at home, to the effect that trade is injured, and property rendered insecure, by the proceedings of the assembly. The assembly comprises 15 members; and attached to it is a legislative and executive council. The laws are in English, and administered by circuit courts; but the police is neither numerous nor effective. The militia of the island consisted, in 1838, of 6,420 men, including 358 commissioned officers. Five schools are supported by the government; and the Newfoundland School Society has established 17 others; but education is greatly neglected, and in 1839 there were not more than 2,000 children receiving any kind of instruction. It is believed, however, that there will be some improvement in this respect, when the Education Act, passed in 1836, has come into full operation. There is no church establishment, all sects having equal privileges; but a titular Rom. Cath. bishop resides at St. John's, and a vicar-general at Grace Harbour. The Rom. Caths. are the prevailing body; but there are also Episcopalians, Presbyterians, and Wesleyan Methodists.

The inhabs. are honest and industrious, but often addicted to drunkenness, and superstitious to a degree almost beyond belief. Capital offences are exceedingly rare, and petty thefts are scarcely known. The people, consisting chiefly of Irish, Scotch, and the inhabitants of Jersey and Guernsey, or their descendants (the Indian aborigines having been long all but extinct), are employed either wholly or occasionally in the fisheries. The pasture of cattle and sheep, and the cultivation of small spots of land, are likewise partial sources of occupation.

The women, besides assisting the men in catching and curing the fish, are engaged either in rural occupations, or spinning and knitting worsted stockings, mittens, and so on. In winter much time is occupied in mending home-fact, building boats, and making or repairing the fishing implements. Marriages and christenings are commonly celebrated at the close of the fishing season, or in winter, and are always times of great festivity and merriment. St. Patrick's and Sheelagh's days are celebrated with riotous mirth by the Irish; and Christmas is a universal holiday, marked by the observance of many customs that are now exploded in England. Celibacy is rare, and families of 10 or 12 children are very common. The fishermen's houses are one story high, built of wood, and covered with boards and shingles, imported from Nova Scotia, New Brunswick, &c. Their usual diet consists of ship-biscuits, potatoes, and fish, salt pork, and beer; the spruce beer being the common beverage for those living, as most of the people do, on fish and salt meat. Spirits are mixed with the beer, to make the mixture called *Calibogus*, and rum is so cheap, that the labouring classes are apt to acquire habits of intoxication, which, however, is somewhat obviated by the practice of *kegging*, somewhat similar to taking the temperance-pledge, either for one or more years, and occasionally for life.

Newfoundland was probably first discovered by the Norwegians, at the beginning of the 11th century, but, if so, it was subsequently forgotten, till John Cabot visited it in the summer of 1497, and gave it its present name. As early as the year 1500 an extensive fishery was carried on, by the Portuguese and French, on the neighbouring banks; but, though Sir Walter Raleigh, and others, attempted to form a colony here, no successful settlement was made, till Sir G. Calvert, afterward Lord Baltimore, in 1623, established himself on the S.E. part of the island, called Avalon, and appointed his son governor. Ten years afterwards a colony was sent over from Ireland, and in 1654 a few English settlers came over, under the authority of a parliamentary grant. The French, who, very early in the 17th century, had formed a station at Placentia, were for many years a constant source of annoyance to the English; and though, by the peace of Utrecht, the possession of the island was confirmed to the English, the subject of fishery rights is still a *vacilla questio* between the two nations. With respect to the fishery generally, it was chiefly carried on during the first half of the last century, by the English, Anglo-Americans, and French; but the capture of C. Breton, and other possessions in America, gave a severe blow to the fishery of the latter. The Americans had previously carried on that portion of it that had been previously carried on from New England being there, merged in that of the United States; but still the English contrived to preserve the largest share. The French, were excluded from the fishery during the French war, in consequence of which the English had almost a monopoly of the business; but since the peace it has been carried on chiefly by the French and Americans, that of the English having declined fully three fourths since the

peace. (See JOHN'S, ST., and ST. PIERRE.) (*McGregor's Brit. America*, i. 123-216; *Murray's Brit. America*, ii. 275-298; *Comm. Dict.*; *Parl. Papers*, &c.)

NEW HAMPSHIRE. See HAMPSHIRE, New.

NEWHAVEN, a city and seaport of the U. States, in Connecticut, of which, conjointly with Hartford, it is the cap., co. Newhaven, on an inlet of Long Island Sound, 35 m. S.S.W. Hartford, and 75 m. N.E. New York: lat. 41° 18' N., long. 72° 57' W. Pop., in 1830, 10,678. "In point of situation, and of the neatness, cleanness, and elegance of its buildings, it is as unlike the dirty village of Newhaven on the Forth as can well be conceived. The town is built on a plain, about 2 m. from N. to S., and 3 m. from E. to W. The streets and squares are quite regular, and all shaded with fine trees. In the centre of the city is the public square, in which are the state-house, several of the churches, and Yale College." (*Stuart*.) The new state-house is built after the model of the Parthenon. Yale College is one of the most distinguished literary institutions in America. It was incorporated in 1701, and removed thither in 1717. The college buildings, which are of stone, comprise 4 halls, each 100 ft. by 40 ft., in which are the dormitories of the students; a chapel, 2 halls for lecture rooms, a large dining-hall, the medical college, &c. This institution has the finest cabinet in the U. States, a good anatomical museum, and libraries, comprising altogether 27,000 vols. In 1840, it had 32 professors and 438 students. The state hospital, the churches of the Episcopalian, Baptist, Methodist, African, &c., the gub. court-house, almshouse, and museum, are among the chief public edifices. There are numerous flourishing boarding-schools in the town, an institution for public lectures, and several banks and insurance offices. The burying-ground at Newhaven is of considerable size, and so well laid out and kept, that Mr. Stuart says it is quite the Père-la-Chaise of the U. States. The legislature of Connecticut meets alternately at Hartford and Newhaven. This city has a considerable foreign and coasting trade. Its harbour, though shallow and gradually filling up with mud, is spacious and secure, and the wharfs bordering it are extensive, one being nearly 4,000 ft. in length. In 1839, there belonged to the port 17,728 tons of shipping. Newhaven is connected with Hartford by a railroad; and with Northampton, and other parts of Massachusetts, by a canal. It communicates daily with New York by steam boats. (*Official Report*; *Murray's Encyc. of Geog.*, Amer. Edit.; *Encyc. Amer.*; *Stuart's America*, i. 357-58.)

NEW JERSEY. See JERSEY, New.

NEWMARKET, a market town of England, celebrated for its races, partly in hind. Chevely, co. Cambridgeshire, and partly in hind. Lackford, co. Suffolk, 13 m. N.E. Cambridge, and 53 m. N. by E. London. Area of its two parishes, 570 acres. Pop., in 1831, 2,248. It comprises one long and wide street, lined with respectable shops, handsome private residences, numerous hotels and inns for the accommodation of the nobility and others who flock thither during the races. It has some handsome public buildings, among which may be specified the new rooms belonging to the Jockey Club. The stables are most extensive, and are fitted up with every convenience. Of the two parish churches, that of St. Mary's is by far the most handsome, and has a tower and steeple that form a prominent feature when seen from a distance. The Wesleyan Methodists and Baptists have also their places of worship, with attached Sunday schools. A subscription charity school is attended by 72 boys and 53 girls, the number on Sunday amounting to 176 children of both sexes. There are numerous other small charities.

Horse-racing, though now so favourite a diversion, is of rather late origin in England, and does not appear to have been much practised till the latter part of the reign of Queen Elizabeth. In the following reign, however, James I. was a distinguished patron of the turf, and imported Arabian horses for the improvement of the native breeds. In the early part of the reign of Charles I., Newmarket became celebrated for its races; and Charles II., who was still more zealously attached to this new resort of the sporting world, regularly attended its races, and repaired and enlarged the house in the town that had been occasionally occupied by his father and grandfather. From this epoch Newmarket has been the racing metropolis of the empire, and has always had to boast of the most distinguished patronage, "Newmarket fame and judgment in a bet" being an object of the highest ambition with many nobles and wealthy commoners of our own day, as well as with those of the days of Pope. The race-course, on the heath to the W. of the town, is probably the finest in England. It is apportioned into different distances, corresponding with the ages and supposed powers of the horses, the longest course being 4 m. 1 furlong and 128 yds., and the shortest 2 furlongs and 47 yds. The grand stand has been accommodated for spectators, with a betting-room, coffee-room, &c. There are 7 race meetings during the year, instituted at different pe-

riods, each lasting three days: the earliest is the Craven meeting, on Easter-Monday; then follow the two spring meetings; a fourth takes place in July; and there are three others in October, the last being called "the Houghton meeting." The sovereign gives three plates annually; one is provided from a fund left for the purpose, and others are given by the nobility or subscribed for by the members of the turf. The training-ground, on a slope S. of the town, is considered superior even to the course for trying the mettle, wind, and speed of the horses. About two thirds of the adult male pop. are trainers, stable-keepers, grooms, &c.; and, in fact, the town is wholly dependent for support on the races, and the training of horses. Markets on Tuesday, fairs, Whit-Tuesday and Nov. 8., chiefly for horses and sheep. Newmarket was nearly burnt down in 1683, and again at the commencement of last century. (*Blaine's Encyc. of Rural Sports*, pp. 236, 373.)

NEW ORLEANS, a city and river-port of the U. States, Louisiana, of which it is the cap., and the commercial metropolis of the southern and western portions of the Union, on the Mississippi, about 105 m. from its mouth; lat. 29° 57' 45" N.; long. 90° 9' W. Pop., in 1830, 50,103, while, in 1840, it had increased to 102,191! It is built on a wide level, along the river's edge, the ground being so spongy that none of the houses have cellars. The surface of the river at high water is also from 2 to 4 ft. above the level of the town; and even in its lowest stages it is above the level of the swamps in the rear of the city. To obviate inundations, a levee, or embankment, from 5 to 30 ft. in height, has been raised for about 100 m. along the river. A breach sometimes occurs in this dyke, but it is rarely permitted to do much damage before it is closed; and the most serious drawback the city suffers from its situation is its insalubrity. It is usually visited by the yellow fever, from July to Sept., every year or every two years, when great numbers of the unacclimated poor are swept off, and the rich betake themselves to some more healthy situation. But the fury of this scourge has latterly been mitigated by draining some of the contiguous swamps, paving certain parts of the city, substituting stone for the wooden sewers, &c. The effective plan, however, would be to raise the ground on which the city stands 8 or 10 ft. above its present level. This would at once elevate it above the level of the river, provide a descent for the drains in the town, and would most probably free it from fever. Considering the vast importance of the objects to be gained, the undertaking, though expensive and difficult, is one that should immediately be set about.

New Orleans, having few steeples or other conspicuous objects, makes no striking appearance from a distance. "The city is built in the form of a parallelogram, composed of six complete squares, with suburbs or *faubourgs*, which are rapidly increasing. The streets in the old city are hardly 40 ft. wide; but in the newer portions they are much wider, and intersect each other at right angles. The cathedral, at the head of a square, is an old building, with 4 towers and massive walls, ornamented with figures of saints in the niches. It is the only public building at all imposing. Public institutions, though numerous, are built in an unpretending style. There are very few churches in proportion to the pop. The French theatre is in the city, and the American in the suburbs. The houses (which in the old city are lofty, ornamented with tasteful cornices and iron balconies, and presenting many characteristics similar to those in the towns of France and Spain), are chiefly of brick, and many of them succeed externally of a white or yellow colour. In the new portion of the city the houses are built in the modern American style. Many of the doors are left open during the day, and mosquito curtains substituted in their stead." (*Stuart's America*, ii. 196, 197.) Next to the R. Cath. cathedral, the state-house, custom-house, exchange, U. S. mint, barracks, college, the charity hospital, which provides for from 8,000 to 9,000 in-door and out-patients annually, 3 other hospitals, the orphan-asylum, and several theatres, are the principal public buildings. The charitable institutions are both numerous and well conducted. There are places of worship for Episcopalian, Unitarian, Baptist, Methodist, &c.; but most of the white pop., being of French or Spanish descent, are R. Catholics. One half of the fixed residents are black or coloured; but in no city is there a greater mixture of races. Inhab. from every state in the Union, and from every country in Europe, with Creoles and all the shades of the coloured pop., unite to form a curious contrast of manners, languages, and complexions. The markets of New Orleans are well supplied, and provisions are cheap, while labour of all kinds is dear. The city is abundantly furnished by the Mississippi with water, which, though turbid at first, becomes clear and palatable on being filtered or allowed to settle. Morals are at a lower ebb in this than in any other great city of the Union, though, according to Mr. Stuart, they are not quite so bad as has been represented. Education and a taste for literature are but little diffused; and there are but few news-

papers and reading-rooms. On the other hand, however, there are an immense number of lottery-offices, billiard-rooms, and gambling houses. The police is good.

**Commerce.**—New Orleans is the grand emporium of all the vast tracts traversed by the Mississippi, the Missouri, and their tributary streams, and enjoys in consequence a greater command of internal navigation than any other city either of the Old or New World. Civilization has hitherto struck its roots, and begun to flourish, only in some comparatively small portions of the immense territories of which New Orleans is the seaport; and yet her progress has been rapid beyond all precedent. It appears from the accounts printed by order of Congress, that during the year ending the 30th of September, 1839, the value of native American produce exported from this city amounted to 30,995,336 doll., while the value of that exported from New York was only 23,296,995 doll. But with respect to imports, the case is materially different; the value of those of New Orleans in the above year being only 12,864,942 doll., whereas those of New York amounted to 99,882,438 doll.

It is believed by many, seeing how rapidly settlements are forming in the "West," that New Orleans must, at no very distant period, exceed every city of America, as well in the magnitude of its imports as of its exports; and, considering the boundless extent and extraordinary fertility of the uncultivated and unoccupied basins of the Mississippi and Missouri, the anticipations of those who contend that New Orleans is destined to become the greatest emporium, not of America only, but of the world, will not appear very unreasonable. Steam navigation has been of incalculable service to this port, and, indeed, to the whole of central N. America. The voyage up the Mississippi, that used to be so difficult and tedious, is now performed in commodious steam packets with ease, celerity, and comfort. "There have been counted," says Mr. Flint, "in the harbour, 1,500 flat boats at a time. Steam boats are arriving and departing every hour; and it is not uncommon to see 30 lying together in the harbour. A forest of masts is constantly seen along the levee, except in the sultry months. There are often 5,000 or 6,000 boatsmen from the upper country here at a time; and we have known 30 vessels advertised together for Liverpool and Havre. The intercourse with the Havannah and Vera Cruz is great, and constantly increasing." (*Geog. and Hist. of the W. States*, i. 557.)

From 1811, when the first steam boat was launched on the Mississippi, down to the beginning of 1830, no fewer than 336 steam boats had been built for the navigation of this river, the Missouri, Ohio, &c.; of which 213 were employed at the latter period. In 1838, the aggregate tonnage of the port amounted to 104,426 tons; of which 57,529 was the tonnage of steamers only. Vessels of the largest burden may navigate the river several hundreds of miles above New Orleans. A large proportion of her foreign trade is, however, carried on in foreign bottoms; and as a shipping port she ranks much below several of the other ports of the Union. The depth of water in the river opposite to New Orleans is, at a medium, about 70 ft.; and it maintains soundings of 30 ft. till within a mile of its confluence with the sea. Besides 3 or 4 of inferior consequence, the Mississippi has 4 principal passes, or outlets. But in the S.E., or main pass, at Balize, the water on the bar at ordinary tides does not exceed 12 ft.; and as the rise of the tides in the Gulf of Mexico is not more than 2 or 2½ ft., vessels drawing much water cannot make their way from the ocean to New Orleans.

The commerce of the city is facilitated by means of canals, which connect it with Lake Pontchartrain, and by the Carrollton, Pontchartrain, and Orleans Street railroads; though none of these works is of any considerable length.

The great articles of export from New Orleans consist of cotton, to the amount of about 600,000 bales a year, principally to England and France; flour, corn, and meal, with bacon, pork, and lard, principally to Cuba, the West Indies, and Brazil; tobacco, shingles, and staves, lead, sugar, &c. There are in the city a great number of joint-stock banks, all which age at present (1841) unable to pay their notes in specie, with numerous insurance offices, &c.

New Orleans was founded by the French in 1717; in 1769 it was occupied by the Spaniards, in whose hands it continued for about 34 years. In 1814-15 a British army, which had effected a landing in the neighbourhood, was compelled to re-embark, after having sustained great loss in an attack on the entrenchments of the Americans under General Jackson. (*Encyc. Americana*; *Flint's Grog*; *Encyc. of Grog*, Amer. edit.; *Amer. Almanac*; *Strutt's America*, ii. 194-221.; *Official Returns*.)

**NEWPORT**, a parl. bor., market-town, and par. of England, in the centre of the Isle of Wight, of which it is the cap., on the Medina (crossed here by an old stone bridge), 14 m. S.S.E. Southampton, and 75 m. S.W. London. Pop. of parl. bor., which comprises, with the old bor., a portion of the par. of Carisbrooke, in 1831, 6,700. The town has one principal street, with two or three

others meeting it at right angles, and forming spacious market-places. The best streets are well built, paved, and lighted with gas; but there are several inferior houses on the N. side of the town and along the river. The market-house is an old building, open in the lower part, the upper story being formed into apartments for the corporation business, &c. The church is a large edifice, having three aisles, divided from each other by pointed arches, and an embattled tower at its W. end; the living is a vicarage, subordinate to Carisbrooke. The Rom. Caths., Wesleyan Methodists, Baptists, Unitarians, and the Society of Friends have their respective places of worship; and there are three Sunday-schools. A grammar-school was founded, in 1619, by James I. In its school-room, a venerable-looking structure of grey stone, Charles I. and the parliamentary commissioners carried on the negotiations which ended so fatally for the former. There is also a girls' charity school. The Literary Institution, assembly-rooms, and theatre are the other principal public establishments. Within the bor. is a gaol, built at the joint expense of the bor. and the island generally: it has rooms for the separate confinement of male and female tried and untried prisoners, but there is little further classification. The old castle of Carisbrooke (which see), occupies an eminence, about 14 m. S.W. the town, about 1 m. N. is a work-house for the poor of the entire island, and near it is Parkhurst military depot and hospital, erected in 1780, and furnishing accommodation for upwards of 3,000 troops. "The town formerly derived much benefit from the presence of a large military force; but the barracks have been all but deserted since 1825, and the withdrawal of the stimulus has been seriously felt. There is a lace manufactory close to the town, employing from 600 to 700 hands, and another of less consequence at the distance of about 2 m. The present importance of Newport depends principally on its being a market-town in the centre of the island, which is an active agricultural and grazing district. The markets are said to be somewhat injured by the existence of the tolls; but the general prosperity of the town seems to be neither increasing nor diminishing to any material extent." (*Mun. Corp. Rep.*)

The bor. of Newport is supposed to have been incorporated in the reign of Henry II., but its principal charter was granted by James I. Under the Mun. Reform Act it is divided into 2 wards, and is governed by a mayor, 5 other aldermen, and 18 councillors: it enjoys, also, a commission of the peace, under a recorder. Corporation revenue, in 1839, 552*l*. An ancient court, the *Curia militum*, consisting of freeholders, is held once in three weeks at the town-hall, and exercises jurisdiction over all the island, except the bor. Newport has sent 2 mems. to the H. of C. since the 23 Edward I. A portion of the par. of Carisbrooke was added to the old bor. by the Boundary Act: registered electors in 1839-40, 669. Newport is also the election-town for the Isle of Wight, which, under the Reform Act, sends 1 mem. to the H. of C. Markets on Wednesday and Saturday; fairs on Whit-Monday and 2 following days. (*Parl. Papers*; *Corp. Rep.*, &c.)

**NEWPORT** (Welsh, *Castell-newydd*), a parl. bor., market-town, and river-port of England, hund. Wentloog, co. Monmouth, on the W. bank of the Usk, crossed here by a stone bridge of 5 arches, and about 4 m. from its mouth, 20 m. S.S.W. Monmouth, and 124 m. W. by N. London. Pop. of parl. bor., in 1831, 7,497. The town comprises a narrow and crooked main street, bifurcating at its S. extremity, and crossed by others still meaner and more irregular. On an eminence S. from the town is the old par. church of St. Woollos, with a square tower, apparently of Norman architecture, though much altered at different periods: the living is a vicarage, in the gift of the Bishop of Gloucester. There are places of worship for Wesleyan Methodists, Calvinists, Baptists, and R. Catholics. National and Lancasterian schools are established here, and the Sunday-schools are attended by about 900 children. Near the bridge are some interesting remains of a baronial castle, said to have been erected by Robert Fitzroy, son of Henry I.; and not far off are the ruins of an old monastery. "Newport is extensively engaged in the iron and tin trade, and in the export of coals. It is connected with Pontypool and Crumlin by the Monmouthshire Canal. Iron and coal are brought from the former, coals only from the latter. Tram-roads also connect Newport with the Itinerary, Tredgar, Sirhowy, Ebbwvale, and Beaufort iron-works. It may, indeed, be considered a very thriving place: new docks and wharfs are building, or in contemplation, and the town is rapidly increasing." (*Mun. Bound. Rep.*) In 1839, 483,855 tons of coal were shipped from this port, of which 13,035 tons were sent to foreign countries. The gross customs' net revenue in 1839 amounted to 18,250*l*., but in 1840 it fell off to 10,539*l*. The river is navigable for sea-going ships close up to the town, and ship-building is carried on to a considerable extent. Between 60 and 70 ships

belong to the port. The iron-foundries are on a large scale, and there are nail factories, roperies, breweries, and a pretty extensive pottery.

Newport, which received its earliest charter in the reign of Edward III., was divided by the Municipal Reform Act into 2 wards; its mun. officers being a mayor, and 5 other aldermen, with 18 councillors. It has also a commission of the peace, under a recorder. Corporation revenue in 1839, 617*l*. In conjunction with Monmouth and Usk, Newport has sent 1 mem. to the H. of C. since the 27th Henry VIII., the right of election down to the Reform Act being vested in the resident burgesses. The electoral limits were enlarged by the Boundary Act, so as to include, with the old bor., additional portions of the pars. of St. Woollos and Christchurch. Reg. electors for the united bors., in 1839-40, 1,304. It is also one of the polling-places at elections for the co., and the principal town of a poor-law union, comprising 30 pars. and townships. Markets on Sat.; cattle markets the 3d Monday in each month; fairs, Holy Thurs., Whit-Thurs., 15th Aug., and 6th Nov. (*Parl. Man. Bound. Rep. &c.*)

Newport is a market-town and par. of England, S. Bradford, hund. co. Salom, near its E. limit, 161 m. W. N. W. Shrewsbury, and 128 m. N. W. London. Area of par. 800 acres. Pop., in 1831, 2,745. It consists principally of a main street, on the road between Shrewsbury and Stafford, in the centre of which stands the par. church; the living is a perpetual curacy, in the gift of the lord-chancellor. A grammar-school, founded in 1565, is endowed with lands producing about 1,000*l*. a year, and funded property to the amount of 12,450*l*. It has 8 exhibitions at Oxford and Cambridge, and is conducted by 2 masters. An English school is supported out of the funds of the same charity, and there are 2 sets of almshouses. The town contains also an old, but well-built market-hall. The chief business of Newport is its retail trade for the supply of the neighbourhood. Malting is carried on pretty extensively; and it derives some advantages from its situation on a branch canal connecting the Shrewsbury Canal with the Liverpool and Birmingham Junction Canal. A private bank and savings' bank are established here. Markets on Saturday; cattle and sheep fairs, first Tuesday in February, Saturday before Palm Sunday, May 28., July 27., Sept. 25., and Dec. 10.

Newport, a decayed bor. and market-town of England, co. Cornwall, N. div. hund. East, separated from Launceston, of which it is a suburb, by a small rivulet. Though it had for many years been quite insignificant, this bor. sent, from the reign of Edward VI., 2 mems. to the H. of C. (nominees of the Duke of Northumberland) down to the passing of the Reform Act, by which it was disfranchised.

Newport, a sea-port town of the U. States, Rhode Island, on the W. shore of the island, whence the state derives its name, 26 m. S. by E. Providence. Pop. in 1830, 8,410. Previously to the American revolution, this town ranked third or fourth among those of the British N. American colonies; but it has since been far outstripped by others, though it has still a considerable commerce. Its advantages for sea-bathing make it a favourite place of summer resort. It is regularly laid out, and its houses have an antique appearance. The state-house, gaol, several banks and insurance offices, and a good library, are the principal public establishments. The harbour, defended by 3 forts, is spacious, deep, and of easy entrance. There belonged to the port, in 1838, 18,468 tons of shipping. (*Dorchester's Gazetteer; Encyc. Americana, &c.*)

NEWPORT-PAGNELL, a market-town and par. of England, at the N. extremity co. Buckingham, hund. of its own name, near the junction of the Ouse and Onsel (crossed here by 2 stone bridges, and 1 of iron), 13 m. E.N.E. Buckingham, and 48½ m. N.W. London. Area of par., 3,220 acres. Pop., in 1831, 3,385. The town is straggling, ill-built, and only occasionally lighted with gas. The church, which has lately been thoroughly repaired, is a large building of considerable antiquity, occupying an eminence which commands an extensive view of the surrounding rich country; the living is a vicarage, valued at 230*l*. a year, and in crown patronage. The R. Catholics, Wesleyan Methodists, and Independents have also their respective places of worship, with attached Sunday schools. National, Lancastrian, and Infant schools are supported by subscription; and there are 2 endowed charity schools for girls. A mechanics' institute was established here a few years since; and there is a theological academy for training independent ministers. Revivis' almshouses provide lodging, clothes, fuel, and a stipend of 10*l*. a year to 7 aged persons, and Queen Anne's Hospital (founded by Anne, consort of James I.) is appropriated to the maintenance of 6 poor men and women, an allowance, also, of 10*l*. a year being made to the vicar as its master. There are several other minor charities and bequests belonging to the par., and in trust of the vicar and churchwardens. Newport-Pagnell had for-

merly a very extensive manufacture of bone-lace, which, though greatly injured by the competition of the machine-lace of Nottingham, still forms the staple trade of the town. The petty sessions for the hund. are held here. Markets well supplied with corn on Saturday: cattle and lace fairs, April 22., June 22., and Oct. 22.

NEW ROSS, a parl. bor. and river port of Ireland, co. Wexford, prov. Leinster, on the declivity of a steep hill, on the E. side the Barrow, 13 m. N.E. Waterford. Pop., in 1831, 6,284. It is in general pretty well built, but its appearance does not indicate prosperity; this, however, is said to be owing to the difficulty that has existed of late years in obtaining land from the proprietor, Mr. Tottenham, on leases of sufficient length to encourage building. (*Boundary Report.*) Its public buildings are the parish church, a chapel of ease, a Rom. Cath. chapel, a friary, and a nursery, with a chapel to each; meeting-houses for Quakers, Methodists, and the Christian Brethren; several endowed schools, an infirmary, a fever hospital, and dispensary, a lying-in hospital, the Trinity hospital, and other almshouses, with several minor charitable institutions; a market-house, and corn-market; a barracks, the borough-court-house, sessions-house, and bridewell. A wooden bridge, 500 ft. in length, with a drawbridge for the passage of vessels, leads across the river to the suburb of Rossberon, in the co. Kilkenny. The corporation, which received its first charter in the reign of Edward I., consisted of a sovereign, burgesses, and commonalty. It returned 2 mems. to the Irish H. of C. till the Union, since which it has sent 1 mem. to the Imperial H. of C. The electoral limits, as fixed by the Boundary Act, comprise about 326 acres. Registered electors, in 1839-40, 329. General sessions are held at Easter and Michaelmas; petty sessions every fortnight. The town is a constabulary station, and it has three breweries and distilleries. Markets on Wednesdays and Saturdays; fairs, 10th Jan., 10th Feb., 17th March, Easter Monday, 3d May, Whit-Monday, 10th June, 10th July, 10th Aug., 10th Sept., 18th Oct., 10th Nov., and 8th Dec.

New Ross is extremely well situated for trade: vessels of 200 tons reach it at all times of the tide, and those of 600 tons at high springs; the river is also navigable for barges to Athy, where it unites with the Grand Canal, communicating with Dublin on the one hand, and the Shannon on the other. In 1835, its exports, consisting principally of grain, provisions, and live stock, were valued at 50,071*l*. It imports fish from Newfoundland, and timber from N. America and the Baltic. Post-office revenue in 1839, 885*l*.; in 1836, 1,035*l*. Branches of the Agricultural and National Banks were opened in 1836. (*Boundary Rep. & Railway Rep.*)

Though called New Ross is really an old town. A sanguinary conflict took place here on the 4th of June, 1798, between the insurgent Irishmen and the military. The former repeatedly forced their way into the town; but were in the end repulsed with great loss.

NEWRY, a parl. bor., river-port, and town of Ireland, prov. Ulster, on the Newry Water, about 6 m. above where it falls into Carlingford Bay, and on the line of the Newry Canal, which gives it a navigable communication with the bay on the one hand, and with Lough Neagh on the other, 34 m. S.W. Belfast, and 56 m. N. Dublin. Area of parl. bor., 2,500 acres. Pop., in 1831, 13,363. It is divided by the river into two unequal portions, the largest of which, on its W. side, is in the co. Down, and the other in Armagh; the communication between them being kept up by 4 bridges, 2 of which are handsome structures.

It is a well-built thriving town. (*Man. Bound. Rep.*) Its more ancient part, on the declivity of a hill, has narrow and ill-arranged streets; but the modern portion, on the low ground along the river and canal, has wide airy streets, with good houses, mostly of granite. The principal public buildings are 2 Protestant Episcopal churches; St. Patrick's, originally built in 1578, and rebuilt after the Revolution, and St. Mary's, a handsome structure, erected in 1812, with a spire 150 ft. in height. It has also 2 Rom. Cath. chapels, one of which, of large dimensions, in the Gothic style of architecture, is regarded as the cathedral of the see of Down. A convent of the order of St. Clare has also a chapel attached to it. The Presbyterians have 3 places of worship, the Methodists 2, and the Independents and Kellyites 1 each. The institutions for education comprise a preparatory seminary for Maynooth College, a school attached to the convent of St. Clare, and 3 schools connected with the board of national education, in which and in other minor schools, about 1,700 pupils are instructed. Some of the apartments of a suite of assembly-rooms, erected in 1794, are now used as public offices and for a savings' bank. It has also a mendicity association, and some almshouses; an hospital, with accommodation for 40 patients; a good custom-house; and barracks for 700 men.

The environs, which are very beautiful, are studded

with numerous seats, surrounded by well-wooded demesnes. The town is paved, cleaned, lighted with gas, and watched, under the management of a board of commissioners: the assessment for these purposes amounts to about 1,000*l.* a year. The supply of water is wholly derived from numerous private springs.

The *Lordship of Newry*, of which the town forms part, extends over about 21,600 acres. It formerly was attached to a monastery, and enjoyed very extensive privileges, which, after the dissolution of religious houses in the reign of Henry VIII., were vested in the Bagnal family, of which the Earl of Kilmorye is the present representative; his lordship being lay rector and improprator of the tithes. The bog was incorporated by James I. in 1613; but the corporation under this charter having, from some cause or other, been extinguished, the seneschal, appointed by Lord Kilmorye, became the ruling officer in the town, holding a minor-court every third Wednesday for sums not exceeding 10*l.*, and a weekly court of record on Mondays for pleas to the amount of 3*l.* 6*s.* 8*d.* Irish. The general sessions for the county of Down are held here twice a year, as are those for the W. division of Armagh, in which the town is partly situated. Here is a bridewell, in which prisoners are confined until transmitted to the county prisons at Downpatrick or Armagh. The bor. returned 2 mems. to the Irish H. of C.; and since the Union it has returned 1 mem. to the Imperial H. of C. The charter restricted the right of voting to the provost and 12 burgesses; but on its extinction the franchise came to be enjoyed by the inhab. at large. It was, however, confined by the act 35 G. 3. cap. 23. to the occupiers of houses rated at the annual value of 5*l.* The Boundary Act did not change the limits of the bor. Registered electors, in 1830-1, 1,669.

Though not distinguished by its manufactures, it has 2 foundries, a flint glass factory, a distillery, 3 breweries, and some large cotton-mills; and in its vicinity are 2 large flax-mills and a cotton-mill. The opening of the Newry Canal connecting Carlingford Bay with Lough Neagh, has been of great advantage to the town, having made it the entrepôt of a very considerable district, and the seat of an extensive commerce: it is the principal port in the kingdom for the shipment of butter. Vessels of small burden come up to its quays, but those of larger burden load and unload at Warren's Point, about 4 m. lower down. Subjoined is

AN ACCOUNT OF THE QUANTITY AND VALUE OF THE PRINCIPAL ARTICLES SHIPPED FROM NEWRY IN 1835.

Articles.	Quantity.	Estimated Value.
Corn, meal, and flour	cwt.	497,547 201,857
Provisions	-	21,233 81,620

Other articles	value	15,500
Total	-	616,836

Exclusive of its cross-channel trade with Great Britain, especially that with Liverpool and Glasgow, which is by far the most extensive, it has some trade with North America, the ports on the Baltic, and other foreign countries. The gross customs' duty received at the port amounted, in 1840, to 44,010*l.*; and it has about 160 ships of the aggregate burden of about 9,000 tons, exclusive of 2 or 3 steamers. A general market, and a market for linens, which are extensively produced in the neighbourhood, are held every Thursday; and a market for grain on Tuesdays, and for meat on Saturdays. Post-office revenue, in 1830, 2,841*l.*; do., in 1836, 2,739*l.*

Newry was early of considerable importance, and had a castle. It suffered in the war of 1641; and was nearly destroyed by the Duke of Berwick in 1699. It is now one of the most thriving towns in the N. of Ireland.

NEWSTEAD, a village of England, co. Nottingham, being a liberty of the par. of Papplewick, in the N. div. ward. Broxtow, 8 m. N. by W. Nottingham. Pop., in 1831, 159. This village would be wholly unworthy of notice were it not for its proximity to Newstead Abbey; a structure, the fame of which will be as immortal as the English language. The abbey was formerly a priory of Black Canons, founded by Henry II., and granted at the Dissolution to Sir John Byron, the ancestor of the illustrious poet, to whom it is wholly indebted for its celebrity. The part now inhabited consists principally of the rooms and offices of the priory, the church, except the S. aisle, having fallen entirely into decay. The front has a noble

and majestic appearance, being built in the form of the W. end of a cathedral, adorned with rich carving and lofty pinnacles. The cloisters exactly resemble those of Westminster Abbey, only on a smaller scale, but possessing, if possible, a more venerable appearance. The cloister-court has a basin in the centre; and many of the ancient occupants of this noble pile lie under its flagged pavement. The chapel is still entire. The abbey stands

"—embosomed in a happy valley,  
Crowned by high woodlands."

And the ivy-covered ruins of the Gothic church, with its "mighty window" and tower, strikingly contrast with the castellated mansion and its offices.

"Before the mansion lies a beid lake,  
Be set in a great of deep, and freshly fed  
By a river—"

with woods sloping down to its banks. The apartments are spacious and suitably furnished in the old style; and the venerable fabric, with its remnants of monastic and baronial architecture, its somber and sequestered situation, seems to have harmonised well with the moody mind of the "noble Childie." An antique cross of red sandstone stands in the courtyard, and a Gothic green-house leads into a beautiful garden, formerly the cemetery of the priory, where is a pedestal of white marble erected by the poet over a Newfoundland dog that had saved his life. The remains of Lord Byron are interred in Hucknall churchyard, a few miles from the Abbey, which has passed from the family.

NEWTON-IN-THE-WILLOWS, otherwise called *Newton-in-Macerfield*, a bor., market-town, and township of England, W. Derby, hund. co. Lancaster, 15 m. W. by S. Manchester, and 168 m. S.W. London. Area of township, 3,101 acres. Pop., in 1831, 2,139; but probably much increased, owing to the recent erection of iron-foundries, engine-manufactories, and glass-works. It comprises one main and rather long street, conveniently situated near the point where the Manchester and Liverpool Railway unites with the Grand Junction and Union Railways: it has also a large depot and station. Two episcopal chapels have been built here within the last seven years, and there are two or three Sunday-schools. A free-school, founded in 1699, is endowed with 55*l.* a year. Horse-races take place annually on the common N. of the town. Its market, long disused, was re-established in 1838, and is held on Saturday. Fairs, May 17, and 18. Aug. 11, and 12. Newton returned 2 mems. to the H. of C., nonages of the lord of the manor, from 1st Eliz. down to the Reform Act, by which it was disfranchised. (*Buttwerth's Stat. of Lancashire.*)

NEWTON-LIMAVADY, an inland town of Ireland, co. Londonderry, prov. Ulster, near the Roe, about 14 m. E. from Lough Foyle, and 15 m. N.E. Londonderry. Pop., in 1831, 2,428. "It is agreeably situated on the E. bank of the river Roe, in a fertile and well-cultivated district. The town is rapidly increasing and improving, arising from the impulse which of late years has been given to husbandry in its vicinity. Wheat is now raised in considerable quantities, though not many years ago it was imported for home consumption. But the great increase in the culture of flax is the principal cause of its prosperity; and such has been the extent of this produce, that it was found expedient to open a market in the town for its disposal within the last twelve months, where the average weekly sales now amount to from 15 to 17 tons, and to the value of 1,000*l.* sterling; and it is now considered that this amount will rather increase than diminish. Since the municipal commissioners visited the town, two banks, or branches of banks, have been established, with a fair proportion of business. (*Municipal Bound. Rep.*) The public buildings comprise the par. church, 3 Presbyterian meeting-houses, and 1 Methodist do.; a dispensary, sessions-house, a market-house, and a bridewell.

The corporation, under a charter of James I., in 1613, consisted of a provost, 12 burgesses, and a community, and returned 2 mems. to the Irish H. of C. till the Union, when it was disfranchised. General sessions are held in June and December; petty sessions on alternate Tuesdays. The town is a constabulary station.

Markets for corn are held on Tuesdays and Fridays, and for general sales on Mondays. Fairs on the second Monday in February, 28th March, 12th June, 12th July, and 29th October. Post-office revenue, in 1830, 474*l.*; in 1836, 468*l.* The banks referred to above were the Belfast and Northern banks opened in 1835.

NEWTON-STEWART, a market-town of Scotland, co. Wigton, beautifully situated in the vale of the Cree, mostly on level ground, on the banks of that river, and on the high road from Dumfries to Portpatrick, 36 m. W. the former, and 29 m. E. by N. the latter, direct dist. Pop. of town, 2,241; or, including the par., 3,461. It chiefly consists of one main street along the road. A suburb, called Cree Bridge, on the opposite side of the river, and in the stewartry of Kirkcudbright, is connected with the town by a handsome granite bridge.

A large cotton-mill was erected here about 45 years ago; but the speculation not succeeding, the premises were sold, in 1826, for a fifth part of the original cost, and have since been pulled down. A few hand-loom weavers are employed by the Glasgow manufacturers; and it has a brewery and tan-work. But the inhab. are chiefly dependent for support on its retail trade with the surrounding country and its markets. Pork, of the value of about 6,000*l.* a year, is cured here, chiefly for the English market. Vessels of 70 or 80 tons come up the Cree (which falls into Wigtown Bay) to Cart, within 1 m. of the town.

The par. church, designed by Mr. Burn, architect, Edinburgh, and now (1841) about being finished, is the handsomest Gothic edifice for religious purposes in the S. of Scotland. It occupies an elevated situation on the outskirts of the town, has a fine light spire, and is altogether extremely elegant, and in the best taste. It cost nearly 7,000*l.* Here are also chapels belonging respectively to the Associate Synod, the Relief, and the Roman Catholics. There are 9 schools in the par., of which the most important is the Douglas School, founded and endowed by a gentleman of that name, a native of the par., who died in Jamaica in 1759. The teacher has a salary of 80*l.* a year, and is allowed to charge school fees. Dr. Alexander Murray, the celebrated orientalist, was born (1775) in the neighbourhood, where a granite monument, 82 ft. in height, has recently been erected to his memory. Adjoining the town is Kirroughtree, the seat of the Heron family. (*New Stat. Account of Scotland, & Wigtownshire*, 167, 168.)

NEWTONARDES, a town and sea-port of Ireland, co. Down, at the N. extremity of Lough Strangford, 10 m. E. Belfast. Pop., in 1831, 4,142. It has a large square and several good streets, in which are the parish church, a small Rom. Catholic chapel, 3 Presbyterian meeting-houses, 2 for Methodists, and 1 each for seceders and covenanters, a large school on the foundation of Erasmus Smith, a spacious town-hall, a court-house, and a house of industry. "It is increasing very much in extent; many houses have been built within the five years ending with 1835; and others are building, but they are generally of a small description." (*Mon. & Ind. Report*.) The corporation, which, under a charter of James I., in 1613, consisted of a provost, 12 burghers, and a commonalty, returned 2 mems. to the Irish H. of C. till the union, when it was disfranchised. A manor court sits every 3d-Saturday for the recovery of debts to the amount of 10*l.* General sessions are held in June and December, and petty sessions on the 1st and 3d Saturday of every month. A constabulary force is stationed here. The weaving and embroidery of damask muslins are carried on to a considerable extent for the Glasgow manufacturers; and there is a large brewery. Markets on Saturdays; fairs on the 2d Saturday of every month, and on the 23d Jan., 11th May, and 23d September. Post-office revenue, in 1830, 524*l.*; in 1836, 552*l.* A branch of the Belfast bank was opened here in 1836.

NEWTOWN, a par. bor., manufacturing and market-town, and par. of N. Wales, of New-London, co. Montgomery, on the Severn, crossed here by a handsome stone bridge, close to the upper end of the Montgomery Canal, 26½ m. S.W. Shrewsbury, and 152 m. N.W. London. Pop. of par., in 1831, 4,550; but now (1841) probably about 6,000. The town consists of a number of small streets, lined with mean-looking houses of lath and plaster. The town-hall is of brick, and there is a handsome modern cloth-hall. The church, an ancient structure in the English style, has a low square tower, surmounted by a wooden belfry; and another church is at present in the course of being erected. There are also several places of worship for dissenters, and numerous Sunday-schools. There is not a single day-school, however, in which the rising poor can receive gratuitous instruction." (*Hand-loom Weavers' Report*, v. 559.) "Newtown is one of the most considerable towns in Montgomeryshire; and appears, indeed, to be more flourishing, and rising into greater importance, than any other town in N. Wales, owing to the number of flannel manufactures carried on in the town and its neighbourhood. The greater quantity of the Welsh flannel is made here; and the peculiar quality of the water is one of the causes assigned for the excellence of its woollen articles. Land in the neighbourhood lets at a high rent." (*Bound. Rep.*) "The flannel markets (removed thither from Welshpool in 1832) are held on alternate Thursdays, and the quantity in the mart averages 400 pieces, valued at 10*l.* each, every market-day. The supply comes from every part of the country, except Llandudno; and from many districts the flannel is sent in the rough, and finished or dressed at Newtown, where there are greater facilities of machinery and water. There are about 700 hand-loom in the town. The labour is performed principally by male weavers, but also by women and children, the average nett wages amounting to 9*s.* 6*d.* per week. The best weavers are

never out of employ; but a great number of the minding hands are thrown out of work by the slightest depression of the trade. Considerable distress prevailed a few years ago among the weavers, owing to the failure of numerous small manufacturers, but the trade has now returned to a wholesome channel." (*Hand-loom Weavers' Report*.)

In 1839, Newtown had 4 woollen mills, employing 91 hands. Machinery is made on a considerable scale, and there are foundries, potteries, tanyards, and malt-houses, besides 2 joint-stock banks. From the extent of its trade, it is designated "the Leeds of Wales." Its communications are facilitated by the Montgomery Canal, which comes close up to the town, and connects it with the internal navigation of the central and northern districts. The Reform Act made Newtown a par. bor., contributory with Llandudno, Welshpool, Machynlleth, and Llanfyllin, to Montgomery. The Boundary Act included with the par. the townships of Hendillley and Gwestydd. Registered electors of Newtown, in 1839-40, 384; and of the united bors. 1021. Provision markets on Tuesday and Saturday; fairs, 1st Tuesday in Feb., last Tuesdays in March and Aug., June 24., Oct. 24., and Dec. 16. (*Hand-loom Weavers' and Bound. Reports; Nicholson's Camb. Guide*, &c.)

Newtown, a decayed bor. and town of England, in the Isle of Wight, on the river of the same name, 5 m. W. by N. Newport, and 100 m. W.S.W. London. Pop. in 1831, 68. It was anciently called Frankville, and is supposed to have been of some importance previously to its being burnt down by the French in the reign of Richard II. Now declining in its decayed condition, it sent 2 mems. to the H. of C. from the 27th Elizabeth down to the Reform Act, by which it was disfranchised.

NEW YORK, one of the U. States of N. America, and though not the largest, in every other respect the leading State of the Union. It extends between lat. 40° 39' and 45° N., and the 72d and 80th degs. of W. long. Its shape, exclusive of Long Island, at its S. extremity, is nearly triangular; it has E. Connecticut, Massachusetts and Vermont; N. and N.W. Lower and Upper Canada, being separated from the last by the St. Lawrence and Lakes Ontario and Erie; and S. Pennsylvania, New Jersey, and the Atlantic. Length E. and W., including Long Island, 408 m.; greatest breadth, 310 m.; area, estimated at 45,658 sq. m. Pop., in 1840, 2,428,921.

*Physical geography, minerals, &c.* This state may be described as an elevated region with extensive indentations in various parts below its general level. It is traversed by the Alleghanies, here divided into two principal chains, their highest summit, the Round Top, one of the Catskill group, being 3,804 ft. above the tide-level in the Hudson. The most remarkable depressions of the surface are the important valleys of the Hudson and Mohawk rivers, by means of which, and various canals, the basin of the St. Lawrence is at many points placed in communication with the Atlantic. Besides the above rivers, it is watered by the Genesee, Oswego, Oswegatchie, the Regis, Delaware, and Susquehanna. There are several lakes of considerable size; the principal being those of Champlain, Oneida, Cayuga, and Seneca. Gneiss and granite are the most abundant primary rocks, and carboniferous slate, greywacke, and limestone the principal transition and secondary formations. In the latter, to the S. of Lake Erie, many salt springs exist, and the salt made at Salina, Geddes, and other places about Onondaga lake, in 1835, amounted to nearly 2,210,000 bushels; a bushel of salt being obtained from 45 gals. brine. Iron is extremely plentiful in the N. part of the state, where a layer of argillaceous iron ore, yielding from 15 to 30 per cent., extends E. and W. for 200 m. Gypsum is very abundant, and highly useful in agriculture; it is used generally in the proportion of about a ton to 10 or 15 acres. Argillaceous limestone, which makes a valuable cement, lead, marble, and pent, are the other chief mineral products. Coal has been found, but only in small quantities. In this State there are numerous mineral springs, and Saratoga Springs and Bulston Spa are the most frequented watering places of their kind throughout the Union.

The climate is very variable; but an estimate of the 5 years from 1826 to 1830 gives 49° Fah. as the mean annual temp. of the whole state. Storms of thunder and lightning occur frequently in the summer, but the atmosphere is usually dry and serene, and the state is in general very healthy.

The soil in the S. is rather barren, but it improves on proceeding northward. Along the banks of the St. Lawrence, and in the region round the Oneida, it is well adapted for growing corn; upon the whole, however, the rearing of live stock is the most profitable branch of rural industry, and a large portion of the state, especially about its centre, is appropriated to sheep farming. In 1835, of 27,324,232 acres, which the state was supposed to comprise, 9,367,426 were said to be improved and worth 241,385,650 dollars. The principal wheat district commences in the valley of the Mohawk, about

long-750, and extends W. to the great lakes, including the fertile vale of Seneca, and the Genesee country. The average produce of wheat is estimated at from 25 to 30 bushels the acre; but from 40 to 50 bushels are frequently reaped, and instances have occurred of upwards of 80 bushels of wheat and 25 of Indian corn per acre having been harvested. Apples, pears, cherries, &c., succeed admirably well. Indeed, the apples called the Newtown pippins, produced in this state, are infinitely superior to any produced in Europe, and are rather extensively imported into England. Owing to the comparative facility with which fresh land may be obtained, agriculture is in a backward state, though probably it is more advanced in this than in most other states of the Union. Artificial manures are rarely used. In the newly cleared lands, the richness of the mould and of the subsoil is all the farmer requires; he only endeavours, by clearing away the forest, to bring it forth. Amid the stumps of his trees he ploughs as he can, not as his judgment might dictate. In farms upon tracts long cleared, some attention is given to the rotation of crops, with a view to the preservation of fertility; but it is not uncommon to find the same field sown with wheat for a series of years without the intervention of other crops. Heaps of straw, stable manure, ash, &c., which would elsewhere be deemed treasures, are here regarded only as incumbrances; and the story of the farmer who reared his stables on a high foundation, that he might not be speedily compelled, by the accumulation of manure, to remove them, is scarcely an exaggeration. The appearance of the farm buildings agrees little with the obvious wealth of the country. The original log cabins still remain upon farms well cleared, well fenced, and under high cultivation; but they are gradually giving way to more commodious buildings, and in some cases to large and beautiful mansions. In the grazing counties the buildings are generally of a better character than in the grain-growing districts. (New York Gazetteer, p. 59.) Long Island, and the adjacent co. Westchester, though comparatively unproductive, are more improved and better farmed than most other parts of the state, probably in consequence of their vicinity to the city of New York. Agriculture, however, is every where improving. Agricultural societies are to be found in almost every county, and the state government has contributed large funds for the promotion of their objects, especially in premiums for raising the best crops. In many parts, however, where the soil is inferior, grazing husbandry has been substituted for tillage, especially since the Erie canal has brought the produce of the more fertile counties on the W. of the state into competition with those of the E.

Mr. Stuart (*Three Years in N. America*, i. c. 12.) gives a detailed and instructive account of the agriculture of New York. Land, he says, is almost always in the possession of the proprietors, except in the neighbourhood of the cap, and some of the larger towns. When it is let, it is generally on the *metayer* principle, the landlord providing half the seed, and receiving half the produce; and in the case of pasture farms, half the stock belongs to the proprietor. The various crops raised are much the same as in Britain, with the addition of maize, for which our climate is not well adapted. Wheat is the most valuable crop; and the attention of the farmers seems chiefly directed to the raising enough of maize for home consumption only, and of wheat for sale. A good deal of buckwheat and rye is grown; but the degree of heat is not favourable for oats and barley. Potatoes, turnips, and other green crops, are not at all general in large fields, neither are they so well managed as in well cultivated districts in Britain. Maize is sown during the latter half of May in drills from 3 to 4 ft. apart; and is harvested in October, or sometimes later. The hoe-weeding and cleaning of this crop is expensive; the whole work is performed by males, females never working out of doors. From 35 to 40 bushels an acre is considered a good average crop of maize; the same proportion of wheat is, however, considered a very abundant crop; and the average produce in that part of the United States where wheat is grown is said not to exceed 12 bushels, while in England it is estimated at 25 bushels, or upwards. Hops are grown, but not extensively. Hay is easily made, the sun in the hay-making season being very powerful; and, like other crops in this state, it is seldom damaged by bad weather. Clover and all sorts of grass-seeds are used, and much more timothy is grown than in any part of Britain; but none of the pastures, except the alluvial land on the banks of rivers, have the beautiful appearance of English meadows; nor are highly-dressed fields any where to be found. Their requisite management, by frequent ploughings, rolling, &c., is far too expensive to be attempted. The high price of labour is, in fact, the great obstacle to good agriculture, to the cultivation of green crops, to adequate manuring, &c. A tract of land is usually cleared by cutting or burning down the trees; and for the first few years abundant crops of corn

are produced; but as soon as the quantity of grain diminishes, the farmer either lays down his land in grass, and commences sowing on new land in the neighbourhood, or sells his cleared land, and proceeds elsewhere in quest of a new settlement. The virgin soil, consisting of an accumulation of vegetable mould, from 6 to 24 inches deep, is abundantly fertile for a period; but the continuance of its fertility depends upon the under stratum on which it lies, this quality in the mould being soon lost by repeated ploughings. The productiveness of the soil in the S. and W. states of the Union, as well as in New York and New England, has, in fact, been prodigiously over-rated; and the *cl. Durando* of agriculturists has travelled westward, as new lands have been successively cleared. Mr. Stuart thinks it will be found, after the effect of the vegetable matter on the surface of the newly cleared land is exhausted, that the average crops of all kinds of grain (maize excepted) will not, according to the prevailing system of management in this state, exceed about a half of their produce on similar soils in Britain. (*Stuart's America*, i. 262.)

Implements of husbandry are, upon the whole, well suited to the country; and their prices are not higher than in England. The two-horse plough, driven by a ploughman, is nearly universal, except on rough stony land; and ploughing is well executed. The cradle scythe is in pretty general use, a good workman cutting down an acre of wheat a day. Thrashing-machines are not so common as in Great Britain.

Orchards are very productive. Various sorts of excellent apples are grown; but a good deal of cider is made from crab apples. It is for the most part very inferior to the English, and sold at from 2 to 4 dollars the barrel of 30 wine gallons. Melons and pumpkins are raised for domestic use, and for cattle.

In 1840, there were estimated to be in the state 5,381,000 sheep, 2,543,000 horned cattle, 476,000 horses, and 2,170,000 swine. Great exertions are making to improve the breeds of cattle and horses, by importations of the Teeswater cattle, and of stud-horses from England. Mr. Stuart saw no beef equal to the best in a good English market, or to the kyle of the Scotch islands, when well fed; but none was bad. Beef varies from 2d. to 5d. per lb. Dairy products are highly important articles of trade. Milk cows sometimes give 10 or 11 lbs. of butter a week, and perhaps 20 quarts of milk a day. Oxen are much used for ploughing on rough lands, and, like horses, are well trained to their work. The price of ordinary horses is from 16l. to 25l. Sheep are less attended to than they deserve in a country where the dryness of the winter preserves them from diseases to which they are subject in England. The merinos and crosses with them, are the breeds generally seen; mutton is of inferior quality. The great extent of the forests favours the breeding of hogs, which are good; and before being killed, are usually fattened with maize or meal. Turkeys, guinea-fowls, and other poultry, are very numerous and cheap; the price of geese and turkeys, even at New York, is often not above 3d. each; while ducks and fowls are about 1s. each, and eggs 1 doll. a hundred.

In the N. and S.W. parts of the state much of the country is covered with dense forests, and the principal business of the inhabs. is the getting-in and vending lumber. There is little or no underwood, and in cultivated tracts, wherever a sufficient quantity of land has been cleared, the woodland of a farm bears as high a price per acre as the land actually cleared. The trees are sometimes above 80 ft. in height. Numerous varieties of oak, the hickory, black walnut, chestnut, plane (*Platanus occidentalis*), maple, ash, beech, elm, tulip tree (*Liriodendron tulipifera*), here called poplar, and wild cherry, are ordinary trees, with red cedar, pine, &c. The locust tree, which is not a native of the state, and the cedar, have been extensively planted, for the purpose, especially, of ship-building.

The culture of silk has long been prosecuted, as in other parts of the U. States, but on no extended scale. An acre of full-grown mulberry trees is estimated to produce 200 dollars' worth of silk. Mr. Stuart, however, speaks of only one farmer as selling silk to the value of 600 dolls. a year.

A hired farm servant gets, upon an average, from 10 to 12 dolls. a month, and his board. Day labourers hired for those sorts of farm-work, which are often performed by women in Europe, get about 3-4ths of a doll. a day; or in time of hay-making or harvest, frequently a doll., besides their board, being engaged to work from daylight to sunset.

New York is distinguished above every other state in the Union by her extensive internal communications. Of these the principal, formed partly by the navigable river the Hudson, and partly by the Erie canal, 364 m. in length, from Albany on the Hudson to Buffalo on Lake Erie, unites the city of New York with the great American lakes, and makes her, in fact, the proper port of Upper Canada, and of all the vast and fruitful countries surrounding the lakes. Upper Canada may, in-

deed, be reached from Europe, by way of New York, in less than half the time in which it can be reached by way of the St. Lawrence and Quebec, and with incomparably less risk.

The Erie canal was begun in 1817, and was opened throughout its whole extent in 1825. Originally it was only 4 ft. deep; but provision was made, in 1835, for increasing its depth to 6 ft. Its first cost amounted to 7,143,789 dollars; and the expense of the enlargement was estimated at about 5 millions more. It discharges, on Lake Erie, the termination of the canal, is 638 ft. above the level of Albany on the Hudson, where it commences. It is joined by a branch canal with Oswego on Lake Ontario, and by another branch canal with the Susquehanna, and consequently with the Chesapeake. This great work was undertaken at the expense of the state, and has been eminently successful, both in a national and a pecuniary point of view, the tolls, which are very moderate, amounting to about 1,200,000 dollars a year. New York has also a direct communication with the basin of the St. Lawrence, by the Champlain canal. The latter, which may be regarded as the N.E. branch of the Erie canal, connects the Hudson with Lake Champlain, which is united, by means of the navigable river St. John, or Richelieu, with the St. Lawrence. Another important canal connects the Hudson with the Delaware. The total length of the canals completed, in 1837, in this state, amounted to 655 m.

In addition to the facilities of intercourse thus afforded by water communications, it is supposed that about 700 m. of railway have either (1810) been completed, or are in a very advanced state. The most extensive lines are the Ulster and Schoenectady, 77 m., the Tonawanda, and the Ithaca and Oswego. The ordinary roads of the state are not so good as in some other parts of the Union. They are merely formed in a rough way, so as to keep off the water, and the holes and ruts are filled up with clay or earth. After the melting of the snows, or heavy rains, they become almost impassable; but in dry weather answer their purpose tolerably well; and stage coaches travel over them at the rate of 6 or 7 m. an hour. The roads are made and kept in repair by the work of the inhabs. actually called out. The travelling expenses for turnpikes and bridges are quite trifling. (*Amer. Almanack*, 1836—1841; *Stuart's America*, i. 273, &c.)

*Manufactures* are various and important. In 1835, there were altogether 7,000 saw and grist mills, 965 filling-mills, 1,090 carding machines, about 110 cotton factories, 230 woolen do., 290 iron works, 340 distilleries, 700 asheries, 400 tanneries, &c., the aggregate value of the manufactured goods was estimated at 60,693,000 dollars, of which the raw material is supposed to have amounted to 43,400,000. Flour and sawn timber are included in this estimate among manufactured goods; and amounted, together, to about 26 million dollars. The other articles were comparatively trifling, cotton goods being only valued at 3,030,700 dollars, woollens at 2,433,000 do., iron wares at 4,350,000 do., liquors 3,098,000 do., and leather 5,598,600 do.

The commerce of this state is very extensive; as she not only supplies her own wants, and exports her surplus produce, but also imports vast quantities of goods for the consumption of the northern parts of Pennsylvania, Ohio, Michigan, and other western states. In 1834, it was estimated that goods to the value of 13,405,000 dollars came to the Hudson river by the Erie and Champlain canals, and the value must have increased materially in the interim. Albany, Hudson, Buffalo, Whitehall, and other towns on these canals, are large emporiums. But the principal part of the trade, including nearly all the foreign commerce of the state, centres in New York city (which see).

The *Legislature* consists of a senate of 32 members, elected for 4 years, and a house of representatives of 128 mems., chosen annually. The state is divided into 8 senate districts, each entitled to send 4 senators; and 1-4th part of the senate is elected annually. The governor and lieutenant-governor are elected for 2 years; the latter presides in the senate, where he has a casting vote. The right of suffrage is enjoyed by every white male citizen above 21 years of age, who has resided for 12 months in the state, or for 6 months in the co. for which he offers to vote; and persons of colour possessed of a clear freehold of the value of 250 dollars. The salary of the governor is 4,000 dollars a year; and the pay of the lieutenant-governor 6 dollars, and of senators and representatives 3 dollars each a day, during the session. The legislature meets annually at Albany on the first Tuesday of January, unless otherwise ordered. For judicial purposes the state is divided into 8 districts corresponding with the senate districts; in each of which is a circuit-court, with a judge having a salary of 1,250 dollars a year. There is a civil and criminal court in each co., besides mayors' and justices' courts in the towns. The superior courts are a court of chancery, vice-chancellor's court, supreme court, and superior court for the city of New York. The chancery

cellor and superior judges are appointed by the governor and senate, and hold office during approved conduct, or until the age of 60; the inferior judges are appointed by the same authorities for the term of 5 years. The common law of England, though with various modifications, forms the basis of the jurisprudence. There are 2 principal state prisons; at Auburn (which see), and at Sing-sing on the Hudson, about 35 m. above New York. They are both conducted on the same plan; the former, at the end of 1838, had 616 inmates, and the latter 842.

The principal religious sects are the Presbyterians, Methodists, and Baptists; the Episcopalians and Dutch Reformed are also numerous. The Episcopalians have a theological seminary at New York, the Presbyterians at Auburn, the Baptists at Hamilton, and the Lutherans at Hartwick. In no state is public instruction more fully carried out. There is a school fund, which amounted, in 1840, to 1,578,069 dollars, the produce of which is distributed among the townships on condition of their raising a sum equal to that which they received from the state. The whole of these sums are expended in payment of teachers' wages; the erection of school-houses, the establishment of libraries, &c. being at the charge of the school districts. The number of children between 5 and 16 in the various school districts amounted, in 1838, to 564,790, of whom 557,229, or about 1 in 4 of the whole pop., were receiving instruction. In each of the 8 senatorial districts, an academy for teachers has been established at the public expense. There are also between 60 and 70 high schools, besides Columbia, Union, Hamilton, and Geneva colleges, and New York university. As an indication of the literary activity that prevails, it may be mentioned that, so far back as 1830, nearly 240 new papers were published in the state, 16 of which were issued daily. Charitable institutions, as lunatic asylums at Ulster, Blackwell's Island, Bloomfield, deaf and dumb, and blind asylums, &c. are numerous. They are supported by a rate on the counties to which they respectively belong, and are under the care of superintendents of the poor. In each co. is a poor-house, to which a farm of about 6,000 acres is attached. In 1836, there were 37,959 paupers, the amount expended for their relief being 396,100 dollars; the average expense of each pauper was 324 dollars a year: the value of the paupers' labour, 39,124 dollars. Slavery does not exist in this state; but the Blacks are, notwithstanding, regarded as an inferior and degraded class. The militia consists of 3 divisions of cavalry, 4 of artillery, 3 of rifle-men, and 32 of infantry; the whole comprising, in 1836, 192,000 men. With certain exceptions, all able-bodied, free, white, male citizens between 18 and 45 years of age, are subject to military duty. The total amount of real and personal property in the state, in 1839, was estimated at 634,224,017 dollars, having increased, since 1835, by more than 1-5th of its then amount. The aggregate tax levied for town and county expenses in 1839 was 3,148,931 dollars. The total debts of the state and city of New York, in 1839, amounted to 26,407,331 dollars. Of this, the canal debt amounted to 12,494,373 dollars, the whole, except 513,279 dollars, bearing interest at 5 per cent.

*History.*—This country was first explored in 1609, by the English navigator, Hudson, then in the service of the Dutch E. I. Company. It was settled by the Dutch soon afterwards, under the name of New Netherlands; but was conquered by the English in 1664, and bestowed by Charles II. on the Duke of York. On the accession of the latter, it reverted to the crown. New York sustained an important part in the revolutionary war: its independence dates from 20th April, 1777. It sends 40 representatives to Congress. (*New York Gazetteer*, 1836; *American Almanack*, 1836—1841; *Stuart's Three Years in America*; *Encyc. Americana*; *Murray's History of Geog.*, Amer. Edit.; *Flint, Pitkin, Darby*, &c.)

New York, the largest and most populous city, principal sea-port, and commercial metropolis of the U. States; cap. of the above state, on the S. extremity of Manhattan island, near the mouth of the Hudson river, on the coast of the Atlantic; lat. of the City Hall, 40° 42' 43" N., long. 73° 59' 40" W. Pop., in 1840, 512,351. The island, which is long and narrow, has S. New York Bay, comprising the estuary of the Hudson, R. Long Island Sound, and W. the Hudson, all having deep water; on the N. it is bounded by a narrow channel, called Harlem river, across which are several wooden bridges. The approach to the city by sea is very fine, the shores of the bay being wooded down to the water's edge, and thickly studded with farms, villages, and country-seats. The view of the city itself from the bay is less prepossessing; for the ground on which it is built, though undulating, being no where considerably elevated, but little of it is visible from the water; and it has no very striking object to attract the eye. It is of a triangular shape, bearing, in this respect, some resemblance to Constantinople. The largest portion of the city, at the apex or S. extremity of the triangle, has, notwithstanding the important improvements effected of late years, many narrow, crooked, and

Inconvenient streets; but in all the more modern portions the streets are broad and straight, and generally cross each other at right angles. The present circuit of New York is about 8 m. Broadway, the principal street, is a long and spacious avenue, 80 ft. in width, extending in a straight line through its centre for nearly 3 m., its upper or more northerly portion being lined with very handsome houses. This is the favourite promenade; and when the entire plan of the city is completed, it will extend to 8 m. in length. Many of the shops or stores in the Broadway and other principal streets are highly ornamented, and are fitted up with plate-glass windows similar to those of London. On one side the Broadway is an open space, of about 4 (according to Bradford 11) acres, planted with trees, and intersected by walks, having the city-hall in its centre; and at the S. end of the same great thoroughfare is a vacant space called the Battery, commanding a fine view of the bay, and much resorted to by all classes. Hudson and Washington Squares are the principal squares already finished; but others have been planned in parts of the town that are not yet completed; certainly, however, in constructing the city, too few open spaces have been left for the health and recreation of the inhabitants. Mr. Stuart says, "The dwelling-houses in the central parts are, as I was told, as high-priced as in the best squares in Edinburgh. The pavement all over the city is generally good, and the side pavements are broader than in British cities. The outside of the brick buildings is almost always kept painted, which gives them a clean, fresh, and cheerful appearance. The buildings for public institutions, and the churches, seem quite as numerous as in British cities, when the difference of pop. is taken into account. There are about 100 (in 1837, 146) churches. Many of these are large; but there is nothing in their architecture particularly requiring notice. There is no building to bear any thing like a comparison with St. Martin's church in London, the front of the Register Office in Edinburgh, or that of the Chamber of Deputies in Paris; but there are churches and public buildings in all those cities of recent erection quite as deficient in good taste as any in New York. In short, though there be no very fine buildings in this city, there is not much to hurt the eye of the fastidious." (*Three Years in America*, i. 21-24.) The city hall, in which the courts are held, is the only very imposing building. It is 206 ft. in length, by 105 ft. in depth, and 65 ft. in height, being enclosed within a massive iron railing. It has a front of white marble, and an interesting collection of portraits, busts, &c. of the presidents and other distinguished citizens of the U. States. Near the hall is a neat building, formerly a gaol, but at present appropriated to city offices; and in the rear is a range of brick buildings, now called the New York Institution, and occupied by the Literary and Philosophical Society, the American Academy of the Fine Arts, &c. The building for the "University of the city of New York," in Washington Square, is one of the finest of the public edifices. It is of marble, in the English collegiate style, 189 ft. wide, and 100 ft. in length. The front is divided into five parts, the chapel being in the centre, with wings, and flanked by towers on either side. The chapel, somewhat similar to King's College, Cambridge, is 55 ft. in width, and 85 ft. in depth. It has octagonal turrets, and a window 50 ft. high, and 24 wide. Columbia College, and Astor House, the largest hotel in the Union, built of granite, 200 ft. by 150, and having 390 apartments, are well worth notice. Trinity Church, founded in 1696, in the Gothic style, with a steeple 198 ft. in height; St. Paul's, with an Ionic portico, and a spire 234 ft. in height; St. John's, on the construction of which more than 200,000 dollars have been expended; and St. Patrick's R. Cathedral, the largest church in the city, are the best ecclesiastical edifices. The city hotel, 7 stories high, and comprising a large assembly room; 5 theatres; the custom house, on the model of the Parthenon; the city lyceum, hospital, alms' house, bridewell, gaol, &c. are among the other principal buildings. There are numerous good hotels and large storehouses. In respect of cleanliness, New York has little to boast of compared with an English town. There is hardly a sink or common sewer in the whole city: the night-soil is collected in pits, of which there is one in every house, and being conveyed to the nearest quay, is thrown into the river; but as these quays are made of timber with many projections, a great deal of filth is retained about them, producing in hot weather an abominable stench, and, probably, also, originating the yellow fever by which the city is sometimes visited. Another great drawback is the want of an abundant supply of water. This deficiency is the more serious, as great numbers of the houses are built of wood, and destructive fires are very frequent. A calamity of this kind occurred in Dec. 1835, which destroyed property to an immense amount, including the exchange, the erection of which, together with the ground, cost 230,000 doll. Another exchange is now (1841) in the course of being constructed.

New York inner bay forms one of the finest harbours in

the world: it is about 8 m. in length N. to S., and has a breadth varying up to 5½ m. It may be entered from the ocean by three passages; the Narrows, East River or Long Island Sound, and Staten Island Sound; but the first is at once the best, and by far the most frequented channel. The bar, at the mouth of the outer bay, between Sandy Hook Point and Long Island, has 21 ft. water at ebb tide; and as the water rises about 5 ft., the largest class of ships may enter the bay. Within the bar the water in the outer and inner bays, and in the Hudson, is so deep that ships of the largest burden lie close to the quays, and may proceed to a great distance up the river. The navigation of the bay is but rarely impeded by ice. The great strength of the tide and the vicinity of the ocean keep it generally open, even when the Chesapeake and Delaware bays are frozen over. In the bay near the city, are Governor's, Bedlow's, and Ellis's Islands, all strongly fortified; and other fortifications are erected on the adjacent shores guarding the approach to the city. The navigation in entering the harbour is extremely easy, and were it not for the risk of visiting ship-insurances, the services of pilots would seldom be required. A light-house is erected on Sandy-hook Point, and there are two others, about 300 ft. apart, 4 m. S. by E. the foregoing, and 250 ft. above the level of the sea. A fourth light-house stands on Staten Island, on the left side of the Narrows. Vessels load and unload at the wharfs on both sides of the city, which are continually crowded with shipping.

#### *Means of Internal Communication and Commerce.*—

The rise of the tide is felt in the Hudson so far as Troy, 160 m. above New York, and large vessels ascend to Albany, a little below Troy, affording the greatest facilities for the transport of produce from and to the interior. These natural advantages are trifling, however, compared with those which have been conferred on New York by the system of canals and railways with which she is connected. These, as shown in the previous article, have made her the grand repository of a vast extent of fertile territory, and have given her an extent of internal navigation inferior only to that enjoyed by New Orleans and one or two other cities. She is now, in fact, not merely the port of the state of New York, but in a great measure also of Upper Canada, and of the states of Ohio, Michigan, Indiana, &c. Not only does the Erie canal place her in direct communication with the countries bordering on the lakes, but the latter, being connected by the Ohio and Wabash canals, it is of every day occurrence that goods laden at New York and sent up the Hudson, find their way, without being unshipped, to the emporiums on the Mississippi and Missouri, and even to New Orleans, and conversely! In consequence of these extraordinary facilities, the trade of New York is very extensive; and it will necessarily continue to increase with the rapidly increasing wealth and population of the vast countries of which she is the principal entrepot.

The value of the merchandise annually loaded and unloaded in the port of New York is estimated at from 180 to 200 millions of dollars. The number of vessels in the port in the busy season varies from 500 to 800, exclusive of about 60 steamers. The number of arrivals from foreign ports amounted, in 1838 to 1,730, and the coasting arrivals exceed 5,000. The total value of the imports into the United States in the year ending the 30th September, 1839, amounted to 162,092,132 doll., of which no less than 59,862,438 doll. were imported into New York! The imports comprise an infinite variety of articles. The principal are cottons, woollens, linens, hardware and cutlery, earthenware, brass and copper manufactures, salt, &c. from Great Britain; silk, wine, brandy, &c. from France and Spain; sugar and coffee from the Havannah and Brazil; tea from China; with spices, indigo, cochineal, dye-woods, &c., &c. The value of the exports from New York in the year ending the 30th of Sept. 1839, amounted to 33,268,099 doll., being between 1-3d and 1-4th part of the total exports from the United States. The exports principally consist of wheat, flour, corn, rice, and cotton; beef, pork, butter, dried fish, and all sorts of provisions; furs, tobacco, coarse cottons, and other manufactured goods, lumber, &c. The great excess of imports into New York over the exports is accounted for by the fact, that while mostly all articles of export from the Western states are sent down the Mississippi, to be shipped at New Orleans, the greater part of the more valuable articles brought from abroad, and destined for the consumption of the same states, are principally imported into New York.

The tonnage of New York is greater than that of Liverpool, or of any other port, with the single exception of London. The registered tonnage belonging to the port on the 30th of Sept. 1838, amounted to 400,071 tons; and on the 30th of Sept. 1839, it amounted to 430,301 tons; being above 1-6th part of the entire tonnage of the United States. Subjoined are some statements respecting the navigation, &c., of New York in 1838, and other recent years:—

## Arrivals at New York in 1838, from Foreign Ports.

		Of which were:—	
Steamers	11	American	1,361
Ships	487	English	230
Barkes	189	French	41
Brigs	710	Swedish	28
Gallies	11	Dutch	21
Schooners	351	Portuguese	20
Yacht	1	Spanish	11
		Danish	11
Total	1,790	Swedish	11
		Columbian	10
		Austrian	7
		And all others	33

## Arrivals of Ships in the under-mentioned Years.

In 1850	1,510	In 1855	2,013
1851	1,651	1856	2,292
1852	1,808	1857	2,671
1853	1,946	1858	1,790
1854	1,952		

## Arrivals of British Vessels included in the above.

In 1850	92	In 1855	257
1851	278	1856	267
1852	569	1857	241
1853	571	1858	339
1854	505		

## Number of Passengers arrived at New York in the under-mentioned Years.

In 1850	30,224	In 1855	35,207
1851	31,730	1856	60,511
1852	48,580	1857	51,925
1853	41,752	1858	25,581
1854	45,110		

The communication of New York with Liverpool, London, Havre, Rio de Janeiro, and those foreign ports with which she has the greatest intercourse, is principally kept up by lines of packet ships, the property of New York merchants. These ships sail at regular intervals; are fitted up with every regard to safety and convenience; and are, probably, the finest and fastest sailing vessels in the world. They vary in size from about 500 to about 800 tons. The speed and regularity with which they perform their voyages is quite astonishing.

More recently steam packets have been established between this country and New York. Hitherto, however, they do not appear to have any material advantage in respect of speed over the packet-ships, while, in respect of security, they would appear to be very decidedly inferior.

There are an immense number of banks and insurance companies in New York. They are all joint-stock associations; and the partners in most of them are liable only to the amount of their shares. It is needless to dwell on the state of these concerns. Every body knows that the banking system of the United States is a disgrace to a civilised country. It seems, in fact, to have every quality that a banking system should not, and not one that it should have; and has over and over again overspread the country, notwithstanding its innumerable advantages, with bankruptcy and ruin. The New York banks are probably about the best in the Union; but, in common with the others, they are every now and then stopping payments, and, speaking generally, are in the most unsatisfactory condition. There is nothing, indeed, so indispensable in America as a thorough and radical reform of the banking institutions of the country; and till they be placed on a totally different footing, those foreigners who invest capital in them may be fairly said to have more wealth than discretion.

In 1835 the city was divided into 16 wards, each electing annually an alderman and assistant alderman. These together form the common council, but meet in two chambers, one called the Board of Aldermen, and the other the Board of Assistants. The mayor, formerly appointed by the governor and senate of the state, has, since 1834, been appointed by the electors of the city. The council possesses the legislative power in the city, subject to the approbation of the mayor; but in case of his refusal to sanction any ordinance, it may be passed by a majority of the whole number of the members of each board. The courts of the city are—the superior court; court of common pleas; courts of general and special sessions; the marine court; a police court, with 5 magistrates; and 7 justices' courts. The university, chartered in 1831, and opened for students in 1832, is subject to the inspection of 21 regents, including the governor and lieutenant-governor of the state, who have power to inspect all colleges and schools therein; but internally it is governed by a council of 32 shareholders, with the mayor and 4 members of the common council for the time being. It has a chancellor and 16 professors, and affords instruction in all the usual branches of general science. The university course includes a period of four years for the degree of B. A. The price of tuition for the whole course is \$12 a year, or for single branches
